## S U I

Suicide.
 UICIDE, the crime of felf-murder, or the perfon who commits it.
We lave often wined to fee a hiftory of crimes drawn up by a ran of ability and refearch. In this hitlory we would propose that the author hould deferibe the crimes peculiar to different nations ia the different dates of lociety, and the changes which they undergo in the progets of civilization. After laving arranged the hiftorical facts, he might, by comparing them with the relegion and the knowledge of the people, deduce forme emportant general concluions, which would lead to a difcovery of the cause of crimes, and of the remedy molt proper to be applied. Some crimes are peculiar to certain flakes of fociety, lome to certain nations, \&c.

Suicide is one of thole crimes which we are led to belice not common among favage nations. The frt infrances of it recorded in the Jewish hiftory are thole of Saul and Ahitophel ; for we do not think the death of Samfon a proper example. We have no reafon to firspoe that it became common among the Jews till their wars with the Romans, when multitudes flaughtered themfelves that they might not fall alive into the hands of their enemies. But at this period the Jews were a molt defperate and abandoned race of men, had corrupted the religion of their fathers, and rejected that pure fyftem which their promifed Meffiah came to Jerufalem to announce.

When it became remarkable among the Greeks, we have not been able to difcover; but it was forbidden by Pythagoras, as we learn from Athenæus, by Socrates and Ariftotle, and by the Theban and Athenian laws. In the earlieft ages of the Roman republic it was Seldom committed; but when luxury and the Epicurean and Stoical philofophy had corrupted the fimplicity and virtue of the Roman character; then they began to feek fhelter in fuicide from their misfortunes or the effects of their own vices.

The religions principles of the bramins of India led them to admire fuicide on particular occafions as honourable." Accuflomed to abftinence, mortification, and the contempt of death, they conlidered it as a mark of weakneis of mind to fubmit to the infirmities of old age. We are informed that the modern Gentoos, who fill in molt things conform to the cuftoms of their ancestors, when old and infirm, are frequently brought to the banks of rivers, particularly to thole of the Ganges, that they may die in its facted freams, which they believe VoL. XX. Pır.I.

## S UT.

can wall ı away the guilt of their fins. But the maxims of the bramins, which have encouraged this practice, we are affured by Mr Holwell, are a corruption of the doctrines of the Shaflah, which pofitively forbid fuicide under the fevereft punishment. The practice which under the everett punimment. The practice which Howell's
religion or affection has cftablifhed among the Gentoos, Interefing for women at the death of their hufbands to burn them- Events, Selves alive on the funeral pile, we do not think ought \&zc. vol. i. felves alive on the funeral pile, we do not think ought to be confidered as fuicide, as we are not anxious to extend the meaning of the word; for were we to extend it thus far, it would be as proper to apply it to thole who choose rather to die in battle that make their efcape at the expence of their honour. Thus we fhould condemn as fuicides the brave Spartans who died at Thermopyla in defence of their country ; we fhould alfo be obliged to apply the fame difgraceful epithet to all thole well-meaning but weak-minded Chriftians in this inland, who in the lat century chofe rather to die as martyr than comply with commands which were not morally wrong. According to the Gentoo laws, " it is proper for a woman after her hufband's deaths to burn herfelf in the fire with his corpse. Every woman who thus bums fall remain in paradife with her hufband three crore and fifty lacks of ycars. If the cannot, the mut in that cafe preferve an inviolable chaftity. If the remain chaste, flue goes to paradife; and if the do not preferve her chaftity, the goes to hell.:"

A cuftom fimilar to this prevailed among many nalions on the continent of America. When a chief died, Among the a certain number of his wives, of his favourites, and of popery, his faves, were put to death, and interred together with dinerica. him, that he might appear with the fame dignity in his future flation, and be waited upon by the fame attendants. This perfuafion is fo deeply rooted, that many of their retainers offer themfelves as victims; and the fame cuftom prevails in many of the negro nations in Africa.

If we can believe the hiftorians of Japan, voluntary the Japadeath is common in that empire. The devotees of the ste, and idol Amida drown themfelves in his prefence, attended by their relations and friends, and Several of the priests, who all confider the devoted perron as a faint who is gone to everlafting happiness. Such being the fuppofed Raymal's honours appropriated to a voluntary death, it is not fur- Efl and prifing that the Japanefe anxioully cherifi a contempt of $W_{e f i} 1 n$ life. Accordingly it is a part of the education of their ${ }^{\text {ares, val. }}$ i. children " to repeat poems-in which the virtues of their

Suicide.
ancefors are celebrated, an utter conlempt of life is inculcated, and fuicide is fet up as the noit herois of actions."

A notion feems allo to have prevailed among the ancient Scythian tribes, that it was pufillanimous and igrothe fios a naan whofe flength was wafted with difeale or infirmity, fo $2 s$ to be uielefs to the community, to continue to live. It was rechoned an heroic action wobuntarily to feek that de. sh which he had not the good fortune to nicet ia the field of battle. Perverfion of moral feeling does not fpiing up, we hope, fpontaneouly in any nation, but is produced by fome peculiarities of fituation. A wandering prople like the Scythians, who zoamed about from place to place, might of ten find it impoffible to atterd the fick, or to fupply from their precaricus flore the wants of the aged and infirm. The aged and infirm ti:cmifelves, no longer able to fuppoit the charater of warriors, would find themfelves unhappy. In this way the pratice of putting to death fuch perons as were ufelefs to the community might eriginate, and afterwards be inculcated as honourable; but he who put an erd to lis infrraities by his own

The tribes of Scandinavia, which worhipped Odin the "father of flaughter," were laught, that dying in the field of battle was the molt glorious erent that could befal them. This was a maxim fuiled to a warlike nation. In order to eflablifl it more fimiy in the mind, all were excluded from Odin's feaf of lieroes who died a natural death. In Afgardia floct the hail of Odin; where, feated on a thoone, be rcceived the fon!s of his departed heroes. This place was called Va/hislla, fignifying "the hail of thofe winn died by violerce." Na.tural death being thus deemed inglorinus, and funithed with exclufion frem Vaihalls tie paradife of Olin, he Who cou!d not enjoy death in the field of battle was led - to leek it by his own hands when ficknefs or old age hegan to aftail him. In luch a nation fuicicic mult hầe been very common.
As fuicide prevailed much in the deciine of the Roman empirc, when lusury, licentioufrefs, protigacy, and falfo phillofupliy, pervalod the world, so it continued to prevail csen after Clunitionity was eltablifhed. The Romans, whon they tecame converts to Chriliani- ( $y$, did not renounce their ancient projudices and falfe apinoanc, but blended them with the new religion which they embraced. The Gothic nations alfo, who fubverted the Ruman empire, while thry reccived the Chiftian religion, adlicred to may ct their fornmer opinions and namners. Amo: g other criminal practices which were retained by the homans aid their conquetore, that of fucicie was ane; lut the 1 tinciples from which it procetded were explained, fo as to appear more agrecable to the nese fytetn whic', thry had efroufed. It was committed, either to fecurc from the danger of apoftacy, to procurc the ho:sour of masty:dom, or to preferve the cown of virginity.

When we defcend to modern times, we lament to find fo many jaftances of fuicile among the moft polithed nations, who have the beft onportunities of knowing the atrocily of hat umatual r rimic. The Englith liave long been reproactied tey forcigners for the fiequent com inisin of it; ard the "glonmy month of Novem. fer" has becolfigmatized as the finfun. when it is mont so:mmon, But this difgraceful inputation, be think,
may be juifly altributed, not to the greater frequency of the crime in England than in other places, but to the cuffom of publifhing in the newfpapers every inflance of fuicide which is known. Mr Moore, who lately publifhed a full inquiry into this fubject, was at great pains to obtain accurate information concerning the perpetration of this crime in different countrics. Mercier, who wrote in 1782 , fays, that the annual number of fuicides in Paris was then about 150 . He does not tell us how he came by the information; but we have the The numauthority of the Abbe Fontana for afferting, that more perfons put ane end to their lives in Paris than in London ris, Londun. The Abhe lad this information from the lieute-don, Genant of the police. Mr Moore was informed by one neva, \&c. of the principal magiftrates of Genera, that in that ci- according the bef ty, which contairs about 25,000 inhabitants, the ave- ${ }^{\text {to the }}$ 保 berts. rage number of fuicides is about eigh. The average number of fuicides, from what caufe foerer, for the latt 28 years, has been 32 each year for London, Southwark, and Weftminter. In Edinburgh, which contains 80,000 inhabitants, we are convirced the average number of fuicides does not exceed four. Mr Moore found, from the accounts with which he was favoured by the feveral coroners of the county of Kent, that for the laf 18 years the number has been upwards of $3^{2}$ each year. Kent is fuppofed to contain 200,00 inhabitants, and London 800,020 . It is caly therefore to fee, that in the metropolis many inftances of fuicite mult occur which are never the futjot of legal inquire, and confequentiy never made known to the worlil. Whereas in the country towns and villages of lient it is fcarcely pofibible to conceal iuch an action as felf murdur from the knowledge of the whole neighbourlooch. The calculation therefore refpecting Kent we may receive as true, while we mult increafe the average nuaber in London very confiderably. Mr Moore compuits the ayerage numiter of fuicides in England cvery year at a thoufand; but the principles on which he founds this opinion are to imperfect and vague, that we do not think it can be depended on as coming rear the truth.

It might lead to fome interelting conchans to compare iogetlicr, not only the numbicr of fuicides in differ. ent countrics, but alfo the ank and principles, the fex and age, of thofe unliappy perfons hy whom it has been commited. Mercier fays, that at Pris it was the lower rouks who were mon commonly milly of fit that it was monly committed in garrets or hired lodgings; and that it proceeded from poverty and oppiefion. A great many, hic fays, wrote letters to the magitrates befure their siore", death. Mr Moore's correfpondent fiom Geacva inform. Furl in.
 Evicides were committed in Gcrieva; that two-thirds of the $f$ Suridide. thefe unfortunate perfons were men; that few of the clerical order have been known 10 commil it; and that it is not fo much the end of an immoral, irrcligious, dill:pated life, as the effert of melancholy and poverty. By the information obtained from the coroners of Kent, it appears, that of the 32, three-fourths have delloyed themfelves by hanging; that the propartion of males to females has been about 'wo thitds of the formur ; that no one feafon of the year is more dilinguilted for this crime than ansther ; and that fuicide is upho the in:creafe. Our accounts scfpreting the city of London are very imperfoc ; but we think ourfelves intiled to conclude, that fuicide is more common among the gicat and

## S U I [ 3 ] S U'I

Suicide. 18 Phy fical caupes to viluch it has been afcribed in Eritain.

Wealthy than among the lower ranks, and that it is ufually the effect of gaming and diffipation.

Thofe who have inquired into the caufes of fuicide in Britain have enumerated many phyfical as well as moral caufes. They have afcribed it to the variablenefs of our climate, to the great ufe of animal food, to ftrong fpirituous liquors, to tea, and to the fulphureous exhalations of the pit coal ufed as fuel, which are faid to produce a depreffion of fpirits and rervous affections. Of our climate, we have no caufe to complain, nor bave we any leafon to impute any of our vices to its inflaence. 'Ihere are many climates much more unfavourable where fiaicide is farcely known. That an exceffive quantity of Erufs animal food, or of frong liquors, or of tea, will powerfully aff.ct the human contitution, we will not deny : but before we confider thefe as caufes, it muff fift be determined, whether thofe who are guilty of felf murcler be much adidicted to them; and if they are, whether there be not other caufes much more violent in their nature which have operated on their mind; for we ought not rafnly to attribute vicious effects to any of thofe things which feem to have been created on parpofe for the comfort or convenience of man. We are rather furprifed to find that coal is mentioned even as a dillant caufe of fuicide; for it is one of the bleflings of our illand; and a good coal fire we have always found rather conducive to good firits than injurious to them.
And moral Among the moral caufes which are fuppofed to cosulues. operate in producing fuicide in Britain, the freedon of our conftitution and laws is reckoned one. That rational liberty fould have any tendency to enconage crimes of any kind, a Chrifian philofopher can, never alluw; for fuch an opinion is totally difccuntenanced by enlightened views of nature. Mercier has afribed the frequency of fuicide in Paris to the opprefion of the late government. Now it appears fomewhat extran dinary, that fuicide in one country thould be occafioned by liberly, and in another by the wat of it. One of thefe opi-nious-munt be falle, and it is furely not difficult to difinguifu which.
Not owing Humanity would in niof cafes difpofe us to conclude, always to infanity;
would commit, compaftion indced may fuppofe; but the murder of a wife, a father, or a child, are allo unnatural ; yet compaffion does not teacls us in all cafes to afcribe fuch a crime to madnefs. Paffion may often arife to fuch a height of outrage as to be fcarccly dittinguifte. able from madnefs in its fymptoms and its effects; yet we always make a dillinction between that madnefs which arifes from difeafe and that which is owing to violent peturbation of mind. If a perfon be capable of managing his wordly affairs, of making a will, and of difpolirg of his property, immediately before his death, or after he formed the refolution of dying by his own liands, fuch a inan is not to be confidered as infane.

But though a regard for truth prevents us from afcrib-but ofteu ing fuicide in all cafes to infanity, we muft afcribe it ci-aifo to ther to infanity or to vicious paffion. Thefe two divi- vicious pais fions, we imagine, will comprehend every fpecies of it, fion. whether arifing from melancholy, tcdium vitue or ennut, difappointment in fchemes of ambition or love, pride, gaming, or a defire to avoid the thame of a public cxecution; paflions which are often increaled by falfe views of God, of man, and of a future tlate, arifing from deifm and infidelity. If thefe be the cautes of fuicide in modern time, what a difgraceful contrat do they form to thofe principles which actuated many of the ancient philofophers, the Genioos, the Japanefe, and the wormippers of Odin ? When they committed fuicide, they committed it from principle, from a belief of its lawfulnefs, and the hope of being rewarded for what they judged an honourable facrifice. But in modern times, we are forry to fay, when it is not the effect of madnefs, it is the effect of vice : and when it is the effect of rice, it proves that the vicious paffions are then indulged to the higheft degree; for there is no crimae which a man can commit that is fo ftiong a fymptom of the violence of particular paftions. It is from not attending to this circumflance, that it has been found fo difficult to refute the arguments in favour of fuicide. If the criminality of fuicide be confined me:ely to the violent action, many apologies may be made for it; but if it be confidered folely as the effect of vice, as the ftrongeft fymp:om of ungovemed pafion, he who undertakes its defence muft undertake the defence of what all men will loudly condemn ( $A$ ).

$$
\text { A } 2
$$

(A) Several of the heathens entertained a very jut fenfe of the atrocity of fuicide. Quintus Curtius intraduces Durius with the following fpeech, when he had lot his empire: "I wait (fays the unfortunate monarch) ihe iffue of my fate: you wonder, perhaps, that I do not terminate my own life; but I choofe rather to die by the crime of another than by my own.

We cannot refule-ourfelves the pleafure of prefenting to our readers the following beautiful paffage upon this fubject from Fitzoftorne's letters *: I am perfuaded (fays this elegant writer) this difguft of life is frequently in-: Leater dulged out of a principle of mere vanity. It is effeemed as a mark of uncommon refinement, and as placing a man in. above the ordinary lerel of his fpecies, to feem fuperior to the vulgar feelings of happinefs. True good fenfe, how.. ever, moft certainly confits not in defpifing, but in managing our fock of life to the beft advantage, as a cheerfuI acquiefcence in the meafures of Providence is one of the frongeft fymptoms of a well contlituted mind. Self-wearinef's is a circumfance that ever attend, folly; and to condema our being is the greateft, and indeed the peculiar infirmity, of human nature. It is a noble fentiment which Tully puts into the mouth of Cato, in his 'Treatife upon old Age; Non lulet milhi (fays that venerable lioman) destorare vitam, guod multi, of $i \ddot{i}$ dovfi, fepe fecerunt; negue me vixiffe panitet: guioriam ita sixi, wh non frufira me naium cxijimem.
"It is in the power, indeed, of but a very finall portion of mankind to act the fame glorious part that afforded fuch high fatisfaction to this diftinguimed patriot; but the number is yet far more inconfiderable of thofe who cannot, in any ftation, feeure thomfelves a fufficient fund of complacency to render life jufly valuable. Who is it that is placed cut of the reach of the higheit of all gratifications, thofe of the getnerous affecions, ard that cannot provide

It is unnecefiary then to enter particularly into the arguments of thofe cafuilts who heve undertaken the de-

Suirde.
15
Uanecelfary to enter into the arguacnis at caluifts upon this jubject.

17
Ite great criminality and impradence. fpicable office of ailvocates for the crime of fuicide. lheir talents might furely have been employed more ufetuily to the world, and more honcurably to themfelves, than in pleading for a crime, which, if it were committed by every man'to whom their princiules would make it laxful, would :otally deitroy fome of the nobleft virtues, forticude, patience, and refignation; nay, would detroy foc:ety itfelf, and teach us to defpife the opinion that this world is a flate of preparation for another. "I came into lite without my own confent, and may I not quit it at pleafure ?" (fay the advocates for fuicide). If, tecaufe we came into life without our own confent, we might quit it at pleafure, why may we no: fpend our life allo as we pleafe? Why may we not rob and murder, and commit every hind of crime, if mere inclination is to be the rule of action! Thus upon the principles of fuicide the highwayman and murderer may reafon, and every man may find a fufficient apology for any crime which he is tempted to cominit. Or this abfurdity may be othervife anfwered: As we came into life without our own confent, we muft have come with the onfent of fome other being; and logic fays, that with the confent oi that Being only can we lavffully quit it.

It is fufficient fhortly to fay, that fuicide is contrary to the ftrongef principle of the human conftitution, felfprefervation; that it is rebellion againf God ; that it is cruelty to the feelings and reputation, and often takes away the fubfiftence of a wife, a child, or a fa:her; that it proves a want of fortitude to brave misfortunes; that it delivers only from imagined to plunge into refl cvils. We may add, that almoft every inftance of fuicide of which we have heard was rahh, imprudent, and premature, interrupted a ufeful life, or prevented a more honourable death. Had Cato's pride permitted him to yield himfeif to the generofity of Cxfar, his character and his influence might have contributed to retard the fitwery of his country, which his death tended to haflen. Had Brums and $C_{\text {aflius not executed the fatal refolu- }}$ tion which they had formed, of dying by their own hands in cafe of misfortune, the battle of Philippi might have had a very different iflue. Had Hannibal farrendered himitif to the Romars, inttead of fwallowing poifon, he would have gained more glory in braving their tortures than he won in the battle of Canne; for to die innocently and heroically is the greatelt exertion of human forriturle.

As fuicide was deemed a crime by the moft illuftri-

## 4 ] S U I

ous and virtuous of the Greck and Roman philofophers, Suride. it was confidered as a crime by the laws, and treated $\underbrace{\longrightarrow-1}_{18}$ with ignominy. Py the law of Thebes fuicides were $\mathrm{ta}_{\mathrm{How}}^{\text {rew }}$ pu-
have no horours paid to their niemory ${ }^{\text {* }}$. The $A$ the- nithed by nian law ordained the hand which committed the deed the Grecks, to be cut off, and burned apart from the refl of the Ceans, \&c. body. The body was not buried with the ufual folem- * Petite nitics, but was ignominioulfy thrown into fome pit. In in lirges Cea and Maffilia (the ancient Marfeilles), it was confi- Atticas, dered as a crin:e againl the flate; and it was therefo:e p. $5^{2} 3^{\circ}$. neceflary for thole who withed to deftroy themfelves to obtain permiffion from the magiftrates. + Plutarch ac- + Plutarch quaints us, that an unaccountable paffion for fuicide feiz-on the $V_{i r-}$ ed the Milefian virgins; from indulging which they could not be prevented by the tears and entreaties of parents ${ }^{m e n}$. and friends : but what perfuafion and entreaty could not effect was accomplilhed by very different means. A decree was iffued, "that the body of every young woman who hanged herfelf mould be dragged naked through the ftreets by the fame rope with which fine had committed the dced." This wife edict put a complete fop to the extraordinary frenzy, and fuicide was no longer committed by the virgins of Miletus.

In the early part of the Roman hiftory there feems to By the Ron. have been feldom occafion for framing any laws againft mans.
fuicide. The only inflance recorded occurs in the reign of Tarquinius Prifcus. The foldiers who were appointed to make drains and common fewers, thinking themfelves difgraced by fuch fervile offices, put themfelves to death in great numbers. The king ordered the bodies of all the felf-murderers to be expofed on croffes, and this put an effectual flop to the practice. It is doubtful whether there was any flanding law againft fuicide during the exiftence of the republic ; but during the reign of the emperors it was thought proper to lay it under certain regulations, though not abfolutely to condemn it as a crime. In Juftinian's Digefts there is a law, by Lib. xhiiio. which it was enacted, "that if perfons accufed, or who Tii. xxi. had been fcund guilty, of any crime ftould make away par. 3with themfelves, their effects thould be confifcated." But this punifhment only took place when confifcation of goods happened to be the penalty appointed by the law for the crime of which the felf-murderer was acculed or found guilty, and was not inflicted for fuicide committed in any other circumfances.

When the Chriftian church had extended its jurif Anil by diction in the Roman empire, it was decreed in the fixth Chiftianss. century, that no commemoration fhould be made in the eucharif for fuch as deftroyed themfelves: neither fhould their
for his own happinefs, by contributing fomething to the welfare of others? As this difeafe of the mind generally breaks out wilh the moll vilence in thofe who are fuppofed to be endowed with a greater delicacy of tafte and reafon than is the ufual allotment of their.fellow creatures, one may alk them, whether thene is any fatiety in the purfuis of ufeful knowledge? or, if one can ever be weary of benefiting mankind? Will not the fine arts fupply a lalling fealt to the mind? or, can there be wanting a pleafurable enjoyment, fo long as there remains even one advantageous truth to be difcovered or confirmed? To complain that life has no joys, while there is a fingle creature whom we can relieve by our bounty, affilt by our cquafeis, or enliven by our prefence, is to lament the lofs of that which we poffefs, and is juf as rational as to die for thirf with the cup in our hands. But the misfortune is, when a man is fettled into a habit of receiving all his pleafures from the mere felfifh indulgences, he wears out of his mind the relifl of every nobler enjoyment, at the fame time that his powers of the fenfual kind are growing more languid by each repetition. It is no wonder, therefore, he fhould fill up the meafure of his gratifications long before lic has completed the circle of his duration; and either wretchedly fit down the remainder of his days in difcontent, or sathly throw them up in definair."

## $\ddagger$ De Legi

 bus et Cons furtudin:Lius Anglise, Iib. iit.'1ract. II.

21
Dificult to devife a puniflmment that woulu be an effec tual prevontive.
their bodies be carnied out to burial with pfalms, nor have the ufual fervice faid over them. This ecclefiaftical law continued till the reformation, when it was admitted into the fatute code of England by the authority of parliament. As an additional punifhment, however, confifcation of land and goods feems to have been adopted from the Danes, as we learn from Bracton $\ddagger$. At prefent the punimment confifts in confifcating all the perfonal property of a fclo de fe for the ufe , of the crown, and in excluding his body from interment in confecrated ground. The warrant of the coroner requires that the body mould be buried in fome public highway, ąud a ftake driven through it to increafe the iguominy.
To inquire into the prevalence and caufes of crimes, in order to difcover the mof judicious methods of preventing them, is the duty of the Patriot and the Chriftian. Suicide, we find, is a common and an increafing evil : but it is a difficult matter to find an effectual remedy; for what motives can be held out fufficient to influence that man's mind who is deaf to the voice of nature fpeaking within him, and to the voice of nature's God declaring that he is fationed at a pof which it is his duty to maintain?' His icputation and property are indeed within the reach of the laws, his body may be treated with ignominy, and his propcrty confifcated; but this punifment will not be a preventive, even if it could be al ways inflicted; and that it is feldom indlicted, though the la*s have decreed it, is well known. The humanity of the prefent age difpofes us to fympathife with the relations of the deceafed, inftead of demanding that the fentence of the law fhould be executed. It is a generally received opinion, and a juft one, that puniffments decreed by human laws thould be dirceted only againft fuch crimes as are injurious to fociety; but when it is hence inferred, that fuicide ought not to be fubject to the cognizance of human laws, every rule of logic is violated. There is no man, however mean in flation and in talents, whofe life may not, on fome occafions, be ueful to the community at large; and to conclude, that a perfon who fancies himfelf ufelefs may therefore lawfully put a period to his life, is as falfe reafoning as it would be to conclude, that by killing a poor man, who lives on the public, we fhould perform an action not only innocent but meritorious, as we fhould thereby free fociety from one of its burdens.

SUIDAS, a Greek writer, according to fome, flourilhed in the 1 Ith century, under the reign of the emperor Alexius Comnenus; according to others, before the roth century. He wrote in Greek an Hillurical and Geographical Dictionary or Lexicon; a work which, theugh not always ftrictly accurate, is neverthelefs of great importance, as it contains many things taken from the ancients that are nowhere elle to be found. The beft edition of Suidas is that of Kuifter, in Greek and Latin, with notes, printed in 3 vols. fol. which has been much improved by 'loup.

petition to the king or any perfon of dignity, where a Suit. lurd diftrains liss tenant for fuit, and none is due. In this cafe, the party may have an attachment againft him to appear in the king's court.

Surt, in Law, the fame with action. The Romans introduced pretty early fet forms for aclions and fuits into their law, after the example of the Greel:s ; and made it a rule, that each injury fhould be redreffed by its proper remedy only: "Actiones, (fay the Pandects) compofila funt quilus inter fe homines difceptarent, quas abtiones ne populus prowt vellot inflituerct, tertas folemnefque efle voluerunt." The forms of the fe actions were originally preferved in the books of $2 l_{i}$ : pontifical college as choice and ineftimable fecrets, till one Cneius Flavius, the fecretary of Appius Claudius, fole a copy and publifhed them to the people. The concealment was ridiculous: but the eftablimment of fome ftandard was undoubtedly neceffary to fix the truc ftate of a que- Blars./t. ftion of right; le!t, in a long and arbitrary procefs, it Commens. might be llifted continually, and be at length no longer difcernible. Or", as Cicero exprefles it, "funt jura, fient formulce, de omnibus relus comfitutce, ne quis aut in genere injurise, aut in ratione actionis, errare poffit. Expreffe eninn funt ex uniufcujufyue damno, dolore, incommodo, calanuitate, injuria, fublice is pretore formuLae, ad quas privata lis accommodatur." And in the fame manner Bracton, fpeaking of the original writs upon which all our aftions ire founded, declares them to be fixed and immutable, unle? by authority of parliament. And all the modern legrillators of Europe lave found it expedient, from the fame reafons, to fall into the fame or a fimilar method. In England, the leveral; fuits, or remedial inftruments of juftice, are, from the fubject of them, diftinguillied into three linds; actions perfonal, renl, and mixid.

Perfonal actions are fuch whereby a man claims adebt, or perfonal duty or damages, in lieu thereof; and lil:ewife whereby a man claims a fatisfaction in damages for fome injury done to his perfon or property. 'The former are faid to be founded upon contracts, the latter. upon torts or wrongs: and they are the fame which the civil law calls" actiones in perfonam, quae adverfus cum. intenduntur qui ex contractu vel delicto obligatus of aliquid dare vel concedere." Of the former nature are all actions upon debt or promifes; of the latter are all actions of trefpafles, nuifances, affaults, defamatory words, and the like.

Real actions (or, as they are called in the Mirror, fiodal aftions), which concern real property only, are fuch whereby the plaintiff, here called the demandant, claims title to have any lands or tenements, rents, com-. mons, or other hereditaments, in fee-fimple, fee-tail, or for term of life. By thefe actions formerly all difputes concerning real eftates were decided; but they are nowpretty generally laid afide in practice, upon account of the great nicety required in their-management, and the inconvenient length of their.procels; a much more expeditious method of trying titles being fince introduced, by other actions perfonal and mixed.

Mixed actions are fuits partaking of the mixture of the oti,er two, wherein fome real property is demandeo. and alfo perfonal damages for a wrong fuftained. As for inflance, an action of wafte : which is brought by him who hath the inheritance, in remainder or reverfion, againf the tenant for life, who liath committed waie-
therein,

## S U I［ ठ ］S U L

therein，to recorer not only the land wafted，which would make it merely a real action ；but alfo treble da－ mages，in furfuance of the fatute of Gloucefter，which is a perfonal recompence；and fo both，being joined to－ gether，denominate it a mixed action．

The orderly parts of a fuit are thefe： 1 ．The origi－ nal acrit．2．The procts．3．The plcadings．4．The itue or demurrer．5．The trial．6．The judgement and its incidents． 7 ．The proceedings in nature of ap－ peals．8．Thee caccution．See thefe articles．

SULLI．See Bethuse．
SULPHATE，in Chomifly，denotes a compound of fulphuric acid wit．：［ome bafe．

SULPHUR，a well known inflammable fubfance． See Chemistry and Mineralogy Index．

Stlpitorlyort．See Plucedanum，Botany In－ dic．

SULPHURIC ACID，the name now adopted for the viriolic acid．See Chemistey Irdex．

SULPICIA，an ancient homan poetefs，who lived under the reign of Domitian，and has been fo much ad－ mired as to be termed the Kumon Sappho．We have no－ thing，however，left of her writings but a fatire，or ra－ ther the fragment of one，againt Domitian，who pu－ blified a decree for the banithment of philofophers from Home；which fatire is to be found in Scaliger＂s Appen－ dix Virgiliana．She is mentioned by Martial and Sido－ nius．Apollinaris；and is faid to have addreffed a poem on conjugal lose to her huband Calenus，a Koman knight．

SULPICIUS SEverus，an ecclefiaftical writer who flourihed about the beginning of the 5 th century，and was contempoary with Rufinus and St Jerome．He was the difciple of Si Martin of Tours，whole life he has written；and the friend of Paulinus biflop of Nola， with whom he held an intimate correfpondence．The principal of his works is his Ififoria s＂acre，from the cre－ ation of th．world to the confulate of Stilicho and Aure－ lian，about the year 400 ；in which his fyle is clegant beyond the age he lived in．

SUITAN，or SOLULN，a title of appellation given to the emerer of the＇Furks．

Vattier will have the word Turkiln，and to fignify king of $k i n g s$ ；adding，that it was firf given to the Turkill princes Angrolipex and Mafgud，about the year 1055 ：others will have it originally Pcrlian，alleging， in proof hereof，an ancient modal of Cofroe；others de－ rive it from foldanus，gunfi folus dominus；others from the Hebress とלシ，folialat or Abeleth，＂to rule，reign．＂

It had its rife under Mahmoud，fon of Sebecteglin， the firlt emperar of the dynalty of the Gaznevides，to． wards the clofe of the fouth century of the era of the Hegird：when that prince going to Segeltan to reduce Kalaf governor of that province，who affected the fove－ reignty，kalaf was no fooner advertifed of his coming than he went out to meet him，delivered the keys of his fortrefs，and owned him his fulfan，that is，lis lord or commarder．The title pleated Mahmond fo well，that he affumed it ever afterwards；and from him it paffed to lis deleendants，and to other Mahometan princes．It is chiefly confined to the Turkifn and Perfian monarchs．

SUL．ZER，M．a celebrated philofopher，was born at Winterthur，in the canto：of \％arich，Onober 16. 1720．He was the youngef of 25 children．His early churation did not pronife much，though it was by wo
means neglected．He had little inclination for what is called in the fchools the fudy of liunzanity，and made but a fmall progrefs in the learned languages，which nees to prepare him for the fludy of theology，for which profifion his parents defigned him．At the age of $: 6$ ， when he went to the academical fchool of Zurich，he had rot the fmalleft notion of the fcie：sces，or of elegant literature，and confequently no tale for fludy．The firit incident that developed a hidden germ of philofophical genius，was his meeting with Wolfe＇s Metaphylics： this was the birth of his tate lor fcience；but he wanted a guide．The clergyman with whom he lodged was an ignorant man；and the academical prelections were，as yet，above the reach of his comprehenlion．On the other hand，a fedentary life was not the thing he liked，nor to which he had been accutonned；and，moreover，a fociable turn of mind led him often into company，where be loft much time in frivolons amufements，yet without corrupting his morals．Who，that obferved him at this period，fays Mr Formey in his Euiogitm，would have thought that Sulzer would one day be numbered among the noof knowing and wife men of his tinse？The leam－ ed Gefner was the inftrument of Proridence that render－ ed Sulzer＇s inclination to fudy triumphatat over his re？－ fion for amufement and company．Animated by the coun！els and example of this worthy and leamed man， he applied himlelf to phislofoplyy and mathematics with great ardour，and $r$ fumed the purfuit of Grecion litera－ ture and the Oriental langunges．The contemplation of nature became his noble and favounte faftion．An ec－ clefanfical fettlement in a rural fcenc，that cxhibited happy objects and cocafions for this delightrul ftudy， began to render his days happy and ufeful；and he pu－ blifhed，in 1741，Moral Contemplations of the Wrorks of Nature；and the year following an Account of a Journey he had made through the Atps；which flowed， at the fame time，his knowledge of natural hiftory and the tefle and fenfbility with which be furveyed the beau－ lies of nature，and the grandeur and goodnefs of its Author．He afterwards became private tutcr to a young gentleman at Magdeburg．＇J his procured him the ac－ quaintance of Neffrs Maupertuis，Euler，and Sack， Which opened to his mentit the path of preferment，and advanced him fucceflively to the place of mathematical profefior in the Ning＇s College at Berlin，in 1547，and to that of member of the lioyal Academy in 1750 ．

In this laft quality he diftinguifted himfelf in a very eminent manner，erriched the ciafs of fpeculative philo－ fophy，with a great mumber of exccllent memoirs，and was juflly confidered as osie of the firft－rate metapliyfi． cians in Germany．But his genius was not confined to this branch of fcience．His Univerfal theory of the Fine $\Lambda$ rts is a valuable production．A prufound linow． ledge of the arts and fciences，and a perfect acquaint－ ance with true tafte，are eminently difplayed in this work，and will fecure to its author a permanent and di－ ftinguifhed rark in the reptblic of letters．The firt vo－ lume of this excellent work was publifhed in 1ヶ7s，and the fecond in 1774 ．We Chall not here give a catalogue of the writings of M．Sulzer；but we cannot help men． tioning his liemarks on the Philofophical Eflays of the late Mr Hume as a work of real merit，which does ju－ nice to the acmencis，whilc it often deteds the fophiftry， of the Britifh Bayle．The moral character of M．Sul－ zer wias amiable and virtuous：fosiability and benef：－

## $S$ U M

Sulace cence were its characterifical lines; and his virtues were animated by that facred philofoplyy that forms the Chrifian, ennobies man, and is the only fource of that heart- Feit ferenity and fodate fortitude which fupport humanity, when every cther object of confidence fails. If is dying moments were calin, humble, and fublime; and when he expired, the placid and compofed air of his countenance made his mourning friends doubt, for fome time, whether it was death or fleep that had fufpended his converfation. He had no enemy; and his friends ware numerous, affectionate, and worthy of the tender returns he made them.

The king of Prufiu diftinguifhed him by repeated marks of munificence and favour. But his royal protector had never feen him before the end of the year 1777 , though he had been member of the academy from the year 1750 . The audience, indeed, though late vouchCafed, was honourable to M. Sulzer, with whom the monarch converled for a lung time with grcat condefcenfion.

SUM, fignifies the quantity that arifes from the addition of two or more magnitudes, numbers, or quantities together.

SUMACH. See Rhus, Botany Index.
SUMA'lRA, an iftand of Afia, the mon weftern of the Sunda iflonds, and conftituting on that fise the boundary of the Eaftern Archipelago. Its general direction is nearly north.wefl and fouth eaft. 'The equator divides it into almote equal parts, the one extremity being in 5 . $53 . \mathrm{N}$. and the oiher in 5.56. S. Lat. Acheen Head, at the north exiremity of the illand, is in longitude 95. 34. eaft. It lies expofed on the fouth-weft fide to the In-

- dian occan ; the north point fretches into the bay of Bengal; to the neritheaft it is divided from the peninfula of Malacca by the flraits of that name; to the ealt by the traits of Banca, from the innd of that name; to the foullh-eaf by the commencenent of what are called the Chincfe fias; and on the fouth by the ftraits of Sunda, which feparate it from the illand of Iara. It is about $9=0$ miles in length, but from 10310150 only in Rrooke's breadth. No accomet had been given of this ifland by Gazeticer any Enclimman till the year =778, when Mr Charles Miller (fon of the late botanical gardener) publithed an account of the manners of a particular dittrict, in the 68ily volume of the Philofophical Tranfations. Thele were the Bittas, a people who live in the interior parts, cailed the Cafin Country. They differ from all the other tahabiants in tangaase, manaces, and cuitome. They eat the prifoncrs whom they take in war, and hang up their lisulls as trophies in their hou?es. Ie obterves, hovever, that human heth is caten iny them in terrorm, and not as cnmmon food, though they prefer it to ail others, and 「peak with peculiar va tures of the fules of the feet and palms of the hands. They expreffed much furprife that the white people did not kill, much lefs eat, their prifoners. From this country the erreateft part of the cafia that is fent to Europe is procured. It abounds al: with the camphite trces, which confitute the common timber in ufe; and in thefe trecs the camphire is found rative, in a concrete form. It is remarkable that, in this ftate it is fold to the Chincfe al the price of 2501 . or 3 zol. per cont. but thefe dexterons artifs contrive to furnifh the Europeans with it at aloout a quarter of that price. In 783 , Nir IIarficn, who had been fecretaryto the prefident and council of föt Marborough, publified a

IIttory of Sumatra, with very copious particulars of the Sumatra. illand. He reprefeutcd it as furpafied by few in the beautiful indulgences of nature. A chain of high mountains runs through its whole extent; the ranges in many parts being double and treble; their altitude, though great, is not fufticient to occafion their being covered with fnow during any part of the year. Between thefe ridges are extenfive plains, confiderably clevated above the furface of the maritime lands. In the? the air is cool; ard from this advantage they are elteemed the molt eligible portion of the country, arc the beft inhabited, and the moit cleared from woods, which elfewhere, in general, throughout Sumatra, cover both hills and vallicys with an eternal thade. Here too are found many lasge and beautiful Jakes, that facilitate much the communication between the different parts. The heat of the air is far from being fo intenfe as might be expreted from a crountry occupying the middle of the torrd zone; and it is more temperate than many regions within the tropics; the thermometer at the molt fultyy hour, about two in the afternoon, generally tluctuating between 82 and 85 degreec. Mr Matfden divides the inhabitants into Ma. lays, Achencfe, Batas, Lempoons, and Rejangs; and he takes the latter as his Itandard of defcription, with refpect to the perfons, manrers, and cuftoms, of the inhabitants. They are rather below the middle flature; their bulk in proportion; their limbs for the mont pat flight, but well fhaped, and particularly fmall at the wilts and ancles; and, upon the whole, they are graceful!y formed. Their hair is ftrong, and of a loining black. 'The men are beardlefs, great pains being taken to render thrm fo when boys, by rubbing their chins with a kind of quicklime. Their complexion is properly ycllow, wanting the red tinge that conflitutes a copper or tawny colour. Thiey are in general lighter than the Meflees, or haif-breed, of the reft of India; thofe of the fuperior clafs, who are not expofed to the rays of the fun, and particularly their women of rank, approaching to a degree of faimefs. If beauty confifted in this one quality, fome of them would furpats our brunettes in Europe. The major part of the females are ugly, many of them cuen to difgult; yet among them are forme whofe appearance is frikingly beautiful, whatever compofition of perfon, features, and complexion, that fentiment may be the refult of. Some of the inhaLitants of the hilly parts are obferved to have the fwell. ed neck or goitre; but they attempt no remedy for it, as thefe wens aie confifent with the higheft healith. The rites of marriage among the Sumatrans confift fimply in joining the hands of the parties, and provouncing them man and wife without much cercmory, exceptirg the entertamment which is given upon the occafion by the father of the gill. The cuftoms of the Sumatians permit their having as many wives as they can purchale, or afford to maintain ; but it is estremely rare that an inSance cccurs of their having more than one, and that only among a few of the ehiffs. Whis continence they owe, in fome meafure, to their poverty. The dichates of frugality are more powrful with them than ilse irregular calls of appetite, and make them decline an indu!gence from wifh their law doos not reftrain them. Mothers carry their chiddecn, not on the arm os our nurfes do, but fraddling on the ilip, and iffaily fupported by a cloth which ties in a knot on the oppofite fhoulder. The efildren are nurfed tat litle; are not

## S U M

Sumatra.
confined by any fwathing or bandages; and being fuffiered to roll about the floor, foon learn to walk and ftuift for themfelvcs. When cradles are ufed, they fwing fufpended from the ceiliogs of the rooms.

The Sumatrans are fo fond of cock-fighting, that a father on his death-bed has been known to defire his fon to take the firft opportunity of matching a cock for a fum equal to his whole property, under a blind conviction of its being invulnerable. When a cock is killed or runs, the other muff have fufficient fpirit and vigour left to peck at him three times on his being held up to him for that purpofe, or it becomes a drawn battle ; and fometimes an experienced cocker will place the head of his vanquifhed bird in fuch an uncouth fituation as to terrify the other, and render him unable to give this proof of vichory.

The wild beaft of Sumatra are tigers, elephants, rhinocerofes, bears, and monkeys. The tigers prove to the inhabitants both in their journeys and even their domeftic occupations moft deftructive enemies. The number of people annually flain by thefe rapacious tyrants of the woods is almoft incredible. Whole villages have been depopulated by them; yet from a fuperfitious prejudice, it is with difficulty they are prevailed upon, by a large reward which the India Company offers, to ufe methods of defroying them, till they have fuftained fome particular injury in their own family or kindred. The fize and ftrength of the fpecies which prevails on this illand is prodigious. They are faid to break with a froke of their fore paw the leg of a horfe or a buffalo; and the largeft prey they kill is without difficulty dragged by them into the woods. This they ufually perform on the fecond night, being fuppofed on the firt to gratify themflyes with fucking the blood only. Time is by this delay afforded to prepare for their defruction, cither by thooting them, or placing a veffel of water flrongly impregnated with arfenic near the carcafe, which is faftened to a tree to prevent its being carried off. The tiger having fatated himfelf with the fellh, is prompted to afluage his thirf with the tempting liquor at hand, and perilles in the indulgence. Their chicf fubiftence is moft pratably the unforturiate monkeys with which the woods abound. 'They are defcribed as alluring them to their fate by a fafcinating power, fimilar to what has been fuppofed of the frake; and, fays Mr Marden, "I am not incredulous enough to treat the idea with contempt, having myfelf obferved, that when an alligator or a crocodile, in a river, comes under an overhanging branch of a tree, the monkeys, in a ftate of alarm and difraction, crowd to the extremity, and, chattering and trembling, approach nearer and nearer tothe amphibious monfter that waits to devour them as they drop, which their fright and number render almoft unavoidablc." Thefe alligators likewife occafion the lofs of many inhabitants, frequently deftroying the people as they bathe in the river, according to their regular cuftom, and which the perpetual evidence of the rifk attending it cannot deter them from. A fuperfitious idea of their fanctity alfo preferves them from moleftation, although, with a hook of fufficient Atrength, they may be taken wilhout much difficulty. The oither animals of Sumatra are buffialoes, a fmall kind of horfes, goats, hogs, decr, bullocks, and hog-deer. This laft is an animal fomewhat larger than a rabbit, the head refembling that of a hog, and its Chanks and feet like thofe
of t.ie deer. The bezoar-fone found on this animal has Sumatra. been valued at 10 times its weight in gold; it is of a dark brown colour, fmooth on the outfide; and the coat being taken off, it appears fill darker, with frings rumning underneath the coat: it will fwim on the top of the water. If it be infufed in any liquid, it makes it extremely bitter : the virtues ufually attributed 10 this flone are cleanfing the flomach, creating an appetite, and fweetening the blood.

Of birds they have a greater variety than of beafts. The coo-ow, or Sumatran pheafant, is a bird of uncommon beauty. They have forks of prodigious fize, parrots, dung-hill fowls, ducks, the largeft cocks in the world, wood-pigeons, doves, and a great variety of fmall birds, different from ours, and diftinguifhed by the beauty of their colours. Of the reptiles, they have lizards, flying-lizards, and cameleons. The ifland fwarms with infects, and their varieties are no lefs extraordinary than their numbers. Rice is the only grain that grows in the country ; they have fugar-canes, beans, peaie, radihes, yams, potatoes, pumkins, and feveral kinds of pot-herbs unknown to Europe; and here are to be found moft of the fruits to be met with in other parts of the Eaft In. dies, in the greateft perfection. Indigo, Brafil-wood, two fpecies of the bread-fruit tree, pepper, benjamin, coffee, and cotton, are likewife the produce of this inland, as well as caffia and camphire mentioned above. Here alfo is the cabbage-tree and filk cotton tree; and the forefts contain a great variety of valuable fpecies of wood, as ebony, pine, fandal, eagle or alocs, teek, manchineel, and iron-wood, and alfo the banyan tree. Gold, tin, iron, copper, and lead, are found in the country ; and the former is fuppofed to be as plentiful here as in Peru or Mexico. The fineft gold and gold-duft are found in the country of Limong, immediately contiguous to the prefidency of Fort Marlborough, to which the merchants repair annually for the purchafe of opium, and fuch other articles as they may be in want of, and give for them gold of fo pure a mature as to contain little or no alloy. The native indolence of the Malay 1 fiatic Re. difpefition prevents them from collecting more than is fearcles, fufficient to fupply the few and fimple wants of a race of men as get uncnlightened by civilization and fcience, and ignorant of the full cxtent of the advantages of the country inhabited by them. The roads leading to this golden country are almof impervious; affording only a fcanty path to a fingle traveller, where whole nights mut be paficd in the open air, expofed to the malignant influence of a hontile climate, in a country infefted by the moft ferocious wild beafts. Tliefe are circumflances that have hillerto checked curiofity; but perfeverance and ftudied precaution will furmount the obftacles they furninh, and fuch difcoveries might be made as would amply compenfate for the difficulties leading to them. The gold merchants who come from the neighbouring and lefs rich countries, give us fuch accounts of the facility of procuring gold as border nearly on the marvellous, and would be altogether incredible, if great quantities of that metal produced by them did not in fome degree evince the certanty of their accounts.

This great abundance of gold in Sumatra fnduces $\mathrm{Mr}_{5}$ Marden to fuppofe that ifland to be the Ophir of Solomon; a conjecture which, in his opinion, derives no fmall force from the word Ophir's being really a Minlay fubfantive, of a compound fenfe, fignifying a mountain

## S U M

Sumatra containing gold. The natives, he confeffes, have no oral tradition on the fubject; and we have elfewhere made it probable, that Ophir was fituated in a different quarter of the world (fee Ophir). Befides the metals and different fpecies of wood which we have mentioned, Sumatra produces fulphur, arfenic, faltpetre, and beeswax, with edible birds-nefts, which are there commodities of great importance (fee Binds-Nefs).

The Englifh and Dutch have factories on this inand; the principal one of the former being Fort Marlborough, on the fouth-weft coaft. The original natives of Sumatra are Pagans; but it is to be oblerved, that when the $\dot{s}$-natrans, or any of the natives of the eaftern iflands, © $\quad$ read the Arabic character, and fubmit to cirumction, they are faid to become Malays; the term Malay being underftood to mean Mufulman. See Acheen.

SUMMARY, in matters of literature. See Abridgement.

SUMMER, the name of one of the feafons of the year, being one of the quarters when the year is divided into four quarters, or one half when the year is divided only into two, fummer and winter. In the former cafe, fummer is the quarter during which, in northern climates, the fun is paffing through the three figns Cancer, Leo, Virgo, or from the time of the greatef declination, till the fun come to the equinoctial again, or have no declination ; which is from about the 21 If of June till about the 22 d of September. In the latter cafe, fummer contains the fix warmer months, while the fun is on one fide of the equinoctial; and winter the other fix. months, when the fun is on the other fide of it. It is faid that a frofty winter produces a dry fummer, and a mild winter a wet fummer.

## Sumner-Ifands. See Bermudas.

Sumafer Red-Bird. See Muscicapa, Ornithozogy Index.

SUMMIT, the top or vertex of any body or figure, as of a triangle, cone, pyramid, \&c.

SUMMONS, in Law, a citing or calling a perfon to any court, to anfwer a complaint or to give his evidence.

Summons, in IWar. To fummon a place, is to fend a drum or trumpet to command the governor to furrender, and to declare that if the place be taken by ftorm, all muft fubmit to the mercy of the conqueror. See Capitulation and Chamade.

SUMMUM bonun, in Ethics, the chief good.
SUMP, in Metallurgy, a round pit of flone, lined with clay within, for receiving the metal on its firft fufion from the ore.

Sump, in the Britifh falt-works, where fea-water is boiled into falt, is the name of a fort of pond, which is made at fome diftance from the faltern on the fea-fhore, between full fea and low water mark. From this pond a pipe is laid, through which, when it is full fea, the water runs into a well adjoining to the faltern; and from this well it is pumped into troughs, through which it is carried to the cifterns, in order to be ready to fupply the pans. See Salt.

Sump, in Mining, denotes a pit funk down in the bottom of the mine, to cut or prove the lode fill deeper than before ; and in order to flope and dig it away if neceffary, and alfo to drive on the lode in depth. The fump principally ferves as a bafon or refervoir, to collect

## 9 ] S U N

the water of a mine together, that it may be cleaned out by an engine or machine.

SUMPTER-HORSE, is a horfe that carries provifions and neceffaries for a journey.
(Leges Sumptuarice), are eating, \& c.

Moft ages and nations have had their fumptuary laws; and fome retain them fill, as the Venetians, \&c. But it is obferved, that no laws are worfe executed tharr fumptuary laws. Political writers have been much divided in opinion with refpect to the utility of thefe laws to a ftate. Montefquieu obferves, that luxury is neceffary in monarchies, as in France, but ruinous to democracies, as in Holland. With regard to England, whofe government is compounded of both fpecies, it may flill be a dubious queftion, fays Judge Blackftone, how fa: private luxury is a public evil ; and as fuch cognizable by public laws.

The fumptuary laws of the ancient Locrian legiflator Zaleucus are famous: by thefe it was ordained, that no woman fhould go attended with more than one maid in the freet except the were drunk : that the fhould not go out of the city in the night, unlefs the went to com. mit fornication: that fie fhould not wear any gold or embroidered apparel, unlefs the propofed to be a common ftrumpet; and that men ihould not wear rings or tiffues except when they went a whoring, \&c.

Among the Romans, the fumptuary laws were very numerous: By the Lex Orckia, the number of gueft at feafts was limited, though without any limitation of the charges: by the Fanuian law, made 22 years afterwards, it was enacted, that more than 10 affes fhould not be fpent at any ordinary feaft : for the folemn feafts, as the Saturnalia, \&c. an hundred affes were allowed; ten of which, Gellius informs us, was the price of a fleep, and a hundred of an ox. By the Didian law, which was preferred 18 years after, it was decreed, that the former fumptuary laws fhould be in force, not only in Rome, but throughout all Italy; and that for every tranfgreffion, not only the mafter of the feaf, but all the guefts too, fhould be liable to the penalty.
The Englifh have had their fhare of fumptuary laws, chiefly made in the reigns of Edward III. Edward IV. and Henry VIII. againft ftoes with long points, fhort doublew, and long coats ; though all repealed by flatute I Jac. I. c. 25 . As to excefs in diet, there remains fill one law unrepealed. Under King Henry IV. Camden tells us, pride had got fo much into the foot, that it was proclaimed, that no man hould wear floes above fix inches broad at the toes. And their other garments were fo fhort, that it was enacted, 25 Edward IV. that no perfon, under the condition of a lord, fhould from that time, wear any mantle or gown, unlefs of fuch length, that, ftanding upright, it might cover the lower part of the trunk of his body.

## $S$ U P

Surday illands in the Indian ccean, between $93^{\circ}$ and $120^{\circ}$ of ealt longitude, and between $8^{\circ}$ north and $8^{\circ}$ fouth latitude. The particular names of the inlands are Bur:aco, Sumatra, Java, Bally, Banca, \&c.

SUNDAY, or the LORD's-D.AY, a folemn feftival obferved by Chriftians on the firft day of every week, in memory of our Saviour's refurtecion. See Sabعath.

In the breviary and other offices we meet with Sundays of the firtt and fecond clafs. Thafe of the firit clafs are, Palm, Eafter, Advent, and Whitfinday, thofe of 2 uafimodo and Quadragefima. Thofe of the fecond clals are the common Sundays. Anciently each Sunday in the year had its particular name, which was taken from the introit of the day; which cuftom has only been continued to fome few in lent; as Reminijgare, Oculi, Latare, Judica.

Some are of opinion that the Lord's day, mentioned in the Apocalypfe, is our Sunday; which they bslieve was fo early inflituted by the apolles. Be this as it will, it is certain a regard was had to this day even in the earlien ages of the church; as appears from thic firf apology of Juftin Martyr, where he defcribes the exercife of the day not much unlike to ours.

But it was Conftantine the Great who firf made a Jaw for the proper obfervation of Sunday ; and who, according to Eufebius, appointed it flould be regularly celebrated throughout the Roman empire. Be fore him, and even in his time, they obferved the Jewih Sabbath as well as Sunday; both to fatisfy the law of Mofes and to imitate the apofles, who ufed to meet together on the firt day.

By Confantine's larrs, made in 321 , it was decreed, that fur the future the Sunday mould be kept a day of reft in all cities and towns; but he allowed the country people to follow their work. In $53^{8}$, the council of Orleans prohibited country labour; but becaufe there were fill many Jews in Gaul, and the people fell into many fuperfitious ufes in the celebration of the new Sabbath, like thofe of the Jews among that of the old, the council declares, that to hold it unlausful to travel with horfes, cattle, and carriages, to prepare food, or to do any thing neceffary to the cleanlinefs and decency of houfes or perfons, favours more of Judaifm than of Cbrifianity. See SABRATh-Brcaking.

Sundaz=Schonls. See Sunday-Schools.
SUOVETAURILIA, an ancient Ruman facrifice, fo called becaufe it confinted of a pig (fus), a fleep or rather ram (ojis), and a hull (taurus). They were all males, to denote the mafculine courage of the Roman prople. It was likewife called folitanrilia, becaufe the animals offered up were always folida, whole or uncut.

SUPERCARGO, a perfon employed by merchants to go a voyage, and overfee their cargo or lading, and difpofe of it to the befl advantage.

SUPIERC1LIUM, in Anatomy, the eye-brow. See Aratomy, $\mathrm{N}^{\prime \prime} .{ }_{4} 4_{2}$.
SUPEREROGATION, in Thcology, what a man does beyond lis duty, or mure than he is commanded to do. The Romanifls fland up Arcnuoufly for works of fuperengation, and maintain that the obfervance of cvangelical councils is fueh. By means hereof, a fock of merit is laid up, which the church has the difpofal of, and which the dilitributes in indulgences to fuch as need.

This abfurd duchine yas firf inyented towards the
clofe of the xith century, and modified and cmbellifhed Supereroby St Thomas in the 13 th : according to which, it was gation pretended that there actually exifted an immenfe treafure of merit, compoled of the pious deeds and virtuous actions which the faints had performed beyond what was neceflary for their own falvation, and which were therefore applicable to the benefit of others; that the guardian and difpenfer of this precious treafure was the Roman pontiff; and that of confequence he was em. powered to affign to fuch as he thought proper a portion of this inexhaufible fource of merit, fuitable to their refpective guilt, and fufficient to deliver them from the punifhment due to their crimes.

The refurmed churches do not allow of any work nar fupercrogation; but hold with the apofles, that when we have done our beft, we are but unprofitable fervants.

SUPELFETATION, in Phyffology, a fecond or afier-conception, happening when the nother, already pregnant, conceives of a latter coition; fo that the bears at once two foctufes of unequal age and bulk, and is delivered of them at different times. We meet with in. fiances of fuperfetations in Hippocrates, Ariftotle, Du Laurens, \&:c.: but they are faid to be much more frequent in hares and fwine.

SUPERFICIES, or SURfacF, in Gcometry, the outfide or exterior face of any body. This is confidered as having the two dimenfions of length and breadth only, but no thicknels; and therefore it makes no part of the fubfance or folid content or matter of the body.

The terms, or bounds, or extremities, of a fuperficies, are lines; and fuperficies may be confidered as generated by the motions of lines. Superficies are either rectilinear, curvilinear, plane, concave, or conves. A rcetilinear fuperficies is that which is bounded by right limes. Curvilinear fuperficies is bounded by curve lines. Plane fuperficies is that which has no inequality in it, nor rifings, nor finkings, but lies evenly and fraight throughout, fo that a aight line may wholly coincide with it in all parts and directions. Convex fuperficies is that which is curved and rifes outwards. Concave fuperficies is curved and finks inward. See Gfonletry.

SUPEMFINE, in the manufactories, a term ufed to exprefs the furerlative finenefs of a fleff: whe a cloth, a camblet, \&ic. are faid to be fuperfine when made of the finelt wcol, \&c. or when they are the fineft that can be inade.

SUPERFLUOUS interval, in Mufic, is one that exceeds a true diatonic interval by a femitone minor. Sce Intervil.

SUPERINTENDANT, denotes an ecclefiaftical fuperior in leveral reformed churches whese epifcopary is not admitted; particularly among the Lutherans in Germany, and the Calvinifls in fome other places.

The fuperintendant is fimilar to a binhop; only his power is fomewhat more reftrained than that of cur diocefan billops. He is the chicf paftor, and has the direlion of all the inferior paflors within his diftriet or diocefc. In Germany they liad formerly fuperintendants general, who were fuperior to the ordinaty fuperintendants. Thefe, in reality, were archbithops; but the dignity is funk into difufe; and at profent none but the fuperintendant of Wistemberg affumes the quality of fuperintendant general.

SUPERIOR, a pesfon taifed above another in rank, effice, or talents.

Sutertor,

Surerior, in Scots Law. See Laiw, No clxiv. 3. clvv. 2. and clvvi.
SUPERLATIVE, in Grammar, one of the three degrees of comparifon, being that intlection of adjective nouns that ferves to augment and heighten their fignification, and flows the quality of the thing denoted to be in the higheft degree, See Grammar.

SUPE1RNUMERARS, fomething over and above a fixed number. In feveral of the offices are fupernumerary clerks, to be ready on extraordinary occafions.

SUPERPARTICULAR PRoportion, or Ratio, is that in which the greater term exceeds the lefs by unit or 1 . As the ratio of 1 to 2 , or 2 to 3 , or 3 to 4 , \&゙c.

SUPERPARTIENT PROPORTION, or Ratio, is when the greater term contains the lefs term once, and leaves fome number greater than I remaining. As the ratio
of 3 to 5 , which is equal to that of I to $\mathrm{I} \frac{2}{3}$;
of 7 to 10 , which is equal to that of x to $\mathrm{I}_{\frac{2}{7}, 8 \mathrm{E} \text {. }}$
SUPERSEDEAS, in Law, a writ iffued in divers cafes, importing in general a command to flay or forbear fume ordinary proceedings in law, which in appearance ought to be done or purfued, were it nut for the caufe whereon this writ is granted.

Thus a man regularly is to have a furety of peace againt him of whom he will fwear he is afraid; and the juftice required hereunto cannot deny it him: yet, if the party be formerly bound to the peace, either in chancery or elfewhere, this writ lies to ilay the juftice from doing that which otherwife he ought not to deny.

SUPERSTITION, a word that has been ufed fo indefunitely, that it is difficult to determine its precife meaning. From its refemblance in found to the Latin word fuperfles, "a furvivor," it is evidently derived from it, and different attempts have been made to trace their connection in fignification. Balbus, in the dialogue De Natura Deorum of Cicero, fays, that they who prayed and facrificed whole days that their children might furvive them, were called fuperfitious. Lactantius cenfures this etymology, and fays they were not called fuperlitious who withed that their children might furvive them (for this we all wih), but becaufe they who furvived their parents worllipped their images. Others again fay, that fuperfition is derived from $\int u$ perfes, becaufe it confifted in confidering the dead as i: they were alive. But thefe etymologies are folely conjectural ; and we confider conjectures as abfurd in philology as we do in fcience; they may millead, but are feldom of any benefit. The ufual meaning affixed to the word fiperflition, both in the Latin and Englilh languages, is fo different from fuperfles, that its change of meaning muft be owing to fome accident which it is in vain to inquire after. If we had not known that the word paganus "a pagan" was derived from pagus "a village," becaufe the heathens in a certain period of the Chriftian hiflory lived in villages, the whims and fancies of etymologifts would not have thrown much light on the fubject.

Without labouring, from the aid of etymology, to define fuperlition, which is a word of a very extenfive fignification, we will confider to what objects it is applied; and then, by oblerving what is common to them all, we thall be enabled to fix with fome degree of precifion the meaning the term. We apply it to the idolatry of the
heathens; we apply it alfo to the Jews, who made the will of God of no effect by their traditions, and fubilituted ceremonies in place of the religion of their fathers. We fay alfo that Chriflians are guilty of Cuperlition; the lioman Catholics, who believe in tranfubitantiation and in the efficacy of prayers to faints; and thofe Proteftants who efteem baptifm and the Lord's fupper, and the punctual performance of other ceremonics, without regard to morality, as fuflicicut to enfure falvation. Thofe perfons are alfo reckoned fuperilitious who believe, without any evidence, that prophecies are flill uttered by the divine infpiration, and that miracles are flill performed. The word is allo extended to thofe who believe in witchcraft, magic, and apparitions, or that the divine will is declared by omens or augury ; that the fortune of individuals can be affected by things indifferent, by things deemed lucky or unlucky, or that difeafes can be cured by words, charms, and incantations.

Through all the particulars which we have enumerated, there runs one general idea, the belief of what is falfe and contrary to reafon. Fiom this, however, we muft not fuppofe that whatever is falfe and contrary to reafon may be denominated fupesfition. We think that it is falfe and irrational to fuppofe that there ever lived on earth a race of men who walked on one leg, and had their eyes in their brean; or that there were giants 90 feet high : yet we do not call the philofopher who believes thefe chimeras fuperftitious, but credulous. Superfition has always a reference to God, to religion, or to heings fuperior to man. We do not however diftinguilh all falfe and irrational opinions in religion by the name of fuperllition. We do not, for inItance, apply this name to the opinions which fome of the ancients entertained, that God is the foul of the world, and that men are only portions of him feparated for a time, or that the foul after death lives fucceffively in different bodies. If we examine the fubject with more attention, we flall difcover that the foundation of fuperfition is ignorance of the moral attributes of God; for we never fay a man is fuperflitious for entertaining erroneous opinions of the natural attributes of God. Some of the Socinians have denied the prefcience of God; and a Frencla philofopher has not only rejected the belief that He is a fpirit, but has prefumed to fay that he is compofed of a fpecies. of cryllals. The frit of thefe opinions difcovers very imperfect ideas of God, and the fecond is the height of impiety and abfurdity; yet the Socinians have not been accufed of fuperfition, nor can this French philofopher be fufpected of it. We do not call every falle opinion concerning the unity or moral attributes of God by the name of fuperlition, as, for inflance, the opinion which fome fceptics have fupported, that God is not good; for, as was mentioncid before, fuperftition always involves the idea of credulity. It does not confift in falfely denying that God poffeffes any particular moral attributes, but in believing more than what is true concerning them; in forming mean, unworthy ideas of them ; in fuppofing that he is guided by blind paffion like mankind, and enjoins upon his creatures commandments which are irrational and abfurd.

As fuperftition arifes from ignorance and credulity in the underftanding, fo it has alfo a feat in the paffions. Fear has been commonly confidered as the pafion of the human mind from which it chiefly derives its origin;

2 I S U P

Superti- and there is no doubt that more fupertition has arifen tion. from fear united with ignorance and credulity than from any other paffion. Yet it would certainly be improper to exclude all other paltions. We cannot account for the fuperftition of the Egyptians, without fuppofing that much of it arofe from gratitude. They worlhipped the Nile, becaufe it diftributed fertility and abundance over the land of Egypt ; and they worhipped fome animals, merely becaufe they prevented the increafe of other animals which were noxious. Thus they adored the ibis, becaufe it deftroyed the eggs of the crocodile.

Having thus endeavoured to analyze the ideas comprehended under the word fupertition, we may fum them up in a few words. It refpects God and beings fuperior to man, and extends to our religious opinions, worfhip, and practices; and may be defined abfurd opisions and actions arifing from mean and defective ideas of the moral attributes of God. Let us apply this definition to the different fpecies of fuperftition already mentioned.

But before entering upon this application, it may be proper to obferve, that fuperftition involves the idea of a blameable inattention to reafon, or a credulity arifing from an indolence of underftanding. We generally make a diftinction between the imperfect opinions which a favage, from the neceffary effects of his fituation, forms of the attributes of God, and thofe which civilized nations entertain. We fay the favage is ignorant, and we afcribe his ignorance to his fituation; but we call the Koman Catholic fuperftitious, and we blame him for not having thofe juft ideas of God which he might have obtained by opening his Bible, or by the exercife of his underftanding in the favourable fituation in which he is placed. Superflition then does not originate fo much from the natural weaknefs of the human underftanding, as from a mifapplication or a neglect of it (A).

We cannot therefore with any propriety apply the name fuperfition to polytheifm in general; for what all the ancient philofophers, after much ftudy and reflection, concluded to be true, could never proceed from credulity and inattention, but from their fituation. We fpeak very properly, however, when we call idolaty by the narne of fuperfition; becaufe there is no man fo devoid of underfanding as not to be capable of difcoverirg, that a piece of metal, or wood, or ftone, can neither hear nor anfwer petitions. Superflition was a name which the ancient philofophers gave to thofe who entertained mean opinions of the gods, or did foolifl things Theopbraf to ohtain their favour. According to Theophrantus, rus'scha- the fuperflitious man is one who, having waflied his xvi.
racters, hands, ard fprinkled himfelf all round, leaves the temple
xvi. with a laurel leaf in his mouth, with which he walks about the whole day. Or, if a wcafel floould crofs the road, he will not advance a flep till he has thrown three ftones over the road. If he find a ferpent in his houfe, he rears a place o! devotion on the fpot. He purifies his houle often, will not fit upon a grave, or touch a dead perfon. He is anxious about the interpretation of his dreams, will not offer a dacrifice unlefs his wife go along with him, or, if the is engaged, he takes the nurfe
and the little children. He purifies himfelf with onions; Superfiand when he fees a mad or an epileptic perfon, he fpits in their bofom. Such was the character of fuperftition in the days of Theophraftus. All thefe whimfical ceremonies were done to prevent mifchief, and to avert the wrath of the gods; and therefore perfectly correfpond with the definition given above.

It is only neceffary to confider a little the fuperftitious opinions and practices among Jews and Chriftians, to be fenfible that they have all arifen from mean and abfurd ideas of the moral attributes of God; for they have generally entertained noble opinions of his natural attributes. The Jews confidered God as a partial Being, who had a predilection for their nation in preference to all others, and preferred external homage and ceremony to moral purity. If the Roman Catholics think confiftently, they muft efteem God as a Being who can be prevailed upon by the importunity of one dead man to affitt another, or as a Being whofe patience would be fatigued with hearing prayers conftantly. Hence their practice of praying to faints. They in effect believe, however they may deceive themfelves, that God is unjuft, or they could not believe tranfubftantiation; for it fuppofes that God can give commands directly contrary to thofe principles of belief with which he has endued the human mind. They confider a ftrict adherence to a variety of ceremonies, to forms, to pomp, and fhow, as effential to the workip of God: this is treating God as a vainglorious Being. They thought it their duty to extirpate heretics: this was fuppofing God a cruel and revengeful Being. Even among Proteftants, we are forry to fay, a great deal of fuperftition remains: we have not yet learred to confider God as a fpirit, who is to be worfhipped in fpirit and in truth, as a pure moral benevolent Being; and hence arife all the fuperftitious practices which prevail among us.

Befides thofe fupertitious opinions and practices which entirely refpect our duty to God, there are others which may be termed anigar fuperfitions. Thefe alfo arife from imperfect and mean ideas of the moral attributes of God. To believe vulgar prophecies, which are al. ways the effurions of madnefs or knavery, is to fuppofe that God, who has drawn a veil over futurity, and only delivers prophecies to accomplifh fome great moral purpofe, fometimes gives them for no purpofe at all, or to gratify idle curiofity, or to difclofe fuch a knowledge of what is to happen as is inconfiftent with the free agency of man and the moral adminiftration of the world. Nor is it lefs fuperftitious to believe in vulgar miracles. To believe in them, is to believe that God fufpends the laws of nature for the moft trivial purpofes, or to countenance fraud and worldly ambition: it is to receive the moft extraordinary facts upon the mofl unfatisfactory evidence. The belief of witcheraft, of appritions, and the fecond fight, may be refolved into the fame principle. To fuppofe that God would communicate the power of doing mifchief, and of controuling his laws, to any being merely for gratifying their own paffions, is unworthy of God. The belief of apparitions is equally inconfiftent with the goodnels of God (fee Spectre). The
fame
(1) We do not pretend to fay that this is the fenfe in which fuperfition is always ufed, becaufe it is often ufed improperly.

Superti- fame objection rifes againf the fecond-fight as againft tion. the belief of vulgar prophecies, and may alfo be extend- ed to omens, to altrology, to things lucky and malucky, to fortune-telling, \& cc. As to the different devices and charms for preventing and curing diforders, they refemble in every refpect falle miracles.

A judicious hillory of fupertlition would be a curious and entertaining work, and would exhibit the human charafter in a remarkable point of view. Superftition is moft prevalent among men of weak and uncultivated suinds ; it is more frequent in the female fex than among men; and abounds more in the rude than in the refined itages of fociety. The gereral features of it have been the fame in all ages; but it affumes certain peculiarities according to the diverfity of character of different nations. It gained admiffion into the fcience of medicine at an early period. He who was endowed with fuperior genius and knowledge was reckoned a magician. Dr Bartolo was feized by the inquifition at Rome in the laft century, becaule he unexpectedly cured a nobleMancheferman of the gout. Difeafes were imputed to fafcination, Tranfac- and hundreds of poor wretches were dragged to the tions. vol. iii.
ftake for being acceffary to them. Mercatus, plyyfician to Philip II. of Spain, a writer of uncommon accuracy and information, appears Arongly inclined to deny the exiftence of fafcinatory difeafes: but he is confrained to acknowledge them for two realons; ift, Becaufe the inquifition had decided in favour of their reality; 2 dly , Becaufe he had feen a very beautiful woman break a fteel-mirror to pieces, and blaft fome trees by a fingle glance of her eyes.

As the opinions concerning the caule of difeales were fupertitious, thofe concerning the method of curing them were not lefs fo. In the Odyliey we read of a cure performed by a fong. Jofephus relates, that he faw a certain Jew, named Eleazar, draw the devil out of an old woman's noftrils by the application of Solomon's feal to her nole in prefence of the emperor Vefpafian. Many different kinds of applications were ufed for expelling the devil. Flagellation fometimes fucceeded admirably ; purgatives and antifpafnodics were other modes of difcharging him. Dr Mynfight cured feveral bewitched perfons with a plafter of affafeetida. How the affafoetida was fo eflicacious, was much difputed. Some thought the devil might confider fo vile an application as an infult, and run off in a paffion; but others very fagely obferved, that as devils are fuppofed to have eyes and cars, it is probable they may have nofes too.

Nor was it only in medicine thefe fuperftitious opinions were entertained; they prevailed allo in natural philofophy. The pernicious effects in mines, which we now know are occafioned by noxicus air, were confidently imputed to the demons of the mine. Even Van Helmont, Bodinus, Strozza, and Luther, attributed thunder and meteors to the devil. Chemilts were employed for centuries in fearch of the philofopher's fone, with which they were to do miracles. It was a common queftion among philofophers in the $x 7$ th century, whether the imagination could move external objects? A queftion generally decided in the afhrmative.

Though fuperftition be generally the mark of a weak mind, fuch is the infirmity of human nature, that we find many infances of it among men of the noft fublime genius and moft enlightened minds. Socrates believed.
that he was guided by a demon. Lord Bacon believed in witcheraft ; and relates that he was cured of warts by rubbing them with a piece of lard with the fk in on, and then nailing it with the fat towards the fun on the poft

$\underbrace{\text { Supine. }}$ of a chamber window facing the fun. Henry IV. one of the molt illuntrious of monarchs, was very uneafy before his affaffination on account of fome prophecies *. * Memoirs Sully declares, that one of the confiderations that kept of Sully. him faithful to his mafter in the moft unpromifing ftate of his affairs, was a prediction of La Brofe, that Henry would make his fortune $\dagger$. 'The attrologer Morin di- $\dagger$ Ibid. rected Cardinal Richelieu's motions in fome of his journeys $\ddagger$. The enlightened Cudworth defended prophe- $\ddagger$ Bayle, cies in general, and called thofe who oppofed the beliefart. Morino of witchcraft by the name of atheifs; and the predictions of Rice Evans have been fupported in the prefent century by the celebrated names of Warburton and Jortin. Dr Hoffman, the father of the Modern Theory and Practice of Medicine, in a difertation publifhed in the large edition of his works in 1747, fays, that the devil can raile forms, produce infects, and act upon the animal fpirits and imagination; and, in fine, that he is an excellent optician and natural philofopher on account of his long experience. Dr Johnfon, the leviathan of literature, is fuppofed to have believed the fecond fight.

With refpect to the effects of fupertition on the human mind, they are indeed deplorable. It chains down the underftanding, and rinks it into the moft abject and fordid ftate, and keeps it under the dominion of fear, and fometimes of cruelty. Where once it takes poffef fion, it has a tendency to become extreme, and generally becomes fo intolerable, that men of rcflection and learning confpire its deftruction. The Chriftian religion gave 2 violent fhock to the heathen fuperfition; the reformation in a great meafure demolifhed the fum perftition of the church of Rome; and the fupertition which remained among Proteftants after their feparation from that church has been gradually yielding to the in. fluence of enlightened reafon, or to the bold and daring attacks of infidelity and deifm. We behold the prolpect of its mins with pleafure, and thank the deifts for their zeal; but it is from the firm hope that the religion of Jefus will arife in all its beauty and fimple majeity, and be admired and refpected as it deferves: for mean and contemptible as fuperfition certainly is, we would rather fee men do what they reckon their duty from fuperftitious principles, than fee anarchy and vice prevail, even though attended with all the knowledge and liberality of fentiment which deifm and infidelity can infpire.

SUPERVISOR, a furveyor or overfeer.
SUPINATION, in Anatomy, the action of a fupinator mufcle, or the motion whereby it turns the hand fo. as that the palm is lifted up towards heaven.

SUPINE, in Latin grammar, part of the conjugation of a verb, being a verbal fubftantive of the fingular num. ber and the fourth declenfion.

There are two kinds of fupines: one, called the for $f$ fupine, ending in $u m$ of the accufative cafe, which is always of an active fignification, and follows a verb of motion; as abiit deambulaturs. The other, called the laft fupine, and ending in $t$ of the ablative cafe, is of a paffive fignification, and is governed by fubflantives or adjectives; as, facile dictu, \&c.

They have their name, fays Probus, and after him Vonfus: Voffius, quod ad inplar fupinorum ct cticforum hominum omnia habent confufa: or, according to Prilcian, quod nafcantur a participiis palivis, que lupina appellata funt, quia in infumo loco fita, toram conjugationis molern fufcipiant.

SUPPER, the evening repaft.--Suppers that are heavy fhould be avoided, becaule the itomach is more opprefled with the fame quantity of food in an horizontal poflure than in an erect one, and bccaufe digeftion goes on more flowly when we fleep than when we are awake. They ihould be eaten long enough before bed-time, that they may be nearly digefted before going to fleep; and then a draught of pure water will dilute that which remains in the foomach.
SUPPER of the Lord, othervife called the Eucharif, is a facrament ordained by Chrift in his church, of which the outward part is bread and wine, and the inward part or thing fignified the body and blood of Chrif, which the majority of Cchriftians bclieve to be in fome fenfe or other taken and received by the faithful communicants. See Sacrament.

Controver-
fies about the outward and vifible fign.

There is no ordinance of the gofpel which has been the fubject of more violent controverfies between diffcrent churches, and even between different divines of the fame church, than this facrament; and though all confefs that one purpofe of its inftitution was to be a bond of love and union among Chriflians, it has, by the perverfenefs of mankind, been too often converted into an occafion of hatred. The outward and vifible fign, and the inward and fpiritual grace, have equally afforded matter of difputation to angry controvertifls. Many members of the church of Rome condemn the Greek church and the Proteftants for ufing leavened bread in the Lord's Supper, contrary to the example fet them by our Saviour ; whilf the Greek church in general, and fome Proteftant focicties in particular, unite with the church of liome in cenfuring all churches which mix not the wine with water, as deviating improperly from primitive practicc. See Eucharist.

That it was unleavened bread which our Lord bleffed and brake and gave to his difciples as his body, cannot he queftioned; for at the time of the paffover, when this ordinance was inflituted, there was no leavened

- Evorl.
xii. 15,19 . bread in be found in Jerufalem *. For the mixed cup, the evidence is not fo decifive. It is indeed true, as we have obferved under the article Eucinarist, that the primitive Chriftians ufed wine diluted with water; and
us that were employed by our Saviour, the neceflity of Supper. unleavened bread is certainly equal to that of wine diluted by water.

But the mixed rup is faid to be cmblematical of the blood and water which flowed from the fide of our Loral when pierced by the fpear of the Roman foldier, while the abficnce of leaven is emiblematical of no particular circumftance in His paffion. This argument for the mixture is as old as the era of St Cyprian, and has lince been frequently urged with triumph by thofe who furely perceived not its weaknefs. The flowing of the blood and water from our Saviour's fide was the confequence either of the fpear's having pierced the pericardium, of more probably of an afoctes or hydrothorax, occafioned by his cruel and lingering death (fec Medicine, No 342,343 ). But whatever was the caule of it, how can the mixing of wine with water in the facrament be emblematical of the flowing of blood and water feparately? Such a mixture furely bears a more flriking re!emblance to the reunion of the ferum and craffamentum, atter they had been feparated by whatever caufe. See Blood.

We urge not thefe objections to the mixed cup from any diflike that we have to the practice. It is unqueftionably harmilefs and primitive; and we with that greater regard werc paid to primitive practices than the generality of Chritians feem to think they can claim : Frivoious but let the advocates for antiquity be confifient; let them either reflore, together with the mixed cup, the ufe of unleavened bread, or acknowledge that neither the one nor the other is eflential to the facrament. This laf acknowledgement mult indeed be made, if they would not involve themfelves in dificulties from which they cannot be extricated. If either the mixed cup or unleavened bread be abfolutely neceflary to the validity of the facrament, why not wine made from the grapes of Judæa? why not that particular kind of wine which was ufed by our Saviour? and where is that wine to be found?

But the controverfies refpecting the outward part or About the fign of the Lord's Supper are of little importance when thing figcompared with thofe which lave been agitated refpect-nified. ing the inward part or thing fignified; and of thefe we haften to give as comprehenfive a view as the limits prefribed to fuch articles will admit.

Our Blefled Lord, in the fame night that he was betrayed, "took bread, and bleffed it, and brake it, and gave it to the difciples, and faid, Take, eat; this is my body. And he took the cup, and gave thanks, and gave it to them, faying, Drink ye all of it; for this is my blood of the new teftament, which is flicd for many for the remiffion of fins." Such was the inflitution of the Lord's Supper as it is recorded in the gofpel by St Matthew; and we have the lame account of it, in alnont the very fame words, by three other infpired writers, St Paul, St Mark, and St Luke. That it was the bread which Chrif bleffed and brake that is here called his body, and the wine over which he gave thanks that he ftyles his blood of the new teflament, will admit of no reafonable doubt ( A ) ; but in what fenfe they became fo, has been the fuhject of many controverfies.

The church of Rome, which holds, that after confe- Doetrine cre conle- ,he chare
cration, of Rome.
(1) Some over-zealous Proteflants have indeed affirmed, that it was not the confecrated bread and wine, but

## S U P [ $15 \quad$ S $\quad$ S U P

cration, Jefus Chrift, God and man, is really, truly, and fubtantially, contained under the outward appearances of the bread and wine, informs us, that about the middle of the mafs, when the prieft, taking into his hand, filt the bread and then the wine, pronounces over each leparately the facted words of confecration, the fubtance of thefe elements is immediately changed by the almighty power of God into the body and blood of Cluritt; but that all the outward appearances of the bread and wine, and all their fenfible qualities remain. This more than miraculous clange is called transubstantiation; and is founded on the philofoply of Arittotle, which refolves all bodies into matter and form ( fee Metaphysics, $\mathrm{N}^{\circ}$ 142-1 50.) ; for it is only the matter or imperceptible fubftance which fupports the forms or fenfible qualities of bread and wine, that is changed into the fubfance or matter of the body and blood of Chrift, fo that this divine matter, coming into the place of the former earthly matter, fupports the fame identical forms which it fupported. Hence we are told, "that Jefus Chrift, now prefent inftead of the bread and wine, exhibits himfelf to us under thofe very fame outward forms or appearances which the bread and wine had before the change."

Could this doetrine be true, it would be abundantly myfterious; but to add to the myftery, we are farther informed, that under each kind is contained Jefus Christ whole and entire, his body and blood, his foul and divinity; fo that when a man eats what has the appearance of a wafer, he really and truly eats the body and blood, the foul and divinity, of Jefus Chrift and when he afterwards drinks what has the appearance of wine, he drinks the very fame body and blood, foul and divinity, which not a minute perhaps before he had wholly and entirely eaten! The ingenious author from whofe work we have taken this account of the Rominh doctrine concerning the real prefence, may perhaps reject our inference that the orthodox members of his church muft believe the foul and divinity of Chrift to be eaten and drunk in the Lord's Supper; but he cannot deny that, according to his ftatement of the Catholic faith, the foul and divinity are both received whole and entire into the flomach of each comnunicant. He fays indecd, that " communion confifts in receiving Jefus Chrift whole and entire, his facred body, his precious blood, his bleffed foul, and his adorable divinity, into our fouls;" but that which was formerly bread and wine unqueltionably goes into the flomachs of the communicants; and fince, according to him, it is now the body and blood of Chrift,
the foul and divinity muft go thither with it, for thefe Supper. four cannot be liphrated. 'This our author himfelf $\underbrace{\text { sur }}$ grants. "The Scripture (fays he) pofitively declares, that Clurif rijug again from the dead, dichle no more; death fball no more have dominion over him (Rom. vi. 9.) Confequently his body, his blood, and his foul, thall never more be feparated from one another; and as the union of his divine and human natures can never more be broken, fo neither can the fe, his two natures, united in his divine perfon, be ever feparated. From this it neceffarily follows, that wherever the body of Chrift is, there alfo his blood, his foul, and his divinity ${ }_{3}$ mun of neceffity be in like manner."

Now, whether we fuppofe, with our author, that the foul and divinity of Chrift directly carry his body and blood with them into the human foul, or, trulling, in fome degree to the evidence of fenfe, believe that the body and blood carry the foul and divinity with them directly into the ftomach of each communicant-is it credible, is it poflible, that the high and lofty Onc, who inhabiteth eternity, and whom the oracles of truth affure us that even the heaven of heavens camnot contain, fhould be fuiflantially received whole and entire into a finite fpirit like the human foul, or into a body fo limited as the human fomach? Our author fays it is ; declaring that, " by the bleffed prefence of Iefus Chrit, zuhole and entire within us, are communicated to our fouls all the heavenly graces which are the effects of the holy communion: fuch as the fanctification of the foul by an increafe of juflifying grace ; the rendering of it more pure, more holy, more beautiful, more agrecable, in the eyes of God; the cleanfing of the foul from all thofe venial fins and imperfections of which we repent, and preferving us from falling into mortal fins; the uniting of us in a moft intimate manner with Jefus. Chtif, who comes to us in this holy facrament on purpofe to dwell in our fouls and abide with us; and the giving us a pledge and carneft of a glorious immortality ${ }_{2}$. to the enjoyment of which it brings us at laft, if we perfevere to the end in the grace of God."

The confequence of the doctrine of tranfubftantiation is the facrifice of the ma/s, by which, it is faid, God's acceptance of Chrift's facrifice on the crofs is obtained for the actual benefit of thofe perfons in particular for whom the mals is offered. In the work fo often quoted, we are told, that "Jefus Chrift our redeemer, who is both our high-prieft and our victim, who, in order to perfect the work of our redeniption, and reconcile man. with his offended Creator, offered himfelf once in a bloodys

[^5]
## $S$ U P $\left[\begin{array}{ll}16\end{array}\right] \quad S \quad U \quad P$

bloody manner upon the crofs, in order to communicate and apply to the fouls of individuals thole graces, which, by his death, he merited for mankind in general, continues to offer himelf daily upon the altar in an unbloody manner, by the miniftry of his prietts, in the ma/s. The facrifice of the crofs and that of ihe mals are both one and the fame facrifice, becaufe in both the victim is the fame and the high prieft the fame, viz. Jefus Chrift. The only difference is in the manner of offering. On the crofs he offered himfelf in a bloody manner and actually died; whereas on the altar he is offered up to God in an unbloody manner, not aEtually dead, but under the appearance of death;" fo that the communicants not only eat the man Jefus Chrift, but even eat him alive ( B ) !

It is known to all our readers that this doctrine of tranfubflantiation was one caufe of the breach between the church of Rome and thofe various focieties which call themfelves reformed churches. The real and fubftantial change of the bread and wine into the body and blood of our Lord is rejected by every reformer as a change contradictory and impollible, and fraught with the moft impious confequences; and volumes have been written to expofe the weaknefs of thofe arguments which have fo often been vainly urged in its fupport. It has been fhown to imply numberlefs abfurdities, fuch as, that the fame thing can be in a million of different places, whole and enite, at the fame inftant of time; that it is above 1800 years old, and yet may be not more than one minute; that forms or fenfible qualities are real things independent of their fubject and the fentient beings who perceive them; that the infinite and eternal God, who created and fuftains the univerfe, is himfelf
wholly and fublantially comprehended by the human foul; and that the balf, or fourth, or tenth part of the body of Ctrift, is equal to the whole of that body. That thefe are neceflary confequences of tranfubftantiation has been fo completely proved in various warks (c) to which every reader may have accefs, that it is needlefs for us to repeat arguments fo hackneyed; but there are two objections to that doctrine, which, as we do not remember to have met with them elfewhere, and as they appear to us abfolutely conclulive, it may be worth while to flate in this place.

The advocates for the real prefence in the Lord's Supper contend, that every word relating to that ordinance is to be taken in the ftrictef and molt literal fenfe, and they affect to triumph over the Proteftants, becaufe their notions of the facrament cannot be fupported without having recourfe to figure and metaphor. This however is a very vain triumph; for we hefitate not to affirm, that fuppofing tranfubitantiation poffible, and even capable of proof, there is not in the whole New Teftament a fingle word or a fingle phrafe which, if interpreted literally, gives the flighteft countenance to that wonderful doetrine. The reader will remember, that tranfubftantiation, as we have ftated it from a dignitary of the Romifh church, and as it is in fact fated by the council of Trent (D), confifts in a change of the matier, imper. ceptible fubflance, or fubflratum of the bread and wine into the matter, imperceptible fubfance, or fubfratum of Chrift's body and blood; for all parties agree that the fenfible qualities of the bread and wine remain, and, according to the Romanift, are after confecration either fupported by the matter of Chrift's body and blood, or hung upon nothing. But the phrafe rovio sofo to oujex is rontrary
nou, to Scrip-
(B) This whole account of the Rominh doctrine refpecting the facrament of the Lord's Supper is taken from a work in two fmall volumes, called The Sincere Chrifian influcted in the Faith of Chrif, from the Written Word. Its author is a man of learning, and great perfonal worth : and as he fills a high ftation in the church of Rome, we cannot doubt but that he has given a fair view of the doctrine of that church refpecting this and every other article of which he treats. We are forry however that his zeal Roould have impelled him, in a popular work, to write in the manner that he has done of the falvation of thofe who are not members of his church, or who cannot embrace all his opinions; for if his doetrine on this fubject be implicitly received by thofe" over whom he lias the rule, and for whofe fouls he is appointed to watch," they muft neceffarily look upon the majority of their fellow-citizens as reprobates doomed to eternal perdition. Let this be our apology for treating fome of thofe opinions, which he thinks fo abfolutely neceflary to falvation, with lefs ceremony than perhaps we Thould have done, had he lefs pofitively pronounced our damnation for not having it in our power to embrace them. He is not indeed much lefs fevere on the moft virtuous heathens, though they never faw the New Teftament, or heard the doctrines of his church preached. But perhaps this feverity may be occafioned by the following queftion of Cicero: "Cum fruges, Cerercm; vinum, Liberum dicimus, genere nos quidem fermonis utimur ufitato: fed y.cquem tam amentem effe putas, qui ilhad, quo vefcatur, deum credat effe"" De Natura Deorum, lib. iii. cap. 16.
(c) Among other works on this fubject, we may confidently recommend to the reader a fmall tract publifhed by Dr $A$ bernethy Drummond, about thirty years ago, in the form of $A$ Dialogue between Philalethes and Bonevolus. In that ireatife, together with a defence of it , which were both printed for Balfour and Drummond, Edinburgh, the abfurd confequences which we have mentioned are, by arguments unanfwerable, proved to flow from the dotrine of tranfubftantiation; and the artful fophiftry, by which a very acute genius endeavoured in keep thefe confequences out of fight, is detected and expofed on acknowledged principles of the foundelt metaphyfics.
(D) The canun of that council which effablifhes tranfubflantiation is thus trar:fated by the author of The Sincere Chriflion Influcted: "If any man flall fay, that in the blefled facrament of the Eucharift the fubflance of the bread and wine remains along with the body and blood of our Iord Jefus Chrift, and fhall deny that wonderful and fingular converfion of the whole fubfance of the bread into the body, and of the whole fubtance of the wine into the blood, the appearances of the hread and wine only remaining, which converfion the Catholic Church calls tranfuhfantiotion, let him be anathema."

Supper. $\mu 00$, if taken in the literal fenfe, cannot poffibly denote the confequence of fuch a change as this; for every perfon at all acquainted with the Greek language, cipecially the language of the Peripatetic fchool, knows that to owpea kou fignifies, not the matter or fublfratum of my body divelted of its fenfible qualities; but the body of me in its natural flate, confiling of matter and qualities, or matter and form united. Unlefs thereiore the fenfible qualities, as well as the matter of the bread and wine, give place to the fenfible qualities as well as the matter of our Saviour's body and blood, and unlefs he appear glorified on the altar as he appeared on the mount at his transfiguration, the words to cwese pov mult be interpreted figuratively. Had the apoitles underfood their Mafter's words in the fenfe in which they are underftood by the churcls of home, they would have rendered them
 but rovio eole in inn rov raualos mov, "this is the matter of my body." In like manner, when St John relates* that Jefus faid, "Whofo eateth my flefh and drinketh my blood, hath eternal life, and I will raife him up at the laft day," had he underftood his adorable Mafter to fpeak of his flefh and blood in the Eucharift in the fenfe in which they are taught to be there by the church of Rome, he would have reprefented him as faying, not

 tos, " whofo eateth the matter of my flefl, and drinketh the matter of my blood, hath eternal life, and I will raile him up at the lati dey."

But further, fuppofing this fingular converfion poffible in itfelf, it cannot be rendered credible, nowerer ftated in any language that ever was or ever will be fooken by man. At firt fight it may appear paradoxical to aflirm, that a poffible fact cannot be fo related as to obtain credit ; but that tranfubftantiation, if poffible, is
that of a horfe; and that the intornal fulsforace or fis. Praturn which exhihits the apprearances of bicad and wine is different from that which fupports the fenfible qualities of Ptch and blood (fee Mriapinsics, Partl. Chap. I. and Part II. Chap. I. and II.). Supposines therefore the doflrinc of tranfubflantiation to be poffibl: and even true, it would fill be impofible, by any Itatement of it in human language, or by any argument urged in its fupport, to revider that doctrine an object of rational belicf; for if it be faid that the words roe? eซf: to capse $\mu$ av were fpolen by a divine perfob, who could neither be deceived himfelf nor intend to deceive us, it may be replied, that the fenfible appearances of bread and wine, which are confeffed to remain, are likewife the language of a divine perion, even of the Creator and Governor of heaven and earth; that this language addreffed to the fight, the talle, the tonch, and the fmeli, is equally intelligible to all nations; that fince the creation of the world its meaning has never been miltaken by the fcholar or the clown, the fage or the favage, ex. cept in this fingle inftance of our Lord's theth and blood exhibiting the lengble appearances of bread and wine; and that it is therefore infinitely more probable that the members of the church of liome fhould mittake the
 though fpoken by Chritt, are part of the language of men, and liable to all its ambiguities, than that all mankind fhould miftake the language of God himfelf, which is liable to $n 0$ ambiguities, and which was never in any other inftance milundertood by a fingle individual. Should tranfubftantiation therefore be really true, its truth can never be proved or rendered probable, but by an immediate upaztion of the fpirit of God on the mind of man; and he who is confcious of no fuch operation on his own mind, may reft affured that the Father of mercies, who knows whereof he is made, will never bring upon him, for his incredulity in this inftance, any of the anathemas denounced by the church of Rome upon thofe who place implicit confidence in the univerfal language of Him who created them, in oppofition to her figurative and contradictory interpretations of the written word. Of the tranfubftantiation of the elements a vifible miracle would afford no proof. Had the water been changed into wine at the marriage in Cana of Galilee, for the exprefs purpole of bearing teftimony to this fingular converfion, what muft have been the confequence on the minds of thole who witnelled that miracle? Nothing, we think, but feeplicifm or diftruft of their own faculties; for they would have had the very fame evidence that no fubftantial change was wrought on the elements, as that the water was aftually turned into wine.

Though the reformed churches unanimoufly reject the doctrine of tranfubifantiation, and of courfe the facrifice of the mafs, its infeparable confequence, they are far from being agreed among themfelves telpecting the nature of the Lord's Supper ; and the notions of this ordinance entertained by fome of them appear to us as unte-Doctrine nable as any part of the doctrine of the church of Rome. of the LinThe Lutherans believe, that the body and blood of therans in Chrift are really and fubftantially prefent with the bread * Lutible. and wine; that the body is really and truly eaten, and cogit. A1s the blood really and truly druak, by the communi- $4 \subset \subset$, Gcrcants; and that whatever motion or action the bread bardin Loco

Supper.
has, the body has the fame *. According to them, ${ }_{\mathrm{C}}$ Theol, de has, the body has the fame ${ }_{\mathrm{C}}^{*}$. According to them, ${ }_{\text {, }}$,herefor, de
therefore, fuch a fact, will be apparent on the flighteft confideration.

The relation that fublifts between things and words is arbitrary; fo that what is termed body in Engliih, is owues in Greek, and corpus in Latin; and the fame thing might with equal propriety (had the authors of thefe languages fo pleafed) have been expreffed in the firt by foul, in the fecond by yous, and in the third by anima. (See Language, $\mathrm{N}^{0} 3$, \&c.) The confequences of this are, that there is no univerfal language fpoken; that the natives of one country underftand not the feeech of thofe of another; and that different men feeaking the fame language are perpetually liable to miftake each other's meaning. Between the fubfrata of bodies and their fenfible qualities there is a relation founded in nature, fo that the fenfible qualities which indicate the fubtance to which they belong, to be gold, for inflance, in one country, indicate the fame thing in every other country, and have donc fo from the beginning of time. The fenfible appearances of bodies therefore are an univerfal language, the language of the Author of Nature, by which he declares to his creature
 all bodies, may be the fame kind of fubltance; yet the inn Teosedns of one body, or the internal combination of its prinary parts, differs from that of another; that gold, for inflance, has a different fulf/fratum or ba/is from iron, lead, or filver; that the intemal organization or ftructure of tle body of an ox is different from

YoL. XX. Part I.

## S U P [ 18 j S U P

 wiltstherefore, the fame fenfible appearances are exhibitcd by two fubftances united in fome inexplicable manner, which is neither a perfonal union, nor incorporation, nor the inclufure of the body within the bread; nor does it lat longer than while the facrament is celebrating. This mion is generally called consubstantiatios; but they reject the term, contenting themtelves wi in aflerting the real prefence, without prefuming to define the mode by which the body and blood of Clurift are united to the facramental elements.

It would be fuperfluous to wafte time in replying to this doctrine. Every reader fees that it implies the poftibility of the fame thing's being whole and entire in a million of places at one and the fame inftant of time, which has been fo often urged as an unanfwerabic objection to the Romilh doctrine; and it is frought with this additional abfurdity peculiar to itfelf, that two bodily fubftances may at once occupy the fame place, which is directly contrary to our notions of folidity. It may be obferved too, that whatever be the real fenfe of our Saviour's words, he fays exprefsly, "This is my body"-this thing which I give you, and which you fee and feel; whereas, had he meant what Luther and his followers teach, he would furely have faid, "With this bread receive my body, with this cup receive my blood."

The nocions of fome of the early Calvinifts refpecting the Lord's Supper are very myfterious, and expreffed in language of which we are not fure that we underfland the meaning. In the year 1561 an attempt was made in France to bring the Catholics and Proteflants to an uniformity of doetrine on this great topic of controverfy; and deputies were appointed by both martics to meet at finif, ond thtate ine quelion in a Triendly manner. The primcipal managers on the fide of the Catholics were the cardinals of Lorraine and Tournor: ; thofe on the fide of the Proteftants were Beza and Peter Martyr. After feveral meetings, difputes, and violent feparations, the Proteftant deputies declared their faith in the following words: "We contefs, that Jefus Chrift, in the Supper, does truly give and exhibit to us the fubftance of his body and blood by the efficacy of his Holy Spirit ; and that we do receive and cat fpiritually, and by faith, that very body which was offered and immolated for us, fo as to be bone of his bone and flefly of his flefh, to the end that we may he cnlivened thereby, ond receive what is conducive to our falvation. And becaufe faith, fupported by the word of God, makes thofe things prefent, which it apprehends, and by that faith we do in diced and reality receive the true natural body and blood of Chrint, by the power of the Holy Spirit; by this means, we confefs and acknowledge the prefence of his body and blood in the Supper." One of the Catholic delegates expreffing his diflike of this laft claufe, the Proteftant miniflers gave the following explanation of their fentiments: "No diftance of place can hinder us from communicating of the bady and blond of Chrift, for the Lord's Supper is a heavenly thing; and though on carth we receive with our mouths bread and wine, which are the true figns of his body and blood, yet by faith, and the eflicacy of the Holy Gloof, our minds, which are fed with this food, are rap: up into licaver, and enjoy the prefence of the hody and bload; and that ly this means it may be faid that the body is truly joined to the bread, and the b:ood to the wine; but after the
manner of a facrament, and not at all according to place Supper. or natural pofition *."
If the reader can difcover the precife meaning of Thuanus, thefe paflages, his fagacity exceeds ours. That the Pro- lib. See alfo $^{2}$ teftant deputies believed, or profeffed to believe, that see alfo the natural body and blood of Chrift are by the faithful Unblocidy received in the Lord's Supper, is indeed evident; but Sarrifice, their notions refpecting the manner of this reception are vol. i. very unintelligible, if not contradictory. In the former quotation, they confefs that Chrift's body and blood are unintellireally prefent in the facranient; that they are made pre- ${ }^{\text {gible. }}$ fent by faith (we fuppofe the faith of the communicants) ; and that the very body which was offered and immolated for us is eaten fpiritually and by faith. In the latter quotation, they feem to fay that Chrift's body and blood are in heaven, at a great diftance from the true figns of them; that on earth the communicants receive only thefe figns, which are bread and wine; but that, by faith and the efficacy of the Holy Spirit, their minds, during actual coinmunion, are rapt up into heaven, where they enjoy the prefence of the body and blood; and that by this means the body and biocd are truly joined to the bread and wine through the medium of the mind of the communicant, which is at once prefent both to the fign and to the thing fignified. To this myfferious doctrine it is needlefs to urge objections. Every man who is accuftomed to think, and is ufe words with fome determinate meaning, wiii at once perceive that the authors of this declezation muft have had very confufed notions of the fubject, and have pleafed themfelves siii found inftead of fenfe, fatisfied that they could not be wrong if they did not fymbolize with the Lutherans or the Council of Trent.

The churches of England and Scotland, in their efta of the blifhed doetrines refpecting the Lord's Supper, appear clurches of to be Calviniftical; but the compilers of the Thirty- Britaino nine Articles and of the Confeftion of Faith muft have been much more rational divines than Beza and Peter Martyr. They agree in condemning the doEtrine of tranfubflantiation as contrary to common fenfe, and not founded in the word of God; they teach, that to fuch as rightly, worthily, and with faith, receive the facrament, the bread which we break is a partaking of the body of Chrift, and the cup of bleffing a partaking of the blood of Chrift ; and they add, that the body and blood of Chrift are eaten and drunk, not corporally or carnally, but only after a heavenly and firitual manner, by which the communicants are made partakers of all the benefits of his death + . In one impnrtant cir $\cdot+$ Arthoes cumfance thefe two churches feem to differ. The Con- of the feffion of Faith, as we underftand it $\ddagger$, aftirms, that in Cburch of the Lord's Supper there is no facrifice made at all. The Ert. 2 s . thirty-firt article of the church of England likewife con- and Confefdemns the Popifh facrifice of the mals as a blafphiemous fion of fable and dangerous deceit; but in the order for the ad- Faitb, chap. mivinfration of the Lord's Supper or Holy Commution, ${ }^{20}$. the celebrator "befeeches God moft mercifully to nc. . cept the alms and oblations of the congregation," and again " to accept their facrifice of praife and thank fgiving :" from which petitions many have inferred that, in the Lord's Supper, that church offers a commemorative and eucharifical facrifice. This inferctuce ferms not to be wholly withnut foundation. In the order for the adminititration of the I.ord's Supper, according to the form of the Book of Common Prayce fot forth by aft of par-
liamont

## S U P [ 19 ] S U P

Supper. liament in the fecond and third years of King Edward the Sixth, the elements were folemnly offered to God as a facrifice of praife and thaukfgiving; and though the the prayer containing that oblation was, at the review of the liturgy fome years afterwards, removed from the prayer of confecration, to which it was originally joined, and placed where it now flands in the poft communion fervice; yet the very act of parliament which authorized that alteration, calls King Edward's "a very godly order, agreeable to the word of God and the primitive church, and very comfortable to all good people defring to live in Chriftian converfation."

The Engliilh church, however, has not pofitively determined any thing refpecting this great queftion; and whiltt the condemns the doctrine of the real prefence, with all its dangerous confequences, fhe allows her members to entertain very different notions of this holy ordinance, and to publifh thcie notions to the world. Accordingly, many of her moft eminent divines (E) have maintained that, in the celebration of the Lord's Supper, the elements of bread and wine are offered to God as a facrifice commemorative of Chrit's one facrifice for the fius of the whole world; that thefe elements, though they undergo no fubftantial change, yet receive fuch a divine virtue by the defcent of the Holy Gholt, as to convey to the worthy communicant all the benefits of Chrift's paffion ; that they are therefore called his body and blood, becaufe being, after their oblation, eaten and drunk in remembrance of Him, they fupply the place of his body and blood in the feaft upon his facrifice; and that it is cuftomary with our Saviour to give to any thing the name of another of which it completely fupplies the place, as when he calls himfelf the door * of the fheep, becaufe there is no entrance into the church or kingdom of God but by faith in him. They obferve, that the Eucharift's being commemorative, no more hinders it from being a proper facrifice, than the typical and figurative facrifices of the old law hindered them from being proper facrifices: for as to be a type doth not deftroy the nature and notion of a legal facrifice, fo to be reprefentative and commemorative, doth not deftroy the nature of an evangelical facrifice. To prove that, in the celebration of the Lord's Supper, there is a real facsifice ofiered to God as well as a facrament received by the communicants, they ap-
$\uparrow$ Heb. xuii. peal to St Paul, who fays exprefsiy t, that "Chriftians
have an altar, whereof they have no right to eat who ferve the tabernacle," and who by contrafting the cup of the Lord with the cup of devils, and the table of the $\ddagger$ Con x. Lord with the table of devils $\ddagger$, teaches plainly, that $\mathbf{H}^{\prime}$, sec.

Lord's table and the table of devils. They ebretse farther, that in all the ancient liturgics extant there is a folemn form of oblation of the facramental elcments, and that all the Chriftian writers from the fecond century downeards treat of the Lord's Supper as a facritice as well as facrificial feaft, having indeed no value in itfelf, but acceptable to Ciod as reprefeming Chrill's one facrifice for the fins of the world. Our linaits will not permit us to give even an abitract of their arguments; but the reader who fhall attentively perufe Johinfon's unbloody Sacrifice and Altar unvcilcd and 'fupported, will difcover that their notions are better founded than probably he fuppofes, and that they are totally irreconcileable with the doctrine of tranfubftantiation and the Popill facrifice of the ma/s.
Other Englith divines of great learning, with the ce-Othere, a lebrated Hoadlcy bifhop of Winchefter at the head of mere micthem, contend ilrenuouly that the Lord's Supper, fo ${ }^{\text {marrial ; }}$ far from being a facrifice of any kind, is nothing more than bread and wine reverently eaten and drink, in remembrance that Chrift's body was broken and his blood thed in proof of his Father's and his own love to mankind ; that nothing is effential to the facrament but this remembrance, and a ferious defire to honour and obey our Saviour as our head; that the facrament might be celebrated without uttering one prayer or thankfgiving, merely by a fociety of Chriftians, whether fmall or great, jointly eating bread and drisking wine with a ferious remembrance of Chrift's death; that St Paul enjoins a man to examine himfelf before he eat of that bread and drink of that cup, not to difcover what have been the fins of his paft life in order to repent of them, but only that he may be fure of his remembering Chrint's body broken and his blood hed ; that, however, it is his duty in that as in every other inflance of religious worflip to refolve to obey from the heart every precept of the gofpel, whether moral or pofitive ; and that to partake worthily of the Lord's Supper is acceptable to God, becaufe it is paying obedience to one of thefe precepts; but that no particular benefits or privileges are annexed to it more than to any other inflarice of duty. Bihhop Hoadley acknowledges, that when St Paul fays ${ }^{*}$, *1 Cor. $\mathrm{K}_{0}$ "The cup of bleffing which we blefs, is it not the communion of the blood of Chrit? ? The bread which we break, is it not the communion of the body of Chriat ?" he has been fuppofed by many learned men to affirm, that all the benefits of Chritt's paltion are in the Lord's Supper conveyed to the worthy communicant; but this (fays he) is an idea which the apoftle could not have in his thoughts as at all proper for his argument. The Greek word xolyavse and the Englih communion fignify only a partaking of fomething in common with others of the fame fociety; and the apofle's meaning (he fays) can be nothing more, than that in the Lord's Suppe: we do not eat bread and drink wine as at an ordinary meal, but as memorials of the body and blood of Chrif, in honour to him as the kead of that body of which we are all members. That the word rossuriz is not meant to denote any inward or fpiritual part of the Lord's Supper, he thinks evident, becaufe the fame word is ufed with regard to the cup and the table of idols, where no
fpiritual

Sifyer. $+A$ Plain sccountt of rie Nature unt Ent of the Lora's shoter.
[piritual past cculd be thought of, and in an argument which fuppofes an idol to be nothing $f$.
'So this view of the nature and end of the Lord's Supper, it must appear no fmatl objection, that " he who eateth and orinketh unworthily is faid to be guilty of the budy and lload of the Lord, and to eat and drinke a judgenstat to himetelf, noi difcorning the Lord's body." No doubt it would be futul to eat and drink a mere memorial of Chrift's death without ferious difpofitions; but we cannot conceive how a little wandering of the thoughts, which is all the unworthinefs which the author thinks there can be on fuch an occafion, fhould be a fin of fo deep a dve as to be properly compared with the guitit of thafe who murdered the Lord of life. Other divines, thesefore, feeling the force of this and fimilar objeçions, fieer a middle courfe between the mere memorialift and the advocate for a real facrifice in the holy Eucharift, and infift that this rite, though no facrifice itfelf, is yet a feaf upon the one facrifice offered by Chrift and flain upon the crofs. 'The mofl eminent patrons of this opinion have been Dr Cudworth, Bifhop Warburton, and the prefent bilhop of Chefter; and they fapport it by fuch arguments as the following: "In thole ages of the world when victions made fo great a part of the religion both of Jews and Gentiles, the facrifice was always followed by a religious feafting on the thing offered; which was called the fenf upon, or after the facrifice, and was fuppofed to convey to the partakers of it the benefits of the facrifice. Now Jefus (fay they), about to offer himfelf a facrifice on the crofs for our redemption, did, in conformity to gerieral practice, inftitute the laf fupper, under the idea of a feal? afier the facrifice; and the circumftances attending its inftitution were fuch, they think, that the apofles could not polfibly miftake his meaning. It was juft before his paffici, and while he was eating the pafchal fupper, which was a Tewith feaf upon the facrifice, that our bleffed Lord inftituted this rite; and as it was his general cuftom to allude, in his aftions and expreffions, to what pafied before his eyes, or prefented itfelf to his oblervation, who can doubt, when, in the very form of celebration, we fee all the marks of a facrificial fupper, but that the divine inllitutor intended it lhould bear the fame relation to his facrifice on the vofs which the pafchal fapper then celebrating bore to the oblation of the pafchal lamb? If this was not his purpofe, and if nothing more was intended than a general memorial of a dead benefactor, why was this inftant of time preferred for the inftitution to all others throughout the courfe of his minifty, ary one of which would have been equally commodious? Indeed any other time would have been more commodious fur the inflitution of a mere memorial; for the patchal lamb and unleavened bread were certainly a Facrifice; and the words ufed by our Saviour, when be gave the bread and wine to the apofles, were fuch as muft neceffarily have led them to confider that bread and wine as bearing the fame relation to his facrifice that the pafchal fupper bore to the paichal facrifice. At that lewif: feant, it was the cuftom of every A.. her of a family to break the unleavened bread, and to sive to every gucit a portion, fiying, " This is the bred of aftiction, which our fathers did eat in the land fif liypt:" a cufom vilich, we may be fure, that Christ, as lather of his family, would religioully obferve. "Jl". actlles knew well that they were not eat-
ing the identical bread which their fathers did eat in Supper. Egypt, but the feaft upon the facrifice then offered in commemoration of their redemption from Egyptian hondage; and therefore when they faw their Mafter after fupper break the bread again and give it to each of them, with thefe remarkable words, "This is my body which is given for you, do this in remembrance of me," they mult have concluded, that his meaning was to. inititute a rite which fhould to the end of the woild bear the fame rclation to his facrifice that the pafchal fupper bore to the facrifice of the paffover.

This inforence, from the circumitances attending the inftitution, Biftop Warburton thinks confirmed by St Paul's mode of arguing with the Corinthians, on their impiety and abfurdity in partaking both of the Lord's table and the table of devils; for "what (fays he) had the eaters of the facrifices to do with the partakers of the bread and wine in the Lord's Supper, if the Lord's Supper was not a feaft of the fame kind with their fealts? If the three fealts, Jewifh, Pagan, and Chriftian, had not one common nature, how could the apofle have inferred that this intercommunity was inconfiftent? $X_{e}$ Cannot (fays he) drime the cup of the Lord and the cup of devils; ye cannot be partakers of the Lord's table and the table of devils. For though there might be impiety in the promifcuous ule of Pagan and Chriftian rites of any kind, yet the inconfifency arifes from their having a common nature, and confequently, as they had oppofite originals, from their deftroying one another's effects in the very celebration. Sacrifices, and feafts upon facrifices, were univerfally confidered as federal rites; and therefore the Lord's table and the table of devils being both federal rites, the fame man could no more be partaker of both, than he could at once engage to ferve both God and the devil. This is the apoofle's argument to the wife men, to whom he appeals; and we fee that it turns altogether upon this poftulatum, that the Chriftian and Pagan feafts had the fame fpecific nature, or were both feafts upon facrifices. If this be admitted, it is caly to fee why St Paul deemed thofe who ate and drank unworthily guilty of the body and blood of the Lotd; for if the Lord's Supper be a feaft upon his facrifice, it muf have been confidered as the means of conveying to the comrounicants all the benefits of his death and paffion; and the profanation of fuch a rite, by rendering his death inefitctual, might be filly compared and junty equalled to the enormous guilt of thole by whom his blood was med." In reply to Biftop Hoadley's remarks upon the word zosvavia, his brother biftop obferves, that "had the apoitle meant what the learncd writer makes him to mean, he would doubtle?s have faid rovervice ifeavers to owpes, ' your communion in the body-your eating it jointly.? St Paul (continues he) knew how to exprefs himielf properly, as appears from a paffage in his epifte to the Philippians, where, profefledly fpeaking of the joint participation of a bleffinf, he ules thefe words, xosvario ipaiv us to suaryencov, " your communion in the gofpel.' 'Jo the other romask, that no fpiritual part could be thought of in the table of idols, becaule an idol is faid by the apoflle to be nothing, Bithop Wathurton replies, "that by St laul the Gentiles are faid to have facrificed to devils, and thofe who ate of fuch facrifices to have had communion with devils: now the drait (continues his J.ordfhip) was in Si Patil's apiaion fomething." Bus the jnfercance which
the apofle draws from the acknowledged truth, that the cup of blefling which we blefs is the communion of the blood of Chrift, and the bread which we break the communion of the body of Chrif, puts his meaning, our author thinks, beyond all doubt. He fays*, that the partaking of one bread makes the receivers of mamy to become one body. A jut inference, if this rite be of the nature of a fcafl upon the facribce; for then the communion of the body anto blood of Chrifl unites the rercivers into one body by an equal dillribution of one cummon benclit. But if it be only a general commemoration of a deceafed benefactor, it leaves the receivers as it found them, not one body, but many feparate profiflors of one common faith.

Thus have we given fuch a view as our limits would permit us to give, of the principal opinions that have been held refpecting the nature and end of the Lord's Supper. It is an ordinance which feems not to be generally underflood; though, being intended to fhow forth the Lord's death till he come, it is furely of fufficient importance to engage the attention of every ferious Chrifian. The moft confiderable Proteltant divines who have expressly written upon it are, Johnfon in his Unbloorly Sacrifice; Cudworth in his Difcoure concerning the true Nature of the Lord's Supper; Hoadley in his Plain Account; and Warburton in his Rational Account. The notions of Cudworth and Warburton are the fame, and perhaps they differ not fo much from thole of Johnfon as many readers feem to imagine. At any rate, the arguments by which Warbarton fupports his doctrine mult have fome force, fince it is faid that Hoadley himfelf acknowledged they would be unanfwerable, if it could be proved that the death of Chrilt was a real facrifice.

SUPPLEMENT, in literature, an appendage to fupply what is wanting in a book. Books of various kirds require fuch an appendage; but none fo much as a dictionary of arts and fciences, which, from the progreflive courfe of phyfical feience, cannot be completed without it.

SUPPORTED, in Heraldry, a term applied to the uppermof quarters of a fhield when divided into feveral quarters, thefe feeming as it were fupported or fuftained by thofe below. The chief is faid to be fupported when it is of two colours, and the upper colour takes up twothirds of it. In this cafe it is fupported by the colour underneath.

SUPPORTERS, in Heraldry, figures in an atchievement placed by the fide of the fhield, and feeming to fupport or hold up the fame. Supporters are chiefly figures of bealts: figures of human creatures for the like purpofe are called teriants.

SUPPOSITION, in Mufic, is when one of the parts dwells on a note, while another part makes two or more leffer notes equivalent to it, by conjoint degrees.

Suppofition is defined by a late author the ufing of two fucceflive notes, of the fame value as to time; the one whereof, being a difcord, fuppofes the other a concord.
The harmony, Mr Malcoln oblerves, is always to be fu!l on the accented parts of the bar or meafuse; bur; on the unaceented, difcords may tranfiently pafs, with. out any offence to the ear. This tranfient ule of difcords, fullowed by concords, make what wic, afier the French, call fupogition.

## $1] \mathrm{S} \mathrm{U} R$

Concords by fuppofition are thofe where the conti- Suppofitun nued bafs adds or luppoles a new found below the fundamental bafs; whence fuch concords always cxeced the extent of the oftave. Of thefe concords there are three forts, all which are concords of the feventh: the firf, when the added found is a third below the fundamental found; fuch is the concord of the ninth: and if the concord of the ninth is formed by the mediant, added below the fenfible concord in the minor mode, then the concurd is called the fuperfluous fifth. The fecond kind is, when the fuppofed found is a fifth below the fundamental found, as in the concord of the fourth or eleventh; and if the coneord is fenfible, and the tonic be fuppoled, this concord is called the fuperfluous feventh. The third kind is that where the fuppofed found is below a concord of the diminifhed leventh : if it is a fifth below, i. $\epsilon$. if the fuppofed found be the mediant, the concord is called the concord of the fourth and fuperfluous fifth: if it is a feventh below, i. c. if the fuppofed found be the tonic, the concord is called the leffer fixela and fuperfluous feventh.

SUPPOSLIORY, a kind of medicated cone or ball, which is introduced into the anus for opening the belly.

It is ufually compofed of common honey, mised up with either foap or oil, and formed into pieces of the length and thicknefs of the little finger, only pyramidal. 'Io the compofition is fometimes alfo added powder of feammony, euphorbium, colocynthis, falt, aloes, \&xc. according to the cafe of the pationt.

The fuppofitory was invented for the convenience of fuch as have an averfion to the taking of elyfters; or to be ufed when the difeafe does not allow thereof.

SUPPRESSION, in Medicinc, is generally ufed to fignify a retention of urine or of the menfes.

SUPPURATION, the fecond way wherein an inflammation terminates; being a converfion of the infpiffated blood and the firt adjacent parts, as the veffels and fat ; into pus or matter; which diforder, when it has not yet found an opening, is generally called an al $\int \cdot e f s$.

SUPRACOSTALES, in Anatomy. See Table of. the Mufcles in Anatony.

SUPRALAPSARIANS, in Theology, perfons who hold that God, without any regard to the good or eril works of men, has refolved, by an eternal decree, fupra lap $u m$, antecedently to any knowledge of the fall of Adam, and independently of it, to fave fome and to. damn others; or, in other words, that God intended to glorify his jutice in the condemnation of fome, as well as his mercy in the falvation of others; and for that purpofe decreed that Adam thould neceffarily fall, and by that fall bring himfelf and all his offopring into a ftate of everlafting condemnation.

Thefe are alfo called antclapfaries, and are oppofed to fublapfares and infralapfaries.

According to the fupralaplarians, the object of predeftination is, homo creabilis at labilis; and, according to the fublapfarians and infralaprarians, homo creatus et laplus.

SUPRASPINATUS, in Annlomy. See Table of the Nufcles in Avitomy.

SUPREMACY, the fuperiority or fovereiguty of the king. Sce Sovfreignty.

SUR, or Srous, in Anciemt Geograpliy, a defert of Arabia Petrea, extending between Jaletline and the Arabian gulf; into which the Ifraelites, after marching

## S U R

Surat. through the Red fea, firft came (Exod. xv. 22.). Again (Numb. xxxiii. 8.), it is faid, that from the lea they went three days journey into the Wildernefs of Etham; whence fome conclude that Etham and Shur are the fame wildernefs; or only differ as a part from the whole, Shur being the general name, and Etham that part of it lying neare? to the place of encampment of the fame name. We know fo little of the geography of thefe places, that there is more room for difputation than for decifion. As to the route which the Ifraelites followed in their paftige through the Red fea, Mr Bryant, we think, has given the moft fatisfactory account in his late work on the Plagues of Egypt. - Shur is now called Corondel.

SURAT, a city of Indoftan, belonging to Britain, on the weftern coaft of the peninfula, a little to the northward of Bombay, and about 16 miles up the river Tappee. It is but of modern date, and is a moft remarkable initance of the power of trade to bring wealth and population to any fpot where it can be brought to fettic. Towards the middle of the 17 th century, this place was only the refort of a few merchants, who, under the fhelter of an old infignificart cattle, laid the firt foundations of a ciiy now almoft as large and fully as populous as London within the walls, and containing many fine buildings of Indian architecture, which is partly Gentoo and partly iIIorifque. Thofe of the greateft note are fo contrived, that the gateway is defenfible againt any fudden irruption of a few armed men. The private apartments lie backwards for the conveniency of the women, of whom the Moors are remarkably jealous. They are fond of having one room, in the midft of which a fountain keeps playing, and which, by its noife, lulls them to fleep, and refreftes the room by its coolnefs; but thus a damp is produced, which would be very dangerous to Europeans. They have alfo generally a faloon with fountains playing in it, whici, with the wariegated flower-beds, in which they are very curious, makes a beautiful profpect. During the intenfe heats of fummer they have country retirements a little way out of town, where they refide, or go in parties to amufe themfelvcs. The freets are irregularly laid out; but have one property which renders it agreeable to walk in them, viz. that a competent width being left at bottom, the upper fiories of the houfes project over one another in fuch a mamer, that people may with eafe converfe from them; by which means the flreet is agrecably fladed, at the fane time that a proper ventilation is not impeded, but rather promoted. The flops, motwithtanding the vaf trade carried on in this great and populous city, have a very mean appearance, owing to the dealers kceping their goods in warehoufes, and felling by famples.

No place is better fupplied with provifions than the cily of Surat while its cnmmunication with the country remains npen. Befides the unbounded importation, by rehich every article is brought here in great abundance, the natural productions of the finl are excellent, though lefs cheap than in other parts of India, as at Bengal efpecially; yet in that place, though the cattle and poultryare bought originally at a very low rate, they turn out very dear by the time they are foll for the table. Here, however, all kinds of catables may be had at a reafonable price, ready for immediate ufe, and as good as can be found anywlierc. The wheat of Surat'is fa-
mous all ove: India for its fingular fubftance, "hitenefs, and tafte; and its falads and roots are likewife of an excellent quality. There are alfo many kinds of wildfoul and other game to be had at an ealy rate; but for wines and firituous liquors they depend mofly on importation.

Surat was furrounded with a wall in a fhort time after it had aflumed the form of a town. The fortification, however, was meant only to prevent the incurrions of the Mahrattas, who had twice pillaged it ; fo that the place was by no means capable of fanding any regular fiege. Even the cafle appears but a poor defence, being mounted with cannon here and there, without any order, or without any thing like an attempt towards military architecture.

In this cily, before the Eaft India company became invefted with the poffeffon of Bombay, was the prefidency of their affiairs on the weftern coalt. For this purpofe they had a faciory eflablifhed there with great privileges "by the Mogul government; and even afler the prefidency was eftablified at Bombay, they continued a factory here at one of the beft houles in the city; which yet not being facious enough to contain their effects, they hired another at fome ditlance from it, and nearer the water-fide, which was called the new factory. In the mean time, the city flourifted, and became thie centre of all the Indian trade, being much more frequented for the fake of foreign merchandife than for either the natural productions or manulactures of the country, though they alfo made a confiderable part of its commerce. In fhort, there was fearce any article of merchandife but what was to be found at all times in Surat, almoft as readily as in London itfelf. While the Mogul government was in its vigour, there was fuch a how of juftice kept up, 'as induced merchants of all religions and dencminations to take up their refidence in the city. The Gentoos efpecially reforted thither, in order to avo:d the oppreffions of their own govern. ment. Great care indeed was taken that no very flagrant afts of oppreffion thould be committed; fo that, in what fometimes happened, appearances were at leaft kept up; and the oppreflions of goverument were chicfly owing tu the animofities and rivaldhip of the merchanis themfelves. As an inflance of the great extent to which commerce was puhted in Surat, we flall here quote from Mr Grofe, what is faid by Captain Hamiltun of a merchant named Abdulgafour, viz. "That he drove a trade equal to the Eaft India company: for he had known him fit out in a year above 20 fail of thips, between 300 and 800 tons, none of which had lefs of his own ftock than 20,000 , and fome of them $25,0 c 01$. After that foreign flock was fent away, it behoved him to have as much more of an inland ilock for the following year's marhct." On the deceafe of this merchant, the government feized on a million of his money; and his grandfon was not only deprived of all that he pofferfed, but barbaronifly murdered through the envy and treachery of his brother mecchants, and the rapacity of the governor.

The city of Surat was taken and ruined by the Purtuguefe in 1520 ; and it was not till after this misfortune that it became fuch a celebrated emponium. All the Indian merchants who had been accultomed to trade thither cor:tributed to re-eflablith it ; but it was not till near a century after that it becarse the gencial flaple of

## $S$ U R <br> 23 ]. $\quad S \quad \mathrm{U}$

Sufat, Indian and European metchandife; when the Dutch Surcharge appearing in the Indian ocean, had deprived the Portuguefe of all their conquefts on that coaft, and almoft entirely ruined their trade. The Englifh eftablifhed a factory here in 3609 , the Dutch in 1616 , and the French in $\mathbf{1 6 6 5}$. In procefs of time, the Indian feas bcing greatly infeited by pirates, a naval officer was appointed by the Mogul to keep them in awe. This officer was named Siddee (A) Muffoot, who had been chief of an Ethiopian colony fetlled at Rajaporc. Here he bad collceted fome veffels of confiderable force, and carried on fome trade, till he was difpoffeffed by the Mahrattas; upon whicl he repaired to Bombay, and afterwards to Surat, where he was appointed admiral on that liation to the Mogul, with a yearly devenue of about 36,0001 . Sierling. 'Though he had no power, indepentent of the marine, he feized on the caftle, encroached on the town, and appropriated to himfelf a third part of its revenues, under pretence of arrears due in his appointed revenue. Another third was paid to the Mahrattas, to prevent their depredations upon trade in the open country; but they, not fatisfied with this ftipulation, watcled an opportunity to plunder the town, which was kept in fubjection by Siddce Muffoot, till his death which happened in 1756 .

Siddee Muffoot was fucceeded by his fon, who foon rendered himfelf very difagrecable to the inhabitants. In 1758 the Englifh factory was greatly oppreficd by him, and the black merchants treated ftill worfe; on which the latter applied to Mr Ellis the Englifh chief at that time, defiring him to recommend it to the prefidency of Bombay to take the caftle by force out of the hands of the ufurper. This propofal proving agreeable, Admiral Pococke, who was then with his fquadron at Bombay, readily concurred in fupporting the expedition. The enterprife was conducted with the ufual fuccefs attending the Britifh arms; and Captain Maitland the conduetor took poffeffion of the caftle with its revenue in name of the Eaft India company, who were confirmed in the government by grants from the Mogul.

SURCHARGE OF THE FOREST, is when a consmoner puts more beafts in the forelt than he has a right to. See Forest.

SURcharge of Common, is a difurbance of common of pafture, by putting more cattle therein than the pafture and herbage will fuftain, or the party hath a right 10 do. This injury can only happen where the common is appendant or appurtenant, and of courfe limitable by law; or where, when in grofs, it is cxpreffly limited and certain ; for where a man hatls common in grofs, fans nombre, or without fint, he cannot be a furcharge. In this cone indeed there mult be left Cufficient for the lord's own beafts.

The ufual remedies for furcharging the common are hy the lord's diftraining the furplus number, or by his hringing an action of trefpafs, or by a fpecial ation on the cafe, in which any commoner may be plaintiff. The ancicrit and moft effectual method of proceeding is by writ of admeafurement of pafture.

Writ of Sccond Streilamge, de fecunda fuperoncra.
tione, is given by the fatute of Wcftm. 2. 13 Edw. I. Surcharge cap. 8. when, after the admeafurement of paiture hatl afcertained the sight, the fame defendant furcharges the common again; and thereby the fheriff is directed to inquire by a jury whether the defendant has in fact again furcharged the common; and if he has, he foall iwen forfeit to the king the fupernumerary cateic put in, and alfo fhall pay danages to the Ll-..iiff.

SURCINGLE, a givele wherewith the clergy of the church of Englane ulually tie their caffocks. See GirDize.

SURCOAT, a coat of arms, to be worn over body armour.

The furcoat is properly a loofe thin taffety coat, with arms embroidered or painted on it. Such as is worn by heralds, anciently alfo uled by military men over thei: armour to diftinguifh themfetves by.

SUlid, in Arithnetic and Algebra, denotes any number or quantity that is incommenfurable to unity: otherwife called an irrational number or quanitity. See Algebra. Pait I. Cliap. IV.

SURETY, in Laze, gencrally figuifies the fame with Bail.
SURF, is a term ufed by feamen to exprefs a peculiar fwell ard breaking of the fea upon the fhore. It fometimes forms but a fingle range along the frore, and at others three or four behind one another extencing perhaps half a mile out to fea. The furf begins to affume its form at fome diftance from the place where it breaks, gradually accumulating as it moves forward till it gain, not uncommonly, in places within the limits of the trade-winds, a height of 15 or 20 feet, when it overliangs at top, and falls like a cafcade with great force and a prodigious noife. Countries where furfs prevail require boats of a particular conftruction very different from the greater part of thofe which are built in Europe. In fome places furfs are great at ligh, and in others at low water; but we belicve they are uniformly moft violent during the fpring-tides.

It is not cafy to affign the caufe of furfs. That they are affected by the winds can hardly be queftioned; but that they do not proceed from the imimediate operation of the wind in the places where they happen, is evident from this circumftance, that the forf is olten higheft and moft violent where there is leaft wind, and vice verfa. On the coaft of Sumatra the higheft are experienced during the fouth-ealt monfoon, which is never attended with fuch gales as the north-well. As they are moft general in the tropical latitudes, Mr Marfden, who feems to have paid much attention to the fubject, attributes them to the trade-winds which prevail at a diftance from thore between the parallels of 30 degrees north and fouth, whofe uniform and invariable action caufes a long and conflant fivell, that exifts even in the calmeft weather, about the line, towards which its direction tends from either fide. This fwell, when afquall happens or the wind frefhens up, will for the time bare other fubsidiary waves on the extent of its furface, breaking often in a direction contrary to it, and which will again fubfide as a calm returns, without having fro-
duced
(A) When the Abyfinian flaves are promoted to any onice under the Mogul government, twey are called sid sifes.
duced on it any perceptible effect. Sumatra, though not continually expofed to the fouth-ealt trade-wind, is not to diftant but that its intluence may be prefumed to extend to it ; and accordingly at Poulo Pefang, near the fouthern extremity of the iiland, a conflant foutherly fea is oblerved, even after a firong north-weit wind. This inceffant and powerful fwell rolling in from an occan, open even to the pule, feems an agent adequate to the prodigious effects produced on the coaft ; whilf its wery fize contributes to its being overio, Eed. It reconciles almoft all the difficulties which the phenomina feem to prefent, and in particular it accounts for the decres? of the furf during the north-weft monfoon, the local wind then counteracting the operation of the general one; and it is corroborated by an oblervation, that the furfs on the Sumatran coaft ejer begin to break at their fouthern extreme the motion of the fwell not being perpendicular to the direction of the thore. This explanation of the phenomena is certainly plaufible; but, as the author candidly acknowledges, objections may be urged to it. The trade-winds and the fwell occafioned by them are remarkably fteady and uniform; but the furfs are much the reverfe. How then comes an uniform canfe to produce unfteady effects ?

In the opinion of our author it produces no unfteady effects. The irregularity of the furfs, he fays, is perceived only within the remoter limits of the trade-vinds. But the equatorial parts of the earth performing their diurnal revolution with greater velocity than the reft, a larger circle being defcribed in the fame time, the waters thereabout, from the ftronger centrifugal force, may be fuppofed more buoyant; to feel lefs reftraint from the fluggill principle of matter ; to have lefs gravity; and therefore to be more obedient to external impulfes of every kind, whether from the winds or any other caufe.

## - SURFACE. See Superficies.

surfeit, in Medicine, a ficknefs with a fenfation of a load at the flomach, ufually proceeding from fume error in diet, either with regard to the quantity or quality of the food taken. Sumetimes, however, a furfeit is only a plethora from indolenice and full diet: in which cafe perfpiration is defective; and eruptions appear on the flkin.

Fafting for Some time, and an attention to temperance afterwards, with fome brifk purgatives, will gencrally
 with other more permanent affections.

Sumfeit, in Farricry. See Farriery Index.
SURGE, in the fea-language, the fame with a wave. See Wave:

SURGEON, or Charurgeon, one that profefies the art of Surgery.

In England there are two diftinict companies of furgeons now occupying the fcience or faculty of furgery; the one company called barbers, the other furgeons, which latter are not incorporated. -The two are united to fue, ami be fued, by the names of mafters or gover. nors and commonatty of the mytery of barbers and furgeons of London. . 32 Hen. Vili. c. 42.

No perfon ufing any barbery or fhaving in Liuidens fhall occupy any furgery, letting of blood, or other matter; dratring of teeth only excepted. And no perfon ufing the myltery or craft of furgery fall occupy or exercife the feat or craft of barbery or fhaving, neither by himfelf, nor any other for his ufe. 32 Hen. VIlI. c. 42 .

By the fame ftatute, furgeons are obliged to have figns at their doors.

The French chirurgeons being refufed to be admitted into the univerfities (notwithfanding that their art makes a branch of medicine), on pretence of its bordering a little on butchery or cruelty, affociated themfeives into a brotherhood, under the protection of S . Cofmus and S. Damian: on which account, according to the laws of their inflitution, they are obliged to drefs and look to wounds gratis the firft Monday of each month.

They diftinguiih between a chirurgeon of the long robe and a barber-chirurgeon. The firft has ftudied phyfic, and is allowed to wear a gown. The fkill of the other, befides what relates to the management of the beard, is fuppofed to be confined to the more fimple and eafy operations in chirurgery; as bleeding, toothdrawing, \&c.

They were formerly diftinguifted by badges: thofe of the long gown bose a cafe ol iuftruments ; the barber, a bafon.

## S U R G E R Y.

THE term furgery has been ufually employed to fignify that part of medicine which treats of the difeafes of the human body which are to be cured or alleviated by the hand, by inftruments, or by external applications.

## INTRODUCTION.

Mf.dicine and furgery, formerly regarded as one and the fame frience, were exercifud by the fame perfons during the moft remote ages; and cheir feparation, fich as now generally exifls, is to be confidercd as a modern inflitution. If we confider their origin and end, the $\because$ nowledge which the praclitioner of each requires, and the connection which naturally fuefirls between the dif-
eafes which are fuppofcl peculiarly to belong to each department, it is probable that the fuft practitioners confounded them with one another; and it is eafy to conceive how the fame idens thould have paffed from one generation to another. At laft, however, the knowledge of the healing art being greatly enlarged, it became neceffiry to feparate it into different clafics, and to form it into diffinct departments in practice. Accordingly there were not only fome who confined themfelves to furgery, but there were lithotomifts, phlebutumifts, oculifts, auritts, dentifs, \&cc.

We do not propofe here to enter intu any detail in attcmpting to thow how this feparation was made, and ftill lefs to make mention of the puerile diffules iestarding the pre-endinence of medicinc to furgery. '1 here

## $S U R G E R Y$.

Limpoduc- are few we believe who in our days do not feel that $\underbrace{\text { tion. fuch a pre-eminence does not exift in nature; that }}$ modicine and furgery are one and the fame fcience; that they are coeval with the human race; and to thofe who are able to appreciate them, they mult appear of equal utility and importance. The healing art is one, its principles ought to be the fame throughout, and the exercife of its different branches fuppofes the lame fundamental knowledge; but it offers in the detail fuch a vaft field for fludy, that few men are able to embrace the whole, and to culcirate all the parts with equal fuccefs. It becomes, therefore, an advantage to fociety that fuch parts as can be eafily feparated in practice be exercifed by different individuals; and that a man who has acquired a general knowledge of the firucture, functions, and difeafes of the animal economy, pracife in fuch departments as he finds his talents and acquirements point out.

Some have oppofed furgery to medicine by qualifying the firf with the name of art, and in giving to the fecond that of fcience. To pretend that furgery is nothing but the art of treating difeafes by external means or by manual operations, is to rank it annong the mechanical profeffions; and to confider as a good furgeon, the man who can drefs an ulcer, apply a bandage, reduce a fracture, amputate a limb, or perform fuch like operations, on the living body. We have already mentioned that the healing art is the fame in all its branches; the internal organs of the body in a flate of health are governed by the fame general laws, and many of them are analogous in flructure to the external parts; and the mature of a local difeafe can never be underfood if we are not acquainted with all the deviations from the na. tural flate, of which the whole animal fyftem is fufceptible. If a pliyfician be called to treat a pleurify, he cannot expect to do it with fuccefs unlefs he have a fuf. ficiently clear idea of the nature of inflammation, or at leaft of the principal fymptoms which characterife it; of its confequences, and of the proper mode of applying the means to remove it. This hnowledge is not lefs necefiary to the furgeon who is called to treat an wound, the management of which depends chiefly on the pre.. cautions neceffary to prevent and remore inflammation in the affected parts, without at the fame time weakening too much the vital powers. The knowledge of the phyfician does not merit more the name of fieience, then that of the furgeon who is well acquainted with the fundions of the animal economy, with morbid fruturc, and with the progrefs and termination of difeafes.

The fludent of furgery has therefore to acquire, not only all that knowledge neceffary for the well educated phyfician, but he has likewife to learn the manner of performing furgical operations. This, though no doubt an effential requifite to the furgenn, is by no means fo important as a comptient knowledge of thofe difeafes and ftates of difcafe which require fuch means; and the young furgeon fhould endeavour not to cherifi that love of operating which is obferwed in fome, and which arifs from the eciât which a dexterous operator generally reсеіче.
To become an intelligent and expert operator, feveral qualifications are neceffary; and fome of thefe fall to the lot of few individuals. There are many people, who, though they have acquired an extenfive knowledge of difeales, have not that calmnefs of mind, that colleet-

Vol. XX. Part I.
ednefs of thought, which is necefiary for a good opera- Introductor ; and there are fome who are even deficient in that mechanical dexterity, which, though not requifite in all, is yet neceffary in feveral of the operations in furgery. Thefe talents, however, are never given in fuch perfection as not to require cultivation. An early habit of being prefcrit, and of affirting at operations, prepares the ftudent to act for himfelf; and a long and uuremitting habit of ufing the knife, and of performing operations on the dead body, gives a facility in all the mechanical part of them, which even experience on the living body does not procure.

## Hifory of Surgery.

That furgery was coeval with the other branches of medicine, or perhaps antecedent to any of them, will not admit of doubl. The wars and contentions which have taken place among mankind almon ever fince their creation, neceflarily imply that there would be occafion for furgeons at a very early period; and probably external injurics would for lome time be the only difeafes for which a cure would be attempted, or perhaps thought pratticable. In the facred wrilings we find much mention of ballams, particularly the balm of Gilead, as excellent in the cure of wounds; though at the fame time we are informed that there were fome wounds which this balfam could not heal.

Concerning the furgery practifed among the Egyptians, lews, and Afiatic nations, we know little. The art defecnded from the Greeks to us, though they confefledly received it from the eaflern nations. The firf Greck furgeons on record are Refculapius and his fons Podalinins and Machaon. Efculapius flourihed about 50 years before the Trojan war ; and his two fons diftinguifhed them!clves in that war both by their valour and by their $\Omega$ ill in curing wounds. This indeed is the whole of the medical fkill attribated to them by Homer ; for in the plague which broken out in the Grecian camp, he does not mention their being at all confulted. Nay, what is fill more ftrange, though lie fometimes mentions his heroes having their bones broke, he never takes notice of their being reduced or cured by any other than fupernatural means; as in the cafe of Acreas, whofe thigh-bone was broken by a flone caft at him by Diomed. The methods which thefe two famous furgeons ufed in curing the wounds of their fellow foldiers, feen.s to have been the extracting or cutting out the darts which inficted thicm, and applying emollient fomentations or flyptics to them when neceffary: and to thefe they endoubtedly attributed much more virtue than they could pofithly poffefs; as appears from the following lines, where Homer defcribes Eurypylus as wounded and -ider the hands of Patroclus, who would certain practife according to the directions of the furgeons.

Patroclus cut the forky ftel away;
Then in his land a bitter root he bruis'd,
The wound he walh'd, the ftyptic juice infus'd.
The clofing. feforb that inltant ceas"d to glow;
The wound to torture, and the blood to flow.
Till the days of Hippocrates we know very litile of what was the practice of the Greck furgeons. From him, however, we learn, that the practice of blood-letting, cupping, and fcarification, was known to them ; al-

Hifory. fo the ufe of warm ard emolient fomentations, iffues made with hot irons, pefiaries, injections, fumigations, \&e. Hippocrates alfo gives directions with regard to fractures, lusations, ulcers, filtulas. He directs the extention, reduction, bandages, and fplints, proper to be ufed in fractures and luxations of difierent bones, with feveral machines to increafe the extenfion when neceffary. He directs the laxity and tightnefs of the bandages; the intervals for unloofing and binding them on again ; the pofition and repofe of the fractured member, and the proper regimen; and he mentions the time when a callus is ufually formed. He treats alfo of fractures of the \&kull, and the method of applying the trepan. In his treatment of ulcers, he fpeaks of reducing fungous tlefly by means of efcharotics, fome of which are alum, nitre, verdigrife, quicklime, \& \& .
Surgery appears not to have exifted in Rome, notwithlanding the warlike genius of the people, for more than 500 years. Archagathus, a Greek, was the firtt profefion uf the art in that city; and fo frequently employed the kuife, hot irons, and other cruel methods of cure, that he was branded with the opprobrious title of carnifex, and explled the city, where no phyfician or furgeon of eminence again made his appearance for 180 ycars. At this time Afclepiades undertook the profeffion of medicine; but feems to liave denlt little in furgery. Neither have we any thing of importance on that fubject till the time of Celfus, who flourilhed during the reigns of Auguflus and Tiberius - In his work on furgery, all the improvements from Hippocrates to his own days are collceted; the mofi minute and trifling difeafes are not omitted. An eminent furgeon, of the moderns, cmphatically exhorts every perfon in that profeflion" to keep Cellus in his hands by day and by night." He defcribes the figns of a fractured f:ull, the method of examining for the fracture, of laying the flull bare by an incifion in the form of the letter X, and afterwards of culling away the angles, and of applying the trepan, mentioning aifo the figns of danger and of recovery. He obferved, that fometimes, though very rarely, a fatal concuffion of the brain might happen fron the blood-veffels within the flull being bu:ll, the bone iemaining cutire. After the operation of the trepan, fpalzes and cloths wetted with vinegar, and feveral other applications, werc made to the head; and, throughout, fevere ablinience was enjoined. It violent fractures of the tibs, he ordered venefection; low dict; to guard againf all agitation of the mind, loud feaking, motion, and every thing that might excite coughing or ficezing. Cloths wetted witl wine, rofes and oil, and other applications, were laid over the fracture. The cure of fractures, in the upper and lower extremitiec, he faid were nearly alike; that fractures differ in degree of violence and danger, is beiny fimple ot conpound, that is, with or without a wound of the flefh, and inl being near to the joint. He direets the extenfion of the member loy affilants; the leduction, by the furycon's hands, of the frectured bones into thicir n'tural firtuation; and to bind the fradurcel part with bandages of different lengthe, previouly dipped in wine and vil: on the third day tre fl bandarg's are to te applied, and the frafured member fomenied wihh wam rapour, efpecially during the intlammation. Splints, if neceffary, are to be applied, to retain the hones in a fixed pofition. The fractured artm is to be fulpended i: a troad
fling hung round the neck : the frastured leg is to be inclofed in a kind of cafe, reaching above the ham, and accommodated likewile with a fupport to the foot, and with flraps at the fide, to keep the leg fleady: in the fractured thigh-bone, the cafe is to extend from the top of the hip to the foot. He defcribes the method of treating compound fractures, and of removing fmall fragments of fplinters of bones; and the manner of extracting darts. In luxations of the fhoulder, he mentions feveral methods of giving force to the extenfion, and of replacing the diflocated bone. One method fimilar to that of Hippocrates was, to fufpend the patient by the arm; the fore part of the fhoulder, at the fame time, refling upon the top of a door, or any other fuch firm fulcrum. Another method was to lay the patient fupine, fome affiftants retaining the body in a fixed pofition, and others extending the arm in the contrary direction ; the furgeon, in the mean time, attempting, by his hands, forcibly to reduce the bone into its former place.

If a large inflammation was expected to enfue after a wound, it was fuffered to bleed for fome time, and blood was drawn from the arm. To wounds accompanied with confiderable hamorrhagy, he applicd a fponge wet in vinegar, and conflant preflure : If neceflary, on account of the violence of the hamorrhagy, ligatures were made round the veffels, and Yometimes the bleeding orifice was feared up with the point of a hot iron. On the third day frefl dreffings were applied. In confiderable contufions, with a fmall wound of the fiefl, if neither blood-veffels nor nerves prevented, the wound was to be enlarged. Abninence and low diet, upon all fuch accidents, were prefcribed; eloths wet with rinegar, and feveral other applications, were to be applied to the insflamed part. He obleives, that frefh wounds may be healed without compound applications. In external gangreae, he cut into the found flefl; and when the difeafe, in fite of every cfiort, fpread, he advifed amputation of the member. After cutting to the bone, the fiefly was then fepaated from it, and drawn back, in order to fave as much flefh as poffible to cover the extremity of the bone. Celfus, thongle extiemely difure in the defcription of furgical dileafes, and of various remedies and external applications, treats llightly of the method of amputating; from which, comparing his treatife with the modern fyfiems, we might infer that the operation was then feldomer practifed than at prefint. He defcribes the fymptonis of that dangerous inflammation the carbuncle, and direets, immediately to burn or corrode the gangiened part. 'Io pronote the fuppuration of ablceffes, he orders poultices of barley-meal, or of marflimallows, or the fecds of linfeed nid ferugreek. He alfo inentions the compofitions of feverail repellent cataplafims. In the cruyipelas, he applics cenufe, mixed with the juice of folanum or mighthode. Sal ammoniac was fornetimes mixed with his plafters.

He is very minute in defcribing difeafes of the eyes, ears, and teeth, and in prefcibing a mullitude of remedies and applications. In inflammation of the cyes, he enjoined abflinence and low diet, ref, and a dark room : if the inflammation was violent, with great pain, he ordered venefection, and a purgative; a Imall poultice of tine tlo:ser, fiffion, and the white of an egs, 10 be latd to the fordicad to fupprefo the flew of pituita;

Hifory. the foft infide of warm wheat bread dipped in wine, to be laid to the eye; poppy and rofes were alfo added to his collyriums, and vatious ingredients too tedious to enumerate. In chronic watcry defluxions of the eyes, he applied aftringents, cupped the temples, and burnt the veins orer the temple and forehead. He couched cataracts by depreffing the cryftalline lens to the bottom of the orbit. Teeth, loofened by any accident, he directs, after the example of Hippocrates, to be faftened with a gold thread to thofe adjoining on each fide. Previous to drawing a tooth, he ordered the gum to be cut round its neck; and if the tooth was hollow, it was to be filled with lead before extraction, to prevent its breaking by the forceps. He defcribes not only the inflammation, but likewife the elongation, of the дıvula: he allo deferibes the polypus, and fome other diteafes affecting the nofe.

He delcribes \{everal \{pecies of hernix or rupture, and the manual affiftance required in thofe complaints. After the retarn of the intentines into the abdomen, a firm comprefs was applied to that part of the groin through which they protruded, and was fecured by a bandage round the loins. In fome cales, after the return of intertinal ruptures, he diminifhed the quantity of loofe fk in, and formed a cicatri., fo as to contract over the part, to render it more rigid and capable of refifting. He defcribes various difeafes of the genital parts, the hydrocele or droply of the forotum, a difficulty of urine, and the mamner of drawing off the water by a catheter; the figns of fone in the bladder, and the methad of founding or feeling for that Itone. Lithotomy was at that time performed by introducing two fingers into the anus; the flone was then preffed forward to the perinæum, and a cut made into the bladuer; and by the finger nr by a fcoop the Itone was extracted. He defcribes the minner of performing this operation on both the fexes, of treating the patient, and the figus of recovery and of danger.

Celfus direeted various corrofive applications and injections to fiftulas; and, in the laft extremity, opened them to the bottom with a knife, cutting upon a grooved inftrument or conduftor. In old callous ulcers, he made a new wound, by either cutting away the hard edges, or corroding them with verdigrile, quicklinuc, alum, nitre, and with fome vegetable efcharotics. He mentions the fymptoms of caries in the bone; dire ©s the bone to be laid bare, and to be pierced with feveral holes, or to he burnt or rafped, in order to promote an exfoliation of the corrupted part; afterwacds to apply nitre and feveral other ingredients. Onc of his applications to a cancer was auripigmentum or arfenic. He directs the manacr of tapping the abdomen in afcites, and of drawing blood by the lancet and cupping-glafes. Hiscupping-glaftes feem not to have been fo convenient as the modern: they were made either of brafs or horn, and were unprovicied with ${ }^{3}$ pump. He cured varicofe reins by uftion or by incifion. He gives directions for extracting the dead fiens from the womb, in whaterer poftion it fhould prefent ; and, after delivery, to apply to the private parts foft cloths wet in an infufion of vinegar and roles. In Celfus's works there is a great redundance and fuperfluity of plafters, ointments, efcharotics, collyriums, of fuppurating and difcutient cataplafms, and extemal applications of every kind, both fimple and comnound: Perhaps, amongt the multitude,
there are a few ufeful remedies now laid afide and ne. glected.

The laft writer of confequence who flourithed at lome was Galen, phyfician to the emperor Marcus Aurelius. His works are for the moft part purely medical ; although he wrote allo on furgery, and made Commentaries on the Surgery of Hippocrates. He opened the jugular veins and performed arteriotomy at the temples; directed leeches, fcarification, and cupping-glaffes, to draw blood. He alfo defcribed with accuracy the different fpecies of herniæ or ruptures.

In the year 500 flourifhed $A$ ërius, in whofe works wc meet with many obfervations omitted hy Celfus and Galen, particularly on the furgical operations, the difeafes of women, the caufes of difficult labours, and modes of delivery. He alfo takes notice of the dracunculus, or Guinea worm. Aëtius, however, is greatly excelled by Paulus Egineta, who Hourifhed in 640; whofe treatife on furgery is fuperior to that of all the other ancients. He directs how to extract darts; to perform the operation fometimes required in dangerous cafes of rupture or hernia, He treats alfo of amenrifn. Galen, Paulus, and all the ancients, fpeak only of one fpecies of aneurifm, and defne it to be "a tumor arifing from arterial blood extravafated from a ruptured artery." The ancurifm from a dilatation of the artery is a difcovery of the moderns. In violent inflammations of the throat, where immediate danger of fuffocation was threatened, Paulus performed the operation of bronchotomy. In obftinate defluxions upon the eyes, he opened the jugular veins. He delcribes the manner of opening the arteries behind the ears in chronic pains of the head. He wrote alfo upon midwifery. Fabricius ab Aquapendente, a celearated furgeon of the 16 th century, has followed Ceifus and Paulus as text books.

From the time of Paulus Egineta to the year 920, no writer of any confequence, either on medicine or furgery, appeared. At this time the Arabian playficians Rhazes and Avicenna revived in the eaft the medical art, which, as well as others, was almoft entirely extinguifled in the weit. Avicenna's Canon Medicince, or General Syftem of Medicine and Surgery, was for many ages celebrated through all the fchools of phyfic. It was principally compiled from the uritings of Galen and Rhazes. The latter had correctly defcribed the fina ventofa, accompanied with an enlargement of the bone, caries, and acute pain. In difficult labours, he recommends the fillet to afiff in the extraction of the foctus; and for the fame purpofe, Avicenna recommends the forceps. He defcribes the compofition of feveral cofm tics to polifh the $\mathbb{1 k i n}$, and make the laair grow, or fall off.

Notwithftanding this, howerer, it was not till the time of Altucafis that furgery came ino repute among the Arabians. Rlazes complains of their grofs ignorance, and that the manual operatic:s were performed by the phyticians írvarits. Albucafis enumerates a tremendous litt of operations, fufficient to fill us with horror. The hot iron and cauteries were favourite remedies of the Arabians; and, in inveterate pains, they repofed, like the Egyptians and eafern Afiatice, great confidence in burning the part. He deforibes accurately the manner of tapping in afcites; mentions feveral kinds of inftruments for drawing blood; and has left a more ample and corrct delincation of furgical inftru-

## Hi:Rory.

 ments than any of the ancients. He gives various obItetrical directions for extracting the fuetus in cales of difficult labour. He mentions the bronchocele, or prominent tumor on the ueck, which, he tells us, was moft frequent among the female fex. We are allo informed by this writer, that the delicacy of the Arabian women did not pernit male furgeons to perform lithotomy on females; tut when neceflary, it was executed by one of their own fex.Fron the isth century to the middle of the I $4^{\text {th }}$, the tiltory of furgery affords nothing remarkable except the importation of that naufeous difeafe the leprofy into Europe. Towards the end of the $15^{\text {th }}$ century the venereal difeafe is faid to have boen imported from America by the firf difcoverers of that continent.

At the beginning of the 16 th century, furgery was held in comtempt in this ifland, and was practifed indifcriminately by barbers, farries, and fow-gelders. Barbers and furgeons continued, fur 200 years after, to be incorporated in one company both in London and Paris. In Holland and forme parts of Germany, even at this day, barbers exercife the razor and lancet alternately.

It is within the laft three centuries that we bave any confderable improvenent in fergey; nor do we know of any eminent Britill furgical writers until within the 1:1t $\mathrm{I}_{3} 3$ years. "In Germany (lays Heitter) all the diffirent furgical operations, at the beginning even of the 18 h century, were left to empirics; while regular praditioners were contented to cure a wound, open a vein or an abliefs, return a fractured or lusated bone; but they feldom or never ventured to perform any of the difficult operations." He alfo fpeaks of their grofs ig. norance of the Latin language.

The first furgical work of the 16 th century worthy of notice is that of J. Carpuc. F. ab Aquapendente, an Italiar, publithed a Syfem of Surgery, containing a defription of the various dileales, accidents, and operations. Boerhaave pays this author the following complimen!: Hle fuperavit omnes, et nemo illi hanc difputat gloriam; omnibus potius quan hocce carere p.fisums. About the fane period, A. Parey, a Frenchman, made $f_{f}$ veral iniportant additions to furgery, particularly in hi:s collection of calles of wounde, fractures, and other accidents which occur during war. The anciente, who were ig:orant of porider and frearme, are defective in this part of military furgery. Parey pretends to have firt invented the method of tying with a neecle and ftrong filk thread wased the extiemities of laree arteries, after the amputation of a member. The ligature of the bluad-vefels is, hor ewer, merely a revival of the ancient practice, which biad fallen inito difure: 'Throughout the daik ages, the hot iron, camerits, and frong aftringents, were futflituted in its place. B. M.sggius and L. Buteilus werote on the cure of guriftot wounde. J. A. Cruce wrote a fy tlem of lurgery.

In the 17 th century, furgery was ariched with fevcral fyfteme, and with detached or mifelhneous obfervations. 'The principal authors are, MT. A. Severinus, V. Vidius, R. Wifman, Le Clere, J. Scultelue, J. Mangetus, C. Magatus, sfigellius, F. Hildanue, T. Bastholin, P. de Marchett. Lightecnith During the laft century, furgery, like all the onlier
cspurg. feiences, made more rapid progrefs toward perfection, than during all the precedin"。 periods. Tlis partly a-
rofe from the affillance of governments in the diffierent Hillory. countrics. They being convinced that anatomy is one of the moit neceilary fciences, and the groundwork of the whele halling art, but particularly of furgery, in many great cities academies were intlituted for the culivatoon of practical anatomy; and fehools were allo eftablithed for the inftruction of the theoretical and praclical parts of furgery.

Thefe improvements in furgery have been chiefly made in England, France, and Germany; and in all thefe countries a number of very eminent men have appeared.

The Englifh furgeons, befides poffefing an accurate knowledge of anatom, , and great abilities in the operative part of their piofeflion, were the firtt who endeavoured to bring the art to its prefent fimplicity. They dircted alfo their attention, in a particular manner, to the diet of patients; the neglect of which had caufed the unfortunate iffue of many operations which had been dexteroufly performed.

Among the furgeons of later times, we may firt mention the name of Sharp. He was a lcholar of Chefelden, and one of the bell furgeons of his day. He wrote a Compendium of Sargical Operations, $17+6$; and alfo a Critical Inquiry into the State of Surgery; beth of which works are ftill in high ellimation.
In the year 1719, Dr Dionro, after vifiting the Schouls of London, Paris, and Leyden, where he was a pupil of the great Boerbaave, came to Edii burgh; and this may be confidered as the date of the foundation ol the Ediaburgh medical felloci. He began by giving lectuies on anatony and furgery, the firt which were delivered in Edinburgh; and in the year 1721 he was appointed profefior of anatomy and lurgery to the miverlity. This eminent anate mitt and furgeon, belides filling bis chair with the greateft reputation, contiluted to the advancement of our knowledge in many important parts of anatomy and furgery. His works, publificed by his fon, befides his Treatife on Oitcology, which is ceitainly the beft defcription of the bones that has ever been given, will be found to contin many.intercfing and valuable obiervations on various furgical difcafes.

Jofoph Warner, furgeon of Guy's Hefpital, in London, publihed his Cafes and Kemarks in Surgery, in the year $: 754$, a wotk which contains many vely important practical remank:. He afterwards publitted a very good work, contaning a defcription of the ruman eye and its adjacent parts, in which he particularly rejeats the faflening of the eye duting the operation of cataract. He allo publiftied An Account of the 'Tellicics, their Cummon Coverings ard Coats, 心̌.

Percival Poth, liurgeon of St Bartholomew's Hufital, may be juftly confidered as one of the primcipal Eninglinh furgeons of his time. He was not only a fuccefful practitioncr, but an indufrious and evcellent witer. The marits of Pout are indeed confiderable. He threw nuch ligh o:a the doarine of wouncis of the head, by his accurate arrangement of the different kinds of i:2. jurics to which the head is fuhjeot. He alfo gives a good account of hydrocele and the other difeafes of the teft:cle. For the operation of the fiftula in ano, lie made material improvements. He has given many ufful hints on fracuures and ditlocations; and he was a great champion in favour of the operation fur cataral by couching. He was the firt pation who deferibad the chimacy-
fiveeps

IRRory, fweeps cancer; and on hernix, polypus, and curvatures of the fpine, he has made many judicious pathological and practical obfervations.

C'iarles White, furgeon in Manchenter, publithed an excellent practical work in the year 1770 , in which he recomracinds amputation of the foot, a little above the ankle joint, inftead of under the knee, as had ufually been practifed. He alfo fhows the effect of fawing off the ends of bones; and difcuffes feveral other interefting points in furgery. In the fame year, Mr Elfe of St 'Thomas's Hofpital, publilhed his treatife on the hydrocele, in which he recomnends the ure of caultic in the cure of that difeafe.

In the year 5770 , Mr Deafe, of Dublin, wrote an exccllent treatife on the wounds of the hea!. Mr Bromfield, of St George's Hofpital, and Mr Hiil, furgeon at Dunfries, alfo diftinnuifhed themfelves; Mr Bromfield for his Chirurgical Obfervations, and Mr Hill for his Obfervations on Cancere.

In the year $177^{8}$, Mr Benjamin Rell publifhed the firt volume of his Syftem of Surgen. The reputation of this work was fom fuch, that it was tranflated into the French and German languages; and it has tince gone through feveral editions in thefe, and many in Endilh.

This work prefented the mot complete fyttem of furgery which had ever appeared; and in every part of it there is difplayed a taient for practical obfervation and clearnefs of thought which muit render it ever a ufeful and valuabie prefent to furgery. Like all fuc! extenfive works, it is not without faults, and the language in which it is written is in fome places prolix and diffufe; but notwilhflayding its errors, it certainly muat be confidered as the moft ufetul body of furgery that has ever yet appeared in this country.

Befides thefe, mention mult be made of two other eminent furgeans, IITilliam and John IItenter; the former rendered immortal by his fplendid work on the grawid uterns, and the latter by his treatife on the venereal difeafe, and his treatife on the blood, inflammation, and gun-ihot wounds.

Many very eminent mea arofe, both in France and Germany, during the lat century. 'The tranfactons of their academies leave a lafling monument of their zeal and induftry.

In Firance we have the names of Petit, Arnand, Giasangeot, Morand, Le Dran, Le Cat, Innis, David L.e:ret, Le Blane, De la Faye, David Chopart, Defluut, Janin, Jourdain, Pouteav, Andrè Lombard Wenfel.

In Germany, furgery has heen enriched by the works of Vugel, Platner, Abett Flaller, Bilguer, IVeitz, Stibold, Brambilla, Theden, Snucker, Stork, Pleak, Ifenflamna, liougemont, Conradi, and many others.

IIJt authors who have wrilten fytems of furgery have defuribel difeafes according to the parts of the body where they wacre fituated; beginning with the head, an! defcriising the parts in fuccefion, according to their tioution.

Befiles this mode of arrangament being unpalofophical, it has many ferious difadvantages. Difeafes which have no analogy to each other, are treated of in the fime place; and fimilar difeafes are treated of ferataely, intead of being chaed together, and confidered in one general point
of view. A repetition of what may be confidered as the Hifory: fpecific characters of the difeafe, therefore, is conftantly occurring. The utility of nofological fyftems in practical medicine and in pathology, has been very generally acknowledged. Difeafes which have common characters are thus brought together and are arranged under claftes, orders, genera, and fpecies. It is to be confidered, therefore, as an important ilep in order to facilitate the knowledge of the difeafes of the human body, and to give clear and dillinct ideas of them; fin: it is equally important, to be able to diftinguilh difeafes, as to point out how they flould be trcated.

All nofological writers have not, however, confructed their fytems on fimilar principles; and their efforts have been often fruftrated by the falfe theories and hypethefes with which they have fet out.

The world is indebted to the ingenious and celebrated Bichat, for the firt truly philofophical view of the ftructure of the human body. The fimple divifion of it into its component parts, which that great anatomilt and philofopher pointed out, mult be conficered as the groundwork of all future anatomical and pathological inquirics.

Bichât demonftrated, that molt of the organs of our body are made up of a variety of elementary parts or textures; each of which, in whatever part of the body it is found, uniformly has the fame fhyfical properties, ard prefent the fame morbid phenomena. Thefe he confiders as the elementary parts; which, by the diverfily of their combinations, produce all the modifications of fructure and functions exhibited in the different organs of animals. This method of confidering organized bodies, accords with evciy planomenon with which we are acquainted, and fecms to arife from the efiential nature of their conftitution. We may trace this sicw of the fhucture of the body in the obfervations of many of the older anatomints; and particularly it may be confidered as the bans of fome of the moft ingenious philotophical. theories of the late ingenious MIr John Hunter.
$\mathrm{I}_{\mathrm{i}}$ order to fix the charalers of the elementary iextares, Bichat cmployed various modes of inquiry. He performed rumerous experiments on living animuls ; perfevered in tedions and minute diffections; employed cliemical reagents to fapply the place of the knite; and examined with minutenefs all the varieties of morbid nlucture. Having by thefe means accomplithed his cojeet in tracing the charater of each feparate toviare, he procecced rest to invefigate their comitinations as they are found in the different organs.
The effects of this mode of inveftigating the fructure of the buman body when difeafed, mutt te at once cbvious. We lean from it, that difeafes at thecir commercement are generally cerfined to one texture of an organ; the othe: textures of which tiee organ is compofed remaining found.

There is no organ of the body from which this im. portant truth may not be deduced. It may be readily illuntrated from confidering the difeafes of the mucous, ferous and nufcular textures, which compofe the flomach and alimentary canal; of the cellular texture of the lungs; of the maccus membrane of the brorchi, the ferous one of the pleura, and many others.

Put difeafes are not only confined to ore indivicual. texture of ary organ, as in the cafcs jut meati ned; the fymptoms and morbid chenges are likewife uniformly the fame in texiures of a Gmilar thucture, in whatcer.
parts.

## $S \quad U \quad R \quad G \quad R \quad Y$.

 parts of the body thefe textures may happen to be found. Thus the ferous membranes which invelt the lungs, the brain, the heart, the abdominal vifcera, have one common character when affected with any fpecific difeafe: fo alfo have the mucous membranes, whether we trace them in the mouth, the nofe, the vagina, the urethra, or covering the eye-ball; and the fame may be obferved of every individual texture which enters into the compofition of our bodies.Befides the fymptoms and morbid changes which are common to all textures whofe fructure is fimilar in the natural ftate, there arc others which are determined from the particular functions of the organ in which the difeafed iexture exitts. For example, when any of the ferous membranes are inflamed, the nature of the pain, the degree of fever, and the duration of the fymptoms, are the fame, in whichloever one it may have taken place. But to thefe fymptoms are added, cough, difficulty of breathing, \&c. when it happens to be connected with the organs of refpiration, as in the cafe of pleuritis; coflivenefs, Atrangury, delirium, lofs of vifion, when the inteltines, the bladder, the brain, or the eye, are involved in the difeafe.

This view of the fubject naturally fuggells a correfpondent divifion of the fymptoms. The firlt clafs are general, and characterife a whole genus of textures; the fecond are in a manner accefiory, and depend upon the relative fituation or the particular functions of the organ into the compofition of which the affected texture enters.
But here we muft fet bounds to this theory; -the hiflory and progrefs of difeales flew, that we ought not to confine our obfervations within fuch narrow limits. The principles which have been fated, indeed, account admirably well for the propagation of fome affections; and for fome of the fympathies which fubfif between different parts of the body; but there are other diforders which advance in a very dificent manrier. In fome difeales which are termed chronic, for example, the whole frtucture of an organ becomes gradually altered, althoug! the primary affection was confined to one of its component textures. This is often to be obferved in cancer, ferofula, lues venerea, \&zc. When cancer attacks the mamina, it is at its commencenment generally confined to a frall portion of that gland : but if allowed to proceed, it ultimately involves the whole gland, and the adjacent cellular and cutancous testures, in one mals of difeafe.

Thefe general obfervations will be fufficient to give an outline of the principics of a pathological fyftem, foundect on the hafis of anatomical knowledge; and in giving an account of thefe difafes which more properly belong in a fyflem of furgery, wc have ventured to apply the e principles. Whe thall, in the firf place, therefore. ronfider the difeares of the cellular membranc; the difenfes of the flim: of the mucous, ferous, and finovial membrines: of bone and cartilage; of the valcular and newans fiftems; and of the glands. In thic fecont plac:- ve thatl treat of difenfes which occur only in particular argans, whether from the peculiarity of thatr fructure or funtions: fuch are the difeafes of the cyes, ear. . 1.nim, tectir. mouth, and fuces, and the crgans of ur: - unve or ions. In the thind phace, we llall take sotice of milcomfurnations, dillortions, and protru-
fons; and in the lat place; of wounds, fractures, ditlo. cations, and fuch operations as are occalionally neceffary to be performed on different pats of the body, as ampution, futurcs, \&c.

## Chaf. I.

## Of the Difeafes of the Cellular Membrane.

## Sect. I. General Remarks on the Patlology of the Cellular Membrane.

The cellular membrane is ditinguifhed from other organs, by the power which it has of throwing out granulations, by its being capable of elongation, of reproduction, and of growth when it has been divided or cut by any means ${ }^{*}$.
Suppuration alfo takes place in the cellular membrane, with a rapidity of which we have few examples in other textures. The fluid which is the refult of this fuppuration, is well known. Its colour, its confiftence, and all its external qualitics, have become the criterion by which we form our ideas of pus; in confequence of which, all difcharges which do not refemble it, have been commonly confidered as pus of a bad kind, or as fanies. This opinion, however, is falfe; and has been formed in confequence of a too fuperficial view of the different circumilances attending different kinds of dilcharged fluids. Certainly the pus which is difcharged from a bone, from a mufcle, from the fkin in eryfipelas, from the mucous membranes in catarrh, is of a good kind whenever the inflammation uns through regularly its different periods, and notwithfanding it is quite different in all thefe cafes from the pus produced by fuppuration of the cellular membrane. As the latter is mof frequently obferved, from it we have formed an idea of Iatdable pus, andi of fanies. The cutancons pus, the inucous pus, the offeous pus, \&c. have all their proper fanies; which differ from one another as much as the natural itructure and functions of the organs froms which they are produced.

There are few parts of the body which have a greater munber of exhalents than the cellular membrane ; and this expofes it to a number of alterations of flructure, fuch as being preternaturally diftended by the different fubfances which it exhales; thefe prefenting a folid appearance, and fonctimes producing a lardy fub. flance, fometimes a gelatinous matter, and fometimes a much firmer and harder mafs. The numerous abforbent veffels which are alfo diffributed on the cellular mombrane, is another caufe of various difeafes; every fmall coll being a rcfervoir common to the exhalents which terminate in it, and to the abforbents which arife from it,

There arc fome difeafes, too, which produce a change in the clatlicity and powers of diftenlion, which the cellular membrane naturally poifelfes. In health it lans enormous powers of diftenfion, as may he obferved in emply foma and in anafarca; and whenever thefe caufes are remored, it regains its matural bulk and form. In inflamnations, this property is in part deliroved, and it happens alfo in many of the different indurations to which it is liable. Its claflicity is alfo Icfs remalkable in people adranced in life, than in children. When an old man becomes rapidly thin, the fisin becomes flacid, and
of the 'a-formed into many folds; but when a young man is emathology of the Cellular Membrane. ciated, the fkin is applied exactly to the fubjacent organ, and preforves its tenfion.

The cellular membrane, when difeafed, becomes fometimes extremely fentible, and the feat of acute pain, though it feems to poflefs no fenfibility in its natural ftate. When cither blood, milk, or lymph, are effufed in it, its lenfibility is not altered, and thefe fluids are abforbed. On the contrary, the fenfibility is fo much altered by the contact of urine, of bile, of faliva, and of the other fluids deftined to be thrown out of the body, that oficn the inflammation which fucceeds the eftufion prevents their ablorption.

As the cellular membrane enters into the compofition of every organ, it is often difficult to dittinguifh in difeafes what belongs to it from what is the attibute of the parts with which it is found. Thefe connections, however, become manifeßt under feveral circumftances : in acute and chronic difeafes it is very fufceptible of being influenced by the difeafe of the organs. We do not fpeak herc of the alterations produced from juxtapofition and continuity, but of thofe which arife in parts of the cellular membrane which have no known connection with the affected organ.

In acute difeafes which affect a particular organ, as the lungs, ftomach, inteflines, \&c. of ten the cellular membrane becomes fympathetically affected and the feat of inflammation and abfocfes, \&c. The greater number of critical abfecfics arife from this connection which exifts between the orgas affected and the cellular membrane. In acute difeafes too it is commonly the function of exhalation or abforption of the cellular membrane that is :ffected, and hence the fudden oelema which often accompanies them. In chronic difeafes their influence is no lefs remarkable. It is well known, that in chronic difeafes of the heart, of the lungs, of the liver, of the flomach, kidneys, uterus, \&ec. they have for their fymptom during their laft flages an anafarca, more or lefs general, which arifes from a debility produced in the cellular fyftem.

We obferve, that in all acute difeafes, the finin receives with great facility the fympathetic intluence of the difeafed organ, and that it is alternately moint and dry frequently during the fame day. It is by no means improbable that the cellular membrane undergoes alterations analogous to thofe of the $\mathbb{R}_{2}$ in ; and if we could obferve what paffes in it, we would difcover the cells more or lefs moift, more or lefs dry, according as it happened to be influenced: it is alfo to this that we ought to attribute the difierent fate of the cellular membrane, in patients who have died of acute difeafes; thefe prefenting numberlefs varieties in the ferous effufions.

The cel'ular fyftem is not only influenced by its fympathy with other crgans; but it alfo exercifes a fympathy orer them. In a phlegmon or inflanmation of the cellular membrane, if the tumour is confiderable, often rarious alterations take place in the functions of the brain, of the heart, of the liver, or of the fomach. The fympathetic vomiting. \&c. are thore phenomena in great phlegmons which are often manifefled without being confidered as belonging to the difea?.e.

Art avails :tfelf of the influence of the cellular fyltem being affected by other"organs, in the whe of fions. Often in the dileafes of the cye and of joints
a feton produces an effect which cannot be obtained by of the $1^{1 \text { sat }}$ ta blifter; and this probably arifes from the connedticin thulog of which exifts between the cellular membrane and the the Collular eye, being more adive than that which exilts between $\underbrace{\text { mente. }}$ that organ and the fkin *.

It ought alfo to be iemarked, in confidering the pa. Anutomie thology of the cellular fyllem, that where is a marafert " fritio. difference in the properties of the cellular texture, which e, par is compofed of layers and filaments; and in that finund exterior to the different mucous furfaces, to the bliondveffels and excretories, which confifts of filaments alone. From this diference refults the rate occurrence of inflammations and of different kinds of tumors in the latter. It often forms a barrier where the morbid affic. tion of the former flops, and thus protedis the organ which it envelopes.

The unfrequency of hemorrhagy when extelivive fuppurations have laid bare large arterics is a proof of what has been faid. We have feen cafes where the cellular membrane contiguous to the brachial and femoral arteries has been completely ulcerated, whilf the cuats of the arteries remained found. We have obferved the fame phenomenon in the urethra and in the intellines. In cafes of fuppuration of the proflate gland and cavernous bodies of the urethra, the canal has remained untouched; and in a cafe of femoral hornia, where the hernial fac, and the cellular membrane covering it, all mortified, the protruded gut remained quite found.

The cellular mombrane has alfo a powerful influence. in the production of a variely of tumors and excrefcences, forming as it were their bafe or parenchyma of rutrition. Encyfled tumons are met with alone in the cellular texture of diffierent parts of the body, and various kinds of fulid tumors and cxcrefcences are formed by the growth of that texture on the pasi, where the tumor is to be developed; afterwards different fubfances are depofited amonght it, the diffcrence in the nature of which conRitutcs the difference in the tumors.

Thefe remarks will be fufficient to give a general view of the pathology of the cellular membrane, and will cnable us to form a more comprelienfive and connected view of thofe difeafes, which may be more propcriy confidered as coming within the province of furgery.

The difeafes of the cellular membrane which we flall treat of in this chapter are, 1. Inflamnation of the cellular membrane, or phlegmon. 2. Panaris or whitloe. 3. Sinufes. 4. Carbuncic. 5. Encyfted tumors. 6. Steatom. 7. Sarcoma. 8. (Edema. And, ว. Enphyfema.

## Sict. II. Of Phlegnoon.

In mof accounts which furgical authors have given of infammation, they have taken the de'cription if is general plenomena from inflammation of the cedular membranc.

Inflammation of the celiular membrane, or phlegmon, is chara Qcrized by a tumor more or le's clevated and circumfcribed, wifible or not vifible, according to the part where it is fituatcd. It is alw: ys accompa:ied with an incteafed fenfibili!y of the part, and with a lancinating or beating pain, a degree of lieat, greater than natural, a bright rednelf, w:ith , becomes nume livid as the difeafe advances, an elevated point; ard it stadual-

Iy turns fofier from the center to one part of the circumference.

Thefe are the fymptoms which are generally to be oblerved more or lefs remarkable in every lipecies of phlegmon. When they are ilight, and when the affected part is not extenfive, or very important from the nature of its functions, it generally has not much influence on the general fyftem. But when they are more confiderable, and the inflammation extends far, the pulfe becomes commonly full, frequent, and hard; at the fame time, the patient complains of univerfal heat, thirf, and other febrile fymptoms.
When by the cfforts of nature, or by the application of proper remedies, the pain, the heat, and the tenfion go away, the other fymptoms, which depend in a great degree or altogether on the fint which have been mentioned, difappear alfo, and the patient quickly recovers his health. This termination, which is commonly the the moof defirable, is cailed refolution.
But if, notwithftanding the remedies ufed, the different fymptoms augment inftead of diminifhing, the tumor gradually increafes in fize and turns foft. A fmall eminence is obfersed towards the centre of the tumor or at fome particular point, and its furface becomes polinhed. Soon afterwards the pain diminiftes, and the febrile fymptoms abate ; and on comprefling the turnor, the fluctuation of a fluid can be perceived in it, and this conftitutes the fecond termination of a phlegmon, or aiffefs.
Of the treatnent of Phlegmon.--The principal object which is to be gencrally kept in view in the treatment of inflammatory tumors, is to cbtain their refolution ; this being the moft prompt and moft certin mode of cure. There are, however, fome cales which are an exception to this general rule; fuch as fome inflammatory tumors which precede fevers, and other internal difeafes: for it is commonly fuppofed that in thefe cafes, fuppuration is a mode by which nature throws off certain fluids or humours, which are pernicious to remain in the fyftem. 'There are other tumors which feem to arife from internal caufes, where it is perhaps better neither to altempt to accelerate their fupparation nor refolution, but to truft them entirely to mature. Such are inflematory tumors which occur in ferofulous fubjects. There are few cafes of this kind where fuppuration ought to be promoted, for their treatment is always embarrafling whether they are opened naturally or by art. It is well known loo, that fuch tumors often remain a long time without any danger; from whence we may conclude, that it is mof prudent not to touch them.

In the venereal difeafe, we have a fpecific for its cure; and when buboes are opened, or other inflammatory venercal fwellings, they generally become very dificult and embariafing to treat. It is therefore always moft prudent to attempt their refolation.

The principal means to be employed, in order to procure the refolution of an inflammatory tumor, are local and general blood-letting, the application of heat and moifure, \&ec. Leeches is per haps the befl mode of bleeding the iuflomed part; but flould the inflommation twhe place in any of the cextremities, or contiguous to suly of the large veins, olle or other of thefe may be opened. 'Hiece is ro applitation which tends fo much to remsure the tenfion and pain of an inflamed part as
the ufe of poultices or warm fomentations. Applications of a fedative nature are recommended by many, fuch as the different preparations of lead, the fulphate of zinc, vinegar, \&ic.; but as far as we have been able to obferve, the ufe of this clafs of medicines has by noo means fuch powerful effects as emollients, though it has been generally fuppofed that emollients haflen fuppuration. In applying poultices, they fhould generally be removed three or four times in twenty-four hours, and the part bathed with warm water each time the poultice is changed. When fomentations are to be ufed, many employ waim water alone, whillt others prefer a decoction of chamomile flowers, or of poppy heads. A piece of flannel of confiderable fize, wet with either of thefe in nearly the boiling heat, is to be forcibly wrung out, and applied as warm as the patient can fuffer it, to the inflamed part. A fecond piece of flamel is to be prepared in the fame manner, and whencerer that which is firt applied begins to cool, the fecond piece is to be employed; and this practice is to be continued for ten or fifteen minutes, and repeated as often as it is fo:md to relieve the patient. The beft mode of applying the $f=$ dative remedies in extornal inflammation, is in the form of watery folution. Half an ounce of the acetate of lead diffolved in four ounces of vinegar, with the adjition of two pounds of difilled water, is a convenient form. In making ufe of this folution, it is of confequence to have the parts affected kept confantly noint, and cataplafins prepared with it generally anfiser that intention exccedingly well. But when the inflamed part is fo tender and painful, as not eafily to bcar the weight of a poultice, pieces of foft linen, moittened with the folution thould be employed. Both flould be applied cold, or at leall with no greater warmelh than is merely necoffary for preventing pain or uneafine?s to the patient. 'ibey frould be kept conflanily at the part, and always renewed befure turning dry and fiff.

When the part affected nith inflammation is not very tender, or lies deep, applications of vinegar are often had recourfe to with coiffiderable advantage; and the moft effectual form in thing it, is in that of cataplafm, made with the Arongent vinegar and crumb of bread. In fuch cafes, the alternate ufe of this remody, with the faturnine folution, las produced more beneficial (ffects than are commonly olferved from a continued courfe of any one of them.

In all cafes of inflammation, the whole body, but, more efpecially the difeafed part, flould be preferved as free as pofible from every kind of motion, and the patient flould be confined to a low cooling diet, and allo a total abflinence from firituous and fermented liquors.

In flight cafes of inflammation, a due perfeverance in the mode of treatment which has been mentioned, will be in general fufficient to accomplifh the intended purpofes; but when there is likewife a full, hard, and quick pulf, with other fymptoms of fever, general blood-letting becomes neceflary; and the quantity of blood taken away is always to be determincd by the extent and violence of the difeafe, and by the age and frengtis of the patient. Evacuations, however, flould never be carried to a greater height than what is merely necesfary for moderating the febrile fymptoms; for flould fuppuration take place after the fyflem is too much reduced, its progrefs becomes more flow and uncertain;
of nor is the patient able to fupport the difcharge that enPhlegmon. fues. The ufe of gentle laxatives, with a cooling diet, is alfo attended with very good effects.

Befides thefe different evacuations, it is of great confequence to procure eafe and quietnefs to the patient. The moft effectual remedy for this purpofe is opium, and, when the pain and irritation are confiderable, as in extenfive inflammations very frequently happens, it ftould never be omitted. In all fuch cafes, the opium thould be given in full dofes, otherwife, inttead of proving ferviceable, it feems rather to have the contrary effeet, a circumitance which is perbaps the chief reaion for opiates having been by fome very unjufly condemined in every cafe of inflammation.

By a proper attention to the fe different circumftances, $n$ refolution of the tumor will generally begin to take place in the courfe of three or four days, and fometimes in a florter time; at leaft before the end of that period, it may be for the moft part known how the diforder is to terminate. If the heat, pain, and rednefs, and other attendant circumfances abate, and efpecially if the tumor begins to decreafe, it is probable that, by a continuance of the fame plan, a total refolution will be finally effected.

But, on the contrary, if all the different fymptoms sather increafe, and efpecially if the tumor turns larger, and fomewhat foft, with an increafe of throbbing pain, we may with tolerable certainty conclude that fuppuration will take place; and we fhould therefore immediately defift from fuch applications as were judged proper while a cure was thought practicable by refolution, and! endeavour to affift nature as much as poffible in the formation of pus, or what is called the maturation of the tumor. To effeet this, nothing is more ufeful than warm fomentations and cataplafms; and fhould thele not have been employed during the former ftage, the cold faturnine applications fhould be given up, and recourfe had to the emollient remedies.

Dry cupping, as it is termed, viz. ufing the cupping glafles without the fcarificator, applied as near as poflible to the part affected, is frequently had recourfe to in promoting the fuppuration of tumors. It is only, however, in thofe in which there feems to be a deficiency of inflammation, that it can ever be either neceffary or ufeful ; but in all tumors of an indolent nature, and where there is ftill fome probability of a fuppuration, no remedy is more effectual. By thefe different applications, continued for a longer or fhorter time, according to the fize of the tumor, its fituation and other circumfances, a complete fuppuration may generally be at laft expected.

Whillt an abfcefs is forming, it extends accoording as the quantity of purulent matter is augmented in the cavity in which it is contained; and this extenfion takes place towards that fide where there is leaft refiftance. It is on this account that where an abfcefs is deep, or covered by an aponeurofis, it e.:tends in the intertices of the neighbouring parts, and diffects, as it were, the tendons, the mufcles, and the bones, whilf in common cafes it makes its way towards the fkin. When matter is collected very near to the furface of the body, and is only covered by the common inieguments, it foecdily makes its way externally; but when it is deep, and furrounded by parts which make great refiftance, purslent matter infinuates itfelf until it arrives at lome Voc. XX. Part I.
place where there is nothing to oppofe its exit ; and it is obferved making its efcape after having made, in fome cafes, a very great circuit. It is generally towards the inferior parts of the body that purulent matter, in confequence of its weight, makes its route. On this account we fee large ablcefles open themfelves moft frequently at tleir inferior part, and from thence the advantage which is found by waiting till they open of themfelves, or that they indcate the place moit convenient for the opening to be made. Thus, we iee abfeefles formed under the temporal mufcles open themflyes in the mouth, and thofe of the loins making their appearance near the ring, or upons the anterior part of the thigh. Deep abfeffies, in certain parts of the bady, proceed rather towards the interior than towards the furface, becaufe the purulent matter finds lefs obftruction in its paffage. Thofe, for example, which form on the furface of the lungs, find great refillance from the ribs and other patts forming the thorax, whilt they eafily make their way through the fpongy fubftance of the lungs, and open in the ramifications of the bronchix. For the fame reafon, abfcelics formed in the cavity of the abdomen fometimes difcharge themfelves into the fomach or inteftines; but as the parietes of the belly yield more eafily than thofe of the cheft, we alfo fee abiceffes of the different organs contained in the belly, difcharge their contents through its parietes.

When matter is fully formed in a tumor, a remiffion of all the fymptoms takes place. The throbbing pain, which before was frequent, now goes off, and the patient complains of a more dull, heavy, and conftant pain. The tumor points at fome particular part, generally near to its middle, where, if the matter be not deep feated, a whitifh yellow appearance is obferved, inftead of the deep red that formerly took place; and a fluctuation of the fluid underneath is, upon preflure, very evidently perceived. Sometimes, indeed, when the abfcefs is thick, and covered with mufcle and other parts, though from concurring circumftances there can be little doubt of there being a vely confiderable collection of matter, yet the fluctuation cannot be readily diftinguifhed. It does not, however, often happen that matter is fo very deeply lodged as not to be difcovered on proper examination.

This, however, is a circumftance of the greateft cor:fequence in pratice, and deferves more attention than is commonly paid to it. In no part of the furgeon's ployment is experience in fimilar cafes of greatcr ufe to him than in the prefent; and however fimple it may appear, yet nothing more readily diftinguithes a man of extenfive obfervation than his being able cafily to detect deep-feated collections of matter; whinf nothing, on the contrary, fo materially affects the character of the furgeon as his having, in fuch cafes, given an inaccurate or unjuft prognofis.

In addition to the feveral local fymptoms of the prefence of pus already enumerated, may be mentioned the frequent fluiverings to which patients are liable on its firft formation. Thefe, however, feldom cccur fo as to be eafily diftinguithed, unlefs the collection is confiderable; but it is a fymptom conflantly obferved in all large abfeefles; and when it takes place, along with other fymptoms of fuppuration, it always contributes to point out the true nature of the difeafe.

Of the opening of $A b f c e f f e s$. - When abfeefies come to 12 complete
complete maturity, tie integuments gradually become thaner over the more prominent part of the tumor ; and they become ulcerated in one or more points through which the pus is evacuated. In many cafes it is advifable to wait for the fpontaneous rupture ; but, on the otber'hand, it is often more prudent, and is indeed ablolutely neceffary, ro give vent to the matter by an antificial opening. It is a general rule not to have recourfe to fuch means before fuppuration is completely formed; for if an abfeefs be opened before this period, and a confiderable hatdnefs remain around, the treatment afterwards becomes very embarrafing and difficult. It is, however, neceflary in fome cafes to depart from this general rule, and to open an abfeefs much fooner. Above all, thofe which are critical, and thofe which are the confequence of lingering fevers.

In many cafes there is neither fafety nor convenience to be expected from the fpontaneous opening of the inieguments. In abfceffes fituated in any of the joints, or upon either of the cavities of the brealt or abdumen, and more efpecially when they feem to run deep, they fhonld always be opened as foon as the leaf fluctuation of matter can be difcovered; for when the refiftance is on either fide cqual, it julf as readily points inwardly towards the cavity, as outwardly towards the flin ; and the confequence of a large abfcefs burfing into either of the large cavities, mof frequently proves fatal.

Abfceffes are fometimes formed about the face, which point externally, and thefe frould be opened in the infide of the mouth, in order to prevent any deformity. Whenever the fuctuation is fentible, this flould be immediately done. They cicatrife very rapidly, and require no dreffings.

Abfeelies confined under an aponeurofis, and in general under thofe parts which are not capable of being estended without much difficulty, ought to be opened carly. Such are abicentes which are formed under the temporal mufcles or fafcia lata of the thigh, or thofe which frequently happen in the extremity of the fingers, under the arch of the palate, found the maxillary bones, behind the ear, above the maftoid procefies, \&c. All thefe ought to be opened very fpeedily, and in particular thofe laft mentioned, on account of the danger of a cazies of the bone in which they lie being produced.

It is alfo particularly neceflary to open without delay abfceffes in the neighbourhood of the anus, or near the urethra. This ouglit alfo to be done in large abfeffes of the extremities, and in particular thofe which are the confequence of violent inflammation, occupying the whole member, as the thigh, the arm, \&\&c. If in fuch cafes the matter be allowed to remain too long, the greater part of the cellular membeane is detached from the fubjacerit aponeurofis, and there often follow large gangrenous floughs, which in feparating themfelves lay opert extenfive furfaces, and often form large bags of pus, which become as many feparatc abfeeffes; and ofien the diforder is fiuch that the whole of the integuments of the member fphacelate and $\mathrm{f}_{\mathrm{al}} 11$ off. It is alfo neceflary not to delay the opening of abfeeffes formed among the large mufclos, the interfices of which are filled up with cellular texture; fuch are thofe of the thigh, the back leg, and under the arm-pit. In thefefituations the matter is very apt to fpreat, and to forin ramifications of the abfeefs in various dircetions, which, if not treated with much care, are very tedions to heal,

With the exception of thofe cales which bave bcen mentioned, it ought to be obferved as a general rule not to open an abfeche until fuppuration has completely formed ; for if it be true, as it is faid, that pus is always fufficiently prepared to be cvacuated, it is alfo the calt, that the more we favour its formation before giving it vent, the more we are fure of diminifhing and of reducing the hardnefles which exift in the neighbourhood, and facilitating the cicatrization of the ulcer.

## Of the different Methods of opening Abfaffes.

There are threc diffcrent modes of opening abfeeffes; viz. by caultic, incifion, or feton.

1. By Cauffic.- The ule of cauflic is recommended in cafes where fuppuration has been flow, and has not occupied the whole tumor ; in thofe where the integuments have fuffered much, and where it was necefliary to wait lorig before opening it, on account of fome afiection of the bottom of the ablcefs; and in general in all cafes of the fuppuration of glands.

But though there are circumfances which may render it neceffary to employ the cauttic rather than the incifion, yet the latter generally deferves the preference. The pain which it occafions lafts only a monient, whilft that of cauflic lafts many hours; and when the inflamed patt has acquired a morbid degree of lenfibility, the pain is very violent. The furgeon alio can never limit precifely the extent of the action of the caultic; and whatever attention be paid to it, it often extends too far, and pene. trates too deep.

To open an abfeefs with cauntic, an adhefive plater fpread on leather is to be applied over the tumor, with a flit in it of a fize fomewhat lefs than what is intended to be made in the fisin by the cauftic. The flit is to be filled with the cauflic reduced into powder, mised with a frall quantity of foap, and wetted, fo as to make it operate more quickly. Another adhefive plafter is then to be laid over it, and the whole fecured with a firm comprefs and bandage. The time neceflary to allow the cauftic to make a fufficient opening will depend on the thicknefs of the ikin and frength of the cauflic, but generally it requires two, three, or more hours. When the efchar is made, and the matter has not efcaped, we ought to aflift its exit with the end of a probe, or the point of a billoury; and the feparation of the efchar is to be promoted by emollient applications.
2. By the Incifion.-The tumors which are not very extenfive, may gencrally be opened by making a longitudinal incifion with the lancet, fee Plate DXIII. fig. 1. For this purpofe, whon the fituation of the abrcefs permits it, the durgeon is to apply one h:ind on the bafe of the tumor, and prefs the pus towards the $\{k i n$, by doing whicl there is no rifk of wounding any artery, or important part at the bottom of the tumor, and the lancet penetratesinto the cavity of the abfeefs with mure certainty and eafe, and with lefs pain. With the other hand an incifion of the integliments is to be made in fuch a direction, that it terminate at the moll deprending part of the tumor ; and fthould be made of fuch length as may appear neceffary, in order that the matter may be allowed frecly to effape. It is in gencral fuppofed fufficient, in cafcs of fmall abfeeffes, that the incifion extend wo thirds of the length of the tumor. Some authors have advifed, that when the integuments are much diffended, an incifion floould be made through the whote length of the tumor, even
where
or . where it is of a large fice; but this practice ought to be rarely adopted. The irritation and confequent inflammation, produced from fuch an operation, muft always be very confiderable; and as it fcarcely ever happens that the integuments are ever fo much extended as entirely to lofe their contrattile power, there is always reaton to hope that they will recover their natural dimenfions. In all very large abfeffes, it is the fafeft practice to make at firf a fmall incifion fuflicient to allow the contents to be dilcharged; for whenever this is done, the extent of the cavity rather diminifhes; and fhould it be found afterwards neceffary to make a more extenfive opening, this can now be done with much advantage. When an ablcefs has been opened by either of thefe methods, it is reduced to the ftate of a limple wound or ulcer, and ought to be treated accordingly.

The mode by incifion ought to be preferred to that of cauftic, when the matter is collected deep; when it is in the neighbourhood of important nerves or blood-veffels; when it is necefflny to make the opening large; when the Rsin which is to be opened has a natural appearance; and, above all, w1. en the ulcer is wifhed for to be healed rapidly up, and leave little defurmity.

Although lurgeons generally agree in preferring the incifion to the cauntic, it has neverthelefs its inconveniences. Whenever the incifion is made, the matter contained in the tumor is fuddenly evacuated; from whence it happens, when the collection is confiderable, that the patient faints, or has fome other difagreeable fymptoms; but the principal difadvantage of this method is, that it gives free accefs to the air over a large extent of the ulcerated furface; a circumftance which is followed by very pernicious effeets, particularly in large abfceffes. A total change takes place in the nature of the matter; a laudable pus is transformed into an ichorous indigetted fluid ; the pulfe becomes quick ; colliquative fiweats and other fymptoms of fever come on, and commonly the patient dies in a fhort time. Surgeons have too often occafion to oblerve the dangerous effects which probably are altogether produced by the admiffion of the air; for we fee a great number of patients have for a long time after a termination of inflammatory difeafes confiderable ablceffes, where the pus is perfectly formed, without fhewing at the fame time any fymptom of hectic fever. But when thefe abfceffes exceed a certain fize, and if a large incifion be made into them, there always follow fymptoms of fever, generally in forty-eight hours from tha time that the abicels had been opened. Thefe accidents, which we have frequently obferved in private practice, are ftill more frequent in grant hofpitals, where the air is im$t_{5}$ pregnated with putrid exhalations.
3. By the Seton.- From the obfervations which have been already made, it appears necefiary that as much precaution as poffible fhould be taken to prevent the conta\& of the air with the interrial furface of the ablcefs. The feton, therefore, has the advátitage, not only of being atcended with little pain, and emptying the abfcefs in a gradual inanner, hut it completcly prevents the accefs of the air. When patients are otherwife in good health, there is am. other advantage in empluying the feton; for frequently a cure is obtained at a period much florter than that which is ufually neceflary when the incifion has been adopted. On the other hand, if we have reafon to wifh to keep up for a long time a certain degree of irritation and fuppuration in the affected part, the feton
ought to be preferred to cerery other raeans. There have been various inftruments contrived for introducing the feton, and it may eafily be done by a lancet and common probe, or by the inttruments repreferted in Plate DXIII. fig. 15. and 16 . One of theefe being threaded with glovers fott filk or with cotton, fhould be introduced into the upper part of the tumer; but if the blunt one be employed, it wil! be neceflary to have the affiftance of the lancet. The inilrument is then to be brought out at the under part of the tumor, and the matter allowed to run gradually along the threads. The feton flould be changed forty eight hours after it has been intuduced, and as much of it ftould be pulled out at the under part as is fufticient to allow the removal of that which was hut up in the abfcefs. The abfeefs is to be dreffed in this manner every day as long as circumifances feem to require.

By means of the leton, we obtain a regular and flow difcharge of the matter contained in the abfeefs; the fides of the abfeefs are allowed to contract in a gradual manner ; the prefence and friction of the fetoi on the furfaces, excites a flight inflammation which contributes to unite them, and to complete an adhefion, much more readily than by any other method. In proportion as the difcharge diminifhes, the thicknefs of the fetou ought to be leffened; and this is eafily done by taking out fome of the threads of the cotton every two or three days. It ought to be entirely taken out when no more matter is difcharged than what would be produced by the irritation of the feton alone; and by compreffing gently the parts for fome days after it has been withdrawn, with a comprefs and bandage, we can in general depend upon a complete cure.

When feaking of the mode of introducing the feton, we recommended that this fhould be done from above downwards, becaufe, if the firl opening be made at the bafe of the tumor, a great quantity of matter immediately efeapes. Thus the boundaries of the ab. fcefs at the upper part become eflace!, and the pafage of the direftor along the ableefs is much more difficult than when the ablcefs is opened according to the manner we have pointed out. In that way the under part of the tumor is left completely diftended till the laft moments, and only a very fmall quantity of matter efcapes by the fuperior orifice. Another adramage is, that the part of the feton left for the future dreffings, is cafily kept clean and dry.

The method of opening abfceffes by the feton has been found particuarly uleful in fuppurations of the joints, and in all thofe glandular parts where the admiffion of the air is fullowed by very pernicious cffects. Thus, whin it is thought neceffary to open a ferofulous tumour, we may generally be able to obtain a more prompt and eafy cure from the ufe of the feton, than by making a larger incifion. Vencreal buboes, too, when come to maturity, have been faid to get well much founer by this than by any other method, when the integuments have not become too thin by great diftenfion long continued. On the other hand, this mode is not with. out its inconveniencies, for in adopting it we cannot be well antured of the fate of the boltom of the ableufs, which it is often imporiant to knou.

Whatever advaytages thefe different methods of open. ing abfecfies may poffefs over one another, yet there is not orit of them which deferves the preference in all cafes, a! thougla the caultic, as already mentioned, be the mearis

Of Sinurfes. to which we ought moft rarely to have recourfe. Howcver troublefome it may be, the action of the air on the interior furface of the alifeefs is not always equally pernicicus; and when by properly applied dreffings, care is taken not to allow purulent matter to form in any particular cavity, and to prevent the accefs of cold air on the furface of the wound, and above all when the furrounding air, as that in hofpitals, is contaminated with putrid exhalations, daily experience thews, that the method by incifion is accompanied with molt fuccefs. On the otlier band, we have feen the feton extremely ufeful in gradually difcharging, and without exciting murh inflammation, laige abfeffes.

Thefe are the general principles we have to obferve in the treatment of abfeffes, in whatever part of the body they are found. There are, however, fome modifications, fome parlicular details of prastice, which ought to be kept in view, when the difeafe is feated in particular organs, as the eyes, the manmor, the cavity of the cheft, the groin, the fcrotum, \&c. Mention will be made of thefe in giving an account of the difeafes of the particular organs.

## Sect. III. Of Sinufes (Fiftulæ).

When an abfcess, inftead of healing continues to difcharge purulent matter, and when this takes place through a imall orifice, it obtains the name of a fiflula. The orifice has fmooth and callous edges, and the fiftula commonly communicates with one or more cavities of different dimenfions, fituated in the cellular membrane, between the common integuments and the mufcles, or between the interfices of the mufcles themfelves,

Thefe different cavities, which are generally known by the name of finufes, ferve as refervoirs, both for the matter which is formed in the body of the ulcer, and for that furnifhed by their own fides. It is thus that when by compreflicn, the matter contained in the finufes is preffed out through the ulcers, thefe difcharge a much greater quantity than what might have been expected, by confidering the extent of their furface alone.

This defcription of a fiftulons ulcer indicates the moft fimple form of the difeafe ; but when it has lanted for a long time, the whole internal furface frequently becomes hard and callous, acquining the properties and fructure of a mucons furface.

The moft frequent caufe of the formation of finufes is, when an abfeefs burfts, that the purulent matter, inftead of being all difcharged, remains fhut up in fome part of the cavity. liemaining there, it raturally falls to the lower patt, and yradually infinuates itfelf among ahe layers of the cellular membrane, which, from its foftnefs, gives little refillance; it a lvances by degrecs among the intertices of the more folid organs, which are connected by that fubftance alone; and at laft it makes its appearance on the furface of the body, or penetrates into one of the cavities. Both recent and old finulous ulcers are generally curable, provided that the uleer be fituated in fuch a manner, that the neceflary remodies can be applied to i , and that the confitution be otherwife free from diforder. But when the difeafe has been of very long duration, and, above all, when the finufes open into any articulating cavity, or are placod in fuch a manner, that one cannot pragife any ope-
ration, the treatment then becomes extremely difficult, of sinules. and the cvent very doubtful. 'There is no difeafe which refiths more frequently all the effurts of art than certain fuccies of fifiula, and particularly fome of thofe about the anus and perinxum.
Of the tratment of Fifhlte.-There are feveral different modes which have been propofed for the treatment of this difeafe, all of which may be ufeful in particular calcs.

Injections, fuppofed to have a cicatrizing quality, By injechave been propofed by fome; and thefe are no doubt tion. ufeful in particular cales, in diminilhing the quantity of the difcharge, and in preventing the extent of the finus from increafing. When the difeafe is far advanced, and the edges become perfectly callous, injections of an efcharotic quality have been employed; but thefe remedies have leldom, if ever, produced any good effects; and their too frequent ufe has even rendered finufes hard and callous, which were of a more benign nature. Bycompref.
In fome cafes, particularly when the difeafe is recent, fion. great advantage may be derived from the proper application of a comprefs and bindage. -In applying thefe, the comprefs flould be placed in fucls a manner, and made of fuch a form, as to make a firm preflure from the bottom of the finus towards its orifice; and care flould be taken that no preflure be made towards the orifice itfelf, in order that any matter which is formed may not be allowed to collect, but be difcharged from it. Indeed in whatever mode we treat finufes, the object to be held in view, is to allow any matter which is formed to be immediately difcharged.

Some have advifed, that, in all filtulæ of long flanding, their cavities nould be laid open from one end to the other, and all the parts fhould be diffected out which have become hard, and thus to convert the whole into an ulcer, and treat it in the ordinary manner. There is no doubt, but that by fuch an operation, it will often be pofible to obtain a cure; but independent of the great pain, and of the large and difagreeable cicatrix which muft always follow, the practice is not without danger. It cannot anfwer, for inftance, in thofe fiftulas which extend far up the rectum. No practitioner furely would advife the adoption of fuch a method in the cale of fillulas which penetrate very deep, and extend, as often happens, underneath the blood-veffels, the tendons, and the nerves; and even although this practice was without danger, it ought to be adopted in no cafe, as we are enabled, by an operation more fimple, and much lefs painful, always to obtain a cure with as much ccrtainty, as by a total deffruction of the parts.

In the treatment of fiftulas, it is necefiary to procure by insifios an agglutination of the edges of the finufes, fo as to obliterate the cavity. The means mof efficacious to fulfil this indication are, to make firt an opening, fo as to allow the exit of the matter; and to excite a certain degree of inflammation on the interrial furface of the cavity, fo as to produce an adhefion between its fides.

Poth of thefe indications may, in fome cafes, be ful. filled in the moft convenient manner, by introducing into the orifice of the ulcer a feton which will follow the whole courfe of the finus as far as its oppofite extremity. The feton flould be of a fize proportioned to that of the finus; and it may be diminifhed by degrees as the cure advances, by taking away fome of the threads day after day. At laf, when the cavity of the finus is
orsinufue, nearly filled up, and conferquently the difcharge much - moderated, the feton ought to be withdraw:. Afterwards a bandage is to be firmly applied over the part, which frould be allowed to continue a convenient time, in order to obtain a complete cure. In all cales, therefore, we ought to difcover the direction of the finus, which can commonly be done by introducing a probe, or by obferving the place in which the matter colle? ${ }^{\text {s.s, when it has been allowed time to accumulate, }}$ and by marking the place from whence it comes, the preflure is to be made on the affected part. A feton ought then to be introduced into each finus.

Another means of procuring the obliteration of finufes is, by a longitudiaal incifion along the whole cavity. In cafes where the fittula extends to parts which it is not dangerous to cut, and where the feton has inconveniences which render it inadmiffible, we thould not hefitate to have recourfe to this means. Indeed, the longitudinal incifion of the finus is to be confidered in all cafes, as the only means which can be adopted with certainty in the cure of the difeafe; and though in many cafes it may be proper to attempt the cure by the milder means which have been mentioned, yel they often fail, and the mode by incifion ought always to be held in view.

We may obferve here, that this part of furgery owes much to the celebrated Mr Pott, he having rendered much more fimple and fucceffful the treatment of fifulas, particularly thofe fituated in the perinæum and anus. When a filtula is to be laid open, the firft thing to be done, is to determine the extent of the incifion. The exact extent of the finus hould be accurately afcertained with a probe, and it is nectifary to lay it open to the extreme point, in order completcly to fecure the filling up of the cavity. The operation may be performed by introducing a director (fig. 9. and 12.), along the whole courfe of the finus, and cutting on it with a common fcalpel (fig. 1.) ; or the tharp-pointed biftoury (fig. 4.) may be introduced along the groove of the director, the point of the infrument pufhed through at the bottom of the finus, and then, by withdrawing the director, the incifion may be fpqedily completed with the bifloury.

A ftill better method is one we have often adopted in cafes of finus with the greatelt advantage. It confints fimply in putting a finall bit of was, about the fize of a pin head, upon the end of a tharp. pointed billoury, introducing the point of the infrument thus defended along the finus; and when it arrives at the bottom of it, the point may be puhed through the ikin, and dif. place the was with very litule preflure. When the point has been brought througl the fikin, the incifion may afterwards be completed with one quick motion of the knife. In laying open finufes in this manner, it is particularly ncceflary to form an exact idea of the direction of the finus, and of the extent of the incifion to be made, before attempting to introduce the biftoury. For ' as a very flight degree of preffure is fufficient to difplace the was on its point, any untoward motion upon the fide of the abfcels would thus expofe the point of the infrument, and render the operation more tedious and difficult, and always more painful.
The principal advantages of this mode of laying open finufes are, that the operation can be much more freedily performed, and that it cofts much lefs pain to.
the patient. The introduction of the diredior through a fmall fiftulous opening, and the tedious procefs of cutting through the integuments with a jcalpel, cannot fail of creating much ditrefs, whereas a thin bifoury can be introduced without giving almoft any unealinels; and after the operator has conducted its point to the bottom of the finus, it may be puftied through the integuments, and the fimus cut open with a coup de mail.

All finufes frould be laid open in this manner, which can be detected by a careful examination with the probe; and if the edges of the fiftulous fore are found to have acquired a great degree of callefity, it is alfo fometimes advifeable to cut them entirely away.

The finufes are now to be dreffed by placing between the edges portions of caddis dipped in oil, or fimple ointment; and great care fhould be taken that no portion of newly divided parts be allowed to come into contact, as there will be great rifk of an adhefion taking place between them, thus fruftrating the very objects of the operation. After the pledgets have been introduced between the edges of the wound, it is commonly directed that the whole wound be covered up with a piece of linen fpread with ointment. In place of the ointment, we have generally found a poultice anfwer better. The poultice, by its moillure prevents any agglutination of the lips of the wound; and it has the power of diminifling the inflammation more than any other application. The wound is afterwards to be treated on the principle of the common ulcer *.

## Sect. IV. Of the Whitloe (Paronichia).

The whitloe is a painful inflammatory fivelling, oc cupying the extremities of the fingers, mof frequently at the root of the nails. Scveral varieties of the difeafe have been defcribed by authors; but thefe differences only confift in the depth the difeafe is fuppofed to have been feated. From what we have been able to obferve, it appears to be fituated chiefly in the cellular membrane immediately underneath the Ikin, and in the fructure connected with the nails; though at the fametime the pathology of this difea?e is not yet well underftood.

The firt fymptom of the whitloe is an uneafy burning fenfation over the point of the finger, or root of the nail. The part becomes tender and painful to the touch; and a flight degree of fwelling takes place, refembling oedena, attended by little difcolouration. A traniparent effufion takes place below the epidermis, and forms a vefication round the root of the nail. A purulent difcharge takes place round the edge of the nail, and the nail always foparates. The peculiarity in this difeafe is, that it generally affects feveral fingers, one after the other, and fometimes all the fingers of both hands.

In the more fevere forms of the difeafe, the inflammation extends to the cellular membrane underneath the fkin, and even to the tendiaous aponeurofis and periofteum of the fingers, producing caries. In fuch cafes the whole hand generally fwells, and the fivelling even extends up the arm and affects the axillary glands.

Whitloes fometimes fucceed a blow or injury of the finger; but they inoft ufually make their appearance without any known caufe.

Treatment.-In the treatment of whitioe, two fets of

Of the Carbuncle.
remedies have been employed. Some ufe fomentations, poultices, and leecles ; whillt others apply ardent fpirits, viregar, cold water, and aftringents.

Local bleeding and emollients do not feem to give the fame relief in this as in other fecies of inflammation. When, however, the inflammatory fymptoms and pain are violent, it is always neceffary to take away fome blood; and this may be beft cone at the bend of the arm. The affected part thould be afterwards immerfed in ftrong brandy, fpirit of wine, or alcohol or ftrong vinegar. We have alfo feen the inflammation much abated by immerfing the hand, on its firf commencement, in 2 very large veffel of cold water.

It is only, bowever, in the firf flages of this affection that remedies of this kind can prove ufeful: for, when effufion has actually taken place, and fuppuration begun, that flate of the difeafe is produced which thefe remedics were intended to prevent. Emollient remedies fhould now be employed; and whenever the prefence of a fluid can be afcertained, it fhould be difcharged with a lancet.

The wound is afterwards to be treated as a common abfcefs; but we may remark, that here, more than in any other part of the body, it is of the greatelt importance to lay open freely every finus, which a patient ufe of the probe can detect. Sinufes, fituated here, never heal ; and, when allowed to fpread, are always attended with mifchief. They deftroy ligaments and tendons, or at leaft produce a thickening of the parts around the jcints, fo as afterwards to interrupt their free motion.

## Sect. V. Of the Carbuncle.

The carbuncle (anthrax) may be confidered as a fpecies of phlegmon, attended with a remarkable degree of malignity, and is one of the fymptoms of the plague, where that difeafe rages, or of typhus fever in this country. It confifts in a deep-feated very hard freelling, attended with an intenfely painful fenfe of burning in the part, and confiderable difcelouration of the fkin.

The carbuncle is often fudden in its appearance. It is of a dufky red colour at its centre, but much paler and variegated at its circumfcrence. Vefications appear on its furface, and when thefe are ruptured they difcharge a darl--culoured fanies. The difeafe fometimes commences with fymptoms of general inflammation; but moft commonly it is attended with rigors, ficknefs, great seflefluefs and depreftion of Atrength, fainting, Jelinium, \&ec. A miliary eruption, or even petcchire, are alfo fometimes found difperfed in different paits of the body.

When fuppuration takes place, feveral openings qcnerally form in the Kkin, a thin ichorous fluid is difcharged, and a dar' yellow flough is obferved at the bottom of the fore.

The catbuncle noof frequently takes place about the back, neck, and thoulders, and is generally folitary. They are ufually two or three inches in diameter, though fometimes they acquire an enormous fize.

The cellular membrane and Rin feem to be the principal textures affected in this difeafe; a great part of the former is always deflroyed by the formation and feparation of very large floughs, and that of the latte: by the extenfive ulceration.

## I R Y.

In the treatnent of this difcare great attention is rec- OfErcy? ceffary, not only to the local applications, but alfo to the general remedies.
Emollient poultices, and warm anodyne fomentations, ought to be employed during the firn ftages of the difeafe; and when ulceration of the fk in has taken place, the application of an ointment, compofed of a confiderable quantity of the powder of opium, we have found to relieve very much the pain which the ulcerative procefs generally creates. The ufe of rags, wet with diluted nitrous acid, or a folution of lunar cauflic, has been found of gieat ufe in promoting the feparation of the nough, and the granulation of the cavities which remain.

When the conftitutional fymptoms are inflammatory in their commencement, it may be neceflary to employ general blood-letting; but the fever being commonly of a typhoid form, wine, bark, and opium, ought to be freely adminiftered. It will be alfo proper to prefribe a generous diet, and to pay great attention to keep the bowels regular.

## Sect. VI. Of Encyßed Tumors.

The word tumor has been the origin of mucla confu- Gencrat of fion in the arrangements of difeafes adopted by the moff fervations celebrated nofologits; they have employed it as a term ${ }^{0}$ to characterife a clafs, and alfo as expreffing merely a fymptom of difeafes. A valt variety of dilieales have been thus included under the clafs of tumors, difeafes which are totally diffimilar, and have no analogy whatever. Anafarca, bubo, encyfted tumors, ferofulous and fcirrhous tumors, warts, \& \& . have all been included under this clafs, thefe being as different from one another as any difeafe with which we are acquainted, having only one common fymptom, which is that of fwelling.
Mr Abernethy has lately made a very laudable attempt to arrange tumors from their anatomical Aructure ; but, like thofe who preceded him, he has claffed difeafes together, among which no analogy can be difcovered. He divides tumors into farcomatons, encytted, and offeous. Under the farcoma he includes the fteatom (adipofe farcoma), medullary farcoma, and others, all of which have no refemblance to each other in their hiftory or fymptoms.

The word tiemor ought therefore to be expunged from nofology, and be no longer employed to characterife a clafs of difeafes. Its uie mould be fynonymous with that of fwelling, and be confined to exprefs merely an enlargement of any organ of the body, or a new growth; whillt all thofe difeufes, which have beens formerly clafied among tumors, hould be arranged either according to their fipccific nature, or to the texture of the body in which they arife. Thus tumors, connected with lues vicherea or fcrof fula, flould be included under thefc general uames. The featom, being a growth of fat, and being always formed in the cellular membrane, ought to be treated of among the difeafes of that texture. Encyfted tumors, being alfo formed in the cellular membranc, ought to be arranged among its difeafes; and wats, cons, and other tumnors being difeafes of the flin, will be with propricty clafied among them: and the fame may he fad of all other difeafes which have ufually receired the general appellation of tumor.
ifencyited tumor. We hall, therefore, in this fection, treat of Tumors. thufe tumors only which are formed in the cellular membrane.

Under the clafs of encyited tumors (tumeurs enkylies, loups cyfides), are comprehended all thofe tumors of preternatural formation, the contents of which are furrounded by a bag or cylt.
Encyited
acyfted tumors are generally formed in the celluar guments, immediately underneath the common inteindolent, without heat or any change of colcur in the kin; and they are very flow in their formation and progrefs. They contain a matter more or lefs thick in confiftence; and, according to the nature and cunfiftence of this matter, they are diftinguinhed hy different names. They have been denominated atheroma, from the contents being of a foft cheefy confitterce; meliceris, when they contain a matter of the confitience of honey; and Rectoma, when formed of fat. The steatom, however, ought not to be claffed among the encylted tumors, as the thin cellular covering in which it is contained has no analogy in its ftructure to the $c y$. of the other tumors.

It ought to be obferved, that the confiftence of the matter contained within the cyft varies in every fpecies of encylted tumor. In the atheroma and moliceris they have fometimes the confiftence and firmnefs of new cheefe, and at other times they are fofter than the moft liquid honey. Thefe varieties depend on the length of time which the fluids have remained in the cylts, and in the proportion of coagulable lymph and ferum, which have been feparated and abforbed, and alfo from their having been inflamed or not, and on the extent to which this inflammation may have proceeded. Sometimes an encyfted tumor is compofed of different cyfts, each of which contains a fubftance of a different nature. Thefe different circumfances render in general the diagnofis in the varieties of encyfted tumors very difficult; and happily this diftinction is not neceffary in practice, and perkaps ought alfo to be omitted in our nofological arrangements. The fac of an encylted tumor is senerally pretty firm, and compofed of concentric lameliz. We have obferved fome of the cyfts which were nearly as firm as cartilage, having fmall chalky concretions formed in many parts between each layer. When the contents of the tumor are wathed out, the internal furface of the fac generally appears fmooth and polifted; but, in others, furne of the matter adheres firmly to the furface of the fac. In fome cafes the tumor very much refembles the hydatids found in the liver and other organs; for, befiles the firm fac, there is fometimes formed within it, and apparently having no adhefion with it, a thin and very cafly torn whitifi bag, which contains the fluid.

Encyfied tumors are very fmall at their commencement, and אrow by almolt infenfible degrees. They vary a good deal in their form and fize. Thofe which are formed in the hip, are generally round and fmooth; commonly of the fize of a but, and acquire rarely the bulk of a large egg. Thofe which are feated in other parts of the body are more irregularly formed, and fometimes become of a prodigious fize, fome having been found which weighed 10,15 , and even 20 lbs . They are never painful, at leal at their commencement, and the 隹in preferves, for a long time, its natural co-
lour; but when they become very large, the veins of GiEncyted the 0 fin are large, and become varicafe; and the fkin tumors. on their upper part becomes polilhed, and aequires a reddilh culour, fimilar to that of a part inflamed. 'Ihey feldom give pain or uneafinefs, except when they receive a blow. Intlammation and pain then eafily come on, and the cyit becomes ruptured, if it is not previounly opened by an infirument.

Such is the ufual progrefs of encyfted tumors; and although they do not come to a rapid termination, yet this fometimes happens more readily under certain circumftances, and even before they have acquired a large fize. In the hip, for example, we perceive the integuments become tender and very thin, and open betore the tumor has acquired any confiderable fize. But on other parts of the body, and particularly the back, fhoulders, and thighs, the integuments preferve their natural appearance, even when the tumor has acquired a large bulk. This appears to arife from the fkin being more loofe in the fe parts.

The fituation of encyfed tumors alfo contributes nuch. to determine the degree of adhefion which thog have contracted with the neighbouring parts. In fame fituations they are fo detached, efpecially while they continue fmall, that they readily alter their fituation by very flight degrees of preffure; but in others, particularly when covered by any mufcular fibre, they are more firmly fixed from their commencement. 'The attachment of encyfted tumors is alfo influenced by their remaining more or le§s free from inflammation; for they. never become inflamed, even in the flighteft manner, without fome degree of adhefion being produced bctween the cyfts and contiguous parts.

It has been generally fuppofed that the membranc Mode of ${ }^{2 \sigma}$ which forms the cyft of this fpecies of tumor is not a their formas new formation in this part, but that it is formed by a tion. collection of fluid in one of the cells of the cellular membrane, which by its increafe dilates the cell, and brings it in clofe contact with the adjacent cells fo as finally to oblitcrate them, and increafe the thicknefs of its own coats.

The ingenious Bichat * has fhown that this opinion fo * Vide generally adopicd is without foundation, and that the Avatomie formation of encylted tumors more probably depends on Gentiate. laws, analogous to thoie which regulate the growth of the different parts of our bodies. He has allo fnown that there is a great analogy between thefe cyits and the ferous membranes.
'The cyfts, like ferous membranes, form a fpecies of fac without an opening; they contain the fluid whicls they exhale, and they have a fmooth and polifned furface contiguous to the fuid, whilft the other furface is unequal, and connected with the adjacent cellular membrane.

The cyfts have a fimilar fructure to ferous mem. branes; maceration, \&\&c. proving them both to be compofed of a cellular texture. In the natural ftate neither of them have any fenfibility, but when intlamed they both become extremely fenfible. The cyfts alfo are evidently fecretory organs, exhaling the fluid with which they are filled, and their power of abforption is alfo very manifeft from the fpontancous cures of fome encyfted drop. fies.

Thefe confiderations led Bichat to conclude that there exifts a perfeet refemblance between the cyfts of

U: Lacyfed the encyfted tumors and the ferous membranes. An Tumors. important queftion here prefents itfelf, to know how thefe cyfts are formed, how a membrane which did not exift in the natural fiate can be produced, can grow, and even acquire a confiderable developement under certain circumflances? The mechanical explanation of thefe phenomena which has been alrcady mentioned, though it at firft fight may appear fimple and fatisfactory, yet it is by no means conformable to the ufual proceedings of nature. How does it happen that as the cyfts and ferous membranes are analogous, that thefe membranes are formed in a different manner, the ferous membranes being never formed from a comprefion of the cellular membrane? How is it, if the cells are applied and compacted with one another fo as to form a fac, that the neighbouring cellular membrane does not difappear, or even diminifh, whilt the fac acquires a large bulk? Thefe refections would lead us to believe with Bichatt, that the common manner of explaining the formation of cyfts is effentially different from the manner in which nature generally follows in all her operations.

Bichât ingeniounly remarks that all tumors which vegetate externally, or appear internally, are formed ard grow in the fame manner as the cyfts, there being no difference between thefe two morbid productions but in the form in which each of them appears. Mof tumors throw out upon their external furface the fluid which they feparate. The cyft, or the contrary, exhales that fluid from its internal furface, and preferves it in its cavity. "Suppofe a fungous tumor in fuppuration (fays Bichat), transformed in a moment into a cavity, and the fuppuration to be tranfported from the external furface to the fides of the cavity, that cavity will then become a cyff.-Reciprocally, fuppofe a fuperficial cyft, the cavity of which is obliterated, and of which the thuid is exhaled from its external furface, you will then have a tumor in fuppuration.
"If therefore the form alone eftablifhes the difference between tumors and cyfts, how does it happen that the formation of the latter is not analogous to that of the firft? or has ever any one attempted to attribute the formation of external or internal tumors to compreffion ? We ought therefore to conceive the production of cyfts in the following manner: they begin to beformed in the cellular membrane by laws analogous to thofe which regulate the general growth of our bodies, and which appear to be deviations of thefe fundamental laws of which we are ignorant. When the cyft is once formed, exhalation begins to take place, and though at firft in a fmall degree, it at laft augments in proportion to its progrcfs. The increafe of the exhalent organ then always precedes the accumulation of the exhaled fluid, in fuch a manner that the quantity of the fuppuration of a tumor is always directly in proportion
to its bulk *."

This mode of explaining the formation of cyfts appears much morc conformable to the laws of nature than that which has been formerly mentioned and gencrally received. But it fill remains to determine the precife mechanifm of the origin and growth of cyits, and confequently of alt other tumors. We ought to llop where the fird caules commence; and as we do not know the mechanifm of the natural growth of our organs, how ought we to guefs at that of morbid productions whicls depetid upon the fame
laws. It is a great deal in the economy of our organs Of Encynted to point out analogies, and to fhow the uniformity of a Tumurs. phenomenon not underfood with one in regard to which all the world agree. Much would be done for the benefit of fcience, if in all its branches we could demonftrate that principle on which depends fuch a great number of effects, that nature, avaricious in her means, is prodigal in her refults; that a few caufes prefide over a multitude of effects, and that the greater number of thofe regarding which we are uncertain, depend on the fame principles as many others which appear to us evident.

Of the treatment of Ency,fed Tumors.-Encyited tumors, though not dangerous, are often inconvenient from their fize, fituation, and from the deformity which they produce, fo that whenever their removal becomes neceffary, this can be done alone by a furgical operation.

If the tumor be of the thin or melieeris kind, which By the fefor the moft part will be the cafe when a diftinet fluc-ton. tuation is perceived in it, it ought to be treated as a common abfcefs. If the tumor be fmall, the matter may be difcharged by laying open the moft dependent pirt of it with a common lancet, and treating it in the ordinary way till the fides of the cavity come in contact by adhefion, or by the procefs of granulation. But when the tumor is more confiderable, the free admiffion of air into the interior of its cavity is always dangerous; and we ought to be attentive to prevent its effects by making the opening in fuch a manner, that the wound be expofed as little as poffible. When treating of abfeefles, we have recommended the paffing of a liton or cord through them, as the beft method of opening them when they are of a large fize. This method is alfo very convenient in the cafe of encyfted tumors, which contain a matter of a liquid confiftence. It will only be neceflary here to obferve, that the feton fhould traverfe the whole tumor, from the fuperior part of it to the moft depending point, and that the inferior opening fhould be fufficiently large for allowing the matter to be freely difcharged. This method often anfwers extremely well; and cures have been performed by it which could not have been obtained in fo fhort a time in following the ordinary method of treatment by incifion. But this method cannot be employed, except in thefe cafes in which the contents of the tumor are foliquid as to be eafily difcharged by a fmall opening. When it is of too firm a confiftence to admit of the feton, the co:ntents muft be emptied, either by making an extenfive opening into the cyif, or the cyft and its contents may be difiected out.

When an encyfted tumor adheres fo firmly to the contiguous parts, as to render its removal tedious and difficult, it is often better not to undertake the operstion. In fuch a cafe it will be fufficient to lay open the tumor its whole length, and to cut away any portions os. the cylt which can be eafily detached. The contents of the tumor will in this manmer be completely removed, and the cure will be effected, either by heeping the wound open till the cavity of the cyfl is filled with granulations; or it may be attempted by draving the divided edres of the fkin togcther, and applying minderate prefiure, fo as to produce adliefion within the fides of the cavity. It fometimes happens, howeser, that from the adhefion being complete, the remaining pur-

1 of tion of the cyff forms as it were the nueleus of a new tuEncyiteal Iumors.
29) mor.

Operation.-When it is determined upen to remove the cyit completely, the firft flep of the operation is to make a free incifion throngh the integuments covering the tunor with a common lcalpel *. If the tumor be not very large, a longitudiaal incifion will anfwer the purpofe; but flould the tumor be of fuch a fiec, that the whole integuments covering it are too large to lie neatly upon the wound, it is much better to remove an oval portion of them $t$. The fize of this portion muit be left entirely to the judgement of the operator, who fhould always take care that a futicient quantity is left, fo as completely to cover the wound. After the flin is divided, the eellular membrane fhould be diffected back, fo as diftinetly to expofe the furface of the fac; and as the fac will be generally found loofely attached to the adjacent parts, it may be eafily feparated by a very fimple diffection. In removing encyfled tumours, it is particularly neceffary to cut fairly down upon the fac; for if this be not done, inftesd of the tumor being readily turned out of the fheath of loofe cellular membrane which furrounds it, it can only be removed by a rery tedious procefs of diffection. Some furgeons have recommended that the contents of the tumor floould be removed, before attempting to difiect out the fac; but if the incifion of the interruments be made fulliciently large, this may be geserally avoided. Wre hare often oblerved the operation of extirpating encyfted tumors, and indeed tumors of every defeription, rendered extremely tedious by a want of proper attention to this flep of the operation. Wre would therefore particulatly recommend, that in the extirpation of all tumors, the incifion of the integuments extend both above and below the tumor a confiderable way, proportioned in all cafes to its bulk and caly accefs.

In fome cafes it is advifeable to open the cyf, and remove its contents, before an attempt be made to dilfeet it out. This practice will only be neecflary in cafes where, either from the flope or fituation of the tumor, it is in:practicable to gafs the knife round it, and where, from the fituation of important parts at its bafe, the diffection is rendered very nice and delicate. We remember a cafe of encyiled tumor elofely attached to the eapfule of the knee joint, where great affiltance was derived from operating in this manner. Whillt the tumor remained dillended, it was impolible to feparate it, without running great rifk of cutting, either into it, or into the eavity of the knee joint. When, however, its contents were removed, the tumors could be readily diffect. ed from one another, without the fmallent rifk of injury.

After an encyfted tumour is exirpated, if any artery bleed very profufely, it ought to be fecured by a ligature; but this fhould always be avoided as much as poffible, as ligatures are apt to interfere with the adhefon of the lips of the wound. At the fame time it is always neccfiary that the hleeding be completely flopped before the wound is dreffed; for fhould any hemorrhagy take place after the dreflings have been applied, it is very apt to difplace the edges of the wound, and prevent them from adliering by adhefio:1.

Pol. XX. Past 1.

## E R Y.

The edges of the wound are to be placed accurately logether, and kept in contact with ndluclive plafter, a comprefs and proper bandage being applied over it. The wound is to be treated in the ufual manner, removing the dreflings whenever they become foiled, and the applieation of the adtuefive plafter continued till a complete cicatrization has taken place.

## Sect. VII. Of the Steatom or Futty Tumor (B).

This fpecies of tumor confirts of a meere accumulation of cellular membrane and fat in a particular part of the body. They occur frequently, and are formed mont commonly on the front or back part of the trunk of the body, and fometimes in the extremities. They generally grow in a flow and progreffive manner, and the blood-veffels are neither large nor numerous. They have always a thin capfule of common cellular fubftance; and this capfule feems merely to be the effect of that condenfation of the furrounding cellular fub. flanee which the preflure of the tumor occafions. "As the growth of adipofe tumors is regularly and flowly progreflive, and as nothing like inflammation in general accompanies their: increafe, their capfules aford it ftriking inflance of an inveflent acquircd, fimply by a dlight condenfation of the furrounding ce!lular: fructure, unaffected by inflammation *." When the *A3ercapfule, which is extremely thin, and which adheres but netivy's flightly to the tumor, is removed, the tumor within con- Surgical filts of a mere piece of fat, more or lefs compacted ac- Obferzan-
 time which it has remained.

Of the treaimint of the Steatom.-When a fientom is fmall, when it caufes little deformity, and when it does not feem to injure the funcions of any organ, it is molt prudent to allow it to remain. They fometimes, horiever, aequire a very large bulk, and from their fituation are extremely ineonvenient and unfeemly, and they then become an obje ef of medical treatment. No external application was ever known to be uffeul in difcufling tumors of this kind; and the only means to be employed for removing them is by an operation. There is indeed no 兒ecies of tumors that can be diflected out with fo much celerity, or with fuch apparent dexterity. In fome cafes, however, if inflammation has been incluced, the capfules even of thefe tumors are thickened, and athere fo as not to be feparated without dificulty from their furface.

In difecting out a tumor of this lind, the fame general rules may be followed as we mentioned when treating of encylted tumors. The external incivion hould be made very free, and it is alfo of great importance to eut completely down to the capfule of the tumor, bcfore attempting to diffeet it out.

Sect. VIIL. Of the Sarcoma or Flefly Turior.
Our knowledge of the pathology of tumors of the cellular membrane is yet too limited to be abie to arrange them in any fyitematic form; and it would be foreign to our purpofe to atteript in this place the inF vefigation
(B) Steatoma, adipofe farcoma of Mr Abernethy.
vefiigution of the fubject. Wrc ha:e adopted the term farcoma as very general; and include under it all thole fiwellings of wens of a flethy feel, which occur in the ceilulat membrane thoughout the body.

The bafs of thefe tumore, as we beiore mentiuned, is the cellular membrane; and the difference in the qualitise of the fubltances depofted in the cells gives the pecuiliar appearatice to the tumor.

The velfels which pervade them are either larger or fmalier, and more or lefs numerous. They are alfo untributed in their ufual arborefeent manner, without any defcribeáule peculiarity of arrangement.
Then tumoss of this hind have attained a confiderzble fize, the fupc:ficiel veins appear remarhably large. They have litule ferflility, cnduring a rough examination.

This kind of tumor generally grows till the flin is fo ditiended that it u!cerates, and expofes the nesw formed fubitance, which floughs away. In this manner does the oifeate occ:fioually terminate; Lut fuch is the confitutional irritation attending this procefs, and the difguling feetor and frighful appearance of the pant, that the furgeon generally recommends its removal. In fome infances farcomatons tumors are compofed of a number of irregular-flayed maffes, which from their refomblance to the pancreas have been called by Mr Abencthy the pancrcatic farcoma, and confidered as a diftinct $\rho_{\text {peciec. "This ncw }}$ formed fabfance is made up of irregularly haped mafies, which in colour, texture, and fize, retemble the larger mafes compoling the fancreas. They appear alfo to be connceted to each other like the portion of tha: gland, by a fibrous fubfance of a loofer texture." Other farcomatous tumors are compofed of a number of cyits, comtaining fometimes a tranfparent and fometimes a dark rluad; and have been called Ly Mir Abemsthy, the cystic farcomns.
The Manmary and Tuberculated Sorcomas are alfo ot'er two lipecies enumerated by Mir Abemethy. In ihe fint the firucture of the tumer hars been fuppofed to refemble the natural truture of the mamma, and in the feund the tumor "comifits of an aggregation of franl, firm, roundifh tumoss of different fizer and celours, comected together ty a kind of cellular testure. The fize of the tubercie is from that of a pea to that of a horfe-bent, or fometines larger; the culour of a brownith red, and fome are of a yeliow tint (c)."

Thefe different terms employed to charade:ize the various kinds of fiveliings which form in the cellul.r membrane, are by no mears adequate; and lumons will be daily aret wih which it is imponible to affign to one or other of thefe feccic. ilhis fubjeit therefore ftiil tomenis open ior the invefiistation of futue ir qquiry. And it is probable, that when the felject is tetter mindenthood, the furgeon sill not on all uceafions be obli. ged to have xccourfe to the knife; and that he will be able to difinguift thofe which may be allowed to temain, or as harmlefs treated by cx'crnal npplications, from thofe whofe nature is more malignant, and reๆuire an early extirpation.

Trcatment. W'hen farcomatous turiors aie painful and tender to the touch, advantage may be had by 10 cal blood-lsting, either by leecises or cupping. Fomenting the parts with a decection of chamomale fluwers or poppy heals, and applying a folution of muriate of amt:onia or of vinegar, and acctate of lead, are alfo ulcful in diminilling their bulk. Frietions with unctuous fubitances, is mercmial ointruent and camphor; camporated fpirits, aqua anmonia and oil; tincture of cantharides-bave becn ufed for the difcufion of indolent fiwellings: Scap and mercurial platters have been alfo much comnended by fome; but of all thefe remedies pertaps there is rone more uieful than friction with the dry hand. The noode by which this practice is to be conducted is particularly mentioned unider Swocliugs of the Toint. While we employ thefe applications to the tumor, we ought alfo to prefcrite purgative medicines every fecond or thind day, enijuin an abAtemious diet and ref. An alterative courte of medicine is alfo fuppofed to be ufeful. Small do'es of calomel or corrofive fublimaie are given for this $\quad$ urpofe. The extract of hyofcyamus and calcmel, or calumel atrd the extract of cicuta, has been much extolled by fome.

Ey caufic.-Some furgeons (and it is a farourite practice with all itinerants) have attempted to remove tumors with cauntic; and though this mode is much more painful and more clumfy than the knife, yet there are fome cafts, where, either from the tumor leing fo fruated, or from the patient being timorcus, this practice may be reforted io.

Where a lumor is to be removed by cauftics, the common cauttic poiafs will anfwer the purpofe civirmely well. This is to be placed over a futticiert bulk of the fim, and allowed to remain lenger or flecter according to the depth of the tumor, and the portion of it intended to be removed. After the dead port:on has feparated ty the affiffance of poultices, Sic. the caultic may be again renewed until the whole mafs is dettrcyed. Equal parts of red precipitate and burnt alum forms a very active eatific, and is ufed by fome; but it creates great pain. By mixing opium with the caulics, the pain has been allcr iated.

By incifor:- Whei a fatcomatous tun:or is to te removed by incifion, the firgeon hould alwas kicep in remembrance, that whin the tun:or is growing, the contiguous cellular membiane is generally condented, ard is fomed into a hind of capfu'e. A knowledge of this not oniy renders the extirpation of the itmor much cafer, but tumoss may le cut out frem a depih, and from conncxions, apparently dangerous. '17e integuments are to be frecly divided, and the incilion carried down to the capfule if the tumer, before we attompt to dificet it from the contiguous parts; if this be not done, the difiection becomes more iddions and dificult, and more blood is loft than what was neseflary, frem reffels being divided which might bave lieen faved; and if the tumor happen to be decply featcd, its extirpation cren Lecomes impıacticable. The gercral dircections given for the extirpation and after treatment of cneyfed inmors may alfo be appiied to the farcematous thmore.

Sf.cT.
(c) Anotlace fuccica of fiererma has been termed the ofico farcoma, from bony matter being formed in the turnor.

## Slet. IX. Of Ocdema.

Oedema confits in the effurion of a watery fluid in the cellular membrane of any part of the body.

The fwelling in cedema is not circumferibed. 'The tkin of the fwollen part retains its nature! colour, and fonctimes becomes paler than natural, having a glofly lue. The part has a cold feeling ; and preflure made by the point of the funger forms an impreflion or dimple, which remains for fome time after the finger is 1 c moved, and difappears flowly. 'There is no acule pain, but there is an uneafinels or fenfe of weight and tightnel's in the part. If a limb be oedematous, the magnitude of the fwelling is always increafed or diminilhed, according as it is placed in a depending or horizontal polure. Oedema always arifes from the want of proper balance in the functions of the exhalent and abforbent fyflems, and it appears both in a constitutional and local form. 'Contulions, farains, the long ufe of relaxing poultices and walies, are often local caufes of cedema. More or lefs redema is conjoined with ersfipelatous inflammation, and this fometimes terminates in gangrene. A part which has been acutely inflamed ofien remains cedenatous for fome time afterwards. It is allo often owing to fome impedimen: which prevents the return of the blood to the heart. Preflure of the gravid utcrus on the jliac veins often renders the lower extremities ocdernatous. Aneurifms and other tumors, by comprefing the veins of the extremity, often produce this affection. It alfo accompanies cifries, luydrothornx, \&xc. \&c.

Treatment.-As an cedematous fwelling is generally the effect of fome other difeafe, the cure mut depend upon the original difeafe being removed.

If the limb be the part affected, it foould be kept in a horizontal pofition. Trictions made on the part with flannel, and a moderately tight roller, applied from the toes upwards, have a powerful effect in diminifling the fwelling. The operation of thefemeans is to be affited by giving purgatives and diaphoretics. See Medicine.

If the tumor become fo tenfe as to create much pain and inflammation of the fkin , thefe are better moderated by the difeharge of the fluid by means of a fmall puncture, than to allow the integuments to burft. A puncीure is, however, not void of danger, for wounds in dropfical conflitutions generally excite a great degree of inflammation, and are apt to hecome gangrenous. The puncture thould te made upon the moft prominent parts of the fwelling with the point of a lancet; and as the fluid which onzes out is apt to create great irritation of the tender fkin over which it flows, it is a proper and very ufeful precaution to keep the fkin always covered with fome unctuous adhefive fubflance. For this purpole the ungucntum refing fum is very well calculated.

Emphyfema confits in an effufion of air into the cellular membrane of any part of the body.

The fuclling is without pain, and colourle $e$; and it is eafly ditinguithed from oedema, by the noife and par. ticular feeling it has when preffed upon. It then makes a, ctackling noile, and relembles the feeling created by
preffing a dry thin bladder half filled with air. The Oedema. fivelling is not heavy. At its commencement, it only affects one part ; but it fuon fpreads orer the body, and diftends the whole 0kin.

Emphy fema generally atifes from a wound of the lungs; often from a fpicula of a broken rib*. It has - Sce allo been known to atife from an ulccration in the llounds of lungs; but this feldom happens, as the intiammation the Thoraxattcuding the formation of the matter condenfes the conliguous veficles, and produces adhefions between the lungs and cavity of the thorax.

Emphyfema has alfo been fumetimes obferved in fome putrid difeafes. Dr Huxham has recorded a cafe of this kind in a failor who was attacked with putrid fever and fore throat $\dagger$.

A partial emplayfema has alfo been obferved in cafes olifirazof gangrene. Dr William Hunter las mentioned a cafe tions and
of that kind.

The treatment of emphyfema must always depend on the nature of the oiiginal difeafe. It may be here, however, remarked, that the effufed air is ieadily abforbed, and creates no inflammation or any change in the cellular fltuefure where it had been effufed.

## Chat. II.

## Of the Difeafes of the Skin.

Sect. 'I. General Remarks on the Patliology of the Skin.
Therf: are a confderable number of difeafes which arife in the different pasts which compofe the flin; and there are others which feem to be the cffect of that fympathy which the fikin has with moll organs of the body.

Of the dileafes which attack the $\Omega \mathrm{in}$, there are five claffes. In the fint, the papilla are aftected; in the fecond, the cellular membrane contained in the areolse of the thin; in the thircl, the rete mucofum or capillary net-work, from which the exhalents arife; in the fourth, the cutis vera or chorion ; and in the fifth, the epidermis or fearf fkin.

1. Under the difeafes of the firn clafs, or thofe of the papillie, may be confidered all thofe in which an alteration ia the fenfibility of the fkin takes piace. Whenever inflammation affects the Ahin, this alteration of fenfibility is perceptible; and in fome of the nerrous difeafes of women it is very remarkable; for on touching the fk in a little roughly, convulfons are produced. It is alfo well known the effect of titillation on the thin; and perhaps an application of this knowledge might be ex. tremely ufeful in the treatment of fome difeafes.
2. We have examples of the fecond clafs of dileafes of the flis, where the areolx of the cellular membrane of the cutis vera becomes inllamed, in boils and perhaps alfo in finallpox, and in fome of thofe tumors commonly called pimples of the 1 kin .
3. The rete mucofum, from its ralculaity, is probably the feat of eryfipclas, mealles, fcarlatina, and that multiplicity of emptions to which the fkin is fubject.
4. In elephantiafis, cancer, \&c. and in general in all chronic cutaneous difeafes, the cutis vera is affected; it appears, however, to be feldom primarily affected in acute difeafes.
5. The epidermis is paffive in all the difeafes of the fkin, and is only affected by its continuity. Its femfibiF 2

Wieares of lity is never incriafed, nor is it fufceptible of being inrhe Skin. flamed, and confequently it never forms adhefions. Its internal furface, too, raifed by a blifter or any other means, and spplied to the parts belorr, never reunites. The excrefcences which form on it, fuch as corns, \&c. are dry and inert, and without circulation; if they are painful, it arifes alone from their preffure on the nerves of the fubjacent parts.

From all thefe different affections of the fhin, a number of fympathetic affections arife which it is worth w:hile here to remark, though only a few of the difeafes of this organ come properly within the limits of a fyfeem of furgery.
: Bicbát
-Inatomic
Generale, fom. iv. p. 730.
:Treatnent of tice White swrlling of the foints.

1. Every time that the papillie are much excited in irritable people, as in titillation, various organs are fympathetically affected by it. Sometimes it is the heart ; hence follows fainting. Sometimes the fomach, and in two cafes mentioned by Bicl)ât, the perfons vomited. Sometimes it is the brain, as is obferved in people, where tickling brings on laughter, and even violent convulfions.
" Medical men," fays Bichât *, " are often aftonifthed at the extraordinary effects which quacks produce on the body from the knowledge they have acquired of the fympathies of the fkin produced by titillation. But how fhould we be more aftonithed at this, than by vomiting produced by difeafes of the womb, than by difeafes of the liver being brought on from a injury of the lrain, or by headaches arifing from a difordered ftate of the gaftric vifcera ?" The influence of titillation of the fisin may be of much ufe in the treatment of fome difeafes. In hemipleg:a, \&xc, would not the excitement of the foles of the feet, which have fo much fenfibility, as every one knows, not anfwer much better repeated ten or twelve times a day, than the application of a blifter, the irritation of which continues only during a thort time.

From this fympatly which thee fkin has with the difant organs, we may be pe:hars able to explain fatisfactorily the influence which friction has been lately found to have in fome difeafes. MIr—, an ingenious furgeon at Oxford, has employed this remedy to a very great extent in difeafes of the joints; and he has experienced from it the boft effects + .
2. Whenever the exhalents of the Rin, or the exterior capiliary fyttem from whence they arile, are affeeted in any manner, a number of other parts participate, and thence arifes a fecond order of fympathies of the flain.

There are ferv organs which have more fympathy. with the Rkin than the fomach. The bath, which aets upon the R.in, during digeftion affects fympathetically the flomach, and difturbs its functions. When that organ is fpafmodically affiected, it often is reffored to a flate of heath, by the influence it receives from the bath. Bichit mentions a cafe of a woman who was troul'led with conflant vomiting, in confequence of fup1 feffed menfes; and who was immediately relieved by the warm bath after other remedies had failcd.

The action of cold on the fitin produces a variety of fympathelic effects; above all when that action takes place duriny $1 \cdot$-rfpiration. It is alfo well known what a number of phatromena refule from a fudden difappearare of many cruptims of the fk in.
3. Wher the cellular menhrane contained in the areolæ of the flkin, becomes intiamed, as in boils, puftules, Difeafes of \&c. a number of fympathies enfue, which may be refer- $\underbrace{\text { the Skin.; }}$ red to the cellular fyltem in general *.
4. The difeafes of the cutis vera and epidernis being all of a chronic nature, their fympathetic affechions liavc the fame charakter, little more being known of them.

We have alfo mentioned, that befides difcafes of the fkin , arifing from a change of ftructure in that organ, there were allo others which arofe from the fympathy it has with other organs. Whenever a cold body enters the fomac! whilf there is a perfpiration on the Illin, the perfpiration inftantly flops. The entry of warm drinks into the flomach, and an augmentation of the cutaneous exhalation, are two phenomena which coincide at the fame moment, in fuch a manner, that one cannot attribute the fecond to the abforption of the drink, 10 its paffage to the venous blood through the lungs, and then to the arteries. The production of perSpiration is, therefore, analogous to the fuppreffion of it in the fermer inftance. Hence will be found a great variety of phenomena in different difeafes, arifing from the fympathy exifting between the fkin and the other organs, various degrees of drynefs, of moiffure, and of perfiration. Sometimes thefe phencmena are chronic. In many organic difeafes, diffierent kinds of tumors are formed on the flin, in the fame manner as we obferve petechis, miliary eruptions, \&c. \&c. produced in acute fevers; the difference being merely in the duration of the periods of the fympathetic affections.

The difeafes of the fk in form a very important clafs in a fyftem of nofology. There are, however, only a few which ought properly to be confidered in a fyfter. of furgery.

It is the feat of all eruptions, as fmallpox, meafles, and a valt number of other difeafes. It is liable to inflammation, fuppuration, and gangrene. It is alfo fabject to difeafes and injuiries from its expofure to the action of exterual bodies, and from ferving as a defence to the internal parts, It is alfo fabject to cancer, warts, and other excrefcences, the treatment of which more properly belong to the furgeon.

## SEct. II. Of the Erysipelas, or the Rofe.

The rofe is fome:imes a local difeafe; at other times it is merely a fymptom of fome other affection. It differs from a!l other inflammations in the peculiar thade of red colour, and it is alfo remarkable for the diforder which it generally creates throughout the whole fyftem. The part of the 1 lin which is affeeted bccomes of a bright fcarlet colour, with a tinge of yellow'; and towards the termination of the complaint, the yellow becomes more difcernible. Befides the difierencc in the fhade of red, the fwelling is neither fo hard, fo clevated, nor fo circumfribed as that of phlegmon. The $\mathbb{E k i n}$ has a gloffy fmooth appearance, a burning heat, and on its bcing touched with the finger, the fearlet colour difappears where the preflure is made, leaving a white fpot, which, however, is almof immediately replaced when the finger is removed. The pain attending the difeafe is fometimes rery great; there is alfo always more or lefs freclling of the parts affected and thofe in the immediate vicinity; and this feems chielly to arife from a watery cffifion in the cellular mombrane.

The rofe is very apt to forcad rapidizy to a great cx-

Eryfipelas. tent; and it frequently changes its fituation, growing $\xrightarrow[\sim]{\text { gradually } \text { well in one fide, and cxtending itfelf on the }}$ other. Sometimes it difappears entircly at one place, and attacks fome other. As the difeafe gets well, the cuticle peels off from the affected part.

Eryfipclas many he combined wilh phlegmon (eryfipelas phlegmomoides), in which cafe the inflammation is of a deeper red colour; the fiwelling is alfo greater and decper, and the pain is more acute. There is alfo a throbbing it the part, and the pulte is full and hard.

There is alfo a particular fpecies of eryfipelas called St Anthomy's fire, in which fmall veficles are formed on
 a thin tluid which furms a feab, and beneath the fab fuppuration fometimes takes place.

The true eryfipelatous inflammation feldom fuppurates, but generally terminates by refolution; very violent cafes fometimes caufe gangrene.

When eryfipelas is accompanied with inflammation of the cellular membrane, as there are no ditinct limits of the difeafe, the matter which is formed in thofe cafes which advance to fuppuration, often extends very far in every direction, and fometimes produces very confiderable floughing, not only of the cellular fubftance, but of the fafcire and tendons beneath the fkin. Ery fipelas is generally accompanied with all the fymptoms of general fever, and thefe occur in a very confiderable degree, even whore the external inflammation is extremely night. Languor, laffitude, wearinefs in the limbs, headach, lofs of appetite, oppreffion about the flomach, precede the appearance of the local complaint. The mof violent form of eryfipelas is moft frequently feen attacking the face, producing a great deal of general fever, often accompanied with delirium; and in a few cales we have known it to proceed fo far as to inflame and fuppurate the membranes of the brain. Eryfipelas feens to be intimately connected with the flate of the general conftifution. Perfons in the habit of drunkennefs and other fpecies of intemperance, and who, when in a ftate of intoxication meet with local injuries, often have eryfipetaious inflammation in confequence of thefe. In general, eryfipelas has its principal fource in a difordered flate of the chylopoctic vifcera, and the wrong fate of the bilious fecretion. It feems alfo to be often connected with a fuppreffion of perfiriation, for it never recedes until that fymptom is relieved.

Of the trcatment of Erysipelas.- The mild erylipelas is to be relieved by the exhibition of gentle diaphoretics. A few dofes of nitre, in order to promote the ordinary evacuations, and the general attention to the antiphlogific regimen.

It is alfo of great importance to attend to the fate of the bowels, and to give purgative medicines, both with a view of temoving any feculent matter contained in them, and as a general evacuant.
When the cafe is conjoined with phlegmon, and when there are ftrong fymptoms of inflammatory fever, venefection becomes neceflary; and this is particularly the cafe when the face is the feat of the difeafe. Copious bleeding, however, is generally, hartful, and no blood ought ever to be taken away when the functions of the abdominal vifcera are much difortered.
When the patient has a very foul rongue, a bitter tafte in his mouth, and a propenfity to vimt; if thefe fymptoms cannot be removed, purgatives and emetics
become neceffary. Indeed, in almofall fevere cafes, Eryfipelay. an emetic is indicated, and ought even to be repcated, $\underbrace{\sim}$ Rould the fymptoms remain fevere.

There has been a gecat variety of opinions with rcgard to the external ticatment of eryfipelas; fome recommending the prat to be kept dry, of a moderate warnat, and excluded from the air : others have uled warm or cold moit apiplications. The practice of Delfrult is perhaps the mofr judicious. In thofe cafes of cryfipelas which werc produced lrom an internal caufe, no topical application is to be employed, except, perhaps, dufting the part with flour; but when any feccies of eryfipelas fucceeds a contufion, a wound or an ulcer, the regimen and internal medicines are infufficient, if proper topical remedies are not at the fame time employed to alleviate the local irritation. In this point of view Deffault employed poultices, the grod effects of which in thefe fort of cafes were confirmed by numerous obfervations. He conlidered it, however, as an effential precaution not to extend this topical application further than the bruifcd part, or the edge of the wound or ulcer. If any application is made to the eryfipelatous furface, it ought to confift merely of a weak aftringent folution: that which was always employed at the Hotel Dieu, confited of a fcruple of the exiract of lead in a pint of water.

## SEct. III. Of the Farunculus or Boil.

The farunculus appears to be an influmation of the cellular membrane of the areola of the chotion; the other inflammations of the fkin and cutaneous eruptions being feated on the corpus reticulare. The farunculus is a circumfcribed, very prominent, and hard tumor, of a decp red colour; and they vary, from the lize of a pea to that of a pigeon's egg. They are extremely painful, and are feldom attended with fever. They are alfo moft frequent in young people. Boils generally pals into a more or lefs perfeet kind of fuppuration; a fmalt white $f_{y o t}$ is formed on the apex of the tumor, which, when it has reached the fkin, difcharges but a fmall quantily of pus in proportion to the bulk of the fwelling. Before the tumor begins to fubfide, a yellow flough, formed by a portion of dead cellular membrane, comes out.

As frellings of this kind almof always fuppurate, and as induration conftantly remains after an incomplete refolution of them, we ought to promote fuppuration by ufing emollient applications. Ensollient poultices are beft for this purpole. When a quantity of matter is collected, it is fometimes advantageous to open the boil with the point of a lancet, then to allow it to remain until the fkin ulcerates. Gentle aperients and antiphlo: giftic regimen ought not to be omitted.

## Sect. IV. Of the Chilblain.

The chilblain is a painful, and very often an extreme. ly itchy fwelling of the fkin of an extreme part of the body, in confegitence of expofure to exttense cold, or fudden change from a very cold to a warmer atmofphere.

Chilblains are moft frequent in young people of fcro. fulous confliutions, and in this country the difeafe is mot prevalent duying thic winter menths. It appears

Cribizin. moit commonly an the toes and heels, and fometimes aifo on the fingers, and parts where the circulation is moft languid.

The firlt fyinptoms of the difeare are a palenefs of the part, which is quichly facceeded by more or lefs rednefs, a very tre:bleforne itching, and fometimes pain. The fkin gradually acquires a purple hue; the part fivells, and the cuticle feparates from a ferous effufion which takes place below it. Beneath the cuticle an u!cer appears of a very irritable appearance, and accompanied with great rain. This ulcer fpreads apidly, has very acute edges, and its futface is of a dark or rather dirty yellow colour. Sometimes the ulceration penetrates as low as the tendons, or even expoles the furface of the bones, producing a $\int_{\text {phacelation of an extre- }}$ inity.

In the treatment of chilblains, before the $\mathfrak{k i n}$ has ulcerated, the principal attention ought to be paid in keeping the afficted part of an equal temperature, and to rub it over with ftimulating applications. Camphorated Spirit, fpirit of turpentine, \&c. have been generally recommended for this purpole; but we have found the tincture of catharides, properly diluted, to be muels more efficasious. A drachm of this tincture to an ounce of the tincture of foap, will be generally found to anfwer extremely well; and this is to be rubbed on the part once or twice a day:

When vefications begin to appear, and ulceration has taken place, emollient poultices fhould be employed; but after this procels has gone on a certain time, and the pain and irritation abated, much benefit will be experienced by the application of the red precipitate ointment to the ulcers. Under this treatment we have repeatedly obferved large ulcers of this kind heal with unufual rapidity.

Reft and a plain nourilhing diet will be commonly beft fuited to people with chilblains; and fhould fymptoms of debility and a floughing of the fore cufue, it may be even neceflary to give freely wine and bark.

## Se.ct. V. Of Cancer of the Skin.

The $\mathbb{R}_{\mathrm{k}}$ in is frequently attacked with cancer. That of the face is more particnilarly expofed to it; and this no doubt arifes from its delicacy, from the great number of vefiels which penetrate it, and perhaps alfo from its more frequent expofure than any other part of the body to external irritations. Cancer, however, is not confined to the fkin of the face; it frequently appears on the back of the hands, and on the feet. Wifeman has feen it on the cranium, Gooch on the infide of the thigh, kichter at the umbilicus; and we have feen an example of it in the $\mathbb{k} \mathrm{m}_{\mathrm{s}}$ above the pubes.

When cancer affects the $\mathrm{k} i \mathrm{in}$, it begins in the form of a fmall, hard, and dark-coloured wart, which increafes very flowly in fize; the contiguous flin becomes bardened, forming a flool or button around the watt. The progrefs of the difeafe in the fkin has been always obferved to be more flow, than cancer in any other part; fo that it often remains in the form of a black fcab for many years. The fcab at laft feparates, and then an ulcer of the flin is expofed, having all the characters of the true cancerous fore. It has a pale colour, ragged hard edges, and unequal furfacc; and it gradually c..tends in an irregular manner along the ©kin;
the hard tumor which forms its bafis, at the fame time canecr of increafing in fize. Inftead of pus, the ulcer difcharges the slim. a thin ichor, which reddens and excoriates the adjacent finiu. The difeafe which, when in the forn of a lea's gave little uneafinefs, now becomes panitul; and the pationt feels more or lefs frequently flarp lancinating pains darting throtgh the tumor, and extending frum it to the adjacent foft parts.

When a cancerous affection of the $\mathbb{f k}: \mathrm{in}$ is examined after it is removed from the body, it has all the leading characters we have defcribed is our general obfervations on cancer $*$. The great degree of hardnefs of the mor-* See char. bid mafs, is produced from the formation of the hard on Cancer. fibrous-looking matter obferved in all fchirrous tumers; and the direction of its fibres will he generally found extending from the bafe of the tumor to the furface of the fivin.

Cancer of the ikin follows the fame p: ;-refs as cancerous affelions of other textures; the contiguous ghands become enlarged and ulcerate; and both the ulcers which thefe form, and the primary one, fpread over whatever parts they meet, till they deflroy the patient.

Treatment--The fuccefs which has been attributed to various medicines, particularly to arfenic and ftrong corrofive applications, in the cure of cancer, has been chiefly from the ufe of thefe medicines in cancerous affections of the fkin. From the difeafe being obferved in the fkin before it has far advanced, from its flow 1rogrefs in that part, and the rendy application of remedies, it affords better opportunities of experiment than other parts of the body when affected with that difeafc. Paft experience, however, leaves tis but little room to hope for a cure of cancer in the flin by any external application with which we are as yet acquainted ; and we know of no remedy to be truffed to but the complete excifion of the difeafed parts.

The more early the difeafed thin is removed, the greater is the chance of a permanent cure of the difeafe. And in whatever part of the body the fkin is affected, it is of the utmof importance to remove cvery part where there is the leaff fufficion of contanination. In the face, we have often obferved the furgeon too anxious to fave fkin, with a view of lefening the bleminh of an extenfive fcar; but in a difeafe fo deporable as cancer, no oljeet of this kind can in any degree compenfate for being expofed to the fmalleft rifk of its return ; the more fo, efpecially as we have often renarked that a fecond operation is feldom if ever attended with permanent advantage. The furgeon, therefore, ought to lay it down as a general rule, to include in his incifion a confiderable portion of the found $\mathbb{k}$ in furrounding the difeafed parts.

The particular cafes wherein an operation is advifable, muft be left entirely to the judgement of the furgeon. The operation may be performed in all cales where the difeafed parts appear to be within the reach of the knife; or if there are any glands affected, if thefe can be fafely removed, it may be even under thefe circumftances undertaken, though no doubt the chance of a return of the difeafe in fuch cafes is greater.

Whenever the periofteun and parts furrounding any of the bones is affected, there is little chance from any affiftance of art, except when the difeafe occurs in the extremitics of the body, as in the hands or fect; for in fuch cafes, amputation of the whole member may be performed.

When cancerous fores appear about the eyelids, and fpread al ners the conjuntiva, covering the eyeball, it is the only fite practice to remove the whule contents of the orbit. .'The difierent parts which compofe the eyeball and its appendages, feem to lave fuch a clofe connection wih one anollier, that it is ditlicult, perhaps impoffible, to mark the boundaries of the difeafed action which is going on; and as the lofs of any part of the organ preveats the olhers from perforning their functions, it becomes no material object to fave nny particular part.

It is senerally remarked, that the lips are particularly fubject to cancer, at leaft in men; and that the under lip is more fo than the upper one. The difeafed part may be removed in this part of the body with great noatiefs upon the gencral principles of the operation of harclip. This can only be done when the difeafed portion is finall, and may be included b; two incifions forming an angle, inclining towarts the chin. See Hhrrifi. When, however, the difeafe has fpread over a confidernble portion of the lip, $f$ as 10 prerent the found parts from being united: after the difeafed parts have been removed, all that can be done is to remove the parts affected, fecure the bleeding veffels, and drefs the fore like any other recent wound.

By a little ingenuity and contrivance, much may be fometimes done in making the incition in luch a manr.er as to allow the found parts to be afterwards brought together and united; fo that in all cafes of extentive difeafe, the furgeon flould confider of all the different modes by which the difeafed parts may be removed with moll advantage.

The operation is performed by fome with a common fcalpel, by others with fciffars. When the fcalpel is ufed, the lip is to be held firmly with forceps by an aliftant, and the fecond incilion made along their edge; but when the difeafe extends beyond the adhefion of the lip to the jaw, no forceps are neceffary.

The Ccifiats are, however, the preferable inftrument; they divide the li? with much lefs pain, and with a mathematical precifion. When they are ufed for this purpofe, it is neceflary they be made thick and ftong; and as in lome people the lip is extrenely thick, and apt to 1 lip through the blades, inftead of being divided. Giving the cutting edge of the blades a circular form will be found to be an improvement on the common flraight edge. It is evident, howerer, that the fciffars can only te employed in thofe cafcs where the forceps could be ufed to aid the knife. All wounds of the lip heal beft and moit accurately with the twifted future; fo that the edges hould be brought together in the fame nannce as has been recommended in the cale of harelip, and the fane mode of after-treatment is allo to be purfued.

## Sect. VI. Of Warts.

There are two hinds of warts which grow upon the furface of the body; the one fpecies is connected with the flin by a broad baie; is of a hard, firm lev'ure, unequal in the furface, and free from pain. Wiarts of this defcription are frenuent in young people, and are gencrally - found on the hands.

The other fpecies of wart is altached to the 0kin by
a flender pedicle; they inare a very uncqual furface, appearing as if compoled of an aggregate of fmall tumors. Warts of this kind feldom attain any very confiderable fize, the largett fearecly excecding that of a pea. They are leldom troublefome; but i:s lome fituations they become extremely irritable, and produce, efpecinlly when injured, very difagreeable linfations.

Thas precies of wart is moft frequently met with on the prepuce and glans of the penis; wr the labix: around the anus, and alfo frequently upon the hairy fcalp. In thele fitations they fometimics acquire a very large fize, numerous warts arifing over the whole Surface, and formingr a nafs of a caulillower appearance. Placy are moit frequent in people advanced in life, and are often connected with the venereal difeafe.

Befides thefe, there are varieties of fmall warts which occur in different parts of the body, which have not been accurately defcribed by authors. There is one variety where a number of fmall, whitilh tumors appear in fome parts of the face of chidren; thele contain an opaque wlite fluid, which when dilcharged, and allowed to remain upon the contiguous fin, contaminates it, and procuces warts of the fame defcription.

Of the tratment of İarts.- A variety of local remedies have been applied, both by medical men and the volgar, for the curing of warts; and thele generally poficfs a corrcfive tuality.
I. anar cautic is one of thofe which generally anfwers beff, and is moft eafily managed for deftroying the firft feceics of warts which we lave deferibed. A iaturnine folution applicd to the warts three or four times a day, or aqua ammonie, and tincture of cantharides, have allo been found beneficial in promoting their abforption.

In the fecond fiecics, when the excrefences are very large, they fould alway be removed along with a fortion of the adjacent $\mathfrak{k i n}$, by the knife. In thore cales where the warts are very numerous, and where, from their fituation, it becomes impoffible to remove thens with the knife, equal portions of aruso at is and favine powder, or favine powder alone, will be fcond fometimes to fucceed in removing them. In fome cales, particularly where the warts are firuated about the glans. of the penis, we have found a faturated folution of the muriate of mercury in firit of wine, complctely anfires the purpofe. 'In thofe cafes connected with fyphilis, befides local applications, it is noceflary to ule mercury. Sometimes, indeed, the warts drop off whenever the mercury begins to affer the confitution.

## SEct. Vil. Of Comb.

A corn is a peculiar hardnels of the epidermis, which fomctimes extends to the fubjacent fkin. In the firl cafe, the difeafed part is removeable; in the fecond cale it is more fixed. It freguently elevates itfelf ribove the Ain, and is not unlike one feecies of wart. It, is hard, dry, and infenfibie, except when preffed upon the contiguous parts; and it sefembles in colour and appearance the thickencd cuticle on the lands of vorkmer, Corns commonly ate formed on the tors and fides of the feet, and they are fenerally owing to the weariag of tight fhees. Scmetimes coins do net oceasion the leaft inconveniency; but in other inflances they oncafon fo.
mach pain, that the patient ran walk with difficulty. Corns are generally more painful in warm than in cold weather. l'he pain feems to arife from an intlamed fiate of the parts in the circumference of the com, which flate is excited and kept up by the preflure of the induration, and not from any fenfibility in the corn itfelf. They are more painful in dyy than in moilt weather, becaufe they become much more hard and dry.

Treatment of Corns.- The pain and dificulty of walking produced by corns, may be alleviated by immering them in warm water, and with a- iharp infrument cutting of their external layers ; much relief will alfo be found by covering the part with a piece of adhefive piafter, and by being careful not to wear floes which are 100 tight. But what we have found a moit complete cure for corns, is the application of one or other of thofe corrofive fubfances which were mentioned for the treatment of warts. The lunar cauftic, or the faturated folution of muriate of nercury in firit of wine, ought to be preferred. They may be applied once every fecond or third day. until the abforption of the com be completed; and before ufing them, it will be found profer to pare off fome of the externa! hard layers of the corn.

Some corn-operators extirpate the corn by a fharp inllrument ; but this only proves a palliative treatment, for fooner or later a hard fubflance is again depofited.

## Sect. VIII. Of Novi Matcrni.

Nevi materni are thofe marks which frequently appear upon the bodies of children at birth, and which are fuppofed to originate from impreffions made on the mind of the mother duing pregnancy. They are of various forms ; their colour is likewife various, though noft frequently refembling that of claret or port-rsine. Nany of thefe marks are perfectly flat, and never rile above the level of the flin : thefe do not require the alfitance of feirgery; but in fome cafes they appear in the form of finall protuberances, which frequently increafe to a great fize in the courfe of $a^{\circ}$ few monihs. They appear to be foft and theniy; of a cellular texture, the cells containing liquid blood. They may be removed with iittle danger when not involving any important organ. They are fupplied indeed more plentifully wihl blood than mof other tumors are; and even foretimes they appear to be entirely formed of a con: eries of imall blood-veffels; but the arteries which fupply them may be, for the moft part, eafily fecured by lifature. An operation thould aever be long delayed; fur as the fize of the veffe!s correfponds with that of the fumor, they fonsetimes are fo large as to throw out a Hood deal of blood before they can be ficured. In performing it, the tumor is to be cut out, the arteries taken up, and the remaining fin brought as anell together as the nature of the part will allow, and kept fo by adhelive plafier or future.
if the whole tumor be removed, little 1 æemorrliagy fienerally follow,; but if the fmailen portion of the difcafed veifels remain, not only a troublefome bleeding followe, but the tumor is quickly reproduced by an increaf. cid exuberance. Tumors of this kind have been alfo remored by ulecration eacited by the application of currufive Tubflaricus; and a knowledre of this circumflance might be in fume cafes of practical application.

# On the Difeafes of Mucous Mempranes. 

## Sect. I. General Remarks on the Pathology of the Aucous Membranes.

Thoucn at firf fight it may appear that the mucous membranes are very confiderable in number, yet when they are viewred mose generally, they appear much more limited; and we will find that in whatever part of the body they be found, they are fubject to the fame morbid alterations of flructure.

The ingenious Bichat has hown that there are two general nucous furfaces, of which the others are all portions. The one penetrates into the interior of the mouth, the nole, and the anterior furface of the eye. After lining thefe two firt cavilies, it is prolonged into the cicretory ducis of the parotids, and lubmaxillary glands. It paffes into all the finufes, forms the conjunctiva, enters the lachrymal points, the nafal canal, the lachrymal fac, and is continued into the nole. It lines the pharynx and eultachian tube, the trachea and bronchix. It goes down the eefophagus into the ftomach, and pafies along the whole inteftinal canai till it joins with the thin at the extremity of the rectum. 'i'his he calls the gafro-pulmonary murcous furface.

The other general mucons furtace, the geinio-urinary, begins in the male at the urethra; pafies along that canal into the bladder, lines the bladder, veliculie fem:nales, and vafa deferentia, along with their numerous branches. It alfo extends into the excretories of the profate gland, the ureters, and the pelvis of the kidneys.

In the female it begins at the vulva, penetrates the ureter, and pafies as in the male over the urinary organs. It alfo enters the vagina, lines the womb and fallopian tubes, and is then continued with the peritoneum. 'This is the orily example of a communication eftablifhed between the mucous and ferous furfaccs.

This view of the extenfion of the nucous membranes is ftrongly exemplified by an examination of their difeafes; for it will appear that there is not only an analugy between the diflerent portions of the firit, by an affection of the whole parts over which it extends, but there is allo a line of demarkation betwecn the two, from the one remaining found whill the other is affected thronghout. This lati circumftance is confirmed in the hifory of many epidemic catarris; one of thefe membranes having been obferved iffected throughout, whillt the other remained unchanged. The epidemic obferved at Paris in the year 1,80 had this character. "This epidemic (fays linel *) which was very general in Paris, aud with which 1 was myrelf attacked, was remarkable; phic Philofor it afieeted almolt the whole mucous membranes, fiphiquace, that of the trachea and bronchix, the conjunctiva, the tom. ii. pituitary membrane, the palate, the pharyns, and the ali-p. p. 205 . mentary canal." The epidemic catarrh of 1752 , defuibed in the Momoirs of the Mectical Society of Edinburgh, is an exiumple of the fame hind; for in all thefe, the mucous membrane ining the urinary and genital oryans remsined unafiected.

We allo obferve that an irritation of any part of a mucous membranc frequemtly creates a pain on a part of the membratie which was not irritated. Thus a cal-
nflamma- culus in the urinary bladder produces the chief pain at inn of Mu- the point of the penis, and the preflure of worms in the ous Mrm- inteflines produces an itching at the ncfe.
branes.

Among thefe phenomena, which are purely fympathetic, it is feldom that a partial irritation of one of the mucous furfaces produces pain in any part of the other. The fingular connection which fubfith between the membranes of the uterus and bronchie in mucons hemorrhagies, however, is an example of this kind. If the blood accidentally ceafe to flow from the one during menftruation, the other frequently fupplies the functions of the firft, and exhales it. In cales of llricture, or thickening and diforganization of the mucous membranes of the urethra, the flomach is fometimes affected: this may alfo arife from the fympathy of the two mucous membranes.

Mucous membranes, from being conflantly expofed to the action of the external air, or to the contact of extraneous fubftances, do not fuffer, when difplaced, like other parts of the animal economy. In a prolapfus of the uterus or rectum, their mucous furfaces ferve all the purpofes of R in ; and furrounding bodies do not produce more pain on them than on common kin . This is very different from the effects produced on opening a ferous cavity or a capfule of any joint. The cellular, mulcular, nervous, glandular, and other fy ftems, when laid open, prefent alfo very different phenomena.

The mucous membrane, like the fkin, is organifed in fuch a manner as to endure with impunity the contact of external bodies; thefe mercly producing an increafed fecretion of thin mucus. A found introduced and retained in the bladder produces no alteration in the frructure of the mucous membrane of the urethra; and for the fame reafon, a flyle or tube can be kept in the lachrymal duet without caufing any irritation.

Molt of the difeafes of mucous membranes cone within the province of the furgeon; the others have been already treated of under the article Medicine.

## Sect. II. Infammation of Mucous Membranes.

The contact of extraneous and irritating fubftances, acrid vapours, or the fudden expofure to cold air of any mucous furface, is often followed by fome degree of inflammation.

A preten natural degree of rednefs is a conftant fymptom of inflammation in moft parts of the body; but the moft remarkable character of inflammation in mucous membranes, and that which diflinguifhes it from all others, is the fectetion of a puriform fuid. The mucus, which in the natural ftate is nearly tranfparent, and merely moiftens the furface, becomes of a yellow colour, and the quantity is fo abundant as to form a purulent difcharge. It is from the fufceptibility of the mucous glands to be acted upon by any irritation which is applied to the extremities of their ducts, that the Itone or any tumor in the bladder, polypi of the nofe or vagina, are always accompanied by a profufe difcharge.

The inflammation is accompanied with a more or lefs degree of thickening of the membrane; and fometimes this remains after all the inflammatory fymptoms ceafe. The abatement of the inflammation is marked by an increale in the thicknefs of the difchargc and a diminution in its quantity.

Vol. XX, Part I.

We have an example of inflammation aficeting the $C$ morrha: mucous membrane of the nofe in coryza, the ear in otitis, the urethra and vagina in gonorrhoea, the bladder in a catarrhus velicx, and the eye in the puriforns oplthalmia, the lachrymal fac or duct in fifula lacrym:lis. In all thefe difeafes the fymptons have a fliking analogy, and are varied only from the difference in the functions of the particular organ, the mucous covering of which has been affected.

During life, mucous memhranes become gangrenons much more leldom than the flin. This is proved fronz the confequences of catarrh, compared with thofe of eryfipelas. There are, however, cafes where this texture dies, whillt thofe adjacent continue to live; as is malignant angina.

## Sect. III. Of the Infammation of the Mucous Membrane of the Urethira.

The term gonorrhoea is employed to fignify a dif-Gonorrtcea charge of puriform matter from the orifice of the ure- (Ecrultcthra or prepuce in men, and from the vagina in women , ment Muwhether it proceed from a fyphilitic or any other irritat- (cux). ing caufe.

The gonorrlheea may be defined a difcharge of a contagious, puriform fluid, which comes from the mucous glands of the urethra, and membrane which lines that canal; or from the glans in men, and the interior of the genital organs in women. The difeafe feems to be produced by a virus fui generis.

This difeafe gencrally makes its appearance in three or four days, fometimes in fix, but rarely later, after im. pure coition, with the following fymptoms. The patient finds a particular itching and difagreeable fenfation at the point of the yard, and a fort of flight itching alfo at the part of the urethra placed immediately under the frenum. This larts one or two days, and on the fol. lowing days the orifice of the urethra becomes fenfible and red ; it alfo fwells, and a limpid matter of a clear yellow colour flows from it, which tinges the linen. Whilf the flow of this matter continues, the titillation becomes ftronger and more painful, particularly in making water ; for this leaves a burning impreffion and fharp pain in the affected pait. In fome individuals the firf Cymptom prefenting ittelf is the difcharge of a thick mucus. In thefe cafes the patient feels from the commencemient a burning and painful fenfation in making water. Thefe fymptoms generally increafe in three or four days. Sometimes, however, that does not fenfibly happen till after eight or twelve days. The glans acquires a deep red livid colour; the difcharge through it increafes, and the matter becomes of a yellow, or greenih yellow colour, refombling pus diluted. The fwelling of the glans, and alfo of the whole penis, becomes confiderable; the patient has frequently a defire to make water, and he finds, particularly when he has romained for fome time in bed lying on his back, fre: quent and involuntary crections, and fo painful that they difturb his fleep, and oblige him to rife out of bed.
Such is ufually the progrefs of the difeafe when the inflammation is fimple, flight, and fuperficial; but in many cafes the inflammation extends farther and penetrates more deeply, affecting the reticular fublances of the
cavernous

Gonorrhcea. cavernous buoies of the urethra. Then the pain becomes exceffive during erections, and the frenum of the glans is drawn downwards as by a cord, in fuch a manner that the body of the penis is forced upwards by the violence of the erection. It is this which is called rordee. It fometimes happens, that in this flate the veffels of the urethra are torn, and thus occafion confiderable hemorrhagy. At other times, the difcharged matter is mixed with ftreaks of blood; the prepuce is alfo fo much inflamed and fwelled that it cannot be pulled back over the glans, or if it has been pulled back, it cannot be again brought forward. In fome cafes the frangulation which accompanies this laft accident, produces a mortification of the glans, and even occafions the death of the patient ; this, however, feldom happens.

In fome perfons one or more of the inguinal glands fwell, become painful, and are attended with fymptomatic fever. Often the glands of the penis fwell alfo, a cord or knots can be felt on the back of the penis, and the $\mathbb{I k}$ in is alfo fwelled and painful. Befides thefe fymptoms, the patient often feels, either from his own fault, or on account of bad treatment, a particular uneafy aching fenfation, with tenfion and fwelling of the feermatic cord and teflicles, accompanied with a diminution, or even a complete fuppreffion of the difcharge by the urethra. In other cafes the difeafe makes greater progrefs; the irritation and inflammation Atretching along the canal of the urethra. All the fymptoms then become more violent, the pain which is felt in the perinecum or behind it, in making water, is fo violent, that the patient is afraid to make the attempt, at the fame time that he is frequently falicited by the fatiguing titillation at the neck of the bladder and anus. There is a perpetual defire to let off the water, whillt he can make no more than a few drops at a time with a burning pain. The whole canal of the urethra is fwelled, and in a fate of tenfion; the patient has frequent erections, and lancinating pains along the whole length of the canal, through the perinæum and anus. He cannot lie down for a long time, nor can he reft feated. In this fate the fwelling of the glands of the urethra, and the fpafmodic contraction of its internal membrane, obiftruct the free paffage of the urine, and allow it to flow in a very thin bifurcated ftream, or drop by drop; and if at the fame time the difcharge diminifl confiderably, or totally ftop, a complete furpreffion of urine fometimes fucceeds, occafioned by the inflammation and fricture of the neck of the bladder, or by the inflammation and fwelling of the profate gland and adjacent parts.

It fometimes happens that the inflammation of the uretha becomes fo violent, that its internal furface, and the orifices of the glands which line it, fecrete nothing; the fame as we obferve fometimes happens in in Hammation of the mucous membrane of the nofe and of the lungs. It is this fate of the difeafe which fome authors have defribed under the name of gonorrbera ficca.

After thefe fymptoms have continued with more or lefs violence, or when they have increafed during one, two, or three weeks, or even during fix or feven, according to the treatment employed, they begin gradually to diminifl. The diffeulty and the frequent defire to make water ceafe; the crections are no longer painful; the mattes acquires more confiftence, and forms into threads
between the fingers, and at laft the difcharge entirely Gonorrhoce. difappears. In other cafes, and thefe the molt frequent, the inflammatory fymptoms difappear by degrees; but the difcharge remains during weeks, montlis, or even years. It is this form of the difeafe which is called gleet, or fimply blennorrhca.

Sometimes the inflammatory fy mptoms difappear by degrees, and leave behind them in the urethra an ulcer, from which there is a malignant and purulent difcharge, and which occafions an affection of the fyftem. This is what has been called gonorrhaca complicata or ulcerofa; but it occurs rarely.

In other cafes a contraction remains in the urethra; fomctimes a paraphymofis continues, and fometimes there is a tumor of the tefticles, a hardening of thefe parts or of fome of the glands of the urethra, an inflammation of the proftate gland, with a more or lefs complete fuppreffion of urine; at other times, though very rarely, the difcharge, when fupprefled, produces fuddenly a perfect deafnefs, or moft violent ophthalmia *.

The exciting caufe of fyphilitic gonorrhœa is always *Traite de the application of the fpecific virus to fone part of the $V^{\prime}$ 'nerieus mucous membrane lining the urethra. The contagious far Sivefluid, applied to any part of the body of a found perfon, diaur. aets with more or lefs difficulty, according to the difference in the ftructure, the greater or lefs debility of the part, and alfo according to the particular conflitution of the individual ; for we fee people who are expofed to every danger of infection, without cver having the difeafe even during their whole life. Perhaps alfo the more or lefs violence of the action of the virus depends fometimes on the greater or lefs degree of acrimony of the virus itfelf.

The feat of gonorrhoea, when it immediately proceeds from impure coition, is always at a fmall diftance from the orifice of the urethra, under the frenum, at that part of the canal where we obferve a dilatation, called folfa navicularis. All gonorrheeas which are fituated more anteriorly on the curvature of the penis, in the veru montanum, the neck of the bladder, or in the bladder itfelf, arife from bad treatment, or from fome caufe which has ftopped or fuppreffed the primary difcharge.

Sometimes by the natural progrefs of the difeafe, and more frequently from faults committed by the patient, or by the effects of improper remedies, the inflammation and irritation are apt to change their place. They often occupy the orifice of a mucous gland which opens at the firlt turn of the penis. At other times they affeet the two glands of Cowper. Sometimes they occupy the protuberances which cover the orifices of the feminal veficles; and thry allo fometimes takes place in the profiate gland, or in the neck of the bladder.

In fome rare cales the contagious virus does not penetrate during the inflammation into the urethra, but applicd to the extremity of the penis, it fixes itfelf upon the corona of the glans, and irritating the excretory ducts of the febaceous glands there, produces a difcharge which las been called the gonorrliana of the glans.

When the urethra of a perfon who has laboured under gonorrhcea is laid open, no ulcer is almoft ever found upon the furface of the internal mombrane; and in thofe who have fuffered nuth in coniequence of the difeafe, there is merely a thickening and contration of one or more
sorrhoca. parts of the urethra. Sometimes, though very rarely, excrefences are formed within it. The ducts of the mucous glands are obliterated, and the proflate gland and bladder clanged in their Atructure.

It has been a matter of great difpute among thofe who have written on the venereal difeafe, whether the gonorrhceal and venereal virus are the fame. In this been brought forward. It is a friking fact, however, which the practical man muft have always in view, that the venereal difeafe is never cured without mercury; whilf a gonorrhoca, however virulent, never requires that remedy. This difference in the treatment of the difeafes fome authors have attempted to explain, from the difference in the Aructure of the parts affected. It is remarkable, however, that the matter from the gonorthoea never affects the fk in, producing chancre; but that when its virus is applied to the vagina, or to the urethra of another perfon, gonorrhœea is the confequence. When it affects the prepuce too, it produces, in place of chancre, a morbid difcharge from the febaceous glands of that organ. It is alfo a ftriking fact, in the hiltory of gonorrhoa, that however long it may remain, it never produces any conflitutional affection. All thefe circumftances in the hiftory of the difeafe, in its progrefs and fymptoms, and in its cure, being fo dif. finilar to thofe of the venereal difeafe, are furely fuffcient grounds to confider gonorrhoea and fyplilis as two diflinct morbid affections, and different from one another as much as any two difeafes of the animal economy.

Treatment.-All the forms of the venereal difcafe, when they are left to themfelves, undermine and deftroy the conftitution; but gonorrhcea ceafes without the refources of art, particularly if during its courfe the paticnt live a fober and regular life. The irritability of the urethra, the conflitution of the patient, the faults in his diet, and his exercife and choice of remedies, and perhaps alfo the nature of the virus itfelf, which is more or lefs acrid, and of which the action will be more or lefs violent, often renders gonorrhoea a very fevere difeafe. Experience confirms, that the fooner proper remedies are applied, and the fooner the patient is cured, the lefs he fuffers; and the more cortainly he avoids the difagreeable accidents which are fo often the confequence of that difeafe. From this confideration, it is evidently of importance, either to prevent the difeafe entirely, or deftroy it in its beginning. Two means have been propofed to accomplifh thefe ends; one is, to remove the virus before it can act on the parts expofed to it ; the other deflroys and alters its nature, and prevents thele effects from the moment that it gives the firft figns of its action.

Different practitioners have tried and recommended various prophylactic remedies. Some have applied mercurial ointment upon the furface of the glans and prepuce, immediately after coition, and others different kinds of lotions and injections, as cauftic alkali, lime water, alcohol diluted with water : thefe preparations being injected feven or eight times a-day, for feveral days after the commencement of the difcharge.

By the ufe of injections the irritation is dimininad, and the progrefs of the inflammation ftopped; and when the difcharge becomes thicker during their ufe, they ought to be continued eight or ten days after it has dif-
appeared; for if we were to give up too foon the ufe of Gonorrhera. thefe injections, the inflammation and difcharge would increafe. In this cafe it is neceffary to make the injection Aronger, and to ufe it more frequently. The advantages to be derived from this practice do not feem, however, to be altogether confirmed; and it is to be wifhed, that enlightened and prudent practitioners would make fome decifive experiments to determine whethe: injections are ufeful or hurfful in the commencement of gonorrhoea.

When indammation has taken place, and when the difcharge and other fymptoms of gonorrhcea are completely formed, a different mode of treatment ought to be purfued. Repofe, ablinence from all kinds of irrita. ting food, Cpiceries, wine, \&c. will contribute much to al. lay the irritation.

In order to defend the irritable parts againft the acrid matter, and to moderate the fymptoms of inflammation, authors have recommended the ufe of mucilaginous, oily, and fedative applications. That which renders the urethra in man fo violently affected by gonorrhoea, and fo different from catarrh, is not from the difference of Aructure in the organ, which has been fuppofed to be more irritable than the mucous membrane of the nofe and other parts of the body. It is the falts of the urine paffing along the urethra, which keeps up the irritation produced by the virus. It has been propofed, in order to remedy this fource of irritation, to give gum arabic or the infufion of linfeed internally; but thefe, when taken in the neceffary quantities, generally injure the fomach. An infufion of hemp has been found by Swediaur to anfwer all the purpofes, and not to be fubject to the inconveniencics of the others. This remedy may be rendered more agrecable to take, by adding a little fugar to it; and in fome cafes a weak decoction of farfaparilla may be advantagcounly added. All thefe drinks flould be takco cold, or at leaft nearly milk. warm, and in fmall dofes frequently repeated.

The antiphlogiftic regimen mult alfo be purfued in the treatment of gonorrhoea. Thic patient ought to avoid all exercife, or high-feafoned food. Lint, wet with a faturnine folution, fhould be kept confantly applied to the penis; and the patient flould keep his bowels open with faline purgatives. When the fymptoms of inflammation are confiderable, and the pulfe hard and frequent, bleeding becomes neceffary, eithe: general or topical : the conflant application of fomentations and emollient poultices is alfo ufeful. Swediaur has advifed, that camphor and the nitrate of potafh hould be given internally, and this fhould be continued according to its effects. Camphor alone, taken in the form of emulfion with fugar or frelh egg, is an efficacious remedy in allaying the pain and ardor urince. The ufe of camphor has alfo been recommended externally, with a view to allay the cordec.

Thefe remedies ought to be continued as long as the pain and fymptoms of inflammation in the urethra continue. After they are abated, the patient may be allowed a better diet, in order to prevent the urethra from being affected with a cluronic gonorrheea or gleet. Injections made of the extract of opium with acetate of lead, applied frequently from the commencement of the difeafe, cons tribute much to horten it, and allay the accompanying pain. Sometimes, however, tven the moft mild injections do harm, from a particular isritable flate of thes
urethra,

Gonorrioea, urethra. Great advantage has alfo been obtained by fome, in very aggravated cafes of the difeafe, by frictions of mercurial ointment on the perincom, and along the courfe of the urethra, or by mercurial fumigatons applied to the genital organs, and even by the injection of mercurial ointment into the urethra.

On the other hand, when the fynmpoms of eryfipelatous intammation prevail; when the patient is feeble, and of an irritable temperament; when he feels better after dinner; when the difcharge is clear and profufe, accompanied with fharp pain, ofien lancinating throughout the whole wrethra; and if the pulfe is feeble and frequent, it is more advifeable to give him a lefs rigid diet; to allow him the moderate ufe of wine, and in fome cafes to give him opium and bark internally. We are fometimes furprifed at the fudden clanges which thefe remedies in fuch cafes produce. The ufe of opium alfo contrioutes much to prevent cordee; and in all cafes this ought to be avoided as much as poffible, by fixing the penis downwards, and in making the patient lie on his fide upon a mattrefs, which anfwers better than lying upon the back, and in a feather bed.

If in confequence of the violence of the inflammation the difcharge fops, and the ponerior parts of the urethra begin to be affected, we thould have recourfe to the warm bath, or apply vapours to the part, by placing the patient upon a veffel containing boiling water, and this fhould be repeated three or four times a-day; the patient hould keep his bed, and an cmollient cataplafm applied upon the penis, which fhould be rencwed every hour. All kinds of injections in fucl: cafes are hurtful. The fame treatment is alfo applicable when the difcharge is flopped by the u.fe of acrid and afringent injections, or by injections improperly ufed, or by the improper ufe of turpentine and balfams.

When the proftate glands and the neck of the bladder are affected, and the patient of a plethoric habit, it becomes neceffary to bleed profufely, either at the arm, or by applying a number of leeches to the perinæum. In all tiefe cafes, a fedative clyfter repeated every feven or eight hours, and a general or local warm bath ufed twice a-day, are the beft remedies which can be ufed. Sometimes a blifer applied to the perinæum is alfo ufeful.
The fwelling of the lymphatic glands of the groin which fometimes takes place, is purely fympathetic, and difappears along with the inflammatory fymptoms of the urethra.

In all cafes of gonorrhera the patient fhould wear a fufyenfory bandage whilh the difeale continues ${ }^{*}$. It is alfo ufeful to perions who are obliged to take exercife, to wear a convenient bandage round the penis, which may be united to the fufpenfory in fuch a manner, that the penis may be enclofed in a kind of cafe, and thus defended from external injuries, from cold, and from friction; this bandage being kept conflantly clean, by often changing the caddlis, which is placed in its cavity. For this purpore, a hode ftould be left in the bag, covered by the caddis, which the patient can take away eacl time ho malies water. Another general precaution which it is u'eful to make, is norer to keep the penis bound up high, lut to l.cep it low, in order that the matter may dlow out frety, and may mo prafa backwards along the usech:a.

- Piate

Dxis
5\% 12.

The gonorrhea which talkes place in the glans and Conorthox: prepuce is generally eafily cured, by injecting frequent. ly warm milk between the glans and prepuce, and by keeping the penis in an emollient poultice. In thote cafes where the prepuce is fo fwelled that it cannot be pulled back, we ought to have secourfe to fedative injections.

It is a ufeful general rule, which ought to be obferved in all cafes of gonorrhoea, to touch the parts affected as little and as feldom as pofible; and every time that it is touched, to wafh the hands immediately afterwards, and with the greateft care, fearing that, by carrying them unintentionally upon the eyes, nofe, $\& c$. thefe organs might be inoculated with the difeafe.

Gonorrbæa in women is feldom followed by fo vio- $5^{5}$ lent fymptoms, or by fo fevere and dangerous confequences as in men. In tome cales the fymptoms are fo flight, that they conceive the difcharge, particularly at its commencement, to be nothing but the whites, to which difeafe a great many are fubject, efpecially in the large towns of Europe.

The gonorrheea in women has been fuppofed by many authors to have its feat in the cavities of the urethra. This, however, will not be found to be the cafe. The difeafe is feated, either upon the clitoris, or on the orifice of the urethra; upors the nymphe, or in the cavity of the vagina; or cven upon the inferior commif. fure.
With regard to the treatment, we have the fame in-Treatmert. dications to fulfil in gonorrhea in women as in men, with this difference, that one can fee the change of flructure in thefe parts, and thus, from the feat of the difeafe, employ proper injections and lotions from the beginning.
Prccautions in ufing Injections.-The fyringe ufed in men for this purpofe ought to have a fhort point of a conical form and of a thicknefs proportioned, that not more than its extremity may pafs into the orifice of the urethra *. The body of the fyringe fhould be perfectly cylindrical, and the pifton ought to play very accurately; for if the pifton does not fit the body of the fyringe, the injection, inflead of paffing into the urcthra, regurgitates between the pifton and the fyringe. From the unfleadinefs of the motion of the pifton, the point of the fyringe is apt to move fuddenly on the urethra, and injure its thin and delicate membrane. To prevent any injury of this kind, we have employed with great advantage, particularly if the mouth of the fyringe is made of metal, a fmall frip of caddis wrapped in a fipiral manner round the mouth of the fyringe, fo as nearly to expofe its point. If the difeafe is feated near the point of the urethra, the patient fhould be attentive to comprefs with one hand the urethra above the arch of the pubis, where the fcrotum commences, whilf with the other hand he holds and guides the fyringe. The lifuid fhould be thrown in gently, and fo as flightly to diftend the urethra; the liquid is to be kept for a minute or two, and the fame operation repeated two or threc times in fucceflion.

The liquid employed flould always be uled warm, which may be eafily done by filling a cup with the ne. ceffary quantity, and placing the cup in a bafon of boiling waler.

It often happens, particularly in young people, that

* Plate DXIV. fig. 12.

Glect. after having ufed injections fome time with advantage, they become lefs atlentive in ufing them, and neslect them even for a day. This omifion is always followed with bad confequences, the difcharge returning with double force; and the patient is ubliged to continue the injections during fome weeks more than would have been neceflary, if the ufe of the remedy liad not been inter rupted.

In order, therefore, to prevent the danger of a relapie, it is always prudent to advife patients to inject three, four, or ceen fix times a day, if the circumftances demand it, and to continue the fame two or three times a-day regularly for at leaft ten or fifteen days after the difcharge has entirely ceafed.

For women the canula ought to be larger and longer. A canula of ivory, an inch in diameter, and two or three inches in length, fixed to a bottle of elaflic gum, is the moft convenient form of a fyringe *.

## Of Glect.

It very often happens, that after the fpecific inflammation of the urethra is removed, from which gonorrhoea is fuppofed to originate, a difcharge fill continues. This diccharge is not attended with pain, nor can it be communicated from one perfon to another. The matter which efcapes is generally of a tenacious confiftence, and of a yellow colour, appearing to be compofed of globules, mixed with a mucous fluid. When a cure cannot be performed, either by the ufe of injections, or by bougies, it has fometimes been propofed to inject liquids capable of exciting irritation and inflammation in the affected part of the urethra. It is probably from this principle that fome gleets have been cured by violent exercife on horfeback, or a long journey. There have alfo been examples of fimilar cafes cured by coition; but this is a cure not to be recommended, as there always may be a rifk of communicating the difeafe to the women. A blifter, applied externally to the part affected, or to the perinæum, has alfo been found ufeful. The cold bath las often been recommended in ob. flinate gleets, from which good effects oftea refult; but there are other cafes in which it feems to increafe the difcharge.

It is alfo proper to change the injection; for it is ob. ferved that an injection lefs frong fometimes produces a good effect, after a ftrong one has been employed without fuccels, and vice verfa. In many cafes it is ufeful to combine the ufe of internal medicines with external means. The chicf of thefe are mercurial preparations, balfanic and refinous fubftances, and tonics. Swediaur has ufed, with much fuccefs, in gleets, pills made of turpentine and oxide of mercury. Among the refinous fubilances which are employed, the mof common is the balfam of copaiba. The beft way of taking this remedy is to give the patient thirty or forty drops in a fmall glals of cold water morning and evening, or from fifty to eighty drops for one dofe in the middle of the day, and aflerwards to take, in a finall glafs of water, twenty drops of the clixir of vitriol, which renders the balfam lefs difagreeable to the fomach. Half a dram of turpentine, of the balfam of Tolu, or of the balfam of Canada, anfwers the fame end. Swediaur mentions the cafe of a young man, who, having been for a long time diffreffed with a very obflinate gleet, frallowed at once between

## E 1 Y .

two and three ounces of the balfam of copaiba, and was coryza. cured.

Sometimes the balfams, combined with tincture of guaiac, or with kino, produce a defireable eflet.

Among the corroborant or tunic remedics, the kino, which we have already mentioned, is one of the moft uffeul ; the cinchona alfo in porder or infufion in red wine, or, which is flill better, in lime water; tormentilla in powder, or in cxtract, is the form of pills, joincd, according 10 circumintances, with preparations of iron, Glauber's fal's, are ufeful and efficacious remedies. The tincture of cantharides, given in a dofe from twenty to thirly drops, has often been found a moft uifful remedy. It is one, however, which ought to be given with precaution, as it might do much harm to pcople of a delicate and irritable temperament.
There are, however, cafes, where all our efforts to cure a gleet are fruitlefs; and we fometimes fee, that nature alone can in time fucceed, after we have ufelefsly tried all the refources of art.

There fometimes remains a fpecies of cordee or cur. vature of the penis after all the other fymptoms of gonorrhoea have difappeared. Frictions, with mercurial ointment, with camplorated oil, fpirituons lotions, or electricity applied to the part, are mof appropriate remedies in fuch cafes.

In all cafes of obftinate gleet, which are fituated far back in the canal of the urethra, the fate of the proftate gland fhould be carefully examined; for they often aile from a difeafe in that part. When the proltate is found fwelled and hard, Swediaur has feen inflances where, after a mercurial treatment, the repeated application of cupping-glafies to the perincum, and the ufe of large dofes of the conium maculatum, has fucceeded, other remedies having failed.

The gonorrbcea of the proftate is a morbid difcharge of mucus from that gland, mixed fometimes with the liquor of the feminal veficles; and it takes place principally through the day, without any venereal clefire. This difeafe is foon followed by feeblenefs and general debility, with emaciation of the whole body, and even with death ; particularly if the patient has not employed proper semedies.

The remedies moft efficacious are the cold bath, injections of metallic falts, fomentations of hemlock, blifters to the perineum, and internally tonic medicines, with a. well-regulated diet.

> SEct. II. Of Infammation of the Mucous Membrane of the Nofe.

Inflammation of the mucous membrane of the nofe is generally preceded by drynefs in the noftrils, with an itching feeling, and with a weight over the forehead. It is alfo accompanied with feneczing and an increafed flow of tears. The fecretion of mucus from the nofe is at firf diminifhed, and afterwards becomes very abundant. At firf it is limpid and irritates the found fkin of the upper lip, over which it palits, and becomes afterwards opaque, of a yellowifl white colour, and a difagreeable odour. This ftate is fometimes accompanied by fever, and it continues for a longer or fhorter period. Noft commonly it ceafes at the end of a ferv days. It fometimes, however, becomes chronic and indetermined. in which cafe it is often iptemittent, and re-appcars at
regular.
regular periods. Coryza, like all other inflammations of the mucous membranes, terminates by refolution. It Cometimes paffes into the fate of chronic catarrh, and it alpo occafions an ulceration of the mucous membrane of the note ; but this is extremely rare.

Coryza is frequently accompanied with inflammation of the mucous membrane of the eye, it also fpreads in many inftances along the euftachian tube, producing deafnefs, and it is very apt alto to pars down the trachea and affect the lungs.

The note is fometimes affected with a difcharge of thick vifcid mucous, when there is very little apparent rednefs or pain. Such inflances are often connected with the formation of polypi : but we have observed feveral cafes, where no other fymptom than the mucous diffcharge appeared, and where the difeafe had very much the general character of tome difcharges from the urethra.

Treatment.-Coryza is commonly an affection fo flight, and of foch hort duration, that it is feldom neceflary to employ any means to produce an abatement of its fymptoms. Sometimes, however, the fymptoms go to a very high degree, and it is then that emollient vapours directed into the natal cavities are particularly indicated. If much fymptomatic fever accompanies the difeafe, it may be advifeable to draw rome blood from the arm, and in all cafes a brick purgative will be found to relieve the fullnefs and uneafinefs in the head. When the inflammation fpreads along the mucons membrane of the trachea, it becomes the more neceffary to use every means to alleviate the inflammatory symptoms, and to prevent the inflammation affecting the mucous membrane of the bronchi.

Patients labouring under this difeafe, feel remarkable relief from living in a warm atmofphere; and the fymptoms of inflammation of the noe and trachea will be much alleviated by the internal exhibition of opium.

When the inflammation and the difcharge are of a chronic nature, aftringent injections, or a doffel dept in ifmilar folutions, kept in the nope during the night, are in fuch cafes the molt useful applications. They grazdually diminifh the quantity of the difcharge, and render it more thick and tenacious; and the fenfe of felling, which is commonly deftroyed, is gradually reftored.

If the difcharge be fetid, and occafionally mixed with hood, in all probability it originates from the formation of an ebfeefs or ulcer, connected with a carious bone.

## Sect. III. Of the Inflammation of the Mucous Membrane of the Ear (Otitis).

In inflammation of the ear, there is the fame characLees deduced from analogy of Aructure, as in other mucous membranes. The principal causes of this difafe arc fudden changes in the atmofphere; above all, the change from heat to cold, or from dryness to moifure; coldnefs of the nights, north winds, fuppreffion of any regular difcharge, the crifis of acute difeafes, metaftafis, the prefonce of an irritating body in the ear, or the imprudent application of oily or fpirituous fabstances.

The inflammation sometimes takes place in the meatus auditorius; and in other cafes it is confined to the cavity

## ER Y.

of the tympanum and euflachian tube. In the firn cafe, there is more or left pain, and buzzing in the ears, and afterwards a difcharge of thin reddish yellow matter. This matter gradually becomes white and opaque, and increafes in confidence till the termination of the dif. cafe; when it differs in nothing from the wax of the ear, but in its white colour. This affection generally lats twelve or fifteen days. It fometimes spreads to the external parts of the ear, and often paffes into a chronic fate.

When the inflammation is confined to the cavity of the tympanum, it produces an obscure tingling fenfaton, and a feeling of tenfion, which the patient fupports without much inconvenience; but mon frequently the inflammation is propagated from the cavity of the tympanum along the euttachian tube. In this cafe, the pains become more violent and extend along the contiguous mucous furfaces; they pals from the interior of the ear into the throat ; there is great difficulty in fallowing, and the food, when palling through the pharynx, gives a fenfation as if the akin had been ceroled. The motions of the neck alfo become uneasy, and the fmalleft attempt to cough, to freeze, or blow the nofe, produces a painful fanfation in the ear. The patent aldo complains of a floppage in the note, of a frequant dry cough, and of pain in the head, and more or left fever in the evening. The ear alfo feels hard and diftended, and there is generally deafnefs, particularly towards the end of the difeafe. Soon all there fymptoms diminish except the hardnefs in the ear, which augments continually till the fifteenth or twentieth day.

Mont commonly after this period, a quantity of foetid matter is fuddenly difcharged into the external ear, or into the throat, and then all the symptoms difappear. This difcharge generally diminishes daily, and in a flirt time ceafes altogether. At other times, particularly in young people, it continues, and becomes chronic.

Treatment. When the inflammation is confined to the external meatus, the difeafe is generally fo flight that it may be allowed to run though its common periods, and it is merely neceflary to keep the patient warm. When the inflammation is very confiderable, the mildeft injectons give pain, and in place of moderating the fymptoms, they increate the irritation. We ought therefore to do nothing, except, perhaps, to allow Some warm vapour to pals into the ear, and to purdue the antiphlogiftic regimen. About the twelfth or fifteenth day, it may be useful to apply tonic medicines, foch as aromatic alcohold dipped in a piece of cotton. When the inflammaton is in the tympanum, or the euftachian tube, betides emollients, it will be alfo neceflary to give forme bilk purgative, or to employ local or general bloodletting. If the membrane of the drum is much diftended, and accompanied with violent pains, it has been even promofed to make an opening through the tympanum *. Whin * Nofogriathe matter has been difcharged from the tympanum ii. P hie Philothar fpontaneoufly or artificially, little more is required fophi,izue to le done, unlefs the difeafe affuntes a chronic form. ${ }^{\text {tar Pine. }}$ This is more frequent in children. We often fee the purulent difcharge continue in them for many months, and forme of the finall bones of the ear become carious, and are difcharged along with the matter. In foch cafes fall dopes of calomel, for fore time repeated, bliflcrs applied behind the car, and injections of lime

Ingina. water combincil with muriate of mercury, acetate of lead and the like, fhould be employed.

## Sect. IV. Of Angina.

The parictes of the mouth, trachen, and larynx, are often intlamed in catarrhal affections, and prefent fymptoms which vary according to the intenfity of the difeafe, and particular feat of the affected membrane.

Angina has therefore been diltinguilhed according to its leat in the tonfils, the trachea, the pharynx, and laryn..

When the patient has great difficulty in fwallowing his food, and when the pain Aretches in chewing, to the ear along the euftachian tube, by a fort of crepitation, and if, on infpection of the throat, the amygdaloz and edge of the palate appear much inflamed, along with an abundant excretion of mucus, the angina has its feat principally in the amygdalx.

Angina affects the pharynx when deglutition is difficult or impofible, and the food is returned by the nofe, refpiration at the fame time not being impeded. This inflamation is alfo vifible by cxamining the botom of the mouth.

But if the deglutition is difficult; if no rednefs is to perceived at the bottom of the throat, and if the patient bas great difficulty in refpiring, a tharp pain in the motions of the larynx, the voice acute but weak, and the feech thort, we may then conclude that the inflammation has attacked the larynx, or upper part of the wind-pipe. An affection of this kind, though a few cales have been known to take place in adults, generally attacks children under twelve years of age. It is known by the name of croup.

When the inflammation affects the amygdalre, inhaling fleams of warm water and vinegar will often be found to give great relief. A poultice, too, applied to the outfide of the throat, affits in leffening the tenfion of the inflamed parts. Though in many cafes the inflammation feems to be confined to the mucous covering of the glands, yct in others it fpreads into the glandular fubftance, where it generally advances to fuppuration and abfeefs. In fuch calcs, the early dicharge of the matter gives great and immediate relief; and though no matter has been formed, puncturing the inflamed part with a tharp inftument often produces an alleviation of all the fymptoms. The inftrument delineated in Plate DXIV. fig. 14. is well calculated for thefe purpofes. By altering the poftion of the forew in the handle, the depth of the cutting part of the inftrument may be regulated. When it is to be ufed, the fore finger of the left hand is to be introduced down the mouth, and the perforator concealed in the canula introduced as a director. When the extremity of the canula reaches the inflamed part, the perforator may be then fafely pufthed into it, of a fufficient depth, which had becin previoufly regulated.

When the inflammation affects the pharynx, relief will alfu be obtained by inholing the feam of warm water, and by employing antiphlogiftic remedies. In croup, calomel lias heen found to have a ipecific effect; and it is aftonifhing the quantity that has been given to infants for the cure of that difeafc. See Medicine.

When the effufion which takes place in croup, is chiefly confned to the upper past of the laryns, and
produces fymptoms of fuffocation, it has, been propofed Oithe, Cato make an artificial opening isto the trachea below tarrh of the where the matter is effuled, in order to fave the life of Mhader. the patient. Sce Bronchotomy.

## Seet. V. Of the Catarrla of the Bladder.

The ureters, the bladder, and the urethra, are all hiable to be affected with catarrhal affections from general caufes, the fame as thofe affections of the mucous membranes which have been already mentioned; and befides, the furfaces of the mucous membranes of thefe parts are expofed to the action of particular caufes, namely, the ureters and the bladder to calculi, and the urethra to the venereal virus.
The catarrh of the hladder is more frequent among men than among women; and old péople are mure fubject to it, than thofe at any other period of life. It is often produced by the internal ufe of cantharides, by acrid diuretics, and by the progrefs of hæmorrhagy from the urethra. The fudden expofure to cold, fuppreffed pertpiration, the difappearance of different difeafes of the ikin, of rheumatim, and of gout, are followed almof fuddenly by this catarrh. Other circumflances may alfo give rife to the chronic catarih of the bladder. The preience of a calculus or any foreign body, the continual application of bougies, a fwelling of the proftate gland ; and above all, ftrictures of the urethra.

This difeafe is marked by pains of the bladder, and at the point of the urethra, both before, and whilit making water. The injection of the urethra is more or lefs difficult, according to the action of the bladder, and of the freedom of the paffage of the urethra. The hypograftric region is tenfe, and the urine prefents variety of colours; it is fometimes whitifh, or reddifl, or of a deep yellow colour; it is muddy, and it exhales an odour of ammonia, which becomes more fenfible a flort time after it has cooled. It alfo forms, in molt common cales, a mucus, which mixes and comes away with the urine in the form of glary filaments, and which. is afterwards depofited at the bottom of the veffiel, in the form of the tenacious glary fubltance, refembling fomewhat the white of egg.

The chronic inflammation of the mucous membrane of the bladder, may be accompanied with an ulceration of the kidneys or bladder; the mucus difcharged then becomes of a greenifh yellow colour, fometimes mixed with ftreaks of blood. It is depofited flowly, is mixed eafily among the urine, and in water; it has little vifcidity, or feetor, and does not coagulate by ebul. lition. The other fymptoms which accompany this excretion, as fever, pain, wafting of the flefh, fufficiently difinguift this double affection of the bladder. The chronic catarrb is fubject to return with intolerant pain in the region of the pubis and perinæum, accompanied with reflefinefs and anxiety. Thefe intermiffions are irregular, and may remain fome treeks.

Treatment.-The mater which exifs in the mucous membrane of the bladder, and that of other membranes of the fame name, is fufficient to point out the means which are to be employed in its treatment. The warm bath, and mucilaginons drinks, are particularly indicated at the beginning of the acute catarrh ; but the tendency which it has to become chronic, onght to make us cat-

Striztures, tious in not profecuting debilitating remedies too far. Onium Thould be employed with great prudence, notwithtanding the intenfity of the pain; and as this is often the refult of the ditiention of the bladder, from the ascumulation of unite, it is iometimes necefiary to have recourfe to the introduction of the catheter.

The chronic catarrh of the bladder is generally difficult to cure, and the more fo, if it occur in old age: if it arifes from the preflure of a tone in the bladder, there is no cure but the operation of lithotomy; if it arifes from metaftafis, rheumatifm, or any other difeafe, we ought to employ remedies to the $\mathrm{K}_{\mathrm{k}}$ in and inteltinal canal, and pour tonic injections lnto the bladder. The uva urif has alfo been found a ufeful remedy. Exercife, dwelling in dry and elevated places, the ufe of woollen clothes next the Alin, contribute often more to the cure of this difeafe, than the ufe of medicines, and they ought always to be combined.

The conjunctiva covering the eye-ball, eye-lids, and lacrymal pailages, are allo fubject to inflammation ; but thefe will be treated of among the difeafes of the eye and its appendages.

## Sect. V. General Remarks on Strictures.

The term fricture has been ufually applied to a contraction of the urethra; generally arifing from a thickening of the mucous membrane lining that canal. This change of Aructure is not, however, confined to the mucous membrane which lines the urethra; the fame morbid alteration takes place in the effophagus, in the euftachian tube and meatus externus, in the maxillary finus, in the bladder, in the lacrymal paffages, and in all canals lined by mucous membranes. Stricures, however, occur much more frequently in the urethra, and are there more pernicious than in any other part. They appear alfo fometimes in the upper part of the œiophagus. A fimilar change has been obferved in the internal part of the bladder. Bichat found the membrane lining the maxillary finus feveral lines in thicknefs, and and reafoning from analogy, and from what ric may obferve by an attentive examination of the fymptoms of many cafes, of what is ufually called fiftula lacrymalis, there is little doubt but a contraction and thickening often take place of the mucous membrane lining the lacrymal fac and duct, and produce that difeafe.

This change in the fructure of mucous membranes is always the confequence of inflammation; and when the membrane is thus altered, the difcharge, inftead of being healthy mucus, is: generally a puriform fluid, apparently a mixture of pure mucus and globules of pus.

## Sect. VI. Of Strictures in the Urethra.

The treatment of the difeales of the bladder and urethra has always been confidered a dificult branch of furgrery, as their true nature is often obfcure, and as it is by no means cafy to direct the proper means of relief.

Of the great variety of caufes which difturb the functions of thefe organs, Arictures in the urethra are perhaps the moft frequent, and moft ferious. They prevent the free cvacuation of the hladder; greatly dilturb, if not entirely defroy the function of generation; and often give origin to conllitulional fympioms which fome-
times increale to an alarming degree, and even prove fatal.

That the urethra mould be fubject to many morbid
That the urethra hould be fubject to many morbid
changes, we may infer, not only from our linowledge of the functions it performs, but alfo from its delicate and no lefs complicated ffructure.

One part of this Aructure is in:ended for the evacuation of the urinary bladner, the other for the tranfmiffion. of the feminal fluid; and as in the exercife of this latt function, the urethra fympathifes, in a greater or lefs degree, with the whole fyftem, and alfo with the mind itfelf, it mult have a connection with many of the other organs of the body.

Aecordingly, we find that patients who have obftructions in the urinary canal, have at the fame time other complaints, which get well when the obftruction is removed. And, on the other hand, difeales of other parts bring on norbid affections of the urethra, which are cured along with the original complaint.

The whole extent of the urinary canal is lined by 2 delicate membrane, which is conllantly covered with a vifcid fluid, fecreted by numerous glands, whofe ducts open on its internal furface by orifices which are called lасии.

It is highly valcular, and is endowed with fo much nervous fenfibility, that irritating bodies applied to it often affect, or even derange the whole fyftem.

It has a confiderable degree of contractility, is evidently elaftic, and perhaps may potfefs a mufcular power, although no mufcular coat has yet been demonfrated ; but to whatever caufe this contractility be owing, it is well known it does not contradt upon irritation.

As a proof of this contractile power, a remarkable cafe is mentioned by Mr Cline in his lectures, where a ftone was lying in the membranous part of the urethra one evening, which during fleep had been expelled and was found among the bed clothes the following morning.

The contraction which forms aftricture in the urethra may take place round the whole circumference of the canal ; it may arife chicfly at a particular point of the circumference ; or, it may extend along a confiderable extent of its furface, and thus produce obffructions of different forms.
The flricture once begun, continues no longer than the caufe which firft produced it continues to operate. But if the parts are kept long in this fate of contraction they generally are attended with a degree of inflammation; the membrane of the urethra acquires a morbid degree of thicknef; the furrounding parts are altered in ftructure; and this change of form and appearance remains after the caufe which originally produced them has cealed to operate.
That fpafmodic ftrictures do exift appears from the impreffions made on bougies which have been paffed through them, and from the examination of the parts after death; for although complete obftruclions to the butgic were found when alive, yet not the fmalleft remains can be obferved on diflection. This contraction is peculiarly violent, and from what we have feen more frenucnt, at the foffa navicularis than at any other part of the canal.

A gentleman, after many attempts to make water duing the night, was not able to pafs a drup, and he applicd for rclief in the morning. A bougie was introducel, and met with a completc obfruetion at the glans,

Stricures. which yielded in a few feconds after the bougie was $\underbrace{\text { in che contal with it ; on being withdrawn the urine }}$ flowed freely, and the complaint has never finee returned.

Contrations at this place are fometimes fo violent as for a long time to interrupt the entrance of the bougie; and in ore cafe it was fo ftrong as nearly to cut the inflrument through, after it was introduced. What is remarkable, this happened repeatedly with the fame patient.

70
Appearalces on dir
fection. ral ftructure of the urethra is changed, and the morbid alterations it has undergone may be feen on diffection. There is commonly a contraction at one particular part of the canal; and the appearance of it has been compared to that which would have been given had a packthread been tied round it, or in flight cafes it is a mere

When a ridge is formed projecting into the cavity of the canal, it is found to be a doubling of the inner menbrane, with the cellular fubitance lying between the fold. The internal membrane itfelf is difeafed; it affumes a whitili colour ; becomes much haider, fometimes as hard as cartilage; and in fome cafes this change is confined to the doubling of the ftricture itfelf, whilt in others it extends into the cavernous bodies. Thefe ridges or folds often form over one another, fo that the intermediate portion of urethra becomes proternaturally contraEted alfo; but it never becomes fo narrow as at thofe parts where the original ftrictures were formed. Inftead of a diflinct curtain or fold, it happens alfo in fome cafes that the urethra has the appearance of a cone gradually converging before the ftricture, and diverging in the fame mamer behind it.
The contraction is generally round the whole of the circumference of the urethra ; but it fometimes happens that it is only at one fide, and in luch cafes the urethra does not form a uniform tube, hut it becomes ferpentinc and contorted in various directions.
When one fricture is formed, that portion of the urethra anterior to it is liable to fuffer fome changes, and thefe probably arife from its not meeting with the ordinary diftenfion, the ftram of urine being diminilhed. It is by no means uncommon, therefore, to find in thofe cafes where the original ftricture has been formed near the bladder, another ftricture anterior to it, fo that when an obftruction is found at the glans or four inches and a half from it, mother is generally met with at feven inches, or at the bulb.

From the peculiarity in the form of the urethra, fone parts are fubject to frictures much more frequently than others.

In the adult, and in the relaxed frate, the urinary canal is about nine inches long, and nearly of the fame dimeter as a common quill; but its fize varies at three diliferent points, and there flrictures mof frequently arife. Thefe contractions are at the glans, the buib, and the proftate gland (fee fig. 5. Plate DXIV.) The narroweft part is juft below the bulb, and here ftriequres moft frequently occur.

The natural contraction renders it, in almof every cafe of tricture, the feat of the difeafe. This part of the canal feems alfo to pofiefs an uncommon degree of irritability, as it is here that the contraction takes place in cales of ftrangury. When ffrictures continue long,

Vol. XX. Part I.
and the violence of the fymptoms increafe, difeales arife $\underbrace{\text { Strictures }}$ in other parts.

The urethra between the ftricture and bladder, from the obftruction the urine has to overcome, enlarges, and is fometimes attacked by inflammation.

As in mofl eafes the fricture is attended with a gleet, the glands fituated about the neck of the blarder become difeafed. The bladder becomes extremely thickened, and its capacity diminifhed. From the flong exertions it is neceffary to make in order to overcome the obftruction, and as it cannot contain muels urine, the ureters allo become dilated.

When the difeafe advances ftill farther, fo that it is impoffible to evacuate the blaclder, the obftruction being complete, the urine efcapes by fome new channel ; for as in fuch cafes the parts between the bladder and obAtruction make lefs refiflance than its coats, both on account of their natural fructure, and as thefe parts are generally inflamed or ulcerated, they give way, and the urine takes a new courfe. When this change lias once taken place, fo that no urive pafies through the meatus urinarius, the other fymptoms will differ according as the aperture bas been forned by uleeration of the inner meinbrane of the urethra, or by a fudden rupture. For when the membranous part of the urethra has been croded, a fuppurating carity muft have formed in the contiguous cellular fubftance, and as the urine canrot fo eafily be diffurfed in the furrounding parts, it makes its way without difficulty through the integuments.

But when a fudden rupture or ulceration of the inner membrane of the urethra takes place, as the urine meets with no obfruction in infinuating itfelf into the cellular membrane, it effures itfelf in a flort time over the periňeum, fcrotum, and adjacent parts; extenfive abfceries are formed where the urine was diffufed; and as thefe burft in numerous places, fiftulous openings are formed, which have either a direct or indiref communication with the bladder, and through which the urine continues to pafs till the original obfruction is removed.

Symptoms.-Often this complaint does not become of fuch importance as to give alerm to the patient till many months, or even years, after the original caufe has been forgot. At other times, a few months after a gonorrhoea has been cured, the urine, infead of coming away with the acculfomed eafe, begins to be paffed with fome difficulty. The ftream, in place of being full and even, diminifhes and becomes unequal; fometimes it comes in drops after much ftraining and exertion, has a forked appearance, or fcatters in all directions. From the irritable flate of the parts, the fmalleft quantity collested in the bladder, brings on a define to make water, and a continual uneafinefs all along the courfe of the canal, about the perinæum, anus, and lower part of the abdomen. In moft cales there is a difcharge of matter from the urethra. The gleet is always more fevere after any debauch or venereal act. It comes on immediately after fuch excefs, and gradually diminifhes or difappears. It is aifo not unfrequent to find ftrictures accompanied with that profufe difcharge of mucus from the bladder called catarrius seffice. The irritation communicated to the bladder in confequence of the difeafe of the urethra, brings on inflammation, which is followed by a profufe dicharge of mucus from the whole of its internal furfaec, and this mucus comes away with the uzine, and
$\underbrace{\text { Strictares. is depofited, and firmly adhercs at the bottom of the pot }}$ $\underbrace{\text { in }}_{\text {in the form of a tough tenacious mafs. }}$

Nociurnal emifions are fometimes the only fymptoms which lead us to fufpect the exittence of fricture; for in fome cales the difeafe is neither attended with any fixtd pain in the urethra, nor is there any difcharge of matier.

Fillulas in the perinæum, and along the courfe of the penis, often derive their crigin from an obfruction of the urinary canal.

When, either from irritating injections, bougies, or any other caufe, inflummation comes on, the urcthra is completely flut at the place of the ftricture, and tiet internal membrane giving way, the urine is effufed in the cellular membrane, which gives rife to abfceffes and fiftulous cpenings, through which the urine continues to pafs, till the flricture is removed.

The intlamnation in fome cafes fpreads to the fursounding parts; the muccus glands inflame, fuppurate, and built; and hemorrhoidal tumors often form at the extremity of the recturn.

Befides theefe, the more ufual fymptoms of fricture, there are others which accompany that complaint, and arife from conflitutional caufcs.

The molt frequent of thefe is a febrile attack, in the form of a complete paroxyfm; but it differs from the common intermittent fever, in its floort continuance, its irregularity, and in the violence of its termination. It happens moft frequently to thofe who have been in warm climates; but it is by no means confined to them alone.

People of weak conflitutions have often ficknefs at fomach, naufea, and romiting, and fometimes an uneafy fate of irritability about the flomach, which gets betler when the fricture is relieved.

Gout, epileply, hydrocele, fciatica, eryfipelas, fwellings in the perinæum, occafional fuppreffions of urine, have all been found conne氏ted with ftrikture ; but fuch cafes rarely occur.
There are other difeafes of thefe organs which have fo many fymptoms in consmon with flrifure, that it is neceifary to inquire with much attention into the hiftory and fate of all the fymptoms, before we can judge of the true nature of the complaint; and when there is any reafon to fufpect that an obftruction exifts, it is afccrtained only by the introducion of a bougie; but the mode of doing this will be explained when fpeaking of that inflement.

There are difuafes that ought to be mentioned as being liable to be miflaken for Alicture, and alway kept in view in forming the diagnofis. An irritable flate of the urethra, proceeding from gonorrhoe, is one that is very frequent.

In fuch a cafe there is a difcharge of matter and a puin in making water. The urine flows in a fimall flteam at the commencement, but bcfore it is all evacuated it is of the natural fize. The fymptoms come on a fer liours after coition, but abate in a ihort time, and whenever the irritating caufe is repeated, they return.

The bladder alfo, when irritated, brings on diferafes of the urethra, as thefe parts fympathize fo flrongly with one another; but when the primaty affection is in the bladder, there are aiways fynptums which aid us in difovering the true complaint.

Eulargements of the profiate gland are by far the Strictures. moft apt to miliead our judgement. Scrophulous and fchirrous enlargements of that organ were at one time fuppofed to be very frequent caufes of retention; it is now generally believed that they occur feldem; and are chiefly confined to people advanced in life.

It will be afterwards mentioned how fwellings of the valvular procefs of the protlate are apt to be miftaken for Atricture when a bongie or catheter is introduced. The obftruction in fuch a cafe is always at a diffance, as the canal has increafed in length from the enlargement of the parts.
If attention be paid to this remark, and if the gland be at the fame time examined from the rectum, little doubt will remain of the nature of the dieafe.

It is often difficult to draw off the water when the proftate gland has become thus difeafed: to do this, much benefit will be found in ufing a catheter longer than ordinary, as the common curvc cannot reach the extremity of the urethra from the increafed length of that canal. Pouches or irregularities are alfo apt to form from the unequal growth of the gland; and as the ducts of the feminal velicles and mucous glands become enlarged, thie inffrument ought to be of a large diameter to avoid being entangled by them.

From the idea we have of the manner in which casfes of frictures are formed, we infer that many fubflances fricturé of an irritating mature. whether applied immediately to the parts themfelves, or to thofe connedled with them, may, under particular circumflances, produce this difo cale. The llone irritating the bladder, numerous difo eafes of that organ and proftate gland, irritations in confequence of gonorrhcea, long and repeated ertetions or other flimulants, and the natural difpofition which the urethra has to contract in fome conflitutions, are the common caufes of Atricture. In whatever manner this irritation is produced, the fymptoms and changes obferved in the ftructure of the urtthra, make it probable that there is always a certain degree of inflammation fubfequent to or accompanying it. Obflructions in the urethra were furpofed by Daran, and others about his time, to originate from caufes very different from thole now mentioned. They conceived that the difcharge from gonorth oea proceeded from internal ulcers, and that the cicatrices and indurations they left behind were the moft common caufes of fricture. But fince the nature of the difcharge from gonorrlicea is found very rarely, if ever, to be purulent, and as ulecrs occur very fe!dom, they cannot be conficlered as a common caufe of the difeale in queflion.

Caruacles were alfo fuppofed to be frequent caufes of obllruction in the urethra; but thefe are rarcly met with. One preparation of fuch a cafe may be fen in the mufeum of St Thomas's Hofpital. Drs Humter and Baillie have feldom met with them. Indeed, fince the internal membrane of the urethra fo much tefembles that which lines the cavities of the nufe, mouth, and oxfophagus, and as ulcers in thele parts are more difpofed to form fain and heal, than to produce fungi, fcw cafes of obfiruction can be arcribed to fuch tumors.

The other caufes which prevent the frce difcharge of the urine, are thofe which are attended with no morbid change in the flrugure of the urethra itfelf.

Such are tumors or indurations of the proftate gland, of the velicule feminales, or parts compofing the body

## Chap. III.

$\underbrace{\text { Stricures. of the penis, or of the mucous glands along the courfe of }}$
$\underbrace{-}$ the ca:al.

By far the molt common of thele, is an obstruction into the entrance of the bladder, from a difeafed prottate gland.

This proceeds from a now form which the canal has affumed in confequence of an enlargement of its parts.

Its cavity becames deeper from the growth of its fides, and the poiterior extremity or valvular procefs forms a projecting tumour into the cavity of the bladder, which interrupts the paffage of the urine, or the entrance of a catheter.
From the frequency of this appearance in difeafed proftate glands, it is probable that it is the caufe of difeafes of that organ being often miftaken and treated as frictures of the urethra, and has in numerous inflances not only prevented the introduction of a bougie into the biaduler, but has been the caufe of the formation of artificial paffuges through the fubstance of the gland.
Trentment of Siritlure.-From the erroneous ideas that the older furgeons formed of the nature of ftrictures, it was not to be expeeted that the means of cure they employed were either founded on juft principles, or attended with maich fuccefs.

They made ufe of various external and internal remedies; they prefcribed long and tedious courfes of mercury, and gave many medicines which were fuppofed to have peculiar virtues in curing difeafes of thefe organs.
They fometimes introduced into the canal mechonical inftruments in order to dilate it; and when that was impracticable, a new paffage was made by force, or the difeafed parts were diffeted away, and a new canal formed in the found parts.
Wifeman, fo far back as the beginning of the laft century, exploded many of thefe rude and dangerous practices, and introduced into ufe the waxad candle or bougie, by means of which he faid he "cruthed the carunculi to pieces." He met with cafes, however, where this could not be done; that is to fay, cafes where it was impracticable to paifs fmall bougies into the bladder ; and this led bim to adopt anather mode of treatment. He confumed them by fimulating applications in the following manner. The wax at one end of the candle was fcraped away, and the wick dipped in plafters compofed of alum, red precipitate, calcined vitriol, arugo, and other fuch fubftances, and then it was applied to the caruncle. The ule of "But (fays he), if after doing this you cannot pafs
sauntic pro- the caruncle, you may well conclude it callous; in oofed by which cafe you may pafs a canula into the urethra to you may convey a grain of cauftic into the canula, and prefs the cauflic to it ; and whilft you hold it therc, you will perceive its operation by the prefling forward of the caurtic. The caruncle thus confumed, caft in a lenicnt injection daily; and if you take notice of his urine, you may fee the feparation of the floughs as rags in it. After which you may with the common medicated candles wear away the remainder, and with the injections cicatrize it."

After Wifeman, Daran introduced into ufe a kind of bougies, the particular compofition of which was kept fecret. They were fuppofed to poffefs very great medical virtues; and it was from thefe qualities that their fu-
perior efficacy was fippofed to proceed. Other furgeo:as Strica are"; fivon began to imitate them, and they found that tho ee they made ind the fame qualities as thofe of the original inventor. This led them foon after this to alter their opinion of their mode of action; and, inflead of fuppofing that all the heneficial effects proceeded from the medicines in their compofition promoting fuppuration, cicatrization, \&c. they explained their action on the principle of a fimple wedge.

But however fucceffful their practice might have been in alleviating, if not in curing Ariftures, yet many cafes occurred where the oblatructian was fo complete as altogether to prevent the bougie being introduced. They were therefore obliged to continue forcing paft the obfruction, till the mode of treatment defcribed by Wifeman was renewed, and held out as an original in. vention. The practice, indeed, gencrally followed by modern furgeons is founded entirely on what Wifeman has written; but fince thefe have been better underftood, from the progrefs of pathological invefligation, it has been confiderably modified and improved.

Whers we confider the effeets of thefe modes of practice, and try to reconcile them with the ideas we have formed of the cautes producing the ffricture, it would appear that thofe very means employed for their removal belong to the fame clafs of bodies as thofe originally producing the complaint.

As this cannot be denied, yet it will appear neither furpsifing nor imprabable, when we reafon from analogy, and obferve the effeet of fimilar applications to other difeafed parts, and fimilar phenomena in other organs. It may be here obferved, that the action of any part depends not only on the kind of the ftimulus applied, but alfo on its degree of violence. We know that a flight preflure on the fkin produces uneafinefs or tickling, whila to a lronger degree it paffes unnoticed. A certain degree of light produces ditinict vifion, but a more intenfe one dellroys it. The upper part of the throat is thrown into violent action by a fight irritation, but a more powerful one has no effect. Similar phenomena take place in difeafe; or flight irritations fometimes occafion violent morbid action, whilft thofe that are more powerful not only produce a lefier degree of difeafe, but are even employed to remove fuch as are brought on from a ilighter caufe. We fee this opinion ffrongly confirmed in ulcers, attended with much local or conftitutional irritation. The moit emollient applications in fuch cafes, if they do not increafe the fufferings of the patient, bring no relief; whilft ftrong flimulating ones, fuch as a folution of lunar cauftic, or diluted nitrous acid, feldom fail to diminith the pain and promote the cure of the difeafe *.

In toothach, the irritation produced by the external air on the expofed nervous furface excites much pain and even fymptomatic fcyer; but the application of cauftic or tures. acid deftroys thefe fenfations.

The fame we will find to take place when we confider the nature and the mode of treating ftrictures of the urethra; and if we can prove that frictures have all that variety of character which an ulcer or many other difeafes have, we will be better able to judga of the comparative merit of the different modes of treatment, and be able in fome degree to account for their mode of action.

Stricitures.

## Of the Bougie.

When furgeons attributed all the benticial effects of bougies to their reechanical qualities, the principal deff. deratum was to have them lufficiently pliable to take the curvature of the urethra, firm and elattic to make refiftance, and mild fo as to produce no irritation. But however fimple fuch inftruments might be in their compofition, yet it will appear probable that their ultimate effect is not the fame as that which a wedge produces on inanimate matter. That bougies camot act by their mechanical powers in removing falmodic itricture, appears from thofe cafes where the mere introduction of the inftrument into the urethra, and its contact with the obftruftion, removes at once all §pafm.

The fame thing is obferved in thofe cafes of permanent flricture which are attended with occafional fpafin. In fuch cafes it frequently happens that a bougie finds a complete obflruction on its firft introduction, but after being allowed to remain for Come time in the canal it paffes readily without force. A remarkable cafe of this kind happened, where there was not only a flricture in the urethra, but fiftulous openings in the perinæum and fcrotum, through which moft of the urine was difchared. After much trouble, a very fmall-fized elaflic catheter was paffed into the bladder, and as it gave no pain it was allowed conflantly to remain. For the firft five days the urinc fowed through the inftrument, but afterwards it began to pals along its fides; and gradually as the urethra dilated, larger inftruments were introduced with fimilar good effect.

The filver ftiles ufed by Mir Ware feem to act, in removing obftruetions of the lacrymal paffages in fiftula lacrymalis, on the fame principle as the catheter appears to have done in the above example. The itile, when firt introduced, fills up completely the lacrymal duct ; but in a flort time the tears begin to flow along the fides, and pals into the cavity of the nofe. In thefe examples it is difficult to explain the action of bougies on mere mechanical principles; it feems much more probable that they produce their good effects, cither by a change of action of the living body, or by fome alteration in the ftructure of the difeafed parts. Says Hunter, "Preffure produces action of the animal powers, either to adapt the parts to their new polition or to seccde by ulceration."

When fpeaking of the fymptoms of ftricture, it was obferved, that in order to determine with certainty their prefence, it was necclfary to introduce a bougie. To do this, either with a view of afcertaining the flate of the urethra, or in order to remove a fricture, a good deal of caution and nicety is required ; for as the urethra is generally tender, painful, and eafily thrown into fpafmodic action, any aukwardnefs might entirely prevent the poflibility of afcertaining the naturc of the complaint, or of affording the means of relief.

When, therefore, the operation is to be performed, in order to difcu, ver the kind of obllruction, bougies ought to be provided of different fizes, of a Coft confiffence, * Sce plate and of a cylindrical form*. One of the fize of a DXIV.
$\mathrm{f}_{5}$ 天.
common goofe quill, or even larger, generally paffes Strictures. eafily, and is lefs apt to meet with obllructions before it comes to the ftricture, than one of lefs diameter. Being of a loft confiftence, it readily takes an impreffion of the ffricture, and its blunt point prevents its being entangled by any accidental irregularity.

As it ought always to be rubbed over with oil before being ufed, it generally paffes with little more force than its own weight, till it comes to the contracted part, where it flops. After changing with much caution the direction of the point, by elevating or depreffing the other extremity of the bougie, and perhaps bringing it a little backwards and then forwards, fo as to be fatisfied of the fituation of the fricture, the inftrument may be allowed to remain in clofe contact with it for a few feconds and receive its impreffion, fo that when it is withdrawn, a precile knowledge is obtained of its fituation and form.

Some patients are often to irritable, that any foreign body touching the urethra excites much irritation and pain. In fuch cafes it is the more neceffary not to employ the fmalleft force, and to ufe an application of opium, or fuch medicine, to the perinsum, to prevent thefe inconveniences as far as poffible.

When the fricture lies near the extremity of the urethra next the bladder, the point of the bougie ought always to be confiderably bent previous to its introduction, fo that it may readily accommodate itfelf to the cu:ve of the urethra; for as a large inftrument does not bend eafily, it is apt to prefs on one of the fide of the canal, and give rife to the fufpicion of a flricture.

It is allo of confiderable importance that the point of the inflrument be not conical *. When once we are well * See Plate acquainted with the Atate of the parts, fuch formed infruments may be ufed with much advantage, as the fmall point enters the flricture, and by pufting the bougie forward it is dilated by the bafe of the cone.

It may be alfo here remarked, that in fome inftances a catheter can be eafily introduced when no bougie can be made to pafs; we ought therefore to make ufe of that inftrument before finally deciding on the nature of the obftruction (D).

When a fricture is difcovered, and when bougies are to be ufed with a view of curing it, the firlt thing we are to attempt is to pafs one through it. As the bougie we employ is mof frequently of a very fmall fize, we mun attend particularly to the irregularities in the canal which may entangle the point of fuch a fmall inftrument and the cccafional bendings it may make, while it is fuppofed it is paffing forwards towards the bladder. As the mouth of the lacunre are chietly fituated on the fuperior part of the canal, the point of the bougie ought to crlide along its inferior furface to avoid them.

The bending of the bougie is only to be provented by a forbearance in ufing force, and in directing properly the point; but as the common bougies are apt to do this, it is often extremely uffful to have catgut ones for this purpofe; and it is neceffary to have them very fmall.

In order to overcome the obftruction when the bougie reaches it, the fituation of the point ought to be changed by mifting it backwards and forwards, :nd
from

[^6]tures. fiom fide to fide, and even employing a little preflure, till it palles forwards, provided the furgeon has a clear and diftinct idea of the direction of the urethra.

As the introduction of the bougie almolt always brings on fpafim to a greater or lefs degree on the firlt attempt, it is often neceflary to perfevere fome time before it can be made to pals the thricture; and we mult continue in our endeavours a long time before we declare it impracticable.

Blifters on the perinxum or loins, fomentations of warm water and fpirits, turpentine glyfters, dipping the feet or glans in cold water, anodyne applications, and the internal ufe of camphor, opium, or tincture of iron, all affilt in alleviating the fpafmodic fymptoms when they occur, and may be felected for ufe according to the judgement of the furgeon.

Attention ought to be paid to the compofition of the bougie; for thofe made of elaftic metal, catgut, or elaftic gum, often give pain, while thofe mads of foft plafter are mild and harmlefs.

The time which a bougie ought to remain in the urethra, mult depend greatly on the peculiarities of the cale, for there are no difeafes which appear under more various forms than itricture. In molt cafes bougies can be introduced with little pain, and can remain for fome minutes without inconvenience; but there are others where the introduction not only produces general irritation, but the pain is fo violent, as hardly to allow them to enter the canal, and fometimes they give rife to conAtitutional fymptoms. In the firt cafe, from the little pain the patient fuffers, their ufe has been abufed, and they have been allowed to remain not only when alleep, but they have been worn during the patient's daily em. ployments.

It is found, however, that bougies have a more powerful effect when retained for a fhort time, and often repeated, than when they are longer continued, but feldomer ufed; fo that in no cafe, however little pain they may produce, ought they to be allowed to remain for a Iong time. Many indeed think that all their good effects are obtained after they have remained twenty or fifteen minutes, while others allow them to remain for one or more hours.

In cafes of ftricture accompanied with much irrita. tion, whatever pain the bougie may bring on, it ought not to be thrown afide, but it fhould be introduced re. peatedly whenever there is the lealt abatement of the fymptoms. This practice fhould be continued for weeks before we defpair of fuccefs, as afterwards the pain, from daily habit, will be diminifhed, and the patient will be gradually more and more able to bear it. Whillt we continue the ufe of the bougie, it ought gradually to be increafed in fize as the ftricture gives way, and be introduced once or perhaps twice a-day till the obftruction is no longer felt, and till the urine flows in a full, even, and natural fream.

When this happens we are not to confider the cure as altogether complete; for it is very generally found, that if the ufe of the bougic is at this time given up, the parts foon begin to contract again, as they have fill a difpofition to return to their former fituation, and the-difeafe in a thort time is completely renewed. It will therefore be proper to continue ufing them at diftant intervals, fome time after the cure appeas com-
plete, and give them up in a very flow and gradual man. Strictures. ner.

It may be here mentioned, that it is not neceflary to retain the point of the bougie in the cavity of the blad. der, but merely to allow it to pafs the ftricture.
Of the Cauflic.

In fpeaking of the ufe of bougies, we have fuppofed that it has been practicable to pals one through the flricture; but it is well known, that cales do often occur, where, from the tortuous form the canal has aflumed, the finalleft bougie is prevented from entering the bladder.

In fuch cales, preffure was employed on the difeafed parts, in order to produce ulceration to deftroy the obftruction; but as this mode was found in many cafes to be followed with violent inflammation, and attended with great pain, it was not often performed.

Laying open the finufes, and diffecting out the difeafed parts, was alfo a paitful and no lefs difficult operation, fo that no eafy mode was ever adopted till Wifeman employed lunar cautiic.

From the delicate Itructure of the urinary canal, it was not without much caution, and in very urgent cafes, that this remedy was firn employed; but fince its action was found not to be fo violent, it has been freely ufed by many furgeons, and its application not confined to the more advanced flages of the complaint.

From the time of Wifeman to that of Mr J. Hunter, we find little worthy of remark in furgical writers regarding the ufe of cauftic. The latter of thefe authors, however, again introduced it into practice, and applied it to all thofe cales where he could either do no good with bougies, or when he could not pafs them through the ftricture. In his firft trials he met with fuccefs ; and as he foon improved the mode of its application, he was able to employ it with confiderable advantage.

Mr Hunter's mode of applying caultic was firft adopted by Wifeman; but as the filver canula which he employ. ed, not only gave much pain, but could not be introduced as far down the urethra as a common bougie in many inftances, and as the cauftic could not be applied directly to the centre of the obltruction, a new mode was invented. A piece of cauftic was fixed in the extremity of a common bougie, and covered with the plafler cxcept at the extremity, where a part was expofed, but fo fmall as mercly to form the apex of the conical point of the bougie. In this manner it is found poffible to apply it to almoft all cafes, and when in dexterous hands, may be ufed with conliderable fafety. When it is to be applied to a Aricture, it is neceflary that 价e previous knowledge of the cafe has been obtained from the introduction of a foft bougie. When this has been done, the armed bougie mult be introduced rather quickly, but fteadily, till it meets the Atricture, which we know both from the feel, and from the fituation previoully determined. When brought into contact with the ftricture, it is perhaps better merely to touch it with the cauItic the two or three firt applications, and afterwards it may be retained longer. When the hougie is to be withdrawn, it ought to be done cautioully; for as it has become foft, and the cauftic not fo firmly fixed in it, it may fall out, and be left behind in the urethra. Althong!

Strictures: this inode bas advantages over the filver canula former$1 y$ employed, yet there is a way which we think may be attended with confiderable fuperiority, as it not only requires lefs dexterity on the part of the fu:geon, but is lefs apt to do mifchief.

It is evident, that when the armed bougie is pafled to a frricture, it will unavoidably touch feveral parts of the fide of the canal in its paflage ; and as often its introduction brings on a fpafm, which lafts fome feconds, or even minutes, a confiderable portion of cauftic may be difolved on the found nembrane.

The frequency of the application of the caufic mult be determined by the particular circumflances of the cafe. It thould never be repeated till after the effects of the firf application have ceafed; in general, every fecond day will be found to be enough, but in fome inflances it may be applied daily.

After the ufc of the cauflic, the patient ought to be kept quiet; he hould not make any exertions to empty the bladder, nor take any violent exercife. In general the pain from the cauftic lafts but a few minutes; and the day following, when the flough feparates, a rawnefs is felt on making water.
The application of cauftic to the urethra is, however, often followed by a train of very alarming fymptoms; inflead of a mere burning heat in the parts, the patient is feized with violent pain, followed by retention of urine, fwelling of the teflicles and petinæum, hæmorrhagy, and fometimcs, a complete febriie paroxyfm.

From the fympathy that exilds betwixt the urethra and tefticles, it is not unfrequent to find difeafes of the former produce morbid affections of the latter.
Stone of the bladder and the ufe of common bougies often bring on fiveiling on one or both of the tefticles; and in one cafe the irritation of a bougie brought on an inflammation, which terminated in a hydrocele of the vaginal coat. It is a frequent effect of cauftic, but foon difappears when its ufe is given up.

Strangury has often followed the application of cauftic after any imprudence on the part of the patient; and it generally happeris in thofe cafes where it has been applied near the bladder. This may happen not only from the great fufceptibility this part of the canal has to contract; but it may arile from the bougie palfing a part of the urethra where cauflic had been formerly applied, and which remained fill tender. 'This retention of urine in general does not continue long, and in moft cafes it is relieved by the introduction of a bourgie, or the application of a blifter.

When caullic has not only deflroyed the fricture, but its action extended to the found parts, blood is often poured out into the canal, or is effued into the ce'lular texture of the penis. The hæmorrhage is fometimes very profufe, and fcems to proceed from an erofion of the Ipongy bodies; but as it has, in every cafe hitherto publinied, ceafed of itfelf, no particular means have been found neceffary to fop it. Keeping the parts cool, and giving cold acid drinks, quietncels, and caution againtt all caufes of irritation, flould be attended to. The tumor compofed of effufed blood generally gives little inconvenience, and like an ecchimofis on any other part, it may be removed by the topical application of flimulants.

By far the moft ferious and molt alarning fymptom
which arifes from the ufe of cauftic is an agua or febrile Stricture fit. It begins with a fevere cold flage, which continues $\underbrace{}_{8}$ from fifteen minutes to an hour. This is followed by fervile fir another fit, which lafts fometimes feveral hours, and is fucceeded by a very profufe perfiration, which is much greater than what happens in commun ague. Thefe parosyfins do not return at the fame periods, and feldom occur more than two or three times. When repeated, they become more and more fevere, and every future application of the caulic brings on one fix or twelve minutes after. Patients attacked in this manner become extremely debilitated; and three initances have come under our immediate knowledge where it proved fatal. When fuch a fymptom occurs, the caultic ought to be inmediately laid afide, emollients applied to the urethra, and the patient lupported by corcials.

The caullic too has been lometimes known to fall out Falling ou of the bougie, and diffolve in the urethra. When fuch of the cauan accident happens, if it be not immediately removed, ftic. it may produce a flough of almon the whole extent of the canal, and bring on very alarming fymptoms.

In place, therefore, of fixing a large piece of caultic ${ }^{86}$ in the bougie, take fich a quantily as is intended to be pyine the diffilved on the fricture; reduce it into a fine powder, caufics and fick it on the point of the bougie, by preffing them on one another. When this is done, it may be dipped in warm wax, and receive a this covering of it.

A bougie prepared in this manner may be intreduced down to the ftricture without any rifk of injuring the found membrane; for as the thin layer of wax which covers the cauftic, prevents it being immediately diffolved, it is not till it has been kept fome time in contact with the fricture that it begins to act. By following this plan we not only avoid ingaing the internal membrane, but we diffolve no more of the caultic on the difeafed parts than what is withed for, and there is no ritk from a portion of cauffic being left behind.

There are, however, cafes where a foft bougie cannot be fo eatily introduced as a metallic infrument: in them, a filver catheter, or one made of Smith's elaffic metal, may be ufed with much advantage.

Inilead of the holes being made at the fides of the inflrument, it ought to be peiforated at the extremity, and this hole filled with cautic, and fixed in that fittiation with adhefive plaller. Or, what anfivers equally well, the catheter may be introduced down to the obitruction, and an armed bougie pafed through it.

## Comparative advantages of the Bougie and Caufic.

Thus far we have mentioned the manner in which the bougie or cauflic are to be employed; we now come to confider the peculiar merits of thafe two modes of practice, and to point out thofe cafes where the one is to be employed in preference to the other.
Notwithfanding the zealous advocates which have lately introduced caullic as a general remedy for frictures, we have no hefitation in declaring it as our opinion, that the fimple bougie is the infrument to be preferred in the generality of cafes of this difeafe, and that in all cafes where the cure can be accomplilhed by its means, it flould be adopted. Cauffic, however, is a remady by no means lefs beneficial, though its ufe ought to be much more circumfcribed; for we certainly belicve
dtures. that by its proper application many of the worft cafes of Atricture, cafes indeed which are guite incurable by the bougie, may he benefited by its application.

In thole cales of fpafmodic flicture where the common bongie either cannot pafs the flrictured part, or where it has ne effeet in relieving the fymptoms, cauftic may be ufed with advantage.

It may be alfo employed whenever the fricture is attended with much pain and irritation or conflitutional fymptoms; and in cafes where the contraction of the urechra is as entirely to clofe up the canal, and the urine to come through fiftulous npenings in the frotum and perinxum, the ule of caultic is attended with the beft efficts. We have met with cafes, where during a fucceffion of years, urine has drilled through filtulous openings in the fcrotum, in which fix, eight, or ten applications of the cautic bougie have opened a free paffage into the bladder, and allowed all the filtulas to heal up.

From the rapidity of the cures performed by caufic in comparifon to thole of the bougie, the former a few years ago came into very general ufe, and was tried by different furgeons all over this illand in every poflible variety of the difeafe. In this extenfive field of experiment the merits of caustic have been fairly balanced, and its exaggerated good effects have fallen into difrepute, whilt the calumious reports of its fatal and dreadful confequences in the hands of experienced men, have been ftown to be without foundation. Thus in the midit of medical rancour and difpule, cautious and intelligent men have become acquainted with the good qualities of a moft active application ; and an unprejudiced mind has laid open before it a valt field of obfervation on a difeale which deeply interefts a confiderable number of men.

## SECT. II. Of Strictures in the Oefophagus.

The mucous membrane lining the afophagus, like that of the urethra, is liable to become contracted, forming a fricture. Thefe contractions may be formed at any part of the canal; but it is obferved that there is one fpot more liable than any other to become affected with it. The part alluded to is immediately behind the cricoid cartilages of the larynx, where the fauces may he faid to terminate, and the ocophagus begin. The difeafe appears, on diffection, to confilt of a tranfverfe fold of the internal membrane of the cefophagus, filling up in different degrees the aperture of the canal.

This part of the oefophagus is alfo liable to two other difeafes, whofe fymptoms are ncarly alike, and therefore may be miftaken for flicture. One of thefe is a thickening of the coats of the cerophagus, which extends to the furrounding parts, and in the end moft commonly degenerates into cancer. The other is an ulcer of the lining of the œ'ophagos, which is commonly fituated a little below the ordinary place of fricture, and upon the pofterior or vertebral portion of the canal. Buth of thefe complaints prodice a difficalty in deglutition, and in their early flages are only to be diflinguifhed from fricture, by an examination with a bougie. Stricture appears to be a difeafe more frequent in the early periods of life; while the two other difeafes are more commonly met with at an advained age.

With a view to afcertain the true nature of the dif. Strictures. eafe, it is always neceffary to introduce a bougie. The belt mode of doing this, is that recommended by Mr Everard Home. The patient is defired to pufh the tongue as far as poftible out of the mouth, thus loringing the orifice of the frifture as nearly as pollible in a line with the middle of the pharynx. The bougrie being oiled or covered with mucilage, is then to be thruft down into the ofophagus. When the bougie paffes down to the difance of eight inchos, meafuring from the cutting edge of the front tecth in the upper jaw, the furgeon may he latisfied that it has gone beyond the ufual feat . of fincture; and if it is brought back without any refiltance, he may conclude that the aperture of the ofophagus confiderably exceeds the fize of the bougie which has been ufed. Hut if the bougie flops at fix inches or even lower, he is to retain it there with a uniform fleady prefture for half a minute, fo as to receive on its point an impreffion on the furface to which it was oppofed. If the end of the bougie retains its natural form, or nearly $[$, and there is an indentation like the mark of a cord on its fide, whether all round or only partially, he may decide that the difeafe is a fricture. But if, on the other hand, the bougie pafles without any difficully to the diftance of feven inches and a half, and when brought back the point lias an irregular jagged furface, it is equally clear that the difeafe is an ulcer on the pofterior furface of the offoplagus.

When itristures of the nefophagus have been of long continuance, ulceration takes place on the fide of the Itricture noxt the ftomach. When fuch ulceration takes place, the character of the original dileafe is loft ; and when the ulceration extends upwards, the fricture ilfelf is deftroycd. A bougie paffed under fuch circumftances, will, in general, have its point entangled in the ulcer; and when fo fisilfully directed as to go down into the efophagus, it will meet with a difis culty while it is pafling from the found ofophagus to the ulcer, and again when it leaves the ulcer and reenters the found caral below; and in its return there will alfo be two parts at which a refiftance is felt. Whis may miflead the molt accurate obferver, and create a belief that there are two ftrictures, whereas in fact there is none but an ulcer of fome extent, and a power of contraction in the upper and lower extremities of the osfophagus where they terminate in the ulcer.

Treatment.-The treatment of Aricture in the œfophagus is to be conducted on the fame general principles as ftricture in the urethra.

Bougies which are made much longer and of larger dimenfions than thofe for the urethra, may be ufed with the greatef fafety. At firl, indeed, they fometimes create a good deal of irritation and a febrile attack; and in fuch cafes they muft be employed with the greateft caution. Once in twenty-four or forty-eight hours, according to the nature of the cafe, will be fuffciently often to introduce them ; and they may be difcontinued in proportion to the alleviation of the fymp.. toms. The ufe of cauftic in this fpecies of ftricture has alfo been not only propofed, but adopted; a practice which is more a proof of the boldnefs of its inventor than of his prudence *. It is not to be denied, that fome * Hone oir defperate cafes of the difeafe may occur, where every stritiores.

Stricures. bougie, introduced and applied to the ftricture with much dexterity, may be beneficial. But thefe cales are fo rare, and there are fo few able to ufe this active remedy: properly, that we cannot help thinking it can never be very generally introduced into practice.
^s far as we know, there is no author who has given any accurate account of the various morbid appearances of the extremity of the rectum. Under the general name of hocmorrhoids, a variety of tumors very different from one another have been clafled; whilft under the name of fchirrus, have been confidered all cales where the diameter of the lower part of the inteftinal canal has been ciminifhed. In a practical point of view, thefe obfervations are of the greateft importance, as they lead the furgeon to difcriminate between thofe cafes which are likely to be aided by the ufe of medicines, and thofe which are beyond the reach of att, or which the fame mode of treatment might tend more to aggravate than to alleviate.

In many cafes of the true fcirrbus, or cancerous affection of the intefline, the difeafe firt appears by the formation of one or more griflly tumors on the internal furface of the canal ; and thefe by increafing in number and ia fize, and by involving the adjacent parts, contract the canal, and at laft ulcerate, forming true cancerous fores. But there is another clafs of cafes, in which the diameter of the inteftines becomes narrowed by a thickening of its coats, and which, were we to reafon from analogy, might be compared to that thickening which forms ftricture in the other mucous furfaces, as in the offophagus and urethra. It is the ame cafes that we fufpect Deffault treated with fo
" Oensires
Chirur-
gicales. mucla fuccefs by the ufe of bougies *; and from the good effects of this mode of treatinent in cafes of ftricture in other parts of the body, it is reafonable to expect benefit from their ufe in ftrictures of the rectum. Deflault, however, wifhes it to be underfood that the practice is to be employed in the true fchirrus; but the two cafes which are given in detail by Bichatt in his edition of Deffault's works, in illuftration of the practice in fchirrus, are by no means conclufive. The firt is a cafe of tumors of the internal membrane, which were much alleviated by the compreffion of a bougie; whilt the fecond was a cafe which fhows the relief to be obtained by the ufe of hougies in cafes of fchirrous contraction in the difcharge of the fixces, but by no means in the cure of the difeafe.

In cafes, therefore, of contraction of the rectum which are not of a fcirrhous naturc, befides the friet attention to k:eep the bowels regular, and render the fieces as liquid as poffible by the ufe of laxatives and cinolient injections, bougics made of a proper fize may be ufed with relicf; and, as we have mentioned in another place, the prastice is alfo highly ferviccable in fome cafes of tumors which grow from this part of the inteftine.

> Siect. IV. Of Polypi.

When the mucous mambranc of any part of the body becomes clevated above its natural level, fo as to form a circumicribed fiwclling, the difeafe is called a polypus.

Polypi have beca found on all the different mucous of Poly furfaces; in the nofe, frontal and maxillary finufes, pharyn:., gullet, mouth and gums, meatus externus, conjunctiva, tiomach, inte?ines, rectum, uterus, vagina, biadder, and urethra.

There are four different kinds of polypi, varying from each other in their firucture. Ift, The mucous ; 2d, the Aefry, $3^{d}$, the carcizomatcus; and 4 th, the encyfed polypi.

The mucous polypi have a flippery furface, and are confantly covered with a quantity of nucus. They are of a greyifh or dull white colour, and have a demitranfparent appearance, refembling, particularly at their extremities, a piece of foftened glue. They are eafily torn and bleed freely; they are neither painful nor fenfible to the touch; they fuffer remarkable alterations from changes in the flate of the atmolphcre, extending prodigiounly in cold and moift, and contracting in a dry and warm air. They are of an irregular and angular hape, and often feem to take the particular form of the cavity in which they grow. They are commonly attached by a narrow neck, and are quite moveable.

The fiefby or carcinomatous polypi are of a bright red colour, their furface is fmooth and regular. They are of a rounded form, and are attached by a narrow neck. They are firmer and are not fo eafily torn, nor do they bleed fo readily as thofe of the mucous kind.

The carcinomatous polypi are of a darker red or more purple colour than thofe of the flemy hind, and fometimes they are of a livid hue. They are fupplied by a great number of blood-vefiels, which makes them bleed profufely even when flightly injured, or gives them a difpofition to bleed of themfelves. They are of a very hard firm ftructure; fome of them are as hard as cartilage. They are more or lefs painful, and are very fenfible to the touch. Sometimes the pain is of that flinging lancinating kind which carcinomatous tumors have in other parts of the body. Their furface fometimes ulcerates, and the ulcer aflumes all the characters of a cancerous fore. They are commonly attached by a firm broad bafis.

The encyfed polypi occur leaft frequently. Richter fays that they refemble a reticular fac, which contains fluid fometimes refembling mucus; at other times it is of a thick confiftence. In one cafe we found the mucous mombrane covering the fuperior fpongy bones extended, but not much thickened; and between its folds there were feveral round fernitranfparent veficles, containing a thick glairy fluid.

## SF.ct. V. Of Polypi of the Nofe.

All the four different kinds of polypi have been found growing from the mucous membrane lining the cavity of the nofe; we have alfo feen the fupcrior fongy bone fo increafed in bulk, as to form a tumor refembling the flefly polypus.

The firl fymptom of a polypus in the nofe is a preternatural degrec of rednefs of its mucnus furface. It becomes finongy and callous, and there is an increafed fecretion of mucus. The patient has fome interruption in breathing, and the voicc is rendered more or lefs indiftinct; he feels as if flitted, and he tries to get quit

If Polypi. of fomething which incommodes him by blowing his nofe, for the fame reafon as a perfon does who labours under a common catarrh; the fenfe of fmell becomes impaired, and all thefe fymptoms are more troublefome in wet than in dry weather.

The fymptoms increafe till the extenfion of the mucous membrane increafes to fuch a degree, as to form a diftinet circumfcribed tumor; and the progrefs of the complaint is generally fo flow, that its nature is frequently not fufpected till it gets this length.

By degrees the breathing througi the nofe and the fenfe of finell are entirely deftroyed from the mechanical obfruction of the tumor; and the patient himfelf finds, that by a violent expiration or infpiration, the tumour can be pufhed forward or backward in the nofe.

The preflure which a polypus fometimes makes on the nafal duct prevents the tears from flowing freely into the nofe, and is the caufe of a watery eye.

When the tumor is large, the feptum of the nofe is frequently preffed on, and pulhed to the oppofite fide, and then the refpiration is oppreffed in both noftrils. Sometimes the tumor defcends, and part of it projects through the noftril; when this takes place, the furface of the part expofed to the air becomes like common fkin. This indeed happens when any mucous furface is expofed. We have oblerved it in the vagina when it was inverted, and in the eyelid when the palpebral membrane was turned outwards, from a tumor, or any other caufe.

Morgagni takes particular notice that the natural pofition of the feptum is apt to be miftaken for difeafe, as it very frequently divides the nafal cavity into two unequal portions.

More frequently polypi extend backward into the pharynx, and can be felt by introducing the finger behind the velum pendulum palati. In one rare inftance, we have known a polypus fo large, as to defcend along the cefophagus into the flomach, and in another to fill up the whole cavity of the mouth, and produce fuffocation.

It happens alfo that polypi growing from an extenfive bafe, feparate, difplace, and produce an abforption of the bones which furround them. The bones of the nofe are pufhed upward; the maxillary bones and the palate bones are disjoined, and carried outward; the arch of the palate depreffed; the inferior margins of the orbits are preffed upward, and puth the eyes out of their orbits.

Polypi are found to arife from every part of the nafal cavity ; but mof frequently from the inferior fongy bones. Many furgeons have conceived that polypi arofe from general difeales of the conftitution, as fcrofula, fyphilis, \&c.; but it will in general be found to be a mere local difeafe, and probably to arife from whatever tends to produce a continued or repeated attack of inflammatiun in the part.

Treatment.-If polypi are attached to the upper fpongy bones, their removal will be more dangerous, as the inflammation excited by an operation will be readily conveyed to the brain. When they are attached to the inferior foongy bones, they can be remeved with perfect fafety.

The moft celebrated furgeons have never advifed any operation when the tumor is fmall and gives no diffrefs; but whenever it becomes of fuch a fize as to fill up the Vox. XX. Part 1.
cavity of the noftril, difurb refpiration, and aflume a $\underbrace{\text { Of Polypi. }}$ malign afpect, it ought to be removed.

As long as polypi continue fmall, or when the miscous membrane aequires that appearance which indicates the commencement of the difeafe, tonic and afo tringent remedies are generally recommended, as de: coction of oak bark, with alum; ftrong folutions of white vitriol, faccharum faturni, or muriate of mercury, ardent fyirits, and vinegar. Either of thefe folutions, which may be felected, ought to be thrown up a little warm inlo the nafal cavity with a fyringe, retained there half a minute or more, and repeated four or five times daily; or a piece of chatpee wet with therr may he put into the nofe with a probe, and applied to the difeafed furface. Kino, galls, white vitriol, \&ec. fabine in the form of powder, fnuffed up into the nofe, as fltong as the patient can fuffer it, aro alfo ufeful in ftopping the progrefs of the difeafe. Mercury has been found rather to make them worfe; caultic and other corroding applications have been of ufe in the fofter kind, though they have never produced a cure. Bougies have been recommended by Mr B. Bell, and are faid to have been uffefu; and when the polypus is fmall, they may act on the fame principle as bougies do on tumors of the rectum, a praclice fo fucceefful in the hands of Deffault.

Polypi may be removed either by tying a ligature round their neck, by tearing or twilting them, or by cntting them out with a knife or fciffars.

Operation.-Profefior Richter of Gottingen, and feveral eminent practitioners of this country, ufe, in general, the forceps; and in thofe cafes where the polypus is attached to the inferior fpongy bones, or to any of the inferior part of the nafal cavity, this mode of operation is much more cafily performed, and has the befe chance of fuccefs.

From the foft fpongy texture of the fuperior foongy bones, and ethmoid bone, with which they are connected, there is a confiderable rik of tearing and injuring more parts than is neceffary for the removal of the polypus; and, as any inflammation excited on thefe may fpread to the membranes of the brain, it is mote advifeable to remove polypi attached to thefe parts by the ligature.

When polypi are completely within the reach of the knife, adhering towards the external opening of the noArils, they may be eafily cut away.

In performing any operation, or even making an examination of the fate of the nofe, it is of confiderable importance to attend to the pofition of the forehead, and to employ a proper light.

The head flould be bent backwards; and in order to enlarge the external noftril, an affiftant, on whofe breaft the head of the patient refts, ought, with the fore-finger of his right hand, to prefs upward the point of the nofe; whilft, with a probe in his left, he fpreads out the alx.

Of removing Polypi with the Forceps.-Forceps for this purpofe ought to be fix inches or fix inches and a half long, and the axis at two-thirds of their length diftant from the extremity of the handle; fo that the operator may have the advantage of a long lever. See Fig. I. Plate DXV.

The points of them ought to be blunt, rounded on the outfide, perforated, and a concavity, made rough, I extending

## Plate

DKY゙。
Hic. 1.
oi Polypi. extending to near the axis. The two blades ought to be feparated at their union, when clofed, and not to become parallel till they are opened to a confiderable diftance, in order that the polypus may be held very firmly. The blades fhould be ftrong, and pretty broad.

Even this form of forceps is not always fufficient; and it is ufefal to have a pair of fuch as has been recom-

* See Platemended by Richter *. They are intended to be em-

UXY.fig. a ployed in thofe cafes, where the polypus is fo large as completely to fill the noftril, and fo hard, that the upper part of the blades of the common forceps cannot fufficiently dilate to allow their extremity to pafs down the noftril, and reach the bottom or neck of the tumor.

It is of great importance to fix the forceps as near the root of the polypus as poffible; for, when that is accomplifhed, the whole mafs may be at once removed: and the hremorrhagy is never fo great as if the polypus was torn through the middle.

Often, however, it happens, that the polypus is fo large as to diftend the noftrils in fuch a manner, that it is impollible to difeover the root till the extremity is removed. We muft, in fucls a cafe, remove as much as we are able, and even although the bleeding is profufe, perfevere in the operation as long as we can pull any away with fafety.

When the operation is to be performed, the patient ought, by his own efforts, to punt the body as far forwards as poffible; then the furgeon, with a pair of fmall forceps in his left hand, feizes the point of the polypus, and having kept faft hold of it, he cautioully introduces the polypus forceps on the outfide of the others. The more time that is beftowed on this flep of the operation, the more the polypus becomes elongated and thinner, the more room is given for the forceps, and thercfore the higher up can the polypus be grafped. After it is completely fecured between the blades of the forceps, it is to be twifted flowly round, and at the - fame time pulled outwards. If only a portion of the polypus is removed, what remains is to be extracted in the fame manner. The hremorrhagy is generally profufe, but feldom requires the affiftance of art to ftop it.

Of Removing Polypi by the Ligature.-The ligatures condilt of wire, catgut, filk or cord; and different methods have been employed for pafling them round the root of the polypus. In order to remore a polypus, the anterior part of which is fituated in one of the noftrils, a ligature $(a)+$ is to be introduced through ta double canula (b), and one end fixed round the ring ( $c$ ); whill the other end $(d)$ being loofe, allows the noofe at $a$, to be increafed or diminithed, according to the fize of the polypus. The polypus is to le grafped by a pair of forceps put through the noofe, and drawn forwards. The ligature is then to be carried to the root of the polypus, either by means of the forked probe (6.7.4.), or by one of the porte-nceuds (fig. 5.), taking care to tighten the wire gradually, the further the inflrument is introduced. When the noofe reaches the root of the polypus, the ligature is to be firmly drawn, and fecured by being twiffed round the ring of the canula. If the polypus hangs down helind the velum pendulum palati, the doubled wire is to be flowly infinuated through the nofiril into the throat. The
finger of the furgeon is to be introduced into the mouth, Of Pclypi. and by opening its doubling the noofe paffed over the extremity of the polypus, and conducted to its root, by gradually tightening the ligature, and then it is to be firmly fixed. The ligature thould be tightened once or twice a-day, until the tumor entirely feparates. As there is generally a confiderable degree of fwelling and inflammation of the tumor before this takes place, if it be fo fituated as to difturb refpiration, it may cven be neceffary to perform bronchotomy as a preliminary ftep. Should any part of the polypus remain, it may be deflroyed by cauftic, or the actual cautery, if practicable.

Befides this, which is the common and moft fimple mode of applying the ligatures, there are others which are well adapted for particular cafes. The apparatus employed by Deffault is extremely ingenious and wellfuited for its purpofe, but is more particularly ufeful in polypi of the vagina and uterus.

When this apparatus is to be ufed, two porte-nceuds Deffault's ( $a$ a) ought to be procured, and having pufned the apparatus. cylinder over the branches of the ftalk, fo as to thut the rings (d) completely, a ligature of waxed thread, catgut, or filver wire, is to be paffed through them ( $k$ ), and the extremities may be either held along with the canula or lecured at $e^{*}$.

The two canulas, thus armed, are introduced pa- PlateDXT. rallel to one another between the tumor and parietes of Fig. 5 . the cavity in which it lies; and when they reach its bafe, one is held firm, and the other carried round the bafe, crofled over the other, forming a noofe round it.

The ligature being pulled tight by an affiftant, the two ends are to be put through the hole $(g)$ of the other canula, and fixed to the axis at $h$.

The extremity ( $g$ ) is then to be flipt along the ligature clofe to the polypus; and the ligature being firmly. fixed to the other extremity, the two porte-nocuds ray be at once remored, by allowing the ring to divide, and the ligature to efcape.

This being done, nothing remains to complete the operation. The ligature is kept round the polypus till it drops off, and as the parts begin to give way, it ought to be retained always perfectly tight; and this may be eafily accomplified by turning the ferew at $h$.

The apparatus, too, (fig. 6. Plate DXV.) may allo be fometimes ufeful, from the flexibility of the canula, which conveys and direds the ligature.

## 2. Of the Polypus of the Rectum.

Polypi of the rectum differ confiderably from the common hamorrhoidal tumor, in their fymptoms and appearances. They refemble the flemy polypi in other parts of the body, in their colour and external form, and they are alfo fometimes ulcerated on the furface. On cutting through a large tumor of this kind, we found it compofed of a vaft number of cells, fome of them very large, and all of then filled with blood. Their progrefs is flow, and we have feen them grow as big as a large walnut. They do not alter their fize at different times, as is obferved in the bomorrhoidal tumor, except that they are apt to fwell, when allowed to remain long external to the anus. They are moft commonly fituated in the rectum, clofe to the anus; fo that when the gatient goes to ftool they are pufted downuard:,
of Polypi．downwards，and appear externally．When very large， they are alio apt to come through the anus by the leaft exertion in walking．They are generally attended with more or lefs pain or uneafinefs on going to ftool；and when they become fo large as to come through the anus in walking，the difeafe becomes very diftrefling．They are eften accompanied with a difcharge of mucus． Sometimes，too，hacmorrhoidal tumors are formed con－ tiguous to the polypus；but the latter is generally pointed out by the patient as the original fwelling，and that which gives moft pain．Thefe tumors may alfo be readily diftinguifhed from one another by their differ－ ence in colour and general form．

Trealment．－Afringents，with opium，and bougies， may alleviate the fymptoms；but as they feldom give permanent relief，the moft complete and fafelt mode of cure is removing them with the knife，if they can be readily reached；if not，the ligature is preferable，al－ though it gives much more pain ；for it fometimes hap－ pens，that a very profufe bleeding follows after they have been cut away．The hremorrhoidal tumors which accompany the polypus difappear after its removal．

When they are tied with a ligature，this can be done in moft cafes by fimply tying a ftrong filk thread firmly round the bafe of the tumor．Often the bafe is larger than the apex，and then it is neceffary to pafs through the middle of the tumor a curved needle with two liga－ tures，one to tie cach half of it．To prevent any mif－ take，and accelerate the operation，furgeons make one of the ligatures of hlack，and the other of white thread． Whilf the mortified part is feparating，great attention is neceflary to keep the furrounding parts from excoria－ Ling；and this is to be done by frequently wafling with warm water，or a faturnine folution，and anointing them with faturnine ointments，or the unguentum refino－ fum．Fig．7．Plate DXV．gives an outline of tumors of this kind．

## 3．Polypi of the Gums

Moft frequently are connected with a carious tooth， or of the alveolar proceffes of the jaw bone；fometimes， however，not．They are generally of a firm flcihy texture，rounded form，polihhed furface，and are very apt to bleed；and they fometimes grow to a very large fize，and become malignant．They are beft removed by the knife；and，as they bleed profufely，it is often neceffary to ufe the actual cautery to reftrain it．If the bone is found carious，the difeafed part thould，if poffi－ ble，be removed，or means ufed to affift and promote its exfoliation；and when this has taken place the polypus often difappears without any operation．

## 4．Polypus of the Frontal Sinus．

This is a very rare difeafe，and it produces the fame dreadful confequences as that of the antrum．Art can perhaps venture to do little，as the clofe connection to the brain would render any attempt to remove it dan－ gerous．

## 5．Polypus of the Antrum Maxillare．

The furgeon is feldom aware of the prefence of this difeafe until it is far advanced，and has begun to diftend the bony cavity in which it is formed．It fometimes acquires a prodigious bulk，feparating and rendering ca－ rious the bones of the face，pulhing the eyeball out of
the orbit，and filling up the cavity of the mouth．If Of Polypi． the nature of the complaint is early fufpectect，by re－ moving a portion of the external parietes of the an－ trum with a trephine，the polypus may perhaps be re－ moved from its attachments；but if that is impracti－ cable，ftrong aftringent applications，cauftic or the ac－ tual cautery，or removing portions by the knife，may arreft the progrefs of the difeafe．

## 6．Polypi of the Urethra．

Thefe are what have been called caruncles，and were fuppofed to be the moft common caufe of fricture．It is now，however，well known that they occur feldom． If their growth is not checked by the ufe of a bougie， and if they are not near the meatus urinarius，it may be neceffary in fome cafes to cut in upon the urtethra，in or－ der to get them extirpated；but that mult happen rarely．

## 7．Polypi of the Bladder

Are beyond the reach of the furgeon，but they occur very rarely；and the diftrefling fymptoms which attend this difeafe，can only be alleviated by thofe internal me－ dicines which dilute the urine and allay the irritability of the bladder．

## 8．Polypi of the Ear．

They fometimes grow from the membrana tym－ pani，but they generally arife from the cavity of the tympanum，after the membrana tympani has been de－ ftroyed by ulceration．They refemble the common mucous polypi in ftructure ；and they are moft frequent－ ly accompanied by a difcharge of puriform matter and a total lofs of hearing．They may be removed with a ligature in moft cafes very eafily；or they may be torn out with forceps；and it is always neceflary to touch the part to which they adhered repeatedly with cauftic， and to ufe ftrong aftringent wafhes，in order to pre－ vent their future growth．

> 9. Polypus of the Comjuntiva.

We have never obferved them on the conjunctiva co－ vering the eyeball；but they are formed on the inner membrane of the eyelids，and moft frequently on the upper one．They are foft pendulous maffes，which， being loofe，float beiween the eyelid and ball，and fomc－ times even pafs beyond the edge of the lids．They are of the red colour of the inflamed mucous membrane； but thofe portions which are expofed to the external at－ mofphere become dry，and often drop off．They are often formed in confequence of the membrane being infla－ med by the abicets burfting internally．They are eafily removed by the knife；and they are prevented from being regenerated，by flight fcarifications or the appli－ cation of lunar cauftic to the bare．

## 10．Of the Polypus of the Uierus．

107
Thefe polypi are found to grow either from the fun－ dus，the lower edge of the os uteri，or from the infide of the cervix．The firft is the moft，and the fecond the leaft frequent．The thape of the uterine polypi is generally pyriform，having a very narrow neck．They are commonly of the farcomatous kind；though it often happens that polypi are formed in uteri affected with
cancer. Poiypi protruding into the vagina are apt to be minaken for prolapfed uteri; and this miftake is more likely to take place in fome cates where the polypus acquires a large bulk in the uterus, and is fuddenly protraded into the vagina, and frangulated by the os tinci. Cales, too, of prolapfed uteri have been miltaken for, and treated as polypi.

The lafeft mode of removing uterine polypi is with the ligature. When it is fituated in the uterus, this operation is impracticable; but when it defcends into the vagina, it may be very readily done by the apparatus of Deflault (Plate DXV. fig. 5.).

The formation of aphthe, when they are examined with care in their different degrees, may probably extend our views of the intimate itructure of the mucous membranes. Boerhaave confidered them as fmall fuperficial ulcerations, and Stahl regarded them as tubercles or puftules. From the prefent thate of our knowledge it is difficult to determine whether aphthr arife from the chorion of the mueous membrane, in its papille, or in jts mucous follicles.

Aphthe are formed on the lips, the gums, the interior of the mouth, the tongue, the palate, the amygdalx, the celophagus, and alfo in the fomach and inteftines. They are moit frequent in children and old people, and they have been oblerved in people who inhabit places where the air is tanted, and who live on unwholefome food.

The aphthre of the adult may be confidered as a collection, more or lefs agglomerated or infulated, of white fuperficial rounded tubercles, each about the fize of a millet feed. 'Thefe tubercles difcharge a ferous humour ; the pellicle which covers the mucous membrane is detached, and is progreffively formed in the different parts of the mouth, and even in the reft of the alimentary canal. They are fometimes diffeminated in folitary pullules over the tongue, the angles of the lips, or the back part of the mouth, with a benign character. At other times they are formed and feemingly propagated from the interior of the oefophagus; pafs the back part of the mouth, forming a white, thick, and Atrongly adluering cruft; and thefe are often dangerous from a complication of typlus fever.

The aphthous tubercles vary in colour. Sometimes they are tranfparent; at other times they are white, with a certain degree of thicknefs; they are alfo fometimes of a deep yellow colour, and fometimes they are livid or blackifl, a fymptom which always indicates a greater degree of danger.

Aphche may alfo be frequently obferved in pcople who have taken many courfes of mercury. In thefe cafes, the repeated action of the mercury on the mouth appears to leave on that organ a degree of fenfibility or weaknefs which difpofes it to the difeafe. It happens not unfrequently that thefe aphthe are confidered as remercal fores, in confequence of the venereal difeafe sint having been properly cured; on this fuppofition a uew morcurial courfe is employed, which only augments the difpofition to aphther, and nakes the fores fpread anore rapidiy.

The aphthe of children are preceded by a profound Iecp, by agitation of the muicle's of the face and lips, dif-
ficulty of refpiration, proftration of Arength, fceblenefs of the pulfe, and vomiting. In the mild form of the difcafe, white fuperficial fpots appear in differert parts of the mouth, which are feparated from one arother, and the interfices are neither red nor inflamed. The bottom of the mouth has often been difcoloured, and the heat immoderate; there is no rlificulty in Cwallowing, and the child can readily fuckle; the fleep is natural, and there is a tlight diarthoea. The fpots dusing the firt days preferve their whitenefs and tranfparency; they afterwards become a little yellow, exfoliate in Hakes, and go away entirely about the ninth or tenth day, particularly when the clild has a nurfe.

The confluent or gangrenous aphthe have other characters. The fmall pullules are contiguous to one another, and fpread not only over the lips, the gums, the tongue, and the interior of the cheek; bat we alfo fee thein at the bottom of the throat. The mouth of the child is burning; the lips are with difficulty applied to thie nipple, and lometimes it is excoriated by their contact. Deglutition is very difficult, and the inof fimple dinks given in fmall quantities, and with precaution, do not enter into the fomach but with pain. There is a confiant purging of greenih matter, which inflames and excoriates the fikin round the anus; the child is very feeble and heavy, and the eyes are funk and fhut, and the child fcreans. The whole interior of the mouth from the lips to the throat becomes at laft lined with a white thick cruft, refembling coagulated milk. This cruft becomes yellow, and forms a flough, which, after it falls off, expofes gangrenous ulcers of a dark brownift yellow colour.

Treatment.-In the benign form of the difeafe in children, it is of great confequence to get the child a good nurfe; and the affected parts may be wafted over five or fix times a-day with a piece of caddis dipped in a little water gruel, to which has been added a few drops of fulphuric acid. Borax, either in powder or folution, has alfo been confidered by fome as a ufeful application. When the cruft has feparated, if the remaining ulcer be painful and irritable, its furface may be rubbed over with nitrate of filver, or any other cauftic application. Sometimes very malignant looking ulcers remain in the adult, after the feparation of the cruff. In thefe cafes, cauftic may be employed; and we have often feen them heal rapidly by touching their furfaces once a-day with a weak folution of corrofive fublimate or muriatic acid. For the treatment of the confluent aphthre, fee Medicine.

## Sect. VII. General Remarts on the Hemorrhagy from Mucous Membranes.

All the mucous furfaces are particularly fubject to hamorrhayy; and this may arife either from a rupture of the velfels, or the blood may be poured out by the exhalents.
The fuperficial pofition of the veffels, and confequently their want of firmnefs and fupport, expofes them nuch to rupture by very flight concuffions. We have examples of this in the bronchice, brought on by coughing; in the nofe, by flight blows on the head, or by violent fineezing; and in the refum, by ftraining on going to flool. The effects of flones or gravel on the mucous membrane lining the urinary oryans are the fame; and

Of Hiemotrhagy Fom Mucous Mem. branes.
$S U R \quad G \quad E \quad Y$.
for the prefervation of health; for if it be fuppreffed, 2 as if it liops fpontaneoully, it occafions a variety of nervous affections, fuch as fpalinodic tightnings about the cheft, colic and vertigo.

Treatment.-When the hemorrioidal difcharge has become hatitual like the menftual difcharge, we not only ought not to attempt curing it, but if it be from any caule fupprefficd, it ought to be reftored. If it be the effect of general plethora, it is io be removed by a vegetable diet and moderate exercife. In order to moderate the difcharge, the patient ought to lie in the borizontal pollure on a hard bed, avoid all exercife, keep the belly open by cooling laxatives, or even to tak: acids if the bleeding is exceffive, and apply cold to the loins and perinsum. As a fudden fuppreflion of the ha: morrhoidal difcharge is the caufc of many difeafes, it is of much importance to reproduce it. To effect this, leecles apptied to the anus, and warm fomentations, are the moft eificacious remedies.

## 3. Hemorrlagy from the Bladder (Hematuria).

Hamorrhagy from the bladder is a difeafe moft frequent in old people; it is often occafioned by a fuppreffion of the hemorrhoidal difcharge, or any other accuftomed difcharge of blood. It is fometimes the conlequence of excefs in living and drinking, and of a fedentary life followed by great exercife. It alfo arifes from a plethoric ftate of the fyftem, violent exercife on horfeback, the internal ufe of cantharides, a contufion in the region of the kidneys, or from fone in the bladder.

Treatment. The treatment to be employed is the fame as in hremorrhagy in general. Every thing ought to be avoided which might tend to imritate the kidneys or the urinary bladder. Laxatives, acid drinks, the application of ice to the lumbar region, hypogaftrium, and perinæum, or to the infide of the thighs, is of great importance. Under the articles Medicine and MidWifery, we have confidered the hemorrhagies from. the lungs and uterus. We may here remark the conneetion and frong fympathy which fubfifts between thefe organs, and alfo between them and the other organs of the body; for a minute acquaintance with thefe may often lead to a fucceffful mode of treating their difeafes. When the menfes are fuppreffed, there is often a hæmorrhagy from the mucous membrane of the lungs; and there are allo many cafes of obftruction in the bowels which bring on hamorrhagy both from the lungs and uterus; a hæmorrhagy which never ceafes until the primary affection be renoved.

Sect. VIII. General Remarks on the Ulceration of Mivcous Membranes.

Simple inflammation of a mucous furface feldom, if ever, terminates in ulcetation, moft ulcers of thefe parts having a fpecific character. The venercal inflammation rapidly terminates in ulceration; and aphthe have the fame tendency, forming often what are called phagadenic fores.

The mucous membrane of the nofe is peculiarly fub. jeet to ulceration; ulcers alfo occur in the differert patts of the mouth and gums, in the inteflinal canal, and alfo, though very feldom, in the urelitra. It is
The difcharge of blood from the rectum is a difeale chiefly confined to thofe advanced in life. It is often occafioned by full living, change from an active to a very fedentary life, the abufe of purgatives, particularly aloes; violent paffions, or habitual melancholy. The fymptoms which precede and accompany this difeafe, are bearing down pains, and a fenfation of weight in the back and loins, fometimes a numbnefs in the limbs; and a contracted pulfe, thirf, diminution of urine, fla tulency, and fometimes a difcharge by flool of a white mucus. The difcharge returns commonly in a periodical manner once a month, and thus becomes necellary.
2. Heemorrhergy from thie Rectum, or Fluxus Hemorrhuidalis.
of II.c- even the moft cautious introduction of a found or bougic morrbayy irom Mur ous Men branes.

III
Hæmorrhagy from the nofe arifes from a variety of caufes. We often obferve it after fevers, and then it has been confidered as critical. In young people it occurs very frequently, and from very flight caufes; and it has been fometimes known to take place at the menflual period.
Hremorrhagy from the nofe is generally preceded by fymptoms of an increafed quantity of blood to the head, pulfating motion of the temporal arteries, feeling of weight about the head, fymptoms which are preceded or accompanied by other changes in more diflant parts; fuch as fpontaneous laffitude, pains about the belly.

When the means mentioned for this complaint in the article Medicise have failed, recourfe muft be had to compreffion. Doffils of lint introduced into the noltrils are fometimes effectual ; or the gut of fome frall animal, tied at one end, then introduced by a probe into the nofe as far as the pharynx, and filled with cold water, or water and vinegar, and fecured by a ligature, by adapting itfelf to all the parts, and preffing equally on them, has been attended with advantage. When thefe remedies likewife fail in their effect, a picce of catgut or wire may be introduced through the nofe into the throat, and brought out at the mouth; a piece of fonge, or a bolfter of lint of a fize fufficient to fill the backpart of the noftril, is then to be fixed to it ; the fponge is next to be drawn back and properly applied. Another is to be applied to the anterior part of the nofril and fecured. The fame may be done to the other noftiil, if it be neceffary; or the fponge may be of fuch a fize as to fill the ends of both noftrils at the fame time. By this contrivance the blood not finding an outlet, will foon coagulate, and prevent any farther evacuation.
the firf of thefe only which are to be treated of in this place.

## Of Ulcers of the Nofe, or O zena.

This fpecies of ulcer fometimes appears in the noArils, and fometimes in the frontal or maxillary finus. It generally fucceeds a violent coryza. It alfo fometimes arifes from blows on the nofe, or from the application of very acrid fubftances. Ozwna is often accompanied with inflammation, hæmorrhagy, pains, caries of the bones which fometimes deltroys the palate bones, cartilages of the noftrils; and by hindering more or lefs the free paffage of the air, it alters the tone of the voice.

Treatment.-In the fimple ozæna, much benefit generally arifes from the ufe of aftringent walhes, fuch as a decoction of oak-bark and alum, folutions of fulphate or acetate of zinc, or the acetate of lead. The beft mode of ufing thefe is to inject them a little warmed, with a common fyringe, into the aftected noftril, three or four times a day; and when the quantity of difcharge diminithes and becomes of a better quality, an ointment compofed of the flowers of zinc or the like, fpread on a piece of lint, fhould be introduced once or twice a day into the noftril.

When the ozrena is of a more virulent nature, and the bones affetted with caries, there is generally great reafon to fufpect a venereal taint. This can only be determined by the hiftory of the complaint and the conftitutional fymptoms of the venereal difeafe being prefent. In fuch cafes mercury is the only remedy, and along with its internal ufe the injection of mercurial lotions, and the ufe of fumigations, will be ferviceable. In fuch ulcers as are obflinate, and which do not partake of any venereal taint, a liniment, with an eighth part of the red precipitate of mercury, or a finaller proportion of the acetate of copper, has been recommended by Mr Bell as a ufeful application. In fome cales, too, where, after the vencreal taint is deftroyed by a proper mercurial courfe, there remains an obflinate fore, the above liniment may be ufeful, and it has alfo been found in fech cafes of much advantage, a courfe of farfaparilla or cinchona.

## Chap.IV.

## Of the Difeafes of Serous Membranes.

## Gencral Remarks on the Pathology of Serous Membranes.

Tur phenomena of the difeafes of ferous mombranes are ve:y different from any of thofe of the other textures which have been mentioned. When they are attacked with inflammation, the fetous furfaces often adhere together, or if fuppuration takes place, it is never accompanied with ulccration or erofion of their fubftance. However abundant thefe purulent collections may be, the membranes always remain found, with only a little additional thicknefs; the purulent thind rejected from them, being like the natural fluid formed by exhalation.

The ferous cavitics are alfo fubject to kiemorrhagy, and to preternatural collections of the exhaled fluid.

Under the article Memicrise we have treated of in. Qammation of the pleura, membrancs of the brain and
peritoneum, and alfo of heemorrhagy from thefe organs. Of Afcite In this place we lhall conlider droply and hæmorrhagy from the vaginal coat of the tettes, as the only difeafes belonging to furgery.

Sect. I. Dropfy of the Peritoneum, or Afcites.
When water collects in a confiderable quantity within the cavity of the peritoneum, the fkin becomes dry and fcurfy, and the fuperficial veins varicofe. In one cafe they appeared like large tubes half filled with blood, the anterior part of the canal thin and dry, and the pofterior portion bard and unyielding. The lkin at the umbilicus is fometimes much diftended, and the water feen thining through it as in a common blifter. The water varies much in its appearance; moft frequently it is yellow or brownifh. We have feen it as thick and dark coloured as coffee grounds. In one cafe it was vilcid and tenacious, refembling the white of an egg; and in other inflances it refembled milk and water, with the milk partly curdled. Afcites is generally accompanied with a difeafe of fome of the abdominal vifcera, and moft frequently the liver.
It is not confined to any particular period of life, but has been obferved more frequently in men than in women.
The fymptoms of afcites are, I. The fwelling and fenfe of tightnefs over the belly. 2. Laborious and difficult breathing, efpecially in the horizontal pofture. 3. The diftinct feeling of fluctuation, upon applying one hand to one fide of the belly, and ftriking it with the other hand on the oppofite fide. 4. The urine is in fmall quantity, and of a dark red colour. There is alfo thirtt, a dry fkin, often a feeling of heat, and very frequently øedema of the inferior extremities.
Paracentefis. - When the fwelling becomes large, and operation internal medicines have no effeet in diminifhing it, it is advileable to difcharge the water by an artificial opening, an operation which feldom cures the difeafe, but is always attended with temporary relief, and may be repeated as often as the water is found to collect. Smucker has performed it feventy times, and protracted the patient's life for many years. The operation is to be performed by introducing a trocar * at the linea * See Pta alba, as in a hydroctle, about two or three inches below Dxiv, the umbilicus. Many furgeons now prefer this place, as it prevents all rifk of wounding the epigaftric artery, or any other important part. It was formerly the common practice to introduce the inftrument on the left fide of the abdomen, half way between the umbilicus and anterior fuperior [pinous procefs of the ileun, in order to avoid the liver and epigaftric artery. But thole who laid down this rule were not aware of the change in the relative fituation of parts when difealed; and it has feveral times happened to Mr Cline and other eminent furgeons, in performing the operation at this place, that they have wounded the epigaftric artery, and the patient las died of hemorrbage. The diffection of the abdominal mufcles in patients who hare died of droply, Hows how much the refli are extended in breadth, and the fituation of the epigaffric artery changed.

The place for entering the trocar being determined, and marked with ink, the patient fhould be placed in the horizontal poflure, and in fuch a fituation that the
water can be run off readily into a veffel proper to receive it. But as patients are very apt to faint if the water is fuddenly removed, and no preffure applied to fupport the belly as it is emptied, it is ncceilary to make an equal preffure during, and after the operation. From neglecting this in fome cafes, dangerous fymptoms have arifen, and in one inflance the patient died thrce days after the operation from this caufe.

A piece of flannel as broad as the belly, and divided inio feveral pieces at each end, and thefe drawn acrofs each other by affillants, or the bandage ${ }^{*}$, anfwers for this purpore. By either of thefe modes the belly may be gradually compreffed as the water is let out, and the compreffion continued for feveral days after the operation. Sometimes the water does not come out readily, by a portion of omentum or intelline coming in contact with the end of the canula; but the difcharge may be affited by introducing within the canula a blunt probe, or a lefs canula within the firlt, having fmall perforations at the extremity and edges. After all the water is difcharged, a piece of plafter fhould be applied to the wound, and every caution taken to exclude the admiffion of the external air. The bandage fhould alfo be kept applied, and it may be worn for fome time.

Sect. II. Water colletcol in the Cavity of the Vaginal Coat, or Hylrocelc.
The effufion of water in the tunica vaginalis frequently accompanies hernia, the fcrophulous fchirrus, venereal and other enlargements of the tefticle; but in fuch cales, it is merely to be confidered as a fymptom accompanying thefe diforders. Mr Home mentions cafes where it was a fymptom of fricture. It occurs alfo during the abatement of inflammation of the tefticle; and fometimes more or lefs of the water remains after the intlammatory fymptoms have difappeared. In cafes of this kind the tunica vaginalis is generally found thickened, and there is an effufion of lymph over its furface and over the furface of the albuginea. In many cafes, the water is collected where there is no apparent alteration in the ftructure of the parts. The difeafe in fuch cafes moft probably arifes either from a diminithed $a b$. forption or from an increafed exhalation. If the difeafe has been of long duration, the tumica vaginalis is generally thickened, to a great degree fometimes; and particularly in old people it becomes hard or cartilaginous. We have feein feveral preparations where it was converted into a thell of bone. We have met with two cafes where a round fubflance refembling cartilage was found floating loofe in the water of a hydrocele. It is not uncommon to find the veffels alfo of the fpermatic veins become more or lefs varicofe. Collections of water of a very confiderable fize form fometimes after birth (wind rupture); but in old people they are mof frequent. The water is ufually collected only in one cavity; but it fometimes happens, that in confequence of adhefions between the tunica vaginalis and teflicle, feveral irregular flaped bays are formed in which it is contained. The watcr ufually collects in one fide of the fcrotum, fometimses alfo in both. The water is generally clear and Araw-colourcd, fometimes it is coloured with blood, fometimes yellow or brown, and fometimes thick, and like coffe grounds. See Morgagni, Ep. xxyviii.

The quantity of water varies. In the Act. Erud. Lipfienfis 1725. P. 492, there is mention made of a cafe $\underbrace{\text { Mifydrocele. }}$ which contained forty pounds of fluid. Doight faw one which contained four pounds. There are fometimes alfo lydatids found along with the water. Irichter has met with four cafes of this kind.
Symptoms.-1. The ferotum is commonly of a pyramidal form, and the corrugations of the external fkin are deflroyed in proportion to the bulk of the fwelling. The flape of the tumor, however varies; in fome cafcs, it is very globular, and in others it appears like two fwellings joined. It is even altered from the manmer in which it is fufpended; if a bag trufs has been worn it is ufually oblong. 2. The fivelling gencrally hegins at the lower part of the ferotum, and as its bulk increafe:, it gradually afcends towards the abdominal ing. 3 . It appears pellucid when held between the cye and a candle; but this is not a certain prognoftic, as the tranfparency is deftroyed when the tunica vaginalis is thick and hard, or when the water is turbid and dark. 4. It gives the diftinat fenfation of fluctuation. In fome cafes, however, the degree of thickening of the tunica vaginalis renders the fluctuation obfeure or impercep. tible, and alfo deftroys its tranfparency. 5. The tunnor cannot be made to recede or change its fituation from preflure or change of pofture of the body. 6 . The tefticle is involved in the fivelling, and can be diftinguifhed like a firm unyielding mafs at the pofterior part of it. In cafes where adhefions have been formed, the pofition varies; but the patient generally knows where it lies, and preffure applied to the part of the fwelling where it is fituated gives pain. Sometines the tefticle is placed at the under part of the fwelling, fometimes in the middle. Mr. Bell felt it twice forwards. Sometimes along with the water there are hydaticis floating in the cavity of the vaginal coat. Sommering fays, that he has often obferved this appearance. 7. The fpermatic cord can be readily diflinguifhed unaltered. 8. The tumor gives little or no pain, and the patient fuffers merely from its bulk. 9. The growth of the fwelling is generally very flow, and fometinnes years elapfe before it becomes a great inconvenience; fometimes, however, it forms rapidly. When it grows very large, the integuments become thick, and the veins varicofe; if the fwelling extends up to the inguinal ring, the cord canmot be felt, and the penis is fometimes fo much involved in the tumor, that it appears like an umbilicus or piece of corrugated ikin.
Treatment.-In children, the water generally difappears in a thort time, by the application of frong affringent or difcutient applications. In fome cafes, the difeafe advances fo flowly, that it is fufficient to wear a fufpenfory bandage. Richter mentions a cafe where it was twenty years old before it was neceflary to remove the water. When the fwelling becomes fo large as to render it neceffary to difcharge the water, the operation may be either palliative or radical. The object of the firft is merely to remove the water, after which the difafe commonly returns; and by the fecond, an adhefion is intended to be produced between the furface of the vaginal coat and albuginea, and confequently the cavity in which the water was collected entirely obliterated. In making choice of thefe noodes of treatment,

Of it is neceinary to attend to the following rules. I. When operation; and afterwards when it has again collected in lefs bulk, the radical one may be employed. 2. When the ftate of the tenicle is not accurately afcertained, it is better firf merely to difcharge the water, which allows it to be completely examined. 3. The palliative operation fhould be employed in all cales there the difeafe is connected with a morbid flate of any contiguous organ. 4. In all other cafes, the radical operation is preferable.

Palliative Operation.-The matter may be difcharged either by a puncture made with a lancet or by a fmall trocar.

* See Plate DNIV.

When the trocar * is to be introduced, the pofterior part of the tumor fhould be firmly grafped in the left hand, fo that the fluid is puthed to the anterior and inferior part of it. A puncture is to be made, with a lancet, through the integuments at the moft prominent part of the fwelling, large enough to admit readily the trocar, taking care to avoid any large fuperficial vein. The trocar is then to be pulhed through the coats of the tumor perpendicularly; but when it has entered the cavity, which is known by the feeling of a fudden want of refiftance, the point ftoould be directed upward, and carried forward a fufficient way; fo that the furgeon is aflured of its being within the cavity fo far that there is 110 rifk of its falling out.

After all the matter has been allowed to flow out, and the canula withdrawn, the wound flould be covered with a piece of flicking plafter, and the fcrotum fupported by a fufpenfory bandage. If the operation is to be done with a lancet, an incifion thould be firf made through the fkin, rather larger than what is neceffary into the cavity. Then a puncture is to be made through the tunica vaginalis, which will allow the water to flow out ; and the difcharge may be affifted by the introduction of a probe, director, or hollow tube, into the opening. The trocar fhould always be employed for this operation, except when the hydrocele is fo fmall that the tefticle would be in danger of being wounded by it, or when there is any enlargement of the teflicle accompanying the hydrocele, which is not well undertood, or if the tunica vaginalis is extremely thick and the fluctuation not diftinct.

Radical Operation.-An obliteration of the tunica vaginalis may be produced either by an effufion of $/ \mathrm{ymp} / \mathrm{h}$ on the furfaces of the tunica vaginalis and albuginea, or by the procefs of granulation. The firft is effected by injecting into the cavity a flimulating fluid to produce inflammation and adhefion; the fecond is by laying open the cavity to produce inflammation and fuppuration, and to allow it to fill by granulation.
By Injection.-Dr Monro primus firt propofed and adopted this ingenious, yet fimple mode of cure ; and it is now that which is moft generally practifed in all cafes not attended with any peculiarity or puzzling fymptom. The fluid contained in the tunica vaginalis, is to be difcharged by a thocar, in the manner recommended in the palliative treatment. The trocar for this purpofe fhould he of a rounded form, which is cither altogether cylindrical, or only a finall fit at its extremity; for that of Andrr, which is flat and flit up at both fides, is apt to allow the fluid to be effufed into
the cellular membrane of the fcrotum ; an accident which we have feen repeatedly happen, and always fru- Hydrocele ftrates the object of the operation.

The fluid is then to be imjected through the canula either by a fyringe (Plate DXIV.), which has a moveable fop-cock, that it may be filled as frequently as is necellary, or by an elaflic bottle, which has a valve in its pipe, fo as to allorv the fluid to pars forward, but to prevent its exit. It is not neceffary to inje $\delta t$ as much fluid, as there was water in the hydrocele; it anlwers well to fill the cavity moderately and by gentle frokes on the fcrotum agitate it over the whole furface. The fluid moft commonly employed is port wine. Some recommend it to be diluted, but it is better to ufe it pure, and allow it to remain a longer or hoiter time according to the degree of pain it excites, and the general irritability of the patient. In hofpitals, other fluids are ufed, as being lefs expenfive. Mr Cline of St Thomas's holpital employs a folution of the fulphate of zisc 3 i. ad 1 bi . From five minutes to a quarter of an hour is in moft cafes a fufficient length of time to allow the wine to remain. If it excite fevere pain in the tefficle or cord, it may be detained more or lefs time. A confiderable degree of uneafinefs is always to be withed for in order to fecure fuccefs in the operation. After the wine is withdrawn, the wound fhould be covered with a piece of fticking plafter or caddis; the fcrotum well fupported with either pillows or a trufs, and the patient put to bed. The operation excites more or lefs fwelling in a longer or fhorter period. The medium effect on the tefticle is to caufe it to fwell about the bulk of a turkey's egg in four or five days; and the furgeon thould, by purfuing the antiphlogiftic regimen, moderate as far as in his power the inflammatory fymptoms to that pitch, and by an oppofite treatment bring them up to that degree fhould they be too mild. Low diet, local or even general blood-letting, purging, the horizontal pofture and fomentations, are the moft powerful means to arref inflammation; but if the patient has little pain, he fhould live on a nourifhing diet, and fome local ftimulant may be applied over the ferotum until a fufficient degree of inflammation comes on. If the inflammatory fymptoms abate, the fwelling difappears; and it is advifable to wear always afterwards a bag trufs to fupport the whole fcrotum. In fome cafes the watcr again collects, and then the operation thould be repeated; but it requires caution, as the relative fituation of parts is fometimes altered from fome partial adhefions having formed between the tunics.

We have fect frequently cafes whore it was thought that the water has been regenerated a few days after the operation, which fwelling afterwards difappearect. This probably arifes from an effufion in the celiolar membrane, but it requires no particular treatment.

By Incifion.-After grafping the tumor firmly, an incifion is to be made through the Rin with a fcalpel, from its fuperior to its inferior part. A puncture is to be made towards the upper part, with a lancet, large enough to admit the point of the fore finger ; the fluid is allowed gradually to efcape through the opening; and the tunica vaginalis is to be laid open its whole extent with a probepointed billoury in the fame direction as the incifion through the integuments. Pledgets of lint dipped in

Of oil, or coveral with fimple ointment, are to be put between the lips of the wound, down to the bottom of the cavity, one on each fide of the tefticle; and the edges of the fcratum are to be brought together either by firaps or liuture. A fingle ligature put through the integuments oppofite the teflicle, anfwers ben, and prevents the teflicie from being pulfed without the edges of the wound in confequence of the degree of fwelling the operation occafions. The whole flould be covered with a pledget of ointment, and fuffended in a tight bandage.

In ihree or four days after the operation, the external dreffings hould be removed; and in oine or two days more, the pledgets interpofed between the tunica vagimalis and tefficle may be taken away and renewed. The ligature flould be cut out whenever the fwelling of the parts begins to abate, or at any time when it appears to create irritation. During the cure, great care fhould be taken, firlt, by the introduction of flips of plafter, to prevent the union but from the bottom; fecondly, to guard againdt the collection of matter in any cavity; thirdly, to prevent the lips of the wound feparating far, thus expofing the teflicle and protracting the cure; and fourthly, to lay open freely any finufes which may form. The cure goes on much more rapidly by perfevering in the horizontal poffure, and keeping the fcrotum well fupported. The bowels hiould be always kept open and regular, and when fuppuration has begun, the pa$\therefore=6$ tient's itrength fhould be fupported by a nourifting diet ien to le and bark or port wine, if neceflary. The cure takes from ipted. three to eight weeks in moft cafes. This mode of opcrating, is the mof eligible when there is any ambiguity in the cafe, as it allows the teflicles to be accurately examined, and caftration performed if neceffary. It ought alfo to be performed when the tunica vaginalis is much thickened and hardened, and it is fometimes neceffary, even to cut away fome of the hardeft portions. The mode of curing hydrocele by a feton, cauflic, \&c. are now generally given up.

Sect. III. Dropfy of the Thorax, or Hydrothorax.
The fluid is fometimes confined to one, and fometimes affeets both fides of the cheft. It is commonly of a brown or yellow colour; fometimes it is reddih from a mixture of blood. Its chemical qualities are thofe of ferum. When it is accumulated in a large quantity, the lungs are more or lefs comprefled. Dr Baillie has feen a lung not larger than the clofed fift. It is alfo in fome inflances accompanied with adhefions between the furface of the lungs and pleura.

The exiftence of water is known by the following fymptoms. Refpiration is fhort and difficult; and the patient cannot reft in bed, except the head and trunk be elevated from the horizontal pofture. The neep is often interrupted by alarms and difagreeable dreams, and the patient fuddenly flarts from it with a fenfe of fuffocation: he is unable to ftonp much forward, or raife any thirg from the ground. There is fometimes a teaf. ing cough, with little expectoration. During the progrefs of the difeafe, the pulfe is very variable; but it is generally irregular. The countenance is pale, and the lips and cheeks of a purple hue. The urine is diminilhed in quantity, and of a high colour. The bowels are generally confipated. The fect and legs are comVoL. XX. Fart I.
monly anafarcous. The undulation of a fluid may be heard by the patient himfelf, and moving the hody by fudden jerks will fometimes affilt in difoovering the difeafe. The affected fide has in fome cafes been obferved to be enlarged.

This dileale is treated by the exhibition of internal medicines, where the quantily of water is fmall; but when it collects in fuch a quantity as to threaten fuffocation, it ought to be dilcharged by an opening made into the cavily of the thoras. The incifion ought to be macie between the fifth and fixth ribs, half way between the fernum and fpine; two incles in length through the ikin. The fubjacent parts ought to be cantioully divided; and the incifion thould be direatad rather towards the upper part of the fixth rib, to avoid wounding the intercoftal artery and nerve, which creep along the inferior edge of the fifth rib. The pleura, which is dittinguifned by its bluifh colour, Mould be carefully cut with the point of the knite ; fo that, in cale of adheion, the lung is not wounded: and if the water flows out, a canula fhould be introduced into the open. ing. If it does not, in confequence of adhefion, another incifion mult be made. Great care thould be taken to prevent the admiffion of air, and for that purpofe, the opening flould be made valvular, by pulling up the flin which is to be cut through. If the quantity is very great, it may be drawn of at two different interval, ; or if it is collceted in both cayitics of the thoras.

## Sect. IV. Droffy of the Pericardium.

Water is fometimes found in the pericardium when there is none in any other cavity of the thorax, but it is generally accompanied with a collection of water in fome of them. The fymptoms of this difeafe are nearly fimilar to thofe of hydrothorax; and we find that Deffault and other very eminent furgeons have not been able to difinguifh them. Dr Baillie fays, "that the feeling of opprefion is more accurately confined to the fituation of the heart; and the heart is more difturbed in its funclions in droply of the pericardium than in hydrothorax." It is alfo iaid, that a firm undulatory motion can be felt at every ftoke of the heart.

If the exiftence of this conplaint is afcertained, and if the quantity of water is fufpected to be great, it may be perhaps advifable to difcharge it, as practifed in one cafe by Deffault, by making an opening between the fixth and feventh ribs of the left fide, oppofite to the apex of the heart.

> SECT. V. Blood effufed in the Tunica Vaginatis.

The effurion of blood within the cavity of the va. ginal coat is characterifed by the fudden appearance of the tumor, by its wanting the tranfparency of a lyydrocele, by its greater weight, and by its bcing moft commonly occafioned by fome accident. It is ufually produced by the trocar ufed in performing the palliative operation wounding a veficl which pours its thood into the vaginal cavity; it is fill more apt to happen when a lancet is ufed and a varicofe veffel punctured. It alio takes place from the rupture of a varicofe veffel by the fudden depletion of a large hydrocele.

If the fwelling is fmall, it may difappenr by the local K
ufe

Oi ufe of difcutients and ftimulants, fuch as folutions of Ganglions. faccharum laturni, or that of alum, vinegar, \&c. If it does not yield to thefe, and if it has acquired a confiderable bulk, the blood thould be difcharged by an incifion; and any bleeding veffel either fecured by a ligature, or by flrong itimulants, and the wound afte:wards treated as in common hydrocele.

## Chap. V.

## Difeafes of the Sinovial Membranes.

Sect. I. General Obfrruations on the Pathology of Sinovial Membranes.

The difeafes of the finovial membranes are much more limited and lefs underitood than thofe of the textures which we have examined. They do not appear to be fympathetically affected in the difeafes of other parts. In the acute difeafes of the important vifcera, the fkin, the mucous furfaces, the cellular membrane, the nerves, \&c. are more or lefs fympathetically affected, whilft all the finovial membranes remain undifturbed. In this refpect they refemble the bones, cartilages, and fibrous membranes. Neither is the finovial fluid fubject to the different alterations, which we obferve of the ferous fluid. We never find any preternatural membranes formed on the articulating furfaces; and the preternatural collections of finovia never contain any of the white floculent matter fo frequent in ferous collections.

The finovial membranes are fubject to inflammation, and are probably the feat of many of thofe pains about the joints which are fo frequent. Their fluids are alfo fometines increafed to a preternatural quantity, and chalky or earthy depofitions are sllo occafionally found in then.

## Sect. II. Of Ganglions.

An increafe of the finovial fluid in the burfe, or tendinous theaths, forms a fpecies of dropfy called a ganglion. It is not, however, probable that thefe tumors are always formed in a natural finovial capfule : moft commonly they are accidental, and are formed in the cellular membrane; for they are frequently found in parts where no natural capfule exifts. They are moft frequently met with over the tendons upon the back of the wrift, and often likewife about thofe of the ankle and other parts of the extremities. When preffed, they are found to poofefs a confiderable degree of elafticity, from which, and from their fituation, they may generally be diffinguified from other encyfled tumors. They feldom arrive at any great bulk, are not often attended with pain, and commonly the Rin retains its natural appearance. On being laid open, they are found to contain a tough, vifid, tranfparent fluid, refernbling the glaire of egg, which is allo fometimes of a reddifh colour.

They are generally penduced by fprains or contufions of the juints, or by theumatifm. In many inflances, they go off infenfibly, without any affilance from art; but as this is ofien not the cafe, means ought to be ufed for removing them. For this purpofe, friction frequently epeated, or felttle compreflion applied to them by means of thin plates of lead and bandages, femetimes se-
move them. In fome infiances they have been removed by the application of blifters; but the moft certain method is, to make a fmall puncture into the fac, or to draw a cord through it; or, after the puncture is made, to prefs out the contents, and then inject fome gently flimulating fluid, as port wine and water heated bloodwarm.

## Sect. III. Of Collections within the Capfular Ligaments of the Joints.

Collections here may confift of ferum, blood, or pus and fynovia combined. They are molt frequently met with in the joint of the knee, and may be produced either by internal or external caufes. Thefe kinds of collections may in general be diftinguifted from each other.

Watery effufions, commonly called dropfical fiwellings of the joints, arife chiefly in confequence of levere rheumatic complaints ; and when the tumor is not very large, the fluctuation of the tluid may be felt by preffure. When a large effufion appears immediately after a violent bruife, it is probable that it confifts chiefly of blood: but when it fucceeds a violent fprain, attended with great pain, inflammation, and fwelling, terminating in an effufion, there is every reafon to think that the contained fluid confifts of pus mixed with fynovia.

Swellings of the joints are moft apt to be confounded with collections in the burfar mucolix, or with natter eflufed in the adjacent cellular fubftance. From the firft of thefe they are generally difinguifhed by the contained fluid paffing readily from one fide of the joint to the other, and from its being diffufed over the whole of it ; whereas, when it is contained in the burfxe, the tumor is corfined to a particular part, and is feldom attended with much pain.

When fuch collections can fafely be allowed to remain, the capfular ligament ought never to be opened, as they can often be removed by difcutients. Even confiderable collections arifing from rheumatifm may commonly be difcuffed by friction, fomenting the parts with warm vapour, keeping them conflantly moift with faturnine folutions, covering them properly with flannel, and applying blifters. When thefe fail, fupporting the part with a laced focking, or with a roller, has frequently been of fervice. But whether a rheumatic tumor can be difcuffed or not, it ought not to be opened; for the inconvenience attending it is more colerable than the pain and inflammation which may enfue. But when the matter would do mifchief by lodging, it fhould be difcharged. Effufed blood and matter which fucceed high degrees of inflammation are of this kind. Blood is frequently extravafated among foft parts without much detriment; but when in contact with cartilage or bone, it foon injures them. The matter ought to be difcharged fo as mofl effectually to prevent the admiffion of air into the cavity of the joint. Fur this purpofe the opening flould be made with a trocar; and the fkin, previoufly drawn tight to the upper part of the tumor, flould be pulled down immediately on withdraving the canuls. A piece of adhefive plafter flould be immediately laid over the opening, and the whole juint thould be firmly fupported by a flannel rnller carefully applied. If the pationt be plethoric, he flould be blooded to fuch au extent as his ftrength will bcar ; he
the Dif fhould be put upon a frict antiphlogiftic regimen, and es of the in every refpect fhould be managed with caution; for Bones. inflammation being very apt to enfue, we cannot too much guard againtt it.

## Sect. IV. Of Moveable Eodies which are found within the Sinovial Casfules.

Moveable bodies have been found in many of the finovial capfules of the human body. But they are moft frequent in the knee joint; and it is there only where they require furgical affiftance. There bodies are gencrally compofed of cartilage in the form of lamclla, and there is often an offeous concretion in their centre. The caufe of their formation is not known; but it is probable that they are formed by a gradual depofition of the cartilaginous matter on the articulating furface. They have been often met with, attached by narrow necks to the finovial cavity ; fo that when this attachment is defroyed, they float loofe in the cavity, and undergo perliaps but little future change.

When they occur in the knee joint, and acquire fuch a bulk as to obftruct or derange the motions of the joint, it then becomes neceflary to semove them. This ought to be done by bringing the moveable body to the outer part of the joint, and making a valrular incifion of fuch a fize as admit of its extraction. Sometimes much inHammation fucceeds this operation, which ought to make us careful in choofing a proper time for performing it, and in ufing every endeavour to reprefs any inflammatory fymptoms afterwards.

## Sect. V. Of the Spina Bifida.

Spina bifida is a tumor which fometimes appears upon the lower part of the fpine in new-born children. A fluctuation is diftinctly perceived in it, and the fluid it contains can in fome meafure be prefled in at an opening between the vertebre. In fome cafes this opening is owing to a natural deficiency of bune; in others, to the feparation of the fpinous proceffes of the vertebre.

The difeafe proceeds from a ferous looking fluid collected within the coverings of the final marrow. It is always fatal. Children labouring under it have been known to live for two or three years; but, in general, they linger and die in a few weeks. All that art has been able to do is to fupport the tumor by gentle preffure with a proper bandage. When a tumor of this kind is laid open or burfs, the child generally diesin a few hours. A tumor nearly of the fame nature with this is iometimes met with upon different parts of the head in new-born children : it is formed by a tluid lodged beneath the membranes of the brain, which have been forced out at fome unoflified part of the fkull. What we have faid with refpect to the former is exactly applicable to $t^{\text {his difeafe. }}$

## Chap. VI. <br> Of the Diferfes of the Bones.

Sect. I. General Remarks on the Pathology of the Bones.
The difeales of bones are remarkable for their flow progrefs, in comparifon with what is oblerved in the other organc. Inflammation proceeds extremely flowly, and callus is remarkable when compared with the cica.
trization of othcr parts, for the length of time neceffary Of the Diffor its formation; the origin and progrefs too of an cx. ealcs of the oftolis is very different from a tumor of the foft parts, Hones. as we obferve in phlegmon. Suppuration tno, which requires only a few days in other organs, takes months before the fame procefs is completed in bones. Tliere is alfo a ftriking difference between a gangrene of the foft parts and a caries or necrofis of the bones. In the natural flate the bones have no fenfibility, but when difeafed, they are often the feat of acute pain; we obferve this in the Jpina ventofa, in carics, necrofis, \&c. Befides the changes to which the bones are fubject from inflammation and various accidents, they alfo fuffer al. terations in their hardnefs and fofmefs. Preternatural growths aifo form upon them; and they are liable to abforption.

Sect. II. Of Particular Difeafes of the Bomes. ${ }_{3} 6$
The bones, as well as the fofter parts, are liable to be fwelled, either throughout their whole length, or to have tumors formed on particular parts of them.

Exoltofis is one fpecies of tumor of the bone. Ac- Exofofis. cording to Mr Bromefield, no fwelling thould be called fo, but an excrefcence continued from a bone, like a branch from the trunk of a tree. Under this head therefore is ranked the benign node, which may be produced by external injury, fuch as contulions and fractures: it can hardly be called a difeafe, as pain feldom fucceeds, but rather a deformity.

There are rifings or tumors obfervable on the bones Tophus. which are often the confequents of venereal virus, and are termed tophi, gummi, or nodes.-Tophus is a foft tumor in the bone; and fcems to be formed of a chalky fubfance, that is intermediate between the offeous fibres. Thefe cretaceous extravafations are fometimes found on the ligaments and tendons, as well as on the bone; and may fornetimes be taken out by the knife. We have many inftances where chalk fones in gouty people make their way out through the fkin of the fingers and toes.

Gummi is a foft tumor on the furface of the bone, be-Gummi. ${ }^{{ }^{2} 39}$. tween it and the periofteum; and its contents refemble gum foftened, from whence it has taken its name.

The confirmed venercal node has the appearance of a venereal divarication of the offeous fibres. When the periofteum node. is thickened, but the bone not affected, a courfe of mercury will often produce a perfect cure: but when the bone itfelf is difeafed, this method will often fail. But here the divifion of the extended periofteum has been known to give perfect eafe.

The ufual method, formerly, was to apply a cauftic cqual to the extent of the node, which being laid bare, required exfoliation before it could be cicatrized. If the incifion is made early, that is, before matter be formed under the invefting membrane, it feldom requires exfoliation; and, as we often find that the bone itfelf is not affected, but only the periofteum thickened, we may be deceived even after a careful examination : it is therefore proper that the patient fhould be pretty far advanced in a courfe of mercurial unction before even the incifion is made; for, fould the tumor decreafe, and the pain abate during the courfe, chirurgical affiftance, with the knife, moft likely may become unneceffary.
of the Dif A bone may become carious firt in its internal parts; tines of the and that from extermal injury, as well as from a vitiated Bones. fate of the animal-fluids. Authors feen not to agree

Cars: as to the technical tern for this hind of difeafe of the bones; fome calling it cancar or gangrena offis; others, $\int_{p}$ ina ventofa, frons the pointed extuberances ufually attendant on this diforder of the bone; and fome again, tcrelo, from the appearance of the caiious bone, like wood that is worm-eaten.
ADEAS.
It is univerfally allowed, that this difeafe takes its rife from matter being formed either in the diploe, or in the marrow: whenver obltruction is begun in the veffels expanded on, or terminating in, the medullary cyfts, the confequense will be in?ammation, and, if not early removed, matter will form; for this reafon this cafe may be called abfeeflus in medulla. Whenever, then, a aatient complains of dull heavy pain, deeply filuated in the bone, confequent to a violent blow received on the part fome time before, though the integuments appear perfectly found, and the bone itielf not in the leatt injured, we have great reafon to fufpect an alfefs in the medulla. Children of a bad labit of body, though they bave not fuffered any e:ternal injury, will often be.ore tame, and complain of the limb being remarkably beary; and though not attended with acute pain, yet the duil throbbing uneafinefs is conftant. If rigors happen during the time the patient labours under this indifpofition, it generally implies that matter will be formed within the fintlance of the bone. If the extremities of the difeafed bune fwell, or if it becomes enlarged throughout its whole extent, it may be knorm to be an abfecfs in the medulla, or the true lpina ventofa, as it is called: if neither of thefe fyruptoms take place, the great infenfibility of the bone in fome fubjects will prevent that acutenefs of paia ufual in other parts where matter is formed, though the acrid matter is eroding the bone during the whole time it is contained within it. This matter at length having made its way through, arrives at the periofteum, where it creates mont violent pain. The integuments then become fwelled and in. flamed, and have a fort of emphyfematous feel. On being examined by preffire, the tumor will fornetimes be leffened, from part of the matter retiring into the bone: from this appearance to the touch, mof likely the name of qentofa was added to the term forina.

When we are alfured of matter being under the periofeum, we cannot be too early in letting it out, as it will fave a conderable deal of pain to the patient, though probably it may not be of any confiderable advantage in refpeet to the carious bone; for, where the Ruids in general are vitiated, no chance of cure can be expected from topical remedies; but where the conftitution is mended, nature will fometimes afonith us in leer part, as the carious bone will be thrown off from the epiphyfes, or the teredincs will be filled up by the onfic matter that flows from the parts of the bone where fome of the fipine have come away.

If proper nedicines are given, the children well fupported, and the parts kept clean and dry, patience and perfeverance will frequently give great credit to the furgenn. In cafe it flould have been thought advifable to apply a trephine, to give free difcharge to the matter, the walling it away, as well as the fmall crumblings of the carioss bone, by means of ceterlive and drying in-

E P P .
jections, has been krown to contribute greatly to the of the Difcuring this kind of caries, after the babit of body in ge. cafes of the neral had been mended.

Befides thofe abovc-mentioned, the bones are liable to two oppofite difeafes; the one termed friabilitas, the other mollitics; the fornier peculiar to adults, the latter more frequent in infants, though fometimes feen in adults, from a vitiated ftate of their juices.

From repeated lalivations, the bones in old people pis ${ }^{243}$ have been rendered extremely bristle; infomuch that in many fubjects they lave been fractured merely fromi their weight and the action of the mufcles: but in fuch cafes, this is not owing to the friability of the bones, but to the lefs of fubflance, from the erofion of the bone by an acrimonious humour thrown on it: to which caufe perhaps may be attributed the difeafe called rikets in children. The effects of fcorbutic humour in rendering the boncs foft in many irilances, have ofien been remarked.

By proper diet, gentle friction, exercife, and cold bathing, rickety children wiill frcquently get their conflitution fo much changed, as that, by the time they arrive at the age of 20 years, there fli: 11 not remain the lealt veltige of their former difeafe. The epiphy fes are genetally moft affected in this ipccies of the tiforder. For want of early attention to invalids of this fort, we find that their bones not only become foft, and yield to the powcrs of the mufcles, but remain diforted during the relt of life, though they have acquired a perfect degree of folidity. In luch cafts, therefore, the affifance of a fiilful mechanic is necefliary beth to fupport the parts improperly acted on, and to alter the line of direction of the diftorted offeous fibres.

Though the curvature of the extremities, or thicknefs of the ends of the bones near their articulations, may give the firf alarm to thofe who are contiantly with children, yet there are other fymptoms that give carlier notice; which if they had been timely difcovered, it is highly probable that the curvature of the limbs in many children might not have happened. The belly generally becomes larger in this difeafe, from the increafed fize of the contained bowels; the head then becomes enlarged; then a difficully of breathing fucceeds, which is gencraily fuppofed to be the effects of taking cold. The fiernum is clevated and A:arp, and the thorax becomes contractcd; the fpine is protruded in feveral parts; the pelvis altered, according to the prefiure of the parts within, and habitual inclination of the patient to obtain that line of direction in which the perpendicular from the centre of gravity may fall within the common bale of the body, the extremitics of the cylindrical bouse, and the ends of the ribs next the flernum, beconie enlarged; foon after this the bones in general become foft and flexible, yielding in fuch directions as the ftrongell mufeles decermine.

Where the alfection of the mefenteric glands is evsdent, Mr Bromefield affierts, that after a dofe or two of the pulvis bafilicus to empty the intelines thoronghly, the purified crude quichfilver is by much the molt efio cacious medicine to renove obftructions in thole glande. When the belly begins to foften and fubfide, the chyle paffes without interruption, and the child begins to get Heft ; then the cold lath becomes truly ferviceable, and the decoation or cold infufion of the Peruvian bark is a

7he tif-proper reftorative; but the cold bath ufed too early, or ies of the the bark given before there is a free circulation of chyle Boncs

## 74

 through the lafteals, would be very injurious.Among the dileales of the hones we may likewife Ny of the talke notice of that pally of the lower extremities which wer ex- takes place, as is generally fuppofed, in confequence of mintics. a curvature in fome parts of the fpine. 'lo this diftemper both fexes and all ages are liable. When it attacks an infant of only a year or two old or younger, the true caufe of it is feldom difcovered until fome time after the effect has taken place. The child is faid to be unconmonly backward in the ufe of his legs, or it is thought to have recised fome hurt in the birth. Whet the child is of an age fufficient to have already walked, and who has been able to walk, the lafs of the ufe of his legs is gradual, though in gencral not very flow. He at firft complains of being very foon tired, is languid, lilllefs, and unwilling to move much or at all brikly. Soon after this he may be oblerved frequently to tri $\varphi$ and thumble, thongh there be no impediment in his way; and whenever he attempts to move brikly, te finds that his legs involuntatily crols each other, by which he is frequentiy thrown oown without ftumbling; and when he endeavours to ttand fill in an erect pofure without fupport, even for a few minutes, his knees give way and bend forward. As the diftemper advances, it will be found that he cannot, without much difficuliy and deliberation, direct either of his feet exactly to any one point; and very foon after this, both legs and thighs lofe a good deal of their natural fenfibility, and become quite ufclefs. In adults, the progrefs of the difeafe is much quicker, but the fymptoms nearly the fame.

Until the curvatare of the fpine is difcorered, the complaint generally pafles for a nervous one; but when the flate of the back bone is adverted to, recourfe is al. molt always had to fome previous violence 10 account for it. That this might have been the cafe in fome few inflances might be admitted; but in by far the greateft number fome predifpofing caufe mutt be looked for.

Mr Putt, who has written a treatife upon this difeafe, recommends it to our obfervation, that though the lower limbs are rendered almoft ufelefs, or even entirely fo, yet there are fome circumfances in which it differs from a common netvous palfy. The legs and thighs, though fo much affected, have rieither the flabby feel of a truly paralytic limb; nor have they that feeming loofenefs at the joints, nor the total incapacity of reffitance, which allows the latter to be twitted almoft in all directions: on the contrary, the joints have frequently a confiderable degree of ftiffnefs, particularly the ankles; hy which ftiffiels the feet of children are generally pointed downward, and they are prevented from fetting them flat upon the ground.

At firf the general health of the patient feems not to he at all, or at leaft not materially affected; but when the difeafe has continued for fome time, and the curva. ture is thereby increafed, many inconveniences and complaints come on ; fuch as difficulty in refpiration, indigention, pain, and what they call nighenefs at the pomuch, obftinate confipations, purgings, involuntary flux of urine and fæces, \&cc. with the addition of fome nerrous complaints, which are partly caufed by the alterations made in the form of the cavity of the thorax, and partly by impreffions made on the abdominal vifcera.

Mr Pott was led to a knowledge of the true caute Of line Dif and cure of this difemper, from oblerving the cafe of a cafes of the youth of 14, who was reftored to the ule of his limbs Arterial immediately after a feemingly accidental abice?s near $\underbrace{\text { Syftem. }}$ the part. From this he was inclined to thitik, that the curvature of the fpine was not the original cante of the diforder, but that the furrounding parts were predifpofed towards it by fume affection of the folids and rivids there; and he was confirmed in thefefufpicions by a variety of appearances, which he obferved both in the living body and upon diffection of the fubject aft:death; all of which are narrated at full length in his treatife upon this fubject.
"'The remedy (fays he) for this molt dreadful difeafe confilts nerely in procuring a large difcharge of matter, by fuppuration, from underneath the membrana adipola on each fide of the curvature, and in maintaining fuch difcharge until the patient thall have perfectly recovered the ufe of his legs. 'Io accomplith this purpofe, I have made ufe of different means, fuch as fetons, iffues made by incifion, and iffues made by cauflic; and although there be no very material difference, I do upon the whole prefer the laft. A feton is a painful and a nally thing: befides which it frequently wears throngh the Okin before the end for which it was made can be accomplithed. Iflues made by incifion, if they be large enough for the intended purpole, are apt to become inflamed, and to be very troublefome before they come to fuppuration; but openings made by cauftic are not in general liable to any of thefe inconveniences, at leaft not fo frequently nor in the fame degree: they are neither fo troublefome to make or maintain. I make the efchar: of an oval form, about two thirds of an inch in diameter on each fide the curve, taking care to leave a fufficient portion of 0 in between them. In a few days, when the efchar begins to loofen and feparate, I cut out all the middle, and put into each a large kidney-bean: when the bottoms of the fores are become clean by fuppuration, I fprinkle, cvery third or fourth day, a fmall quantity of finely powdered cantharides on them, by which the fores are prevented from contracting, the difcharge increafed, and poffibly other benefit obtained. The iffues I keep open until the cure is complete; that is, until the patient recovers perfectly the ufe of his legs, or even for fome time longer : and I hould think that it would be more prudent to heal only one of them frift, keeping the other open for fome time; that is, not only until the patient can walk, but until he can walk firmly, brifily, and without the afliftance of a fick: until he can fand quite upright, and has recovered all the beight which the habit or rather the neceffity of Alooping, oceafioned by the diflempers, had made him lofe."

## Chap. TII.

## Of the Difeafes of the Arterial System.

## Sect. I. General Remarks on the Difeafes of the Aiterial System.

The difeafes of the vafcular fyftem form an important clafs in fyltems of Nofology. In the difeafes of every organ, the action of the arteries and veins is more o ${ }^{*}$ lefs influenced, though the changes of fructure to which thefe veffels are fubject are very limised. The only
firf into contact wilh the ©kin, the parts become inflant. ly livid, indicating the approach of mortification; and Aneurifme a real fphacelus has fometimes been induced. The tumor at firft produces little uneafinefs; but as it increafes in fize, the patient complains of fevere pain, lliffuefs, numbnefs, and immobility of the whole joint; and thefe fymptoms continuing to augment, if the artery be large, and affiftance not given, the teguments at laft burf, and death enfues.

When an artery is punctured through a vein, as in Of the blood-letting at the arm, the blood generally rullies intoricofe a. the yielding cellular fubftance, and there fpreads fo as neurifm. to fhut the fides of the vein together. But in fome inftances where the artery happens to be in contact with the vein, the communication opened has been preferved; and the vein not being fufficiently ftrong for refiling the impulfe of the artery, muft confequently be dilated. This is a varicofe ancurifn. Soon after the injury the vein immediately communicating with the artery begins to fwell, and enlarge gradually. If there be any confiderable communications in the neighbourhood, the veins which form them are alfo enlarged. The tumor difappears upon prefture, the blood contained in it being chiefly pufted forwards in its courfe towards the heart; and when the tumor is large, there is a fingular tremu. lous motion, attended with a perpetual hifling noife, as if air was paffing into it through a fmall aperture.

If a ligature be applied upon the limb immediately below the fwelling, tight enough to fop the pulfe in the under part of the member, the fwelling difappears by preflure, but returns immediately upon the preffure being removed. If, after the fwelling is removed by preffure, the finger be placed upon the orifice in the artery, the veins remain perfectly flaccid till the preflure is taken off. If the trunk of the artery be compreffed above the orifice, fo as effectually to ftop the circulation, the tremulous motion and hiffing noife immediately ceafe; and if the vcins be now emptied by preflure, they remain fo till the compreffion upon the artery be removed. If the vein be compreffed a little above, as well as below the tumor, all the blood may generally, though not always, be puhbed through the orifice into the artery; from whence it immediately returns on the preffure being difcontinued.

When the difeafe has continued long, and the dilata. tion of the veins has become confiderable, the trunk of the artery above the orifice generally becomes greatly enlarged, while that below becomes proportionably fmall; of confequence the fulfe in the under part of the momber is always more feeble than in the found limb of the oppofite fide.

Aneurifms have frequently been miftaken for abfeeffes and other collections of matter, and have been laid aneurifn open by incifion; on which account great attention is fometimes required to make the proper diftinction. In the commencement of the difeafe the pulfation in the tumor is commonly fo trong, and other concomitant circumftances fo evidently point out the nature of the diforder, that little or no doubt refpecting it can cver take place; but in the more advanced ftages of the difeafe, when the fwelling has beoome large and has loit its pulfation, nothing but a minute attention to the previous hiftory of the cafe can enable the practitioner to form a juigment of its nature.

Ancuifins may be confounded with foft enryfted tu-
of mors, fcrophulous fwellings, and abfecffes fituated fo near Aneurims. to an artery as to be affedled by its pulfation. But one fymptom, when connected with ftrong pulfation, may always lead to a certain detemination that the fwelling is of the aneurifinal kind, viz. the contents of the tumor being made eafily to difappear upon preffure, and their returning on the compreffion being removed. The want of this circumftance, however, ought not to convince us that it is not of that nature; for it frequently happens, efpecially in the advanced flages of aneurifms, that their contents become fo firm that no effect is produced upon them by preflure. Hence the propriety, in doubtful cafes, of proceeding as if the difeafe was clearly of the aneurifmal kind.

In the prognofis, three circumftances are chiefly to Prognofis. be attended to; the manner in which the difeafe appears to have been produced, the part of the body in which the fwelling is fituated, and the age and habit of body of the patient.

If an aneurifm has come forward in a gradual manner, without any apparent injury done to the part, and not fucceding any violent bodily exertion, there will be reafon to fuppofe that the difeafe depends upon a general affection either of the trunk in which it occurs, or of the whole arterial fyftern. In fuch cafes art can give little affiftance; whereas if the tumor has fucceeded an external accident, an operation may be attended with Succefs.

In the varicofe aneurifm a more favourable prognofis may generally be given than in either of the other two fpecies. It does not proceed fo rapidly; when it has arrived at a certain length, it does not afterwards acquire much additional fize; and it may be fuftained without much inconvenience for a great number of years. As long as there is reafon to expect this, the hazard which almoft always attends the operation ought to be avoided.

Treatment.-In every cafe of aneurifm, the ufe of preffure has been indifcriminately recommended, not only in the incipient period of the difeafe, but even in its more advanced ftages. In the diffufed or falfe aneurifm, as preffure cannot be applied to the artery alone, without at the fame time affecting the refluent veins; and as this, by producing an increafed refiffance to the arterial pulfa. tions, muft force an additional quantity of blood to the orifice in the artery-no advantage is to be expected from it, though it may be productive of mifchief.

In the early ftages of encyfted aneurifm, while the blood can be yet preffed entirely out of the fac into the artery, it often happens, by the ufe of a bandage of foft and fomewhat elaftic materials, properly fitted to the part, that much may be done in preventing the fwelling from receiving any degree of increale; and on fome occafions, by the continused fupport thus given to the weakened artery, complete cures have been at laft obtained. In all fuch cafes, therefore, particularly in every inftance of the varicofe anetrifm, much advantage may be exvected from moderate preffure.

But preffure, even in encyfted aneurifm, ought never to be carried to any great length; for tight bandages, by producing an immoderate degree of reaction in the containing parts to which they are applied, inflead of anfwering the purpofe for which they were intended, have evidently the contrary effect, Indeed the greateft length to which preflure in fuch cafes ought to go,
fhould be to ferve as an cafy fupport to the parts affected.

Of late years the fubject of ancurifm has attracted the notice of reveral eminent furgeons of this country; and arterial trunks have been tuccefsfully tied, which had been often propofed, but never executed. Mr John Bell feveral years ago, tied the trunk of the gluteal artery. Mr Abernethy of St. Bartholomew's hofpital, tied the common femoral. Mr Aftey Cooper of Guys, tied the common carotid; and Mr llamfden of St. Bartholomew's hofpital, has lately tied the fubclavian artery.

## Sect. III. Of the Popliteal Ancurifm.

We are indebted to Mr John Hunter for the ingenious operation for popliteal aneurifm. The operation confifts in expofing the femoral artery about the middle of the thigh, and putting a ligature round the veffel. An incifion is to be made through the integuments, two inches and a half in length on the inner edge of the fartorius mufcle (fee Plate DXV. fig. 1.). An incifion is to be made through the theath containing the artery with its accompanying vein and nerve, and a double ligature is to be introduced underneath it, by means of a blunt needle; care being taken not to include either the femoral vein, or crural nerve. One ligature is to be tied as high up, and the other as low as the artery is feparated from the contiguous parts; the diftance between the two being rather more than half an inch. The artery flould then be divided by a probe-pointed billoury, (Plate DXIII.) in the interppace between the two ligatures, but nearer to the lower ligature than to the upper one. The ligature ftoould be moderately thick, in order that the noofe may be drawn as tightly as poffible, without rifk of tearing, or cutting the coats of the veffel. The limb may be kept warm after the operation, by artificial heat if neceflary; and the wound treated in the ufual manner.

## Sect. IV. Of the Femoral Aneurifm.

[^7]

$\qquad$

I54

The external iliac artery was firt tied by Mr Abernethy*; and there are now eight cafes on record where the * See ATr practice has been followed, fix of which were fucceffful. Aberncthy's Mr Abernethy's operation confifts in making an inci- Surfical fion through the integuments of the abdomen, about tionss. three inches in length in the direction of the artery, beginning juft above Poupart's ligament, (fee Plate DXV. fig. 1.) and half an inch on the outfide of the abdominal ring, in order to avoid the epigaftric artery. The aponeurofis of the external oblique mufcle is then to be divided in the direction of the wound. The lower margin of the internal oblique and tranfverfe mufcles is to be cut with a crooked bifoury. The finger may then be paffed between the peritonæum by the fide of the pfoas muicle, fo as to touch the artery. A double ligature is to be put underneath the veffel, and tied as in the operation for popliteal aneurifra.

Sect. V. Of the Carotid Aneuriju.
It had been repeatedly propofed to tie the carotid artery; but the operation was firft performed by Mr

Of Vatricofe Alliey Coopcr. There are three inflances of this artery Veins. having been fuccelsfully tied, fo that there is fufficient encouragement to adopt the prafice in future cales, where there is room to tie the artery above the flemuns. The operation is to be done by making an incifion on the fide of the artery next the trachen, laying bare the veffel, and carefully avoiding the par vagum and the recurrent branch in placing the ligature.

## Sect. VI. Of the Axillary Aneurifn.

Mr Keate of St George's Hofpital, tied with fuccefs the axillary artery, where it paffes over the frlt rib; and Mr Ramfden las lately tied the fubclavian artery for an axillary aneurifm. The patient however died. A fimilar operation was attempted by Mr Cooper, but he failed in tying the ligature round the artery, from the bulk of the tumor. The great difficulty felt in thefe operations was the paffing of the ligature below the vefiel on account of its depth. Some contrivance is therefore necellary in order to facilitate this part of the operation.

## Chap. VIII.

## Of the Difeafes of the Venous System.

Sect. I. Of Varicofe Veins.
Whes the veins of any organ become preternaturally dilated, they are faid to be varicofe. This ftate of the veins is moft ufually met with in thofe which are fuperficial, and feems to arife either from fome mechanical caufe preventing the ready flow of blood through them, or from the weins themfelves lofing the neceflary fupport of the $\mathfrak{i k i n}$ and adjacent parts. The gravid uterus, by preffing on the iliac veffels, frequently renders the veins of the lower extremity varicofe. Various tumors produce fimilar effets. We alfo fee the veins of the integuments of old people become tortuous and fivelled from no mechanical preflure.

Varicofe veins are a frequent attendant on uilcers of the leg, and it has been obferved that the ulcer feldom or ever heals until the varix is cured.

Taricofe veins of the extremities may generally be mucls relieved by the application of a proper bandage from the toes upwards; and in cales where this does not give relief, the venous trunk fhould be tied with a ligature as direated in aneurifm.

## Sect. II. Varicofe Spermatic Veins (Variocele).

The veins of the fpermatic cord often remain varicofe after inflammation of the tefticle, and alfo in early life without any known caufe. The difeafe is generally eafily diftinguifled by the tortuous irregular fwelling. It fometimes, however, acquires a large fize; but even then its nature may be readily diftinguifted by placing the patient in a horizontal pofition, and applying preffure to the tumor. By this the fivelling difappears, and if the upper part be grafped fo as to allow nothing to pafs out of the abdomen, the fivelling will neverthelefs be again formed.
The difanfe occurs mof frequently in the left fide, and this may arife from the vein in that fide not termi-
nating direaly in the vena cava, but in the emul- of the Difgent.
Treatment.-The ufe of aftringents, along with a pro- Tenticle. pet fufpenfory bandage, will generally afford relief. It has alla been propoled to tie a ligature round one or more of the varicofe veffels. In one cafe this was done with complete fuccefs.

## Sect. III. Of Heemorrhoidal Tumors.

The hemorrhoidal tumor confifts in a dilatation of the veins about the anus and extremity of the rectum. They are round fmooth tumors of a purple cclour, and more or lefs painful. They vary in their fize and number. Sometimes they are accompanied by a regular periodical difcharge of blood, (bleeding piles) and in other cafes no fuch difcharge takes place, (blind piles) and then they are more fubject to inflammatory attacks.

Hæmorrhoids occur more frequently in women than in men, and they conımonly arife from a long continued preflure on the rectum ; as obftinate coltivenefs, prulapfus, geftation, calculus or tumors ahout the bladder, uterus, or vagina.
Treatment.-When they are inflamed, local bleeding, fomentations and poultices give much relief, care being taken at the fame time to keep the tumers within the anus, and to keep the bowels very open by mild laxatives and clyfers.
In fome cales the piles acquire a very confiderable builk, and form a number of large and loofe tumors round the anus, which prevent the free difcharge of feces. In fuch cafes the tumors ought to be rennoved, and this may be beft done with the knife; or, as fometimes happens, if they be fo fituated as to render this dangerous, they may be removed by a ligature.

## Chap. IX.

Of the Difeafes of the Glandular System.
Sect. I. General Remarks on the Pathoiogy of the G/ands.
We obferve a valt variety of difeafes of the glandular fyftem, and the greater number of thele arile from a morbid ftate of their fecretions. We fee friking cxamples of an increafed fecretion in diabetes, in the mercurial falivation, and in many bilious diforders : on the other hand the natural fecretion is diminifled in fuppreffion of urine, in drynefs of the mouth, \&c.

An alteration in the fecretory function is not, however, the only difeafe of this fyttem ; there are a great number of organic alterations of flruclure with which they are affected, and a varicty of tumors are alfo found to form in them. As, however, molt of the primcipal glands of the body are fituated within the larger cavities, few of their difeafes come within the province of the furgeon.

Sect. I. Of the Dijenfes of the Tiphicle.

1. Of the Schirrus and Cancer of the Tefficle, (Sarcoctle).

This affection is liable to a confiderable variety in its appearanccs; and as in the defcription of it which has been given by authors, they have included fymptoms of
of the Dif-difeafes which are very different from the true fchircafes of the rus.
$\underbrace{\text { Bettice. }}$ The moft remarkable fymptom of fchirrous tefticle is a gradual enlargement and induration of the body of the gland or epididimis, advancing from one point, without marks of inflammation or pain. Aleng with its increafe in bulk it acquires additional hardnels, and its farface,
162 frombeing fmooth, turns by degrees unequal and knot-
symptoms. ty. The integuments become of a purplifh red, at laft ulcerate, dilcharge a foetid ichor, and a cancerous fungus grows from the wound. The fpermatic chord alfo becomes enlarged, knotty, and hard, and the glands of the groin fivell, the health of the patient becoming entirely deftroyed, and at laft carrying him off in the greateft milery.
The progrefs of this difeafe is in general llow, and is commonly attended with an aching fenfation about the tefticle, and fevere pain dating from it to the loins, particularly when the telficle is not fupported. The difeafe is moft frequent in the advanced ftages of life. It commonly arifes from an unknown caufe. It has at times been known to fucceed a vencreal affection, but this is by no means common, and it is fometimes preceded by a blow or fome accident which excites inflammation.
When the fchirrous teficle is examined by diffection, Dr Baillie obferves that "it is found to be changed into a hard mafs of a brownih colour, which is generally more or lefs interfected by membrane. In this there is no velfige of the natural fructure, but cells are frequently obfervable in it containing a fanious tluid, and fometimes there is a mixture of cartilage." Sometimes water is found collected in the cavity of the tunica vagivalis, but more frequently the tumics adhere to each other. When the feermatic cord is affeeted, that exhibits the fame changes of itructure as the tefticle itfelf.

Treatment. When a tefticle is known to be affected with the true fchirrus, all profpect of a cure by the exhioition of internal or external remedies becomes hopelefs, as there is no fagt better known and more feverely felt in the hiftory of fchirrus and cancer in every organ of the body, than its refifing all means of relief, but by the complete removal of the difeafed part. In a few tare cafes, by a moderate diet, keeping the bowels open, fufpending the tumor, avoiding violent exercife, or any thing which may prove a fource of irritation, the diforder has beculaid to be not only prevented from increafing, but has in a gradual manner entirely difappeared; but we much furpect that thefe cales whofe termination was fo favourable, have not been of a fchirrous nature. This is probable from what is known of the termination of fchirrus in other organs of the body, and alfo from the difficulty we have in forming an accurate diagnofis in the difeafes of the teflicle. There are, we befitate not to fay, many tefticles extirpated which might have been faved; for our impeffect knowledge of the various morbid changes of this organ, has made it too muc'l an $e^{7}$ ablifhed practice to extirpate all tefficles which are enlarged and hard, and which do not yield to mércury.

When, however, by an attentive examination of the hiftory and fymptoms of the difeafe, no dou't is entertained of its fchinrous or cancerous nature, the more fpeedily the tumor is removed, the better chance there is of a permanent cure. In performing the operation, Vol. XX. Part $I$.
care fhould be taken to remove completely every part of the Diifufpected to be difeafed, and no part of the Ikin flould cafes of the fe eft wo be of wertile. pletely which has the lealt difcolouration or mark of difcafe.

## Mode of extirpating the Tyficle.

16. 

The parts being previoufly farved, the patient is to be laid upon a firm table covered with a blanket or mattrefs. His legs hould hang over the table, and be lupported by affiltants. An incifion is to be made throuagh the integuments with a common fcalpel, extending from a little above the external abdominal ring to the botton of the fcrotum. The cellular membrane around the Peermatic chord is to be diffected back, and the chord laid fairly bare ; and this part of the operation is much more ealily accomplifhed when the incifion through the fkin is very frec. A ligature of confiderable thicknefs is to be put underneath the chord, and it may be introduced with a blunt pointed needle or inftrument (fig. 1 Plate DXIII.). The extent of the difeafe in the chord thould now be examined as accurately as poffible, and the ligature flould be tied firm with a running knot, as far above the difeafed part as poffible. If any hardnefs extends to the external abdomitral ing, the chord may be even diffected up along the inguinal canal, and the ligature put on at that place. The chord may be divided one-fourth of an inch below where the ligature has been applied, and then the whole of the tellicle and its vaginal coat may be readily diffected away, taking care not to cut into the vaginal cavity of the oppofite fide of the fcrotum. Afier the tellicle is removed, the ligature thould be loofened, and the fpermatic artery and veins included in feparate ligatures. The ligature upon the fpermatic chord is to be left loofe, fo as to act as a touniquet if a hemorrhagy Chould enfue. Much care fhould alfo be taken to fecure any arteries of the integuments of the fcrotum which are feen bleeding; as we once met with a very troublefome hromorrhagy from one of thefe retracting ainong the loofe cellular texture, and not being feen after the operation. It therefore will be a good general rule to tie thefe with ligatures immediately after they are divided.

The wound is to be dreffed, fo as to be healed if poffible by adhefion; and this may generally be accomplifhed, except at the upper part where the ligatures come through. With this view the wound and ferotum are to be carefully wafhed, and two or three fitches, as may be thought moft expedient, are to be put through the edges of the wound ; for in a part like the fcrotum, where the fikin is loofe and puckered, it is hardly poffible to apply adhefive Itraps with fufficient accuracy, fo as to ferve the purpofe. Small pieces of adhcfive plafter, however, fhould be neatly placed between each of the fitches, along the whole extent of the wound, and a pledget of fimple ointment and comprefs afterwards to be laid over it, the whole being fecured with a $T$ bandage.

After the operation, the patient is to be put to bed, being directed to lie on his back with a pillow betveen the thighs, fo as to fupport the frrotum.

Opiates thould be given to allay pain, and if ary inflammatory fymptoms fupervene, bleeding at the arm Hould be had recourfe to without the ?eaf hefitation; 1.

Ot the Dif- for we have made a general remark, that after almoft eares of the all furgical operations, there has fcarcely ever an inTeftuc.e.

166 Mode of drefling the wound. flance occurred where the patient died from lofs of blood, and on the contrasy, that almort all patients who have loft much blood, or who have been previoully much emaciated, have recovered more quickly than thofe in full health. The antiphlogitic regimen in almoft every cafe thould be rigidly purfued, until at leatt all inflammatory appearances of the wound are gone, and a healthy fuppuration commenced. About four, five, or fix days, according to circumftances, the dreflings thould be removed, and if the wound has healed by adhefion, the ftitches may be withdrawn, and the edges of the wound kept together by adhefive plafters. The ligature on the fpermatic chord may now be fafely taken away, and that round the fpermatic artery and veins generally comes readily away before the tentl2 dreffing. In this manner the wound thould be dreffed daily until it is cicatrifed. When the wound, inftead of healing by adhefion, fuppurates, the Ititches may be taken away as foon as it appears that the edges of the wound can he accurately kept together with the adhefive platters; for if the flitches are allowed to remain long, they generally uicerate the contiguous ikin, and form finufes, which continue to difcharge matter after the refl of the wound has healed. The wound fhould be dreffed once or even twice in twenty-four hours if the difcharge be profufe, and care flould be taken to wafl away with a fponge any matter which may be depofited on the found flkin of the fcrotum or groin. The edges of the wound flould be brought accurately together at each dreffing, any matter collected in different parts of it fhould be gently fqueezed out, fo as to prevent any lodgement from taking place. Should the patient become weak from the continuance of the difcharge, he flould be ordered a nourifling diet, with a proper proportion of wine; and if the difcharge be at any time thin and very profufe, we have found much benefit in fuch a cafe from the internal ufe of barls (cinchona).

## 2. Infammation of the Tefticle (Hernia humoralis).

Inflammation is one of the moft frequent difeafes of the tefticle. Sometimes the inflammation is confined to the fubitance of the tefticle, at other times it affects the epididimis, and in fome cafes it fpreads to the albuginea and vaginalis. The furface of the inflamed tefticle is uniform and fmooth, more or lefs fenfible to the touch, equally firm and tenfe throughout when preffed upon, and the integuments are generally difcoloured, having a blunt of rediefs, and interfperfed with varicole veins. When examined by diffection, the tefticle exhibits, according to Dr Baillie, precifely the fame appearances as the inflammation of the fubfance of other parts. The vas deferens fometimes partakes of the inflammation, its coats becoming confiderably thickencd, and in other infances the veins of the fpermatic chord become varicofe. Inflimmation of the tefticle mon lrequently is prereded by gonorrlice:, but it alfo occurs froma a variety of caufes: It occurs fometimes from expofure to cold. from violent exercife, and is often excited from blows, riding on horfeback, \&cc.

Thic inflammation of the teflicle concomitant of gonorylice generally hemins by fipeading along the vas deferens from the profate gland through the inguinal
canal till it comes to the tefticle ; it is in moft cales at- Ot the Dir. tended with excruciating pain from the rapidity of itseafes of the progrefs; and as it commonly comes on when the gonorfetticle. rhoeal difcharge diminifhes or difappears, and fublides when the dilcharge returns, many authors have fuppofed that it was a true metaftafis of the venereal matter.

If the difeafe be left to itfelf, the body of the teflicle becomes more hard and painful, with all the fymptoms of local inflammation, and the tumor fometimes acquires an enormous bulk. Sometimes the inflammation is accompanied with violent fever, with a pulfe hard and ftrong in the plethoric, and feeble and rapid in conftitutions which are delicate and irritable. The patient alfo often complains of pains in the loins, and has naufea and vomiting. In general the difcharge from the urethra diminithes confiderably, and often it ceafes altogether before the teflicle becomes affected; but fometimes that does not happen in any remarkable degree till one or two days after the fwelling has begun to appear. It never happens that both telticles are affected at the fame time, but when the fwelling of one difappears, often the other one begins to be attacked.

The tefficles fometimes fwell and inflame from the abforption of the matter of a chancre, and as the progrefs of the fwelling is in fuch cafes low, and generally more irregular, it has fometimes been miltaken for a fchirrous teflicle; but an inveftigation into the hiftory of the cafe, and particular attention to the appearance of the $\mathbb{i k i n}$ of the fcrotum, and any fymptoms of the venereal difeafe in other parts of the body will generally lead to a knowledge of the true nature of the cafe. It fometimes happens that inflammation is chiefly confined to the fpermatic chold, and in many cafes it affects the epididimis alone. The extent of the difeafe is always eafily afcertained by a careful examination of the parts. It feldom happens that both tefticles are inflamed at once; we have, however, remarked this to take place. Inflammation fuch as has now been defcribed, generally abates by the application of proper remedies : in fome cafes, however, an induration of the tefticle remains. It terminates, though rarely, in fuppuration.

Treatment.-When an inflammation has arifen from a blow, from expofure to cold, or from any injury done to the tefficle, it cught to be treated according to the general plan laid down of treating inflammation of other organs. Local bleeding by leechcs is a mof ufeful remedy, and ought to be the firt thing cmployed, if there is the flighteff pain, tendernefs, or rednefs of the fcrotum. Fomenting the fcrotum with warm water, or a decoction of poppy heads, chamomile ilowers, or tobacco leaves, of en give much relief, and great attention fhould be paid in fupporting the telticle with a filk net trufs (Plate DXIV.). Some have alfo ufed with fuccefs the application of ice or fnow to the part. If the fymptoms and pain are very violent, bleeding at the arm may be neceffary. The bowels thould be kept open, and even purged; the patient flould be confined to a low diet, and he thould keep as much as pofiible to the hooizontal pofture, as this is found to be of the greateft importance in promoting the cure.

When the inflammation arifes from gonorrhere, particularattention mun be paid not only to the difeafe in the tedicice, but to that of the urethra. lndeal it is of much inportance in the treatment of gonorrluca to ufe
ithe Dif- means to prevent the teflicles from becoming inflamed; fes of the and as every thing which caufes a fuppreftion of the difTefticle. charge tends to produce a fwelling of the teilicic, it is natural to fuppofe, that in order to prevent this troublcfome diforder, every thing thould be avoided capable of increafing the irritation and inflammation of the urethra, as expofure to cold, violent exercife, ill chofen injections, and ballamic medicines; but above all, the ufe of a fufpenfory is moft efficacious, and Swediaur * recom-

## Traite

 r les $A$ an-mends one to be worn in every cafe of gonorrhcea from dies Ve- the commencement of the difeafe, to prevent all rifk of eriernes. the tellicles becoming inflamed. When the inflammatory fymptoms are fevere, the treatment fhould be adopted as we have recommended in common in Aammation of the tefticle. If the difcharge from the urethra is fopt, means houid be ufed to reftore it. Whenever the inflamnatory fever is rendered more mild, Swediaur recommends, with this view, a dofe of opium to be given, and according to circumilances, an injection compofed of two or three ounces of oil of linfeed and decaction of barley, along with fifty or fixty drops of the vinous tincture of opium. This may be repeated every ten or twelve hours, taking care always to have the bowels well opened before ufing it. Swediaur has found the extract of hyofcyamus in many cafes anfwer better than opium. Fomentating the penis and adjacent parts with warm vinegar and water, injecling warm oil, and the ufe of bougies, may alfo be advantageous in promoting the difcharge from the urethra.
## 3. Induration of the Teflicle.

After the inflammatory fymptoms have abated, it generally happens that a degree of fwelling and hardnefs of the body of the telticle, but fill more frequently of the fermatic cord or epididimis, remains, and in many cafes continues for months, or even during life. This effect takes place from whatever caufe the inflammation may have arifen. In many cafes the telticle itfelf remains quite found, and the epididimis is converted into a very hard unyielding mafs, which feels as if it were injected with quickfilver. Sometimes the tefticle, whilft it remains hard, diminithes in fize, and becomes much fmaller than natural. When the tefticle is examined by diffection, it is found to have lof its natural fructure, and is fometimes changed into a hard brown-coloured mals (Voirtel), interfected more or lefs by membranous bands; fometimes parts having a cartilaginous quality appear $i t$, and fometimes cells are formed which contain matter. The feminal vefiels are fo changed and hardened, that they cannot be dittinguifhed from each other. In fome cafes the whole tefticle has been found converted into a cartilaginous mafs, and in a feiv intlances fome parts of it have been converted into bone. The treatment ufually recommended in cafes of induration of the tefticle preceded by inflammation, are ftrong fimulating and aftringent applications; fuch as folutions of the muriate of ammonia, acerate of lead, fulphate of zinc, \&c. either applied by moiltening with them a piece of linen, which is to be kept cosflantly wet, or by uing them in the form of a poultice. Frictions with mercurial ointment, either fingly or combined with camphor, over the frotum and perineum, fometimes produce a good effect; mercurial fumigations to the genital organs have alfo been recommended. In fome
cales the internal ufe of mereary has been found necef- of the Diffary. A mercurial plater with camphor, or the com- cafes of the mon foap plafter, is allo a good application, and is very Tciticle. ufeful in defending the tefticle.

The internal and external ufe of the hemlock (conium maculatum) has been much recommended by Plenk. Electricity has allo been fuccefffully employed. The muriate of lime, and the muriate of barytes, have been ufed by fome authors. Sxcdiaur fays that he has known fome aftections of the tefticle produced by gonorthoea, and alfo fome difeafes of the eye from the lame caufe, cured by the patient getting a frefl infection. In a few cafes of induration, and fwelling of the teflicles, we have employed bliftering with good cifects. The fcrotum fhould be thaved before this is done; and it is often neceffary to repeat the blitter feveral limes before the hardnefs or fwellisg begin to abate.
4. Abfcefs of the Toficte.

It fomatimes, though rarely happens, that the tefticle Sympioms. fuppurates. The matter which is formed, is commonly a tough, thready, yellow-coloured 1uoflance, which adheres to the furface of the cavity in which it is contained. Sometimes there is only one abfcefs; in other cafes the matter is contained in leveral fmall irregular haped cavities. Sometimes the matter is formed in the very middle of the body of the tefticle, in other cafes we have obferved fmall abfcefles in different parts of the epididimis, the body of the tellicle remaining quite found. When an abfeefs is formed in the tefticle, the ftructure of the gland becomes more or lefs changed; generally inftead of being foft, and the tubes of which it is compofed being ealily feparated, it degenerates into a hard firm mafs.

Abfcefies of the tefticle fhould be opened as foon as Treatinent. pofible, in order to prevent the fubftance of the tefticle from being deftroyed. The prefence of matter is learnt by a fuctuation which can be felt externally; but it is often extremely difficult to determine the true fituation of the abicefs, whether it is formed in the body of the tefticle, in the epididimis, or between the albuginea and tunica vaginalis, or in the cellular membrane external to the tunica vaginalis; for when fuch a degree of inflammation has taken place as to terminate in the formation of an abfcefs, the accompanying fwelling oeftroys the natural form of the parts, and involves the whole into a undetermined flapelefs mals. Richter remarks, that there are fometimes foft foots in the tefticle, in which it is believed there is a fluctuation. When fueh fivellings are opened no matter is dilcharged, nothing but blood appears, and the inflammatory fymptoms are afterwards increafed. The more matter which is difcharged from an abfcefs of the tefticle, the fmaller the tefticle grows, as the matter is fometimes formed partly of the thready fublance of the tellicle. Cafes have occurred where the whole tefticle has bcen pulled away, the furgeon having miftaken the feminiferous tubes for floughs. Abicefles of the fubftance of the teflicle feldom heal, and generally a fiftuious opening remains, through which there is a conftant oozing of the feminal tuid.
3. Fifulous Sinus of the Teficle.

As far as we know no author has taken notice of this appearance. In one cafe we oblerved it very remarkable. The epididimis alone was fwelled, and there was
of the Dif- a thickened portion of frotum adhering to one part of cafes of the it, in which there was a fmall /inus, and through which
Tefticle. the feminal fluid confantly oozed. In a fimilar cafe the finus was laid open, but with no good effect ; for a fmall opening remained unhealed, through which the femen continued to be difchaged.

## 6. Scrofulous Teficle.

## 

 in moft cafes of this kind furgical aid does not avail much, for the progrefs of the difeafe cannot be checked by any internal and external remedies. All that can be done is to relieve the inflammalory fymptoms, to allay pain, and to prevert the formation of finufes. With a v:ev: to alleviate the fymptoms of inflammation, nothing is fo beneficial as the application of leeches to the fcrotum, and the ufe of fomentations and poulticing, or folutions of the acetate of lead. Opiates and laxatives may be alfo freely given, unlefs in cales where from experience thefe are known to difagrec. When matter has once formed, the fooner it is difcharged the better, and this fhould be done by a fmall incifion. After one abfcefs has healed, others are very apt to form in fucceffion; thefe fhould be treated in the fame manner, and if at any period of the difeafe finufes form, they thould be at once laid completely open to the tottom; or if they are very deep and extenfive, a feton may be introduced; if this, however, does not produce an adhefion of the cavity, they mould be laid open with a bifloury in the manner direfted when treating of finufes.
## 7. Tefticle precernaturally fmall, and awanting.

After violent attacks of inflammation, or in cafes of abfeefs, the tefticle fometimes diminifhes greatly in fize, is almoft entirely abforbed; and in a few inftances people have been born with them much fmaller than natural (Baillie). Sometimes a tetticle has been known to wafe away witl.out any known casfe, fo as to difappear a.together. Sometimes one tefticle, and fometimes both remain in the cavity of the abdomen through life; fo that a perfon appears to have only one tefticle or to be without them altogether. Mr Hunter fuppeds that in thefe cafes they are not fo perfect as when they defcend into the fcotum; and if we were to reafon from what is olferved in other animals, in the horfe particularly, where this by no means unfrequently takes place, it is highly prubable that when the teflicles do not defcend into the ferotum, they are not capable of performing their functions.
Thefe cafer, though they cannot be relieved by mediC?] 2 in, ye: they are vortliy of the not:ce of medical men.

E R Y.
8. Fungus of the Toficte.

There fometimes arifes from the telticie a fpecies of fungous tumor, which was firf accurately defcribed by Mr Lawrence, demonfrator of anatomy at Bartholomew's hofpital, in London.

The patient generally affigns the origin of the com-Symptome plaint to fome injury. In fome cafes, it is the confequence of hernia lumoralis, and in others it appears Spontaneoully. The fcrotum, after a certain length of time inflames, and adheres to the tefticle already frvelled; at laft the fkin ulcerates, and the opening thus formed, inftead of difcharging matter, is filled $u p$ with a fungous tumor, which is of a firm texture, and generally infenfible. Whilt the fungus is increafing, the inflammation of the frotum diminifhes; and if the fungus is at this time removed, a cicatrix is formed in the Akin, which adberes to the teflicle. There is fometimes a copious and very feetid difcharge from the whole furface of the fungus. On diffection, the fungus is found to arife from the pulpy fublance of the tefticle, more or lefs of which remains according to the duration and extent of the difeafe.

It may be worth while to remark here, that we have met with one cafe, where, from an abfcefs and ulceration of the ferotum, the telficle ilfelf flipt out at the ulcerated orifice, and exhibited very much the appearance of the fungus above defcribed.

This fiecies of tumor may be fafely removed by the 178 knife, by ligature, or by efcharotics; the removal by the knife is perhaps the fafeft, and certainly the moft expeditious method.

For an account of Fungus Hematodes in the teficle, we refer to Wardrop's Obfcrvations on Fungus Hamatodes.

## Secr. II. Of the Difeafes of the Mamma.

From the changes which take place in the female General oit breaft at the age of puberty, during the menftual differvationscharge, and before and afier the birth of the child, we ought to expect a confiderable variety in the difeafes of this organ ; and, in confidering thefe, we fhould always keep in view the powerful fympathy between that gland and the uterine fyftem.

The gland of the mamma is fubjeet to inflammation and abfeefs. Scrofulous tumors alfo form in it; it is fuhjeet to a particular difeafe, called milk abicefs, to fcirthus, and to other fpecies of indurations, the nature of which is not well afcertained.

The nipple and integuments around it arc alfo fubject to particular kinds of excoriations and ulcerations; the lymphatic glands which lie clofe to the manma, are alfo frequently difeafed, and the contiguous cellular niembrane is fubject to thofe difeafes which are met with in the cellular membrane of othcr parts of the body.

At the age of puberty, when the uterine fyftem becomes fully developed, the female brealt fwells, turns hard, and becomes tender, or eren paiuful. A change alfo takes place during pregnancy; the breat enlarges, becomes very tender and painful, and a dark-coloured zone is obferved round the nipple. In women who aro fuckling alsout the minth or tenth month after parturition, and fonctimes fooner, the menfes reappear; and

If the Dif- if the woman afterssards contintes to fuchle, at each ifes of the monthly return a remarkable change takes place in the Manma. milk; it lofes its fweetnefs, acquires a bitterilh tafte, becomes of a reddilh colour, and excites a temporary derangement in the fyflem of the child. Obftructions of the menfes, their final cellition, and all the difeafes of the womb, aftict morc or lefs the mamma; and it is at the age of puberiy, at the time of menflruation, during pregnancy, in the early months of fuckling, and at the time of the ceflation of the meufes, whicla are the peculiar periods when blows and other injuries are moft apt to produce difeale in the mamma.

This confent between the mamma and uterine fyfem ought to be always kept in view when forming our opinion of any difeafe in thefe organs; and it is particularly worthy of the notice of furgeons when operations on that organ become neceflary.

## 1. Of Infammation and Abfeefs of the Mamma.

This diforder occurs monf frequently in nurfes by the foppage of the milk, which is always occafioned by fudden or imprudent expofure to cold.

In the early flages of the affecion, refolution is to be attempted, unlefs the fivelling appears to have an evident tendency towards fuppuration. The remedies ufed in inflammation, in general, feem ufeful in every cafe of inflammation of the breafts. When the patient happens to be nurfing, a fulden eracuation of blood is apt to diminifh the quantity of milk: In fuch cafes, therefore, blood is to be extracted in finall quantities at a time. The application of cooling faturnine poultices is advifeable. When fuppuration is tahing place, fomentations and poultices are to be ufed, and the matter is to be difcharged by making an incifion in the molt depending. part of the tumor.

## 2. Of Scirrhus and Cancer of the Mamma.

Cancer has been met with in the female breaft more frequenily than in any other part of the body. We have allo feen an example of it in that gland of the male ; but fuch inftances are extemely rare.

The commencement and progrefs of a fcirrhous tumor in the fenale breaft, is extremely varions in different people; and has been often the canfe of firrhous tumors, and tumors of a more benign nature, being miftaken for one another.

Scirrhous tumors have generally made fome progrefs before they are taken notice of. Sometimes they are firft felt like a pea underneath the fkin, and lying loole. over the gland of the mamma; in other infances, a portion of the central part of the gland is found indurated. Of whatever bulk, and in whatever filuation the fwelling be difcovered, it is remarkable for its unyielding and iacompreffible hardnefs, and its rugged unequal feel.

When the tumor is fmall it foldom gives any pain, and the patient generally difcovers its prefence by accident. In fome cafes its exiftence is difcovered by an acute pang darling through the breaft leading to its examination ; but in many cafes it acquires the bulk of a large hazel nut or walnut, particularly when the patient is fai, before any circumitance leads to its difcovery.

As the tumor increafes in bunk, it advances torvards the furface of the body an 1 adheres to the $\mathfrak{d s}$ in. The

Rkin then becomes thickened, inflamed, and ulccrated. Ifor the Dif the tumor be fituated near the nipple, the difeafe fpeedi- Mamnes ly affects that part, Cometimes enlarging and hardening $\underbrace{\text { Mamnace }}$ it ; and in other cafes puckering it and drawing it inwards. When the nipple becomes involved in the difeafe, the fanious fluid formed in the tumor often efarics before the flin ulcerates, by the ladiferous tubcs.

The pain whish accompanies the tumor in its more advanced form, is generally of a lancinating lind; but: its frenucney and degree is fufceptible of great varicly. Sometimes dharp finging pains pafs frequently from the tumor as a centre, and extend through the whole loreaft; in other cafes there is more of a burning heat in the fart.

The progrefs of the dificafe is yencrally very fluw, and in many calcs thrce, four, or more years elapfe before it ulcerates. When ulceation has takein place, the appearance of the ulcer is fimilar to that we have defribed when treating of cancer of the $\mathbb{R k} \mathrm{Kin}^{*}$; and the $*$ See Chap. progrefs of the ulceration is often fo low, as that many II fect. v. years elapfe before the difeafe proves fatal.

Scirrhous tumors have been met with in the mamma, from the age of twenty or twenty-five, to a very advanced period of life; but they occur about that period, when the catamenia difappear, much more frequently than at any other.

Treatment.-There is no part of practice about which lefs has been Fatisfactorily eflablidhed, than the treatment: of fcirrhus in the mamma. The good effects of an early extirpation of cancer in the flain is very generally admilted; but the want of fuccefs in remoring fcirrhous mamene in the hands of many, has not only led fome lirgeons to defill performing an operation, except in very tecent cafes, but has cwen deterred others from at. tempting their removal in the firft flages. There are no doubt many patients who fubmit to a painful operation from which no relief can be reafonably expected; on the contrary, the irritation and fever occafioned by it feem to haften the pregrefs of the difeafe. But there are others where this practice has had a happier effect, and where the patients have lived for many years without a return of the difeafe. Whenever, therefore, a fcirrhous tumor appears in the mamma, which is moveable and diftinctly circumfcribed, paft experience warrants us in removing it. On the other hand, when any of the abforbent glands liave become enlarged and hardened, or when the flin has ulcerated, we believe the operation in all fuch cafes flould not be reforted to. Sume folitary examples of the difeefe, affuming this form, may have occurred to individuals, where an operation has arrefted the progrefs of the difeafe; but thife, oppofed to the vaft number of unfucceffiful cafes, are by no means fufficient to warrant us in propofing the operation.

Method of Extippating the Manma.-In extirpaling the mamma, which we flall firt fuppofe is to be done where the fhin is found, and where the turnor has no uncommon adhefion to the pectoral mufcle, the patient ought to be placed horizontally in a bed, or upon a table covered with a mattrefs. Two incifions are to be made with a common fealpel through the fin and ce!lular fubfance along the whole extent of the tumor, including a fmall portion of Nk in. When the longett diameter of the tumor is acrofs the body, inftead of a longitudinal incifion, a tranfverfe one is to be made. 'I he integuments being diffected from the mamaa on both fides of the incifiuns, the patient's arm is to 'be extend-

Of the Dii- ed to fave the pecioral mufcle; and the whole glandueafes of the lar part is to be detached from the mufcle, though a Manma. frall portion only thould be difeafed, beginning at the upper fide, and feparating downwards. After the difealed parts are removed, the wound is to be cleaned with a fponge wrung out of warm water, which will generally render the fmall bleeding veffels more confpicuous. Thefe are to be tied, and the integuments are to be clofely applied to the parts underneath, and retained there by adhefive ftraps. A large pledgit of fimple ointment is now to be laid over the whole; and this is to be covered with a comprefs of lint, tow, or foft li. nen; and the dreffings to be kept in their place, and moderate preflure made by a circular roller and fcapulary bandage.

I84

## 3. Of Sore Nipples.

Women are more generally affected with fore nipples in fuck ling their firf child than at any future period. This may, in fome meafure, be owing to the fmallnefs of the nipples; but very often it arifes from their being unaccuffomed to the irritation of fucking. In fome cafes, the nipples are fo flat, and fo much funk in the breaft, as to render it difficult for the child to lay hold of them. Here affiftance can fometimes be given, by the mother prefiing back the prominent part of the breaft, fo as to make the nipple project between two of her fingers. Should this be infufficient, the nipple may be made to project by applying to it a ftout child feveral months

* See Plate old: but when this cannot be done, breaft-glaffes * may
DXV. anfuer the fame purpofe. By applying thefe to the anfwer the fame purpofe. By applying thefe to the nipple, and fucking out the air, the child will commonly be enabled to lay hold of it.

The nipples at this time are liable to excoriations, cracks, of chops; which, though not attended with a formidable appearance, are frequently more diftrefing than large ulcers. Mild, aftringent, arid drying applications are moft to be depended upon in fuch complaints; faturnine water, or lime-water, will anfwer; and either ought to be applied warm. After bathing the parts with any of thefe, the nipple fhould be covered with Goulard's cerate. Even a little foft pomaturn frequently rubbed upon the part, and covered with a foft linen rag, is formetimes found to give confiderable relief. But the nipple fhould be perfeetly cleared of thefe applications before the child is laid to the breatt ; and this may be done with a little port wine, or equal parts of brandy and vinetar. If proper attention be paid to thefe remedies, they will commonly be found to have the defired effect ; but if the contrary fhould happen, another remains to be mentioned, which, in different inflances, has given great relief: it confifls in the application of a thin fkin to the nipple, as the neck and part of the body of a fwine's bladder with an aperture in it; which, being properly moiftened and fixed to the breaft, will completely proted it in the time of fucking. As long as the nipples remain any way affected, fuall cups of glafs or tin are ufeful for retaining the dreffings, defending whe nipples from the frition of the clothes, and receiving any milk rhich may fall fro:n the breatt.

[^8]Srellings and hardnefies are found in the breaft which are not of a fcirrhous nature. Serofulous indura-
tions are particularly frequent. They often become of the Dir. old and hard, and are then commonly confidered as eafes of the foirriuts. If the furgeon fucceeds in difcuffing them by "Oonfils and means of any kind of remedy, he is apt to think that he has difcuffed a fcirrhus. Thefe fcrofulous fwellings fometimes intlare, and the progrefs of the inflammation is very tedious. The breaft is long painful before any foftening or fluctuation can be perceived. The furgeon then perhaps confiders it as an occult cancer, extirpates it, and thinks that he has fuccefffully cured a cancerous affection. If the furgeon opens fuch a fuppurating knot before all the hardnefs is diffolved by the fuppuration, and if he makes a large opening, then commonly follows a very malignant ulcer, which may be alfo miftaken for a cancerous fore. Many cales, where ulcerated cancers have been fuppofed to have been extirpated with fuccefs, may have been of this kind.

Venereal indurations are not unfrequent in the breaft, and alfo caufe fimilar miltakes in practice. Encyfted tumors are alfo met with in the breaft, and are moft commonly of that kind called meliceris.

In the breaft of young girls, ten or twelve years of age, hardnefles fometimes appear, which difappear as foon as menftruation takes place. Sometimes they do not go away until the firf delivery. Sometimes the brealt fwells to an enormous fize, and becomes indeed not hard, but throughout firm, like mufcular flefh. In Cuch a cafe the extirpation has been fuccelsfully performed.

Sometimes confiderable and often quite hard fwellings appear in the breafts, which proceed merely from blood. In fuch cafes blood flows from the nipple at each mentrual period. When the menfes difappear with years, the difcharge of blood no longer appears from the breaft; but then there is a hard not painful fwelling arifes, which often acquires a confiderable fize. If it is opened, coagulated and fluid blood is difcharged, and a fiftula follows, which difcharges a purulent fluid, and fometimes pure blood, and often continues feveral years, without giving great uneafinefs. The fwelling, which was at firft quite hard, fumetimes becomes foft, and then the furgeon is commonly induced to open it. Sometimes fuch fwellings are obferved in women who have the menftrual difcharge ; and in fuch cafes the fwelling always becomes greater at each period. Sometimes hectic fever and death follow the ouening of thefe tumors. (Monro). The mamma is alfo fubject to fungrus hommatodes; for an account of which, we refer our readers to Wardrop's Obferiations on Fungus Hamatodes.

SECT. III. Of the Difeafes of the Tonfils and Uvula.

## 1. Of the Enlargement of the Tonfils and Uuula.

The tonfils fometimes grow fo large and hard as to become incurable, and even to threaten fuffocation. The tumors have been commonly confuleced to be of a fcirrhous nature; but they are ncither attended with ftrooting pain, nor are they apt to degencrate into cancer; neither do fwellings return after the tonfils have been extirpated: hence they ought not to be removed till by their fize they cffentially impede deglutition or refpiration; but whencver they do this, they may be removed with fafely. The only proper method of removing them is by ligature, which is not only void of
of the Dif. danger, but feldom fails to perform a cure. If the bafe eafes of the of the tonfit be fmaller than the top, the ligature is to Tonfils and be ufed as for polypi in the throat; but however broad Uvula. the bafc of it may be, much difficulty will feldon occur in fixing it, for the fwelling is always very prominent. In difeales of this kind both tonfils are generally affected; but if the removal of one of them forms a fufficient palfage for the food, the other may be allowed to remain. Wher, however, it is neceffary to extirpate them both, the inflammatory fymptoms produced by the extirpation of the firt chould be allowed to fubfide before any attempt be made to remove the other.
When the form of the tonfils happens to be conical, fo that the ligature would be apt to flip over their extremities, Mr Chefelden has recommended a needle (Plate DXV.) with an eye near the point : a double ligature being put into the eye, the inftrument is to be pulhed through the centre of the bafe of the tumor, and the ligature being laid hold of by a hook and pulled forwards, the infrument is to be withdrawn; then the ligature is to be divided, and to tied that each part may furround one half of the tumor. This method, however, is fcarcely ever found to be neceffiary. Cnlarge- Enlargements of the uvula, from inflammation or
nentsof the from other caufes, may generally be removed by the nents. frequent ufe of aftringent gargles, as of Arong infufions
ivula of red rofe-leaves or of Peruvian bark. But when thefe fail, and the enlargement is to confiderable as to give great uneafinefs by impeding deglutition, irritating the throat, and fo caufing cough, retching, and vomiting, extirpation is the only thing upon which any dependence can be placed. Excifion is the readieft merhod when the uvula is only elongated; but when the fize is confiderable, dangerous hemorrhagies fometimes attend this method; on which account a ligature is preferable.
In performing the operation, the fpeculum oris (Plate DXV.) is neceflary to keep the mouth fufficiently open, and the uvula fhould be laid hold of by a pair of forceps or a finall hook, fo as to keep it firm, and prevent it from falling into the throat. After the operation, if the bleeding be confiderable, it may be checked by aftringent gargles, or by touching the part with lunar cauftic; but this will feidom be neceffary.

When a ligature is to be employed, it may be readily done according to the method recommended in the extirpation of polypi. A double canula with a ligature may be paffed through the nofe, or the ligature may be applied according to Chefelden's method in extirpation of the tonfils.
2. Of Scarifying and Fomenting the Throat.

In inflammatory affections of the throat, the means commonly employed are gargles, fomentations, fcarification, or topical bleeding. Gargles are ufeful for cleaning the fauces from mucus, or in cafes of ulceration. In relawation of the parts, they are employed with advantage when made of aftringent materials. Fomentations may be of fome ufe when externally applied; but the fleam of water, $\& z c$. drawn into the throat, by menns of Mudge's inhaler (Plate DXV.), is preferable. Sometimes it is neceflary to draw blood from the part affected. Here recourfe may be had to fcarifying, which may be readily done by the fcarificator (Plate DXIV.
fig. 14.). After a fulficient number of punctures have of the Difbeen made, the flow of blood may be promoted by the cafes of the patient's frequently applying warm water to the punctures. When an abfeels forms, notwithitanding the ufe of thefe renedies, the matter may be difcharged with the fcarificator already mentioned.

## Chap. X.

$12 \pm$

## Of the Difeares of the Ete and its Appendages.

Is the account of the difeales of the eye, we flall follow the fame principles of arrangement as we have already adopted, and treat of the dileafes of each particular texture of which the eye is compofed, in the order in which they appear molt natural ; as the difeafes of the conjunctiva, cornea, iris, crystalline lens, \&ic.

## Sect. I. Of Infammation of the Conjunctiva.

The general phenomena of inllammation of the con-General junctiva, are analogous to thofe which lave been al- remarks. ready enumerated, when treating of the innlammation of mucous membranes*. Along with the fymptoms there * See Chap. enumerated, there are others which arife from the pecu-IIt. liar functions of the organ. The eye cannot endure the ufual quantity of liglat, vifion becomes obfcured, and there is an increafed fecretion of tears. The inflammation is fometimes confined to the palpebre, fometimes to the conjunctiva covcring the white of the eye, in forne cafes to that portion of it uhich forms the external layer of the cornea, and in others it fpreads over the whole of thefe furfaces. Thefe differences merely regard the extent of the inflammation: but there are others which arife from a difference in the fpecific nature of the difeafe, forming three diflinet fpecies; 1. The purulent ophthalmia; 2. The purulent eyes of new-born children; and, 3. The gonorrheeal ophthalmia.

## 1. Of the Purulent Ophithalnia.

The purulent ophthalmia appeared in this country as Symptoms ${ }^{193}$ an epidemic after the return of our troops from Egypt in the year 1801. Since that period, it has fpread with the greatell violence over moft part of Britain. This difeale generally begins with a peculiar purple. coloured rednefs over the whole eyeball and inner mernbrane of the eyelids. There is a fudden pain produced in the eye, as if fand or fome foreign fubfance was lodged between it and the eyelid. As the rednefs increafes, the conjunctiva becomes fwelled, from the effufion of a tranfparent fluid in the loofe cellular membranes, between it and the fclerotic coat. There is at firt a profufe difcharge of tears from the eye, and the eyelafhes are glued together when the patient awakes. There is foon created intenfe pain in the ball of the eye, and a dull aching pain in the forehead. The cornea fometimes becomes opaque; and if the violence of the inflammation continues, it ulcerates and ruptures, al. lowing the aqueous humour to be difcharged; after which, an abatement of the inflammatory fymptoms generally takes place.

Before the difeafe advances thus far, the eselids are generally confidiably fwelled; and, befides the flow of

Oif the Dif tears, there is a profufe difcharge of a puriform fluid. cates of the The inflammation ufually attacks both cyes, and it beEye.

## 19.4

 gins in one feveral days before the other.Treaiment.-In flighter cafes of the difeafe, fomenting the eye with a decoction of poppy heads, and a brikk purge, have been found fufficient to abate the inflammatory fymptoms. In other cafes, however, it has been neceffary to draw blood to a very great extent. When the difeafe occurs in a flrong plethoric perfon, recourfe fhould be immediately had to the lancet, and the operation repeated on any recurrence of the fymptoms. It has been the ufual practice of Dr Veitch, and of thofe who have had extenfive opportunities of theating this difcafe, to draw the blood from the arm. A fraller quantity, however, taken from the temporal artery or external jugular vein, would be found to have an equally good effect.

When the purulent difcharge becomes profufe, fome have recommended the ufe of collyria, in the from of injections. The aqua camphorata is recommended by Mr Ware ; and a weak folution of corronive fublimate, with opium, has been found to have equally good effects. In thofe cafes where there is much pain and tenfion in the eyeball and brow, along with a turbid fate of the anterior chamber, and ulceration beginning in the cornea, the difcharge of the aqueous humour has been

* See $M r$
llane's
Treatife on the Purulent Ont thalnia.

195

* Sce The

Edinburgh
Medical
and Surgical fournal, vol. iii
atiended with much fuccefs ${ }^{*}$. This operation may be eafily, and at all times fafely performed, by making a puncture with a common extracting knife, through the found part of the cornea, near its junction with the fclerotic coat.

## 2. Of the Purultni Ophthalmia in Cliddren.

The fymptoms of the purulent eyes of children are very fimilar to thofe which have been mentioned. The difeafe generally appears a few odays after bisth, by an increafed rednels of the palpebral membrane, more or lefs liwelling, and a puiform difcharge. Somelimes the :nembrane fwells fo much as to evert the eyelids, and render it impoffible to examine the eye-ball. The cornea becomes obfcure, ulcerates, and allows the aqueous humour to be difcharged. The difeafe generally affects both eyes. From what we know of the origin of purulent ophthalmia, and from fome ingenious obfervations of Mr Giblon of Mancherter, * it appears probable, that the origin of this difeafe is communicated by the lodgement of an acrimotious difcharge upon the cyes of the child, from the vagina of the mother. In a great proportion of cafes, Mr Gibfon found the mothers of thofe children, affected with purulent ophthalmia, had leucorrtoea; and it is probable, that this, as well as other acrimonious difcharges, which we know to take place from the mucous membranes of thefe parts, produces the difen?e.

Trentment.-Solutions of faccharum faturni and opium, iujected between the eyelids, or the arpua camphorata of lienter, ought to be employed in the firt flame of the diferfe; and the cyclids ought to be likewife covered with fome mild unctuous application. When ulcerstion has advanced fo as to endanger a rupture of the cornea, that may be prevented by difcharging the aqucous humour. In the fecond fage of the intlammation, fcarifying the cyelids, and applying the red precipitate ointment. will generally be found to be ufeful in allaying the inflammation and fwelling of
the eyelids, and in reficsing the tranfparency of the cornea.

## 3. Of the Covorrtual Ophlhalmia.

The gororthueal ophthalmia occurs very rarely; and it has been known to arife from the fuppreflion of a gonorrhcea, or from the accidental application of the gonorrboeal matter to the eyes. In this refpect, its origin is very fimilar to the common purulent or Egyptian ophthalmia, and to the purulent ophthalmia which occurs in children.

The fymptoms and progrefs of the difeafe are alfo fimilar, only that its progrefs is much more violent, and it generally completely deftroys the organ.

Trentment.- When it is fufpected that the difeafe has arifen from a fuppitfled gororrhcea, fuch means ought to be employed as are moft likely to reflore the difcharge from the urethra; fuch as the introduction of a bougie, the injecting of warm oil, and the application of poultices and fementations to the perinæum. If the inflarematory fymptoms run high, powerful evacuants fhould be employed. Befides purgatives, blood flould be taken from the arm or temporal artery.

The local applications fhould confft of weak injections of corrolive fuolimate and opium, or acetate of lead and opium; and the fwelling and rednefs may be alfo relieved by the spplication of the red precipitate ointment, or the ointment of Jarin.

## Sect. II. Of the Pierigium.

The word pterigium denotes all thofe morbid changes in which that portion of the conjunctiva covering any part of the cornea or fclerotic coat becomes thickened, vafcular, and opaque. If the difeafe be confined to a particulat part of the conjunctiva, the difeafe is obferved at its commencement like a finall globule of fat, or condenfed cellular fubftance, fituated moft frequently near the junction of the cornea and fclerotic coat; and this fpot extending imperceptibly along the furface of the conjunctiva at length pafles over the cornea, the conjunctiva on the adjoining part of the felerotic coat becomes puckered, and as if it were forcibly drawn over the cornea. The portion of it which lies on the fclerotic coat is commonly loofe, and can be eafly elevated, but that which is on the cornca adheres more firmly. This Species of ptetigium has generally a triangular form; one of the angles of the triangle advancing towarts the cornca, or covering a portion of it, and the bafe lying on the fclerotic coat. Sometimes the thickening of the conjinnetiva is firl perceived on the cornea. The conjunctiva corering the fclerotic coat remaining quite found. A pterigium is always confiderably elevated above the adjacent cornea; but the degree of its thicknefs varies from that of a thin membrane to that of a fiethy mafs.

Pterigia arile moil conmonly at the nafal angle of the eyeball. They are formed, alfo, at the temporal angle ; and they fomctimes occur at boih places in the fame eye. In one cafe there were tro pterigia in each cye. They are formed very rarely on the upper and under parts of the eyeball.

Trentment.- The ouly mode of removing this difeafe is by excifion. This may be done by clevating the difcafed portion of the conjunctiva with a pair of forceps; and feparating it at its bafe by culting it throngla with a

If the Dif- pair of fciflars; and then carefully diffecting it off to its afecs of the apex. If any portion of it has been allowed to remain, Eye. or if the wound thews any tendency to form a fungus, lunar cauftic ought to be applied to it, and the application repeated as often as may appear neceffary. Any night inflammation or weaknefs in the eye which may continue after the operation, may be fpeedily removed by the application of the vinous tincture of opium.

## Sect. III. Of Pufules (Ophthalmia puftulofa).

Puftules are fmall tumors which are formed both on the cornea and fclerotic coat, but they occur molt frequently near the junction of thefe membranes. A pultule commonly frit appears like a dufky yellow or reddifh fpot, a little elevated above the furface of the cornea or fclerotic coat; and in a flort time it becomes a diftinct conical tumor. The adjacent part of the cornea is always more or lefs dim ; and a confiderable degree of inflammation accompanies it, which is either confined to the white of the eye contiguous to the pufule, or is fpread over the whole eyeball. Whilf the puRule is forming, the inflammation is generally confined to that part of the white of the eye which is in its immediate vicinity. The blood veffels are of a pale livid hue; they appear fuperficial, and can be readily elevated by a pointed inftrument; each trunk can be diftinguifhed, for they are never fo numerous as to appear confufed, or like one red mafs. They fometimes run in various di. rections, anaftomore freely with one another, forming net-works upon the white of the eye.

If the inflammation and puftule remain for fome time, the puftule generally advances to fuppuration. When fuppuration takes place, the apex of the puftule ulcerates, and frequently a chalky white fpot appears at the centre of the ulceration; and the opacity of the cornea at the fame time daily increafes around it. In other cafes, the opaque matter feparates, and leaves behind it a deép ulcerous excavation.

Sometimes the fuppuration proceeds more like a common pimple or phlegmon of the fkin ; a fmall quantity of a thick matter collects within the puftule, and when it is difcharged, a conical tumor remains, which has a depreffion at the apex. When the puftule contains a watery fluid, the fluid is moft frequently ablorbed in a gradual manner; but at other times the puftule breaks, and an ulcer is formed.

If, in either of thefe cafes, the contents are artificially difcharged, all the accompanying inflammatory fymptoms are much increafed.

Moft frequently there is only one puftule, and only one eye affected; but in fome cafes there are feveral both on the cornea and fclerotic coat of each eye.

The difeafe, at its commencement, is almof invariably accompanied with the fenfation of a mote in the eye, and the whole conjunctiva covering the fclerotic coat has often a yellowifh and fhining glafly colour before the rednefs appears. Thete is often, alfo, a degree of rednefs and fwelling, chiefly of the upper eyelid; and the tarfi are found adhering together in the morning, from the exudation of a ycllow matter among the ciliæ. There is frequently an unufual drynefs felt in the eye; but if it be expoled to a bright light, or if an attempt be made to ufe it, the fecretion of tears is increafed.

This fpecies of inflammation is always accompanied Vox. XX, Part I.
with a much greater degree of general fever, in propor- Of ilhe Diftion to the feverity of the local fympoms, than any cafes of the other oplothalmia. The pain is rarely acute till the pu. Lye. flule ulcerates; but, if that takes place, it is comn.oniy very fevere:

An eye which has been once affected with pullule, is very tubject to repeated attacks of the dife: of the cornea are met with in people of all ages; but they are more common in young people than in thofe advanced in life.

Treatment.-Sudorific medicines, cooling diluent drinks, and purgatives, ought to be employed in the frift ftage of the difeale; and given according to the violence of the conltitutional fymptoms. The cye, and parts 30 round it, fhould be fomented three or four times a day, with a decoction of poppy heads; to which may be added a frall quantity of fpirits. When the fymplomatic fever abates, and the rednefs affumes a more purple hue, the vinous tincture of opium may be applied to the eye. once or twice a-day; and this will be found equally uleful whether the puftule is in a ftate of fuppuration or not ; and it ought to be continued as long as there are any remains of the difeafe.

## Secr. IV. Of Matter collected between the Lamcllie of asio the Cornea.

Purulent matter is fometimes collected between the lamella of the cornea, when the difeafe is termed unguis or onix; or in the anterior chamber, when it is called hypopion.

When the matter is collected between the lamello of the cornea, it appears in the form of a yellow fjot ; and as the quantity increafes, the fpot becomes larger, but does not alter its fituation from the pofition of the head.

When the matter is collected in the anterior chamber, it generaliy appears like a fmall yellow globule between the iris and comea, occupying the inferior part of the cavity. Thefe abfceffes are commonly the effect of violent ophthalmia, occafioned by a blow, or injuzies of the eyeball; they are alfo formed, though rarely, without any accompanying inflammatory fymptoms.

Treatment. - Though the purulent matter may be more or lefs abforbed on the abatement of the accompanying inflammatory fymptoms; yet it would be found a good general practice to evacuate the matter whenever it appears, by making an incifion through the cornea. The difcharge of the aqueous humor along with the matter, never fails to diminith the inflammation ; and this perhaps may be the reafon why the practice is fo ufeful. Befides this, fomentations, brik purges, and cupping at the temples, may be neceflary if the inflammatory fymptoms are fevere.

## Sect. V. Of Ulcers of the Cernea.

Ulcers of the comea lave been divided by fome authors into a number of fpecies, from differences in thecir fize, in their duration, in the degree of the leverity of the accompanying fymptoms, and from the various caules from which they have been fuppofed to originate.

The mof frequent variety of ulcer, is that which remains after the cornea has fuppurated and burit ; either in confequence of a puftule or of ann abfefs.

Whas a pufule fuppurate, the centrai part of it ge-
neral!

Of the Dif-nerally gives way; and as the difeafe continues, the ul. eales of the ceration extends in all directions from that point. U1. $\underbrace{\text { Iye. }}$ cers of this kind are generally circular, and the edges rounded and froooth; having lometimes the appearance of a fmall artificial dimple: in other inflances they have ain irregular fhape, and their eages are jagged and acute. The fize of ulcers is very various; in fome cafes they do not appear larger than a depreffion made by the point of a pin, whilit in others they cover a large furface. Moft frequently the part of the cornea contiguous to the ulcer becomes more or lefs dim; and in fome cafes red refiels may alfo be traced in it.

Treatment.-The acute pain which generally attends molt ulcers, particularly thofe which are the confequence of puftules, will generally be much relieved by the application of the vinous tincture of opium, repeated two or three times a day. When this produces no good ef$f \in \Omega$, and the ulcer fpreads rapidly, attended with acute pain, nuch relief will be obtained by touching the furface of it with lunar cautic, or if there is a rifk of the nlcer eroding the whole thicknefs of the cornea, and a $j$ rolapfus of the iris to take place, it may be advifable to prevent this by difcharging the aqueous humor.

## Sect. VI. Of Specks of the Cornea.

There nre three forms of the corneal fpeck; the fir $\beta$ and mof fimple variety, is when a particular part of the cornca lefes its natural tranfparency, and appears clouded; cbjects being feen by the patient as if looked at through a mill or fmoke. Some of thefe fpecks are undefined, others diltinctly circumfribed, and they have each an equal degree of opacity throughour, or onc part is more opaque than the reft. They are mof commonly of a circular form ; but in fome cafes their haspe is very irregular. This fize varies from the fmalleff foot, to fach an extent as occupies the whole cornea.

In the fecond form of the corneal fpeck, the opacity is of a darker fhade, giving the cornea a bluifh, or in fome parts a milky appearance. It is Seldom equally opaque through its whole extent ; being generally more fo at the centre, and becoming gradually of a lighter made towards the margin. In fome inflances the flade is very unequal in the different parts of the fpeck.

In the third form of the corneal fpeck, the cornea becomes of the opaque gliftening white colour of common pearl, and the opacity gencrally extends through the whole of the lamellr of the cornea; fo that if even leveral of tho fe lavers which are external be removed, the remaining ones completely interrupt vifion. Specks of this defcription fometimes produce a nlight thickening of the cornea, and are accompanied by achefions between the cornea and iris. They are almoit always diftincly circum?cribed, though generally not fo opaque at the edge. When they are of any confiderable fize, they are nourinhed by one or more red veffels.

In the firn form of fpeck, the iris can be feen through the difeafed portion of the cornea; but in the fecond and third form of the difeafe, the degree of opacity is fuch, that nothing can accurately te diffinguifhed behind it. If there is an external inflammation accompanying the fpeck, the red veffels will be feen in a clufter on that part of the felerotic part nearef to it; and fome of the branclies can often be traced paffing over the edge of
the cornea, and terminating in the fubftance of the of the Dif fpeck. As the accompanying inflammation abates, the eafes of th.
number of the red veffels on the cornea commonly dimi. Eye. number of the red veffels on the cornea commonly dimi. nifhes; but fometimes onc or more trunks remain, and are diftributed on the fpech. In fome cafes, there are large $\Gamma_{\text {Fecks }}$ with numerous blood-veffels fupplying them during the continuance of active inflammation; and although the opacity remains extenfive after the inflam. mation abates, yet no red vcfels continue to nourifh it. The number of blood-veffels is in no cafe in proportion to the degree or extent of the opacity during any flage of the accompanying inflammation. For we frequently obferve a net-work of blood-veffels on a cornea which has very little obfcurity, and at other times there is a large opaque fpot, with only one, or even without a fingle red veffel fupplying it. Specks appear on every part of the cornea, but moft frequently towards its centre.

Specks appear to be formed mon fiequently on the external lamella of the cornea; but it is difficult to determine accurately their fituation. They vary in number. Commonly there is only one; but it frequently happens that there are two, three, or more difinct fpots on one cornea, all of which differ in their fize, fhape, and in degree of opacity.

Specks impede vifion in proportion to the degree of their obfcurity, and according to their fituation. Even a fpeck of the flightef Chade, which is hardly perceptible to a common obferver, if it be placed directly oppofite the pupil, materially injutes the fight; whereas thofe of the opake kind, if placed beyond its circumference, diminith the fphere, but not the diftinctnefs of vifion. In thofe cafes where the fpeck is of a moderate fize, and placed towards the centre of the cornea, the patient fees better in a dull, than in a clear light. For in a clear light the pupil contracts fo much, that it becomes covered by the $f_{1}$ eck, and the rays of light are prevented from entering; but in a dull light it becomes larger, fo that the rays of light enter by its edge.

Specks, mofl commonly, are either preceded or accompanied by inflammation of the cornea. Likewife wounds, if they do not unite without fuppuration, and ulcers of the cornea, are followed by a fpeck.

Specks are formed at every period of life; but they occur moft frequently in young people; probably becaufe in thom the cornea is much fofter, and more fpongy; and alfo as they are more fubject to inflammatory complaints of the eye than adults.

Trentment.-Thofe fpecks which have been defcribed under the fiv? and fecond form of the difeafe, generally difappear either by the ufe of remedies, or in fome cafes after the inflanmatory fymptoms abate.

When the eye is inflamed, and the eyelids turgid with blood, flightly fcarifying the eyclids, and immediately after the bleeding ceales, applying a quantity of an ointment compofed of the red oxide of mercuiy (ten grains to a dram of fimple ointment), will be found a very active remedy. And the fearifications along with the ointment frould be repeated every fecond or third day as long as any inflammation continues. When there is no inflamation accompanying the fpeck, the ointment may be applied alone. The unguentum citrinum, and various powders compofed of the fulphate of alum, fulphate of zinc, fub-borate of foda, diluted with from a fourth to an
f the Dif-eighth part of fugar, may alfo be advantageoully employafes of the ed. In fpecks of long duration, it will be found ufeful to vary the application, and to employ two or threc of the abore nedicines ten days or a fortnight alternately.

Thofe fecks of the third form, feldom become more tranfparent, even hy the ufe of the molt active remedies. In thofe cafes where only a fmall central portion is of that defcription, the fize of the fpeck may be diminifhed by the treatment already mentioned; and in fome cales, much henefit has arifen from cutting away an external layer of the moft opaque part; and afterwards ufing the above applications. It often happens, however, that if portions of a very old and opaque fpeck be cut away, the part is regenerated by an equally opaque matter.

The fpecks which are formed rapidly, are in general moft fpeedily removed. They go away, too, much more quickly in children than in old people; and in them, alfo, a much greater degrec of obfcurity can be made entirely to difappear. When a part of the cornea has become opaque, the opacity begins to difappear at the circumference of the fpeck, or at that portion of it neareft to the circumference of the comea. In fome cafes it may alfo be obferved, that the external laminee of the corneafirft regain their tranfparency.

## Sect. VII. Of the Staphyloma.

When the cornea, befides lofin'g its tranfparency, fwells to fuch a degree, that its internal furface comes in contact with, and adheres to the iris, and when it forms a prominent tumor externally, the difeafe has generally been called Aaphyloma. When the whole cornea is affected, it generally affumes a moze or lefs conical form ; lofes entirely its natural tranfparency; and vifion is completely deftroyed. The opacity is generally moft remarkable towards the apex of the tumor, and is generally of a pearl white colour diffufed through the whole corneal fubftance. The internal furface of the cornea adheres to the iris, and the pupil is in mofl cafes altogether obliterated.

In many cafes the cornea does not project beyond the eyelids; but in others, particularly in children, a large tumor is formed, which projects beyond the eyelids, and is attended with pain and inflammation, which, in fome inflances, renders the other eye weak and ir ritable.

Treatment.-When a part of the tumor gives way, and allows the contents of the tumor to be difcharged, the patient always experiences a fpeedy relief, but the tumor is foon formed again; fo that in order to prevent its growth, it is neceffary not only to difcharge its contents, but alfo to remove a portion of the difeafed cornea of fuch a fize as to prevent the humors from again collecting. A common extracting knife may be pafed through the tumor, fo as to divide a fegment nearly equal to half the cornea, and the other half may be readily cut away with fciffars. Intlammation and fuppuration fucceed; and the eyeball finally collapfes if there be not a fufticient degree of inflammation excited. A pointed inftrument may be introduced through the wound, fo as to allow the cryftalline lens, or any portion of the vitreous humour which may have remained, to be preffed out.

Sect. VIlI. Of Inflammation of the Iris.
Inflammation feldom affects the iris alone, liough in fome cafes it appears to be the principal difeafed part of the organ. The difeafe is accompanied with intenfe pain on expofure to light; difcoloration of the iris from the addition of red blood; difpofition of the pupil to contract ; and lymph to be effufed on the furface of the iris and pupil.

Treatment.-Copious bleedings from the arm, or temporal artery, are generally neceflary ; and in order to prevent any permanent contraction of the pupil from taking place, much benefit will be derived from liceping it dilated by the action of an infufion of bellaciona.

## Sect. 1X. Of the Mode of making ant Arificial Pupit.

The iris, whether from previous inflammation or other caufe, has been often found with the pupil fo much contracted, and adhefions formed between it and the capfule of the cryftalline, to fuch a degree, as to prevent vifion. The pupillar edge of the iris, too, fometimes adheres to the comea, and is contracted; and fometimes a portion of cornea oppofite to the pupil is a caufe of blindnefs. In all fuch cafes it has been repeatedly attempted to make an artificial pupil; but this operation has feldom been fucceffful. Various modes have been propofed to perform it, but that recommended by Scarpa is entitled to moft attention. This method confifis in introducing a curved cauching needle (Plate DXVII. fig. 20.), as in the operation of couching the cataract, palfing its point through the iris at the place where it is intended the new opening fhould be made, and then forcibly tearing down a portion of iris from its connection with the ciliary ligament. After the operation it will be found ufeful to keep the iris for fome time under the influence of belladona. We underftand that Mr Gibfon, an ingenious furgeon in Manchefter, has operated with great fuccefs in a new manner. He makes the punctuation of the cornea at its tranfparent part with an extracting knife (Plate DXVII. fig. 1.), and preffes the eyeball fo as to fqueeze the iris through the incifion of the cornea; or if any adhefions render that impracticable, he drags it out with a hook (Plate DXVII. fig. 19.), and afterwards cuts away with a fciffars the prolapfed portion. Then immediately the perforated iris falls back into its natural fituation, leaving a proper opening.

## Sect. X. Of the Cataralf.

The moft common difeafe of the lens is a lofs of its ratural tranfparency; and this arifes either from a change in its ffructure, or from a depofition of new matter. The capfule of the lens is alfo fubject to opacities. Thefe difeafes are known by the name of cataract.

There are four fpecies of cataract generally enumerated. In the firit, the crytalline lens itfelf becomes opake (cataracta cry/fallina). In the fecond, the capfule is changed in its itructure (cataracta membranacca). In the third, the liquar Morgagni becomes opake (cata. racta interfitialis) ; and when all thofe parts are aftected at the fame time, it bas been denominated the mixed cataract, cataracta miria.

$$
M=\quad \text { Whe: }
$$

Of the Dif- When the cryftalline lens becomes opake, the opacity eafes of the上ye.
210
Confiftence of cataracts.
genera!ly begins towards the central part of the lens, and extends cowards its circumference; in other cafes a general obfcurity extends over the whole lens.
The confiftence of the lens varies very much in the different kinds of cataract. Sometimes it is converted into an aqueous or milky fluid, or like thin jelly; at other times it becomes harder and firmer than matutal ; and in feveral cafes it has been found converted into bone or into a chalky looking fubftance. It has been generally remarked, that the fluid or milky cataract is moft frequent in children, but we have alfo met with it in thofe advanced in life. The folid or concrete cataract, on the other hand, has been genetally found in adilts. At the famie time, we have obferved the lens of young people converted into a lard and white fubftance refembling chalk.

The colour of different cataracts is very various; and they never appear of the fame colour in the cye as when removed from it. The mon ufual colour of them in the eye is a-bluifh white or gray; fometimes clouded in different parts or ftriated, fometimes of a lead colour, fometimes greenih, and fometimes of a yellow or amber colour. When taken out of the body, thofe which appeared white or gray are generally dark yellow or amber; and thofe of a yellow tinge in the eye often appear white when extracted.
'There is fearcely any diagnoftic nark of a foft and hard cataract which can be altogether depended on. The colour proves notning, thofe of a milky colour being ofien quite hard, and tometimes thofe of a pearl colour are quite foft. Neither is there any thing to be Icarnt from the degree of the opacity; for it will be found that thofe who iee no more than to be able to diftinguifh light from darknefs have the lens quite foft, whilft thofe who can difinguith colours and large objects have the lens quite hard. Richter, however, has remasked two fymptoms, which he fays have feldom deccived him in afcertaining this point. The fofter the lers is, the larger and thicker it is in general, and therefore approaches nearer to the plane of the iris or to the edge of the pupil. Hence he always concludes that the catarad is foft when it is near the pupil. In order, however, to judge of the fpace between the pupil and lens, the furgeon muft look into the patient's eye from one fide; and in general it requires much experience to judge of this with accuracy.

We are alfo able, in fome cafes, to difcern points, fireaks, or inergualities, in the thade of a cataract. If, after having obferved the place, figure, and difpofition of them, we find that in fome day's afterwards, or upon rubbing the eye pretty hard, they have undergone any change in their figure, fituation, or thade of colour, we may then conclude with certainty that the cataract is foft; only we mult be catious not to draw an oppofite conclufion, vi\%. that we are not to conceive the cataract to be liard if thefe changes fhould not be perceptible. felf A perfenty hard cataract," fays Becr, * "flows itequall: pis to be olsferved ansy points, ftrcalss, or fpots, of a clearer or darker colour ; the lens is evidently feparated from the irse, fo that a fufficient number of rays of light can moner, and the patient is ftill capable of diftinguifhing forme ol jects from the fide of the cye; the motions of the
pupil are extremely lively, and it never remains confl- of the dir derably enlarged. The opacity behind the pupil at the cafcs of th commencement of the difeafe is firf obferved in the Eye. middle, and it then extends, but very flowly, towards the circumference. Such patients, if the middle part of the pupil-is completely opake, can for the molt part read writing by the affilance of a magnifying glafs, and diftinguih tmall objects. The colour of the hard cataract is gray, paffing more or lefs to a greenifh hue; and the fmouth level of the lens may be very plainly remarked."

In moft patients the cataract is to be confidered as a Cataract local dileafe, though there ase alfo many cafes where an generally opacity of the lens comes on after or along with other difeafes of the eye. It has been obferved in gouty and rheumatic conflitutions, and in fuch people there is reafon to fufpect that it is more or lefs connected with the general conftitutional affection. This obfervation is of importance; for when an operation is performed in fuch cafes, a total blindnefs is ufually the confequence. Rich. ter operated on a man who had been much troubled with gout, and his fight was reftored. In feven months afterwards the pupil gradually contracted, at laft clofed, and a fecond blindncfs followed. In one cafe of a fimilar kind on which we operated, an attack of gout fucceeded the operation, the eye fuppurated, and the inflammation has never altogether difappeared, though two years have elapfed fince the operation. Even in fuch cafes the operation is not to be entirely forbidden: the fuccefs is lefs certain, and the patient will require a very careful preparation before it, and much attention after it.

There are fome varieties of cataract which are confi-Heredital ${ }^{214}$ dered to be hereditary. Richter extracted a cataract cataract. from a man whofe father and grandfather were both blind from that complaint. Maitre Jean and Janin have both met with fimilar cafes. Richter alfo faw three children, born of the fame parents, who had all cataracts at the age of three years. We have known feveral fimilar facts, and particularly one of twins, who both were affected with cataract when one year old.

When the cataraet is feated in the capfule above, it in Catarat ${ }^{215}$ general arifes from a blow or wound with a pointed in- of the ca Itrument. Sometimes the whole anterior portion is opake fule. and very much thickened, whilst that which is potterior remains tranfparent; and in fome cafes the capfule has been extracted in the form of a bag, having become altogether opake, and containing within it the cryftalline. Such cafes have been called by Richter the cataracfa cyfica. He fays he has only met with one cafe of that form of the difeale; Becr, however, mentions many; and from neeting with them he has been led to propofe the extraction of the capfule along with the cryftalline in all cafes of the difeafe.

The cataracta membranacea primition of Scarpa is alfo another form of the difeafe. In this variety the lens difappears, and leaves the capfule opake, or at moft in its interior a fpeck not larger than a pin-head. This kind of cataract, Scarpa remarks, occurs mott frequently in infants, or in people under twenty years of age. It may be diflinguifled by its refemblance to a very thin frale, or by a very white point, at the center or at the circumference of the cryftalline.

The tromulous cataract (cataracfe tremblante of the Trembl French), is another vailety of the difcafe which deferves catarac to be noticed. It is generally of a very opake white colour,
of the Dif-colour, and feldom large. It moves about on every moa afes of the tion of the eye, and the whole iris trembles and fluctuates to and fro. Sometimes they altogether difappear, at times pafling behind the iris, but they foon regain their fituation. In one example of this difeafe we obferved that the opake lens fometimes foll into the anterior chamber through the pupil. In this form of the difeafe it generally happens that the functions of the retina are impaired or loat; though this is not always the cafe.

Cataract is often accompanied with a complete amenrofig. In fome cafes of this kind there is a great dilata--tion, and immobility of the pupil, and the opake lens is obferved of a very large fize behind it. 'The patient can feldom diftinguifh light from darlinefs; and the want of fight generally precedes any obfcurity of the lens. In fome cales, where there is a combination of cataract and amaurofis, the pupil remains of its natural form, and alters according to the quantity of light. But, as in the former variety of the difeafe the opacity of the lens mof commonly precedes the amaurolis, it generally too comes on fuddenly, preceded by farks of fire appearing before the eyes, or clouds flying before them, or headach, and pains about the brow or temples. We have feen an inftance of a fimple cataract in one eye, and in the other cataract and amaurofis combined.

Commonly cataract affects both eyes fimultaneoufly; but there are alfo many examples of the difeafe affecting only one eye. It alfo happens, that firf one eye is affected, and many years afterwards the fecond. We have in general obferved, that when the cataract takes place only in one eye in young people, or when it fucceeds a blow, the other eye is feldom affected. But on this we fhould not trutt much, for it is an undeniable fact, that a great fympathy exifls between the two eyes; and that when one of them becomes difeafed, the other is very apt to become fimilarly affected. We have feen a cafe where a flaphyloma arofe in one eye in confequence of a wound, and in a few years afterwards the other eye became ftaphylomatous. A man who received a blow on one eye, which produced amaurofis, had foon afterwards a cataraft formed on the other. Richter mentions an analogous cafe. St Ives mentions a very remarkable cale of a man who was wounded in the right eye with a fmall ftot, and fhortly after that eye was affected with a cataract. Some time afterwards the fame difeafe took place in the left eye, but which gradually difappeared after the cataract had been extracted from the right eye. Thefe obfervations on the connection between the two eyes, have led fome furgeons to advife operating for cataract when only one eye is affected, in order to prevent the fecond eye from becoming difeafed. There are a few cafes where this practice has heen fuccefsfully adopted, and there are others where it has failed. We know of one gentleman, now upwards of feventy years of age, who was couched for a cataract in one eye when twenty years old, and the difeafe has never attacked the other eye. Richter once performed the operation on a woman who had a complete pearl-coloured cataract in the lcfi eye, and an incipient one in the right, which, before the operation took place, was beginuing to advance rapidly. After operating on the left eye, the progrefs of the difeafe in the right feemed to be checked, and for years after the operation it had not made the finallef progrefs. On the other hand, we
have operated in feveral cafes where the difeafe was juft of the Dif. commencing in onc eye, and when the operation did not eafes of the appear to arrelt its progrefs in the fecond one. It is F.ye. therefore a point not yet detcrmined in what cales it would be advilable to operate when only one eye is affected; for in thofe where the progrefs of the difeafe in the lecond eye cannot be arrefted by an operation on the firl, no operation ftould be performed on either eye until vilion is nearly altogether deftroyed.

The progrefs of this difeafe is very various; fome-Progrefo of times it proceeds fo llowly as not to dellroy vifion for the dileafe. many years, at other times a complete ublcurity of the lens has bcen known to take place almoft inftantaneoufly. Richter and Efchenback both relate cafes where people labouring under gout, which fuddenly retroceded, were entirely deprived of their fight in one night. We have obferved analogous cales, though we could not determine the exiftence of any conllitutional affection.

From the found cryftalline being chiefly compofed of albumen and a finall quantity of gelatine, whatever might produce a coagulation of thefe, would deftroy the pellucidity of the lens. Whatever too would produce inflammation of the capfule of the lens might alfo render it obfcure; for when any ferous furface is inflamed, and to that clafs belongs the capfule of the lens, its tranfparency is deftroyed, and it becomes thickened from an effufion of albuminous matter on its furface. Cataracts arifing from wounds are probably produced in this manner.

In old people there is often diftinguinable a flight obfcurity of the lens, and fometimes it even forms a complete cataract. In fuch cafes the obfcurity probably arifes from a want of balance in the fecreting and abforbent fyftems, or the neceflary perfection of thefe functions to preferve the natural Rate of parts, which we obferve to decay in many other organs, as well as the eye, in thofe far advanced in life.
Befides the fymptoms which are to be obferved in an eye ${ }^{219}$ affected with cataract, there are others remarked by the remptrom patient. Objcets appear to him as viewed through a by the pa. mif or cloud; and as the opacity of the lens increafes, tient. the cloud appears greater until it finally prevents even the largeft objects from being dilinguilhable.

The patient, at the commencement of the difeafe, can diftinguith objects better in a moderate than in a briorht light; and the fame thing happens if the light be interrupted by the interpofition of the hand or any other thade. The reafon of this is obvious; becaufe the pupil is more dilated in a moderate than in a bright light, and thus fill admits a certain number of rays of light by means of the pellucid circle of the lens.

When the exterior part of the lens is lefs oblcured than the centre, the patient fees thole objects much better which are placed by his fide, than thofe which are oppofite to him.

If the obfcurity has not affected the middle of the lens, but fome part of its edge, any circular body looked at by the patient, appears to have its edge imperfect. It has been alfo remarked that fome patients fee every thing with perforations in them. The cataract is feldom accompanied with any pain. When it is brought on from internal caufes, both eyes are generally affectcd.

## Of the Triatment of Cataract.

In the treatment of cataract, recourfe has generally been had to a furgical operation. Some have pretended to cure cataract by internal medicines. Small dofes of calamel, electricity, extractum hyof cyami, aqua laurocerafi, have been extolled; but their ule is now very generally given up. In fome cafes of cataratt which have arifen from an injury of the cye, Mr Ware has feen them difappear by an external application of ather, which promoted the abforption of the opaque body *.

There are two operations which have been propofed operations. for the cure of the cataract ; the one called extraction, and the other couching. In the firt, an incifion is made into the cornea, and the lens semoved by pufthing it through the pupil. In the fecond, the lens is taken out of its capfule, and lodged in fome part of the vitreous humour, where it may be entirely out of the axis of the eye. Each of thefe methods has been much practifed; and though a decided preference feems at prefent to be given by the mon diftinguifhed furgeons to the mode by extraction, yet there are alfo cafes attended with peculiar circumfances, in which the operation of couching may be fuccefffully employed. Both operations ought therefore to be well underfood by every furgeon.

It was formerly the cuftom, before performing either of thefe operations, to confine the patient for feveral
weeks, or even months, to a frict antiphlogiftic regimen; but this precaution, except in very particular cafes, may be generally difpenfed with. People who have become blind, generally lead a quiet life, and are not expofed to any of thofe diffipations which are likely to affect the conflitution. It will therefore generally be found fufficient precaution, before attempting an operation, to enjoin the patient to live moderately; to avoid firituons liquors, and take a few dofes of any of the common laxative medicines. If he be ftrong and plethoric, it will be neceffary to purfue fuch a courfe a little further; to give dofes of laxative medicines for a longer period, and even to bleed the patient in the arm. Many furgeons lay it down as a general rule, to take fome blood on the morning of the day of the operation, either from the arm, from the temples, or frons the neck by cupping; and either of thefe methods is to be preferred, according to the quantity of blood which is intended to be taken. In old people of a healthy conftitution, we have often found it unneceffary to ufe any of thefe means, no inflammatory fymptom having arifen during the progrefs of the cure. In many cales, inftead of bleeding before the operation, we liave preferred doing it after the operation was performed, when the patient was put quiet in bed. Blood taken at this period may be reafonably fuppofed to have a more powerful effect in giving check to any inflammatory attack which might be apt to fuceced the operation, than if an equal quantity had been taken away before it. The bleeding too, immediately after the operation, we have often oblerved, renders the patient calm, and more difpofed to reft, whereas at the fame time any of thofe difagreeable fymptoms are avoided during the operation, which are apt to remain for feveral hours after blecding, when the patient is in the erect pollure. It is alfo of importance before the operation is performed, the patient being fo fituated, that he can be
eafily put to bed. The operation fhould therefore be of the Diiperformed in the fame chamber in which he is to re-eafes of the main, or in one immediately adjoining; and he fhould be cluthed in a bed-gown, or fome Joofe drefs, fo as to enable him to get into bed without much trouble. The bed flould be placed in fuch a pofition in the room that the light does not fall directly on the patient's face, fo that during the cure, all glaring lights may be eafily avoided.

## Of the Extraction of the Cataract.

In this operation the object of the furgeon is to make a wound in the cornea, and to extract through it the opake lens. In performing it there are four fleps which require to be particularly confidered. The fir $\beta$ of them is the means to be employed for fecuring the eye during the operation. The focond is the mode of making the incifion through the cornea; the third, the mode of opening the capfule of the cryftalline lens; and the fourth is the extraction of the lens. All thefe fhall be confidered feparately.

## Mode of fecuring the Eye and Eyclids.

One of the great improvements in modern furgery is the fimplicity of the mechanical means employed in performing operations. A great variety of contrivances have been propofed, in order to fecure the cyeball and eyelids during the extraction of the cataract. Experience, however, hews, that almoft all thefe are completely ufelefs, and moit of them extremely hurtful. To dif. penfe, therefore, with thefe inftruments, and to be able to execute with the fingers alone thofe parts of the operation for which they were employed may be jufly confidered as a material improvement. The eyeball and eyelids may be completely fecured in almoft all cafes, by the fingers of one hand of the operator, and thofe of an affittant. The affittant will generally find that, with the forefinger of one or of both hands placed upon the tarfus, one upon the internal, and another towards the external angle of the eye, he will be eatily able to raile the upper eyelid, fo as to expofe the cornea; and by the finger being placed towards the internal angle he will be alfo able to affilt the operator in preventing the eyeball from being turned inwards, when the incifion into the cornea is about to be made. The operator is to fecure the under eyelid by the fore and middle fingers of his left hand. They are to be placed in fuch a manner over the edge of the tarfus, that they may come in contact with the eyeball; and the middle linger is to be prefed pretty firmly in the internal angle of the eye, between the eyeball and lachrymal carcuncle, fo as effectually to prevent the motion of the eye towards the nofe. In this pofition of the fingers of the operator and affiftant, theie who arc accuftomed to perform operations on the eye, find that they are completely mafler of the motions of the cyeball; and by altering the pofitions of the points of the fingers, and applying more or lefs preffure, they are able to counteradt any untoward motion of the organ. Before attempting to fecure the eyeball, the operntor frould be prepared to advance in every tlep of the operation; for it will be generally found, that if an attempt has heen made to open the eyclids forcibly, a certain degree of irritation and watering of the eye takes place; fo that; when a fecond attempt is made,

Of the Dif-with a view of proceeding to the other fleps of the opeeafes of the ration, more difficulty is met with in holding the cye Sye. than at firlt swould have been the cafe. It is a guod precaution, however, for the furgeon to take an opportunity, before the day of the operation, to try to fix the cyc, and to explain to the patient this flcp of the operation; for it often happens, that patients fart, and make grcat refillance by fqueezing the eyelids, when the operation comes to be performed; fo that by habituating them to the mode of fecuring the eye, it is more cafily accomplithed. The firft thing to be attendrd to, before attempting to fix the eye, is a proper light, the pofition of the patient's head, and the lieiglat of the chair in which le is to fit. The light of the room fhould come from one window, and the patient fit in fuch a manner that the light falls obliquely over his nofe upon the eye to be operated on. If lie be placed fo that the rays of light from the window fall in the direct line of the eye, the furgeon will find that lie is obliged, either to fit in his own light, or that the reflections upon the cornea tend to embarrafs him. As foon as the other eye is covered, fo as to prevent it from having any motion, and communicating that motion to the eye on which the operation is to be performed, the affitant is to be placed belind the patient, and the patient's head to be fupported firmly on his breaft. Ihe leight of the chair on which the patient is to be placed, will depend on the height of the patient, and always fiould be fo low, that the affiltant is able to look over the head, and completely command the motion of his own fingers. The operator and affittant thould open both eyclids at the fame time, which will more readily fecure the eyeball in a proper polition. The eyeball, however, is apt to be turned upwards, fo that the cornea is thrown out of view. When this happens, the upper eyelid foould be firft raifed, and the affiltant fhould be always ready with the points of his fingers, to prefs in fuch directions, that when the eyeball at any moment places itfelf in a proper pofition, he may be ready to lecure it. When, on the other hand, the eyeball is thrown downwards, the operitor himfelf muft place it in a proper polition, and in this manner both the operator and alfiftant are to co-operate with each other, and the one or the other placing his fingers in fuch a manner as to counteract moft effectually any aukward polition of the eyeball. When the cyeball appears Ateady, the incifion of the cornea ought to be immediately performed. But before entering the knife, it will be found a ufeful precaution to touch the cornea frequently witlits back, and fee if the patient ftarts, or if the eyeball remains quite fteady. It will often bappen, that whenever the point of the inftument touches the eyeball, it is Cudtenly thrown into motion; and was the incifion of the cornea to have been begun at this moment, much difficulty would have arifen. If however, the eye be repeatedly touched with the knife, the farting motion will fooner or later ceafe, and then the incifion of the cornea may be begun with every poffible advantage. When the knife has paffed through both fides of the cornea, there is no danger of any motion of the eyeball hindering the operation.

If fometimes happens that the eye is extremely fmall, and that it is funk deep in the orbit. In fuch people the operation becomes much more difficult; and we lave met with cafes, where, from thefe circumfance it was
almof impoffible to fccure the cyeball with the fingers; Of the Jif the room which the fingers neceflarily take preventing eafes of the the kisife from being properly managed, and cuvering a Eyc. portion of the cornea. In fuch cales, the fpeculum contrived by M. l'ellier will be found to be a uleful inftrument. See Plate DXVII. fig. 8 . 'The fpeculum confifts of a piece of filver wire, bent in the mamner reprefented in the plate; and though in itfelf extremely fimple, it requircs a good deal of management and nicety in ufing it. 'lize curved edge of the wile (a) is to be placed upon the infide of the cilia on the borizontal plate of the tarfus; the fkin of the upper cyelid being previuully itretched upwards: The allillant is then to move the fpeculum upwards, imitating, as it were, the natural motion of the eyelids; and, when the cyeball is fufficiently expoled, the fpeculum, with the handle (b) retling on the brow of the patient, is to be kept firm and iteady in the fame pofition. In ufing the fpeculum, it is neceffary to make a confiderable preflure on the eyeball, in order to prevent the eyelid from flipping from underneath the fpeculum. At the lame time as little preffure fhould be employed, as will prevent this from taking place. Many lurgeons, in uling the fpeculum, place it behind the cilice; and whenever any watering of the eye takes place, from the irritation of the inftrment, it is very apt to flip from the moifture of the fkin. In order to prevent this, we have found very material benefit from fimply folding round the fpeculum a thin fold of crape, which, from its roughnefs, cffectually prevents the rifk of the feculum flipping. 'lhe operator is to manage the under eyelid in the fame manner as if the upper eyelid was covered by the fingers of an affiftant; and it more particularly relts wilh hin to prevent the eyeball from rolling inwards, the fpeculum merely ferving to fupport the upper eyelid.

After the knife bas penetrated both fides of the cornea, the affiftant is to be aware that no preffure is to be made upon the cyeball. When, therefore, this ftep of the operation is completed, the affitant, if he be ufing the fpeculum, is to be particularly careful in taking off any preflure which it may make, and merely to fupport the eyelid.

## Mode of making the Incifion of the Cornea.

The great object to be kept in view in making an incifion of the cornea is, that it be of fufficient fize to allow the eafy extradtion of the cryllalline lens, and that any cicatrix which may remain may not interiupt the entrance of the rays of light through the pupil. The mode which has been recommended to effect thefe purpofes, is to make a femicircular incifiun, parallel to the circumference of the cormea, and about half a lme difiant. from the junction of the cornea and (clerotic coat. One of the knives (Plate DXVII. Fig. $1,2,3$. ) is to puncture the cornea half a line difant from its circumference, to be carried acrofs the anterior chamber to the oppofite fide, and brought through the cornea at the fame diftance from the fcierotic coat to where it was entered; afterwards the incifion is to be finifhed by puhing the knife forwards till the incifion is completed.

Inftead of making the incifiun in this manner, NIrburgb NeJames Wardrop has propofed another form of urifion, dicai and in order to remove feveral objections to whicl the other Chivuegicat operation was liable *. The difadyanageswlich MIr Mrar- jout ive,

Of the Dif-drop fuppofes to arife from the ufual mode reconimendeales of the ed are,

Eye.

1. The cornca being of very confiderable thicknefs,
a great part of the femicircular incifion will be carried through between its lamine, and therefore the length of the incifion of the internal lamina will be much lefs than that of the external one. This he explains by two plans, Plate DXVIL. fig. I I. and 12, where befides the external form of the incifion ( $a, a, a$ ), there is drawn a fecond line $(b)$, intended to reprefent the incifion of the internal lamina. The dark ipace, therefore, included between thefe two lines ( $b$ and $a$ ) is intended to reprefent that portion of the incifion which is made between the laminze.
2. The external form deceives us in the extent of the internal incifion, and much more difficulty is met with in bringing the lens through it, than from its apparent length could have been expected; for, as the line of the internal incifion has a very flight curvature, the thicknefs and tenfion of the cornea allow the edges of the wound from being feparated only a little way from one another.
3. When the cornea is divided nearly at its union with the fclerotic coat, and when the aqueous humour and lens have efcaped, the portion of the iris oppofite to the centre, and moft depending part of the wound, lofes its natural fupport given to it by the cornea, and is pufhed forward, fo that it comes in contact with the cornea, and even infinuates itfelf between the edges of the incifion. The greater the opening is, the more danger there is of a prolapfus, both of the iris and vitreous humour; for it would feem as if thefe two parts of the eye were pulhed forwards in confequence of the contraction of the coats of the eye, which takes place as foon as the incifion is made; and if two thirds of the cornea be cut, there is certainly much lefs refiflance than when the half only has been divided. Thus, the iris and cornea form permanent adhcfions in confequence of the inflammation which always follows the operation. The pupil becomes of an irregular form, is drawn from the centre of the eyeball; is fometimes very much contracted, and retains but a very limited fphere of contraction and dilatation.
4. The contraction of the mulcles of the globe of the eye preffing forward the contents of the pofterior chamber, are very apt to pulh a portion of the vitreous humour through the pupil and wound of the cornea. When this happens, the pupil becomes irregular, and drawn down towards the incifion, the form of the eyeball is fomewhat altered, and the prolapfed vitreous humour inclofed in its capfule, appears externally in the form of a rouid tranfuarent tumor.
5. As the external edge of the femicircular flap of the cornca is very thin, and lies loofe, the fralleft move. ment of the eyelids, particularly of the upper one, is apt to catch and raife it out of its proper fituation, and thus that \{peedy union is prevented which would take place if the two divided furfaces had been kept in accurate and conflant contact.
6. and lallly; As the internal edge of the incifion is often unavoidably made, from the fimallnefs of the anterior chamber, and the fatnefs of the cornea, nearly oppofite to the inferior margin of the pupil: and as all the cxtent of the cut furface $a b$ (Plate DXVII. fig. 12.), fomctimes remains opaque after the wound is hesi-
ed, the opacity of the cicatrix muft diminifis the fphere of vifion.

All thefe difadvantages in the ufual mode of making an incifion of the cumea, appeared to Mr Wardrop to arife chictly from the wani of a fufficient portion of the cornea being left at the inferior part of the wound, to fupport the iris, and to prevent the proflure of the parts contained within the eyeball, and the occafional action of the mufcles pulling forward the iris towards the wound of the cornea; be therefure conceived that if the incifion could be made in fuch a manner that a larger. portion of the cornea could be left at the inferior patt of the wound, being at the fame time made of fuch a form as to allow the ealy extraction of the cataract, and the cicatrix not afterwards to interfere with vifion, a confiderable improvement would be made in the operation. With this view he made the incifion in the following manner.

225
The belt knife for the purpcfe is of the fame fize and Of the cor Chape with that delineated in Plate DXVII. fig. I. nea knife. The blade is of a fimple trianguiar form, the back being one continued line with the handle, except merely the point. The point, though extremely tharp, fhould be made firm, and the blade fhould turn gradually thicker from the point towards the handle. The point of the knife muit be fharp on both edges for at leaft the breadth of a linc, in order that it may penetrate the cornea quickly and eafily. The back of the knife fhould not be left angular, but the edges rounded off and made fmooth, fo that it be convex on both fides. Particular care ought to be taken that the point of the knife be well condisioned; and it is not only neceffary that it be flarp, but that the metal of which it is made be neither too hard nor too foft. This may be eafily afcertained by preffing the point upon the nail; for if it bend readily, not being fo brittle as to break through, and fufficiently elaftic to recover the flraight line, we may be confident that it will anfwer the purpofe. It is alfo a good precaution to have the knife fharpened the day before, or the morning of the operation; and in cafe of any accident happening to the point, the opera. tor himfelf fhould carefully examine by trying how it penetrates a thin piece of leather, immediately before ufing it. From the point of the knife being too brittle, we have known a cale where the point of it was broken off, when attempting to penetrate the inner part of the cornea; and from the point being too foft, we in one cafe, after puncturing the cornea, found it impoffible to penetrate with the knife the oppofite fide, and this we found had arifen from the point of the knife bending round.

Having previoufly fmeared the knife with oil, or fmoothed the edge of it upon the palm of the hand, in order to make it cut more keenly, its point is to be thruft through the cornea at its tranfverfe diameter, and at leall half a line diflant from the fclerotic coat, and in a direction as if it was to wound the iris, or nearly perpendicular to the foherical furface of the cornea (fee Plate DXVLI. fig. ${ }^{1} 3$. and $15 . a$ ). Whien the point of the knife reaches the plane of the iris, it is to be turned towards the oppofite fide of the comea, by moving the blade upon the incifion already inadc, as a fulcum. It is then to be carried forward, fo that the cornea is again punctured at its tran $\int$ verfc diameter $b$, at the fame diftance from the fclerotic coat at which it had been entered on
of the Dif- the oppofite fide (fig. 13.). By thefe two incifions the eafes ot the blade of the knife bas cut perpendicularly, or very nearly

Fiye. fo, to the โpherical furface of the cornea, and the gradual ${ }_{225}$ thickening of the knife, by filling up the wound as fall of the in- as it is made, prevents any of the aqueous humour from cilion of the making its eflape. The eye is now completely fecured corrica.
the cornea, the wourd was long in uniting, and after it of the of $f_{0}$ was healed, the pupil remained very irregular and con- calce of the tracted.

In making the incifion of the cornea in the manner that has been directed, another circumflance alfo particularly deferves notice, which is, that after having punctured both fides of the cornea, in giving the knife the motion round its axis, fome of the aqueous humour efcapes, and there is a great liik of the iris turning over the cutting edge of the knife. An operator who meets with this for the firt time, is apt to think an wound of the in is is inevitable; but if he cautioufly thops the progrefs of the knife by gliding the point of the forefinger over the cornea, and prefling the iris from its edge, the incifion will be completed with perfec fafety.

It fometimes happens that after the knife has entered the cornea, the eyeball makes a fudden motion inwards, towards the nofe, and a confiderable part of the cornea is thus thrown out of view. This accident happens either from a fault in the operator or his affifant, and ought to be particularly guarded againft; for when it has taken place, it is irremediable. The operator muft not attempt to procecd any further, but immediately withdraw the knife, allow the wound of the comea io heal, the aqueous humour to be regenerated, and after any light inflammation which might fucceed, has gone off, the operation may be a fecond time atterupted with. out any additional rif.

It fometimes happens that, on puncturing the cornea on the nafal fide, the point of the knife does not come through at the proper diftance from the feleratic coat. If it pals through too near the centre of the cornea, as is reprefented in Plate DXVII. fig. 17. confiderable difadvantage arifes; for hefides the incifion being too frall, fo that the lens is extracted with difficulty, the eye is apt to receive colfillerable injury, and the cicatris afterwards to interfere with vifion. When this accident happens, it will be the moff prudent practice to proceed no further in the nperation, but to allow the wound to heal by adhefion, fo that a fecond oueration might be afterwards atiempted with all the advan qges of the firt. It is aftonifing the ra ridity with which a wound of the cornea made by a cutting inftrument heals, and except it be very large, fearcely can the moft acute eye detect any cicatrix. It is therf fore much more prudent whenever any fault in the incifion arifes, that the wound be allowed to reunite, fo that afterwards a fecond operation may be fucce[ffully performed, inflead of attempting by Iciffars or other inftruments to correct any bungling. If the knife paffes through the cornea too clofe to the fclerotic coat, it is not attended with fuch bad eff cts as when it pafies near to the pupil; and was it not for the danger in wnunding the iric, it would he advifate in all cafes to lay it down as a general rule to $m$ ke the knife come out very clofe to the fclerotic coat. cornea, he fhould malie a paufe, and allow the patient to compofe himfelf a little, in cafe of any involuntary motion of the eye-ball injuring any part of its Aructure. Ir Comelimes happens, indeed, that the moment the inciinon of the comea is finifhed, the lens fudde ly follows the knife; but this is a circumftance never in be wifhed for, as the lame caufe which throws out the lens may

Of the Dif-alfo pull after it fome of the vitreous humour. When eafes of the the incifion of the cornea is finifhed, and nothing has Eye. $\underbrace{\text { Eye. }}$ efcaped but the aqueous humour, the patient fhould be directed to turn his eye from the light, and to keep his eyelids fhut, taking great care not to fqueeze them, fo that the pupil may be allowed to dilate. In molt furgical operations, particularly thofe attended with much pain, it is of importance to finifh them as quickly as porfible. This, however, is not the cafe in the extraction of the cataract. It will be in general found that the feverity of an injury done to any part of the body depends, not only on its extent, but on the fudden manner in which it is inflicted. Thus, a fmall drop of blood fuddenly effufed on the lurface of the brain, often produces a feries of much more diftefling fymptoms than a large collection of purulent matter in that organ. It is therefore reafonable to expect that if the different fteps of the operation for the extraction of the catarad are gone through in a rapid manner, the eye will be much more injured than if the fame operation be performed more flowly. There is another advantage too, derived from performing the operation in a cautious manner; by holding the eye firmly for fome time, the mufcles become fatigued, and during the latter fteps of the operation, when there is the greateft danger of injuring the organ, the power

Mode of puncturing the capfute. of refiltance to the operator is nuch diminifhed.

The next Itep of the operation is to make a puncture in the capfule of the cryftalline lens, fo that the lens is allowed to pafs through the pupil. On opening the eyelids, it will generally be found that the pupil has a very irregular appearance, which a beginner may often fuppofe to be in confequence of a wound of the iris, though no fuch accident has happened. Some furgeons employ an affitant to fupport the upper eyelid, whillt others take both eyelids completely under theis own management; and when the operator finds that he can eafily accomplifh this laft mode, he fhould always prefer doing fo. When the eyelids are opened in fuch a manner as io expole the incifion of the cornea and pupil, the

* See Plate point of the inftrument called the curette *, is to be inDXV11. troduced through the wound of the cornea and pupil, to Fig. 19. puncture the capfule of the lens. Richter advifes that the capfule fhould be punctured feveral times with the point of ihis inftrument, in order that a large opening may be made into it. When the lens is foft and milky, this may be neceffary, but when it is of a firmer texture, if one puncture is made it fufficiently tears the capfule fo as to allow itfelf to come away eafily. Before introducing the curet:e, moderate preflure fhould be made on the eyeball, which has the effect not only of keeping the eyc fleady, but allo of dilating the pupil. The convex part of the inftrument ( $a$ ) is then to be introduced through the wound of the cornca, and conducted to the central part of the pupil. When it reaches the pupil, from the curvature of the infrument, a very fmall turn of the handle will place the point upon the capfule of the cryftalline lens, and by pulning the point inwards, the capfule will be radily punctured. It is not neceffary that the point of this inftrument be very thin ; a rounded point will anfwer all the purpofes of puncturing the capfule; whilf from this form there will be lefs danger of woundine the iris from any unexnected motion of the eyeball. Very little force is neceffary to puncture the capfule, and whea the point of the curette paffes through
it, it gives the fenfation as if puncturing a piece of very fine paper with a pin.

This part of the operation we have often found to be one of the mofl difficult; for in many patients the eye becomes extremely unfteady, and whenever an attempt is made to hold it tirm, or introduce the point of the curette, the eyeball is immediately rolled upwards under the roof of the orbit. The eytball, too, is apt to make fome untoward motion, after the point of the curette has been introduced into the anterior chamber; fo that if the operator be not on his guard, the iris may be caught and torn by the point of the curette. In one cafe where, after the point of the curette was introduced through the pupil, the eye turned fuddenly upwards, and the hooked part of the inftrument catching the edge of the iris, pulled it a good way downwards, though fortunately it did not tear it.

## Mode of Extracting the Lens.

Whenever the capfule of the lens is punctured, the lens in many cafes begins to move forward, and the pupil to dilate. 'The operator carefully watching this effeet, fhould keep up an equal and moderate preffure upon the eyeball, which will affuf the lens in getting through the pupil. Whilft the lens is making its efcape, and appears to prefs very much on the inferior part of the pupil, the iris fhould be fupported by the back of the fpoon, ( $b$ Plate DXVII. fig. 19.) which is generally for conveniency, fixed upon the oppofite end of the handle of the curettc. In applying the preffure on the eyeball, it is of great importance that it be kept up uniformly, and it fhould always be proportioned to the cffects which it appears to produce on the dilatation of the pupil. In molt cafes a very moderate preffure will be found to anfwer the purpofe. We have met with others, however, where it was neceffaiy to comprefs the eye with a good deal of force, before it was poffible to remove the lens.

Any fmall portion of opaque lens which now remains in the capfule, or on its furface, muft be extracted by means of a fmall fconp. When the fragment lies on the furface of the capfule, or in any part of the anterior chamber, it is in general eafily removed; but when the opaque body remains within the capfule, it becomes neceflary, that the foop fhould enter the capfule through the opening which was made in it. When this opening is large and wide, the fcoop will eafily get in, and reach the opaque fragment; but on the contrary, when the opening is fmall, the fcoop may be moved about in every direction, in hopes of laying hold of it, for the fooop is on the outfide of the capfule, and cannot procure an entrance. It has happened accordingly, that every endeavour to extrast the remaining fragment has been fruitlefs, and in fuch cafes it was fuppofed by the operator to adhere to the capfule. It was mare probable, however, that the capfule had not been fufficiently opened, and that the fcoop could not reach the fmall fragments. In all cafes, however, it is an object of importance, completely to remove the opaque body ; for though any remaining portions be ultimate. ly abforbed, yet in the mean time the operation is by no means fo complete as it would have been, had nothing been allowed to remain. It has been advifed by fome, (and the practice has certainly been attended
of the Dif-with gond effects), that after the principal part of the eafes of the lens is removed, any fragments which may remain, and Eye. which are not vifible, may be brought into view by flutting the eyelids, and cautioully rubbing them with the finger.

## Of the Extraction of the Canfule.

When, after the cryfalline lens is removed, the capfule is found to be opaque, it is abfolutely neceflary that it be at the fame time taken away. Opacities of the capfule are generally fituated in its anterior parts, which renders the removal of them much more practicable. The forceps for this purpole (Piate DXVII. fig. 9.) are to be cautionlly introduced through the wound of the cornea and pupil, and any opaque portion laid hold of, and cautioufly removed. It has been obferved that though the capfule did not appear opaque during the operation, yet in confequence of inflammation, which occurs more or lefs afterwards, the capfule has become opaque. This circumfance has led to a propofal, that in all cafes the capfule fhould be extracted along with the opaque lens. From the natural frufture of the eye, and the flrong adhefion which exifts between the pofterior part of the capfule of the lens and the anterior portion of the capfule of the vitreous humour, it would appear impracticable to feparate them from each other, fo as to extract the capfule entiice. Many cafes, however, are recorded by different authors, where, in performing the common operation, the lens inclofed in its capfule has made its efcape. In thefe cafes, however, it is probable, that the natural adhefion between the capfules of the two humours had been deftroyed by fome morbid alteration of ftructure. Such cafes have probably been the caufe of the propofal to extract in all cafes the capfule of the lens. Mr Beer, a celebrated oculift Pratifichein Vienna, has publifhed a work *, in order to recom-eobach- mend and defcribe the mode in which fuch an operation vngen. flould be performed. After fome general obfervations on the bad confequences which arife from portions of the capfule remaining behind after the lens is removed, he defcribes his mode of operating in the following words.
" Immediately after dividing the cornea, I dilate the pupil as much as poffible, by a gentle preffure on the eyeball with the finger. I then introduce the lancet (Plate DXVII. fig. 4.) through the wound of the cornea, and plunge it into the lens; one furface being turned upwards, and the other downwards, fo that none of the lancet is vifible. It is particularly to be recommended to the inftrument-maker, that this lancet have a pretty thick body, by which means, the moment of introducing it, the lens will be fomewhat preffed back, and its weak anterior adhefion will be feparated. The lancet muft now, when in the middle of the lens, he moved upwards and downwards, in order to divide its connections above and below. Lafly, the inftrument mult be turned fuddenly on its axis, and moved to the inner angle of the eye, and then drawn out in a ftraight direction. 'rhe lens often follows with its capfule, im. mediately after the lancet is withdrawn, or at leaft it comes out quite eafily, along with its capfules, on a continued preffure of the finger. There is not merely a fleight of hand, which mult be carefully obferved in the ufe of the lancet ; experience has taught me many precautions which muft not be noglected the moment
that the lens comes out, otherwifc the capfule may be of the Dicvery eafily rubbed of form the lens, either in paffing the eafes of the pupil, or in the wound of the cornea.
"In order to avoid this, the opening of the cornea fhould be made as large as poffible, and it is bett to divide two-thirds of it; thereby the operator has the following advantages.
" I. The pupil dilates of itfelf after the divifion of the cornea by the preffing forward of the lens; and this dilatation may be eafily increafed by the flighteft preffure.
" 2 . The more the pupil is dilated, the betterathe operator can obferve the management of the lancet; he can move his inftrument more freely in different directions in the lens, and confequently feparate more quickly and more furely, the lens along with the capfule, from all its connections.
" 3 . The lens with its capfule paffes more eafily thrcugly the pupil, the wider the opening in the cornea, (whicly indeed requires in moft cafes much face), and the further and more eafily the pupil dilates, the lefs danger there is of the capfule being feparated on coming out. If the wound of the cornea is fmall, the capfule will be either feparated from the lens in the pupil, or in the wound of the cornea, or paffed back again either entirely, or at leaft partly, into the pofterior chamber of the eye."

To thofe who are accuftomed to perform operations on the eye, the method which we have detailed will at once appear to be difficult, extremely dangerous, and in many cafes totally impracticable. The caufes of failure in the operation for the cataract feldom arife from an opacity of the capfule of the lens, and when this does occur, it is always in confequence of a violent or longcontinued inflammation of the eyeball. Whenever, therefore, the inflammation which takes place after the operation is checked by proper remedies, a cataract of the capfule will feldom be met with.

## Of the Treatment after the Operation.

After the lens has been extracted, and the eyelids allowed to remain hut for a fhort time, the eye ought to be examined, in order to afcertain that the edges of the wound of the cornea are in their proper place; that no portion of the iris has paffed through it, and the pupil is quite regular. When the incifion of the cornea is made in the manner and fize already defcribed, the edges of the wound, from their firmnefs and thicksefs, accurately apply themfelves to each other; and if the iris has futtained no injury, it will remain in its natural fituation, and the pupil will become perfeclly circular. When the pupil is not regular, it has been generally recommended to expofe the eye to a bright light, in order to make it contract, and thus detach it from any part to which it might have adhered. When a portion of the iris protrudes through the wound, this generally arifes, not from any injury of that part, but in confequence of the incifion of the cornea having been made too large. If the incifion be more than femicircular, (or two-thirds of the circumference of the cornea as directed by $\mathrm{Mr}_{\mathrm{r}}$ Beer) this accident will almoft conftantly happen; and when it does take place, can never, as far as we know, be remedied. In fuch cafes the operator thould be careful not even to attempt with the fpoon, or any fuch inftrument; to replace the prolapfed iris; for it has always

Of the Dir been oblerved, that attempts of this kind are fruitlefs, tafes of the and never fail to increafe the inflammation which fuc-
Eye ceeds the operation.

In applying the neceffary compreffes and bandages on the eye, the objects to be held in view are, to keep the eyelids in fuch a pofition, that they cannot difturb the wound of the cornea by their motion, and that the eye be not expofed to any light. The upper eyelid will be completely fecured, by placing over it, and in the holIow of the orbit, a fmall ftipe of wet caddis. The piece of caddis thould not be fo large as to prefs much upon the eye, and from its being wet, it will be readily kept in its fituation. Above the caddis thould be placed a piece of linen covered with firmplefointment, large enough to cover both eyes; and this may be fecured by one turn of a bandage round the head. In applying the bandage, cate fhould be taken to place it fo that the pins are put in at the forehead and temples. The conveniency of this will be afterwards found, the bandage being edfly removed without moving the patient's head from the pillow. The patient fhould now be put cautioufly to bed, and his head kept extremcly low. The room in which he fleeps thould be made fo dark, that no light may pafs through the bandage to the eye. In an hour or half an hour after the operation, after the patient has become compofed, he floould be bled in the farm, if from the previous flate of the pationi's health that fhould be deemed a proper precaution. Refl, quietnefs, and abflinence, ought to be rigidly adncred to for the firft dav afier the operation; the patient fhould be allowed no food except that which is liquid, in order that any motions of the jow may be avcided, and the food thould be given through a teq-pat, in arder to prereat any motion of the head. Sisteen or twenty hours are faficieat to produce an adhefion of the cormea in favourable cafes; and after this period, the comprefs of wet caldis placed upon the upper cyelid, becomes no longer neceffry ; for if it be allowed to remain any longer, it becnimes hard and dry, and will be apt to irritate. The bandage and plafter ought thcrefore to be loofened, and the piece of caddis removed. The eyelids will no:" be found to adhere, and the patient will fiol much relief by cautioully wetting the ciliæ with cold water, in order to liberate the eyelids. From this period it is advifeable to keep the evelanhes confaatly greafy with any unchuous application.

In all cafes, the fymptome which we are particularly to guard againft after this operation, are thofe of intammation ; for when thcte atife, various effects may be produced which might frultrate all our endeavours 10 rellore the patient's fight. If the wound in the comea, inflead of uniting by adhefion, goes through a tedisus procefs of fuppuration, the pupil liecomes irregular and contracted; or if there is an effufion of lymph in the papil, or if an oracily of the capfule takes place, thefe cffects, all of which may arife in confequence of inflammoltion, might either greatly impair, or entircly deftny vifion. The patient, therefore, ought to be corefuilly watched every fix or eight hours for feveral daye, and on the evening of the day of the operation, or at any future period, if fymptoms arife which indi. eate the commenremont of infammation, he oucht to be frecty bled. The fymptonss which are to guide us in adopling fuch means, are pain and uneafinefe datting through the eye or head, and a ficquent and sull puife.

We have often remarked, after this operation, that even Of the Dif. in thole cafes where no biceding is neceffayy, the pulfe eafes of the becomes unufually full. This fymptom alone would not, therefore, be fulficient to warrant us in procecding far in adopting fuch a practice. We have long believed, that the luccefs of all furgical operations depends much on the adoption of the means to prevent any inflammatory action. It is well known the danger of amputation, and fuch operations in a vigorous and healhy conAtitution; it is equally well known the feeedy recovery of patients from operations, who have been much debilitated from previous diferfe; and we have repeatedly remarked that patients who have loft much blood rom fome accident, after an operation, have recovered much more feetdily than thofe to whom no fuch accident had happencd. Aware of thefe circumflancts, we have invariably adopted rigoroufly the depletive lyftem afier the operation for the cataract ; and in many of thofe patients from whom a very confiderable quantity of blood has at different periods becn taken, we have obferved that the fuccefs of the operation has been more fpcedy and inore complete. The furgeon will fornetimes find cafes where, from the mildnets of the fymptoms, he is led to hefitate on the propriety of bleeding. In fuch a fituation it is the fafelt plan to have receurfe to it; for in gencral, wherever no fymptoms have arifen which may indicate the impropriety of fuch a practice, if it be not ufeful, it is at leafl never followed by any bad confequences.

Venelection at the arm is the eaficft and beft mode of extracting the blood; but thould any circumftances occur which render the operation at this place impracticable, or fhould it be thought neceflary to take away the bloord nearer to the inflamed organ, an opening may be made in the temporal artery. For the firt two or three nights after the operation, the patient's arms mould be watched, or fecured in fuch a manner, that when he is afleep, he flall not be able to raife his hand towards his eye; for the moft gentle ftroke upon the eye, even feveral days after this operation, is attended with mon excruciating pain, and is generally fucceeded by violent inflammation. The patient fhould be enjoined to lie on his back, or on the found fide of the head; and after the firft twelve hours he may be allowed to raife his head to the ufual hcight. Mofl authors who have laid down rults to be followed after this operation, have directed that the cye fhould be kept hut up, and in total dahbuefs for many days after the operation. We have, however, found an oppofite praclice attended with the moll beneficial effects, and we have always confidered it as a general principle to be followed, that the eye, from the very diy after the operation, be gradually rellored to its natural flate, that the globe of the eye and cyelids be allowed to mnve, and that day after day the quantity of light to which it is expofed be gradually increafed. In regulating the quantity of light, and the motion of the eve and cyelids, we flould be entirely guided by the patient's feelings. Whatever be the quantity of light to which the cye is exponfed, or its extent of motion, if it does not create uncafinefs or pain, it will never be found to prove injurious; but on the contrary, if fuch a quantity of light he admitted as to create uneafincts, or if any inotion of the eyes or eyclide gives pain, thefe circumbances will all tend to increafe the inflammatory fymptoms.
if the Dif- It has been already mentioned, that on the firft day : fes of the after the operation, the wet caddis fhould be removed, and the cyclids feparated and covcred with fome uncluous fubllance, fo that the patient may, from time to time, cautioully more the eyclids, provided it gives him no uneafinefs. The pledget of ointment covering the eyes will prevent, during this day, any light from entering.

On the fecond day the pledget of ointment may be removed, and both eyes covcred with two or three folds of old limen, the patient being directed to bathe his eye frequently with a little warm water, fo as to remove any glutinous or concreted matter from the eyelids. He fhould alfo continue frequently to move the eyelids, and by opening them, to expofe the eye to the fmall quantity of light which pafles through the linen. On the folluwing days, the light is to be admitted more and more freely into the room, and by degrees the patient will find that he is able to look down upon the bed clothes, or any large object, without uneafinefs. People are often apt, from the joy which they feel in having their fight seltored, to make too much ule of the cye, and to render it weak and painful. Ton much care, however, cannot be taken, to avoid any accident of this kind; and though the patient may feel his eye perfectly ealy, and has no other complaint, yet it is always prudent to confine him to his bed for the firlt fin or eight days. After the fecond or third day he may raife the head or body fafely in bed; but we have repeatedly obferved that when patients began to fit up early, and particularly when they approached too near a fire, they have been feized with a peculiar headach and inlamination of the eve, which were atteaded with much diftrefs, and very dificult to remove. In ten or twelve days after the operation, the patient is commonly able to ufe the eye with confiderable freedom, and to look even at minute objeds without pain or uateafinefs. It fometimes happens that after this period, a flight irritability of the eye remains, but this in general is fpeedily removed by the ufe of the vinous tincture of opium, or fometimes by the application of a work ointment compofed of the red oxide of mercury. The application of the vinous tincture of opium will be found peculiarly ufeful; and we have known many infances of patients who have undergone this operation, who were frequently, for a long time afterwards, attacked with flight pain or inflammation of the eye, which were always fpeedily and completely removed by the ufe of this me licine. It is fcarcely neceffiry to obferve that during the whole of the after treatment, the antiphlogiftic regimon thould be risidly purfued, and that the patient thould av id every kind of food which from experience he knows to be apt to difagree with him; and that above all he thould ablain from the ufe of wine and fpirituous liquors of every defcription.

## Of Couching.

By this operation the lens is depreffed from its natural fituation behin! the pupil, by introducing a needle into the pofterior clamber.

The operation may be performed by in?rotucing a needle (Plate DXVII. fi:- 22.) through the fclerotic coat, about two lines diftant from its junction nith the cornea. The noint of the needle is to be direct od immediately over the opaque lens, and the lens to be
depreffed a little with the convex furface of the end of of the Difthe needle. The point is to be puthed in a tranfverfe eafes of the direction as far as the imer edge of the lens. "Ilien the operator is to incline the handle of the inftrument towards himfelf, by which means its point will be directed through the capfule into the fubilance of the opaque lens, and by inclining the needle downward and backward, the former will be lacerated and conveyed with the latter deeply into the vitreous humour. The treatment to be employed after couching is fimilar to that after extraction.

## Sect XI. Of the Fifula Lacrymalis.

## When the lacrymal fac is diflended with a puriform

 fluid, or when it has ulcerated, and the tears do mot pafs freely down the nalal duct, the difeale is called fife iula lacrymalis. In the finfl flage of the difcafe, a difimet tumur is formed in the fituation of the lec, which, when comprelled, a quantiy of purstorm fluad flows upon the eyebali through che punkture, or tome of it paffec through the nole. In the fecont tiage of the difcafe, the integuments covering the tac ulcerate, and the puriform iluid and tears are contantly ouzing through the filtulous opening. The eyelids are affected molt commonly in the fecond ftage of the difeafe, and fometimes allo in the firt, though not always. From the affection of the internal palpebral membrane, Scarpa has fuppofed that all the puriform fluid contained in the fac was fecreted by it, but this does not always happen.Treatment.- When the difeafe has originated in the mucous membrane of the eyclids, applications to it alone will be fufficient to remove the accumulation in the fac. A collyrium of the muriate of mercury, and the daily application of the ointment of Janin, or of an ointment compofed of the red oxide of mercury, are well fuited for this purpofe. When the fac has been the original feat of the difcafe, a folution of corrofive fublimate, acetite of zinc or of lead, will be ufeful, and thele may be ufed by allowing them to be abforbed by the puncta into the fac, along with the tears, or by injecting thrm into the puncta by a proper fyringe, (fee Plate LXVII. nig. 23.).

If there be a complete obfruction in the nafal duct thefe remedies generally fail, and it becomes neceffary to open the fac, and remove the caufe of obftruction in the ducl. 'The fac may be readily opened by boldly plunging a common lancet into it while diftended with matter. I'he fac foould then be examined with a probe, and the probe paffed down into the nofe in the direction of the natural canal. A furgeon well acquainted with the fituation and direction of the duct, can never fail in introducing the probe; for we never met with any cafe where the obftuction could not be overcome. A fyle, (Plate DXVII. fig. 24.) fuch as has been recommended by Mr Ware, is to be introduced is place of the probe, and allowed to remain until the canal is quise open. When the parts around the fac appear healthy, the fyle may be withdrawn, and the opening of the fac then heals. In many cales the difeare returns, and in fuch, afer the parts are a fecond time healiliy, a tibe (Plate IDXVIl. fig 25) may be introluced and niloned to remain duing life. This ove-tion requires that there be a free evernal openi. $g$, and that the lead of the tube be prefied comple ely
dows

Oi the Dif down below the edge of the fkin. $t$ afes of the ternal opening heals in a few days.

Generally the exWhen the fac has $\underbrace{\text { Ese. }}$ ulcerated, therc will generally be found fome finufes in the integuments covering the fac, all which fhould be freely laid open, and the ffyle introduced as in the former cafe. After the fkin and fac are apparently healthy, the tube may be introduced as in the former cafe. Befides the ufe of the ftyle, it is alfo requifite to apply the eye-waters and ointments recommended in the firft flages of the difeafe.

## Sect. XII. Of the Pforophlhalnia.

In this difeafe there are numerous fmall brown coloured eminences formed at the roots of the cilix of both eyelids, and generally both eyes are affected. The adjacent 1kin has a brownifl red tinge, and becomes fcurfy ; the cilize drop out, and the patient has a dificulty and uneafinefs in opening the eyelids, particularly in candle light. The blood-veffels of the internal palpebral membrane are alfo turgid, and preternaturally numerous. This difeafe affects often many branches of the fame family.

Treatment.-The unguentum citrinum is a fpecific remedy in this difeale. When there is much inflammation of the eyelids, they ought to be fcarified, and the ointment applied immediately after. A collyrium compofed of a weak folution of corrofive fublimate is alfo fometimes uleful.

## Of the Ophthalmia Tarfi.

In many people who ufe their eyes much, particularly in candle light, and in thofe who live freely, the internal membrane of the eyelid often becomes gorged with blood; a thick puriform fluid glues the ciliæ together in the morning, and the patient complains of an inability to move the eyelids, or to look at an object in a bright or dazzling light, without much uneafinefs being excited. In other inftances the eyelids become affected with fcrofulous inflammation, the glands of Meibomius fwell and fuppurate, the ciliæ drop out, and the eyelids lofe their natural form.

Treatment.-Scarifying the inflamed veffels, and applying immediately afterwards a quantity of the red precipitate ointment, feldom fails in bringing relief, and in many inffances alone the ointment will anfwer. In fome cafes the difeafe in the eyelid is much aggravated, and connected with affections of the fomach and bowels, and in fuch the greateft attention becomes requifite to keep the belly regular, and even to purge.

## Of the Entropion.

When the eyelids are inverted, fo that the tarfus with its cilise come in contact with the eyeball, the difeafe is called entropion. This difeafe, Mr Crampton has fhown arifes in fome cafes from a thickened and difcafed flate of the internal palpebral membrane. In others the cilise are turned in upon the eye from repeated and tedious inflammation altering the form of the tarfus, tand in fome old people where the integumeuts are very lonfe, the whole tarfus is inverted by the action of the orbieulari mufcle.

Treatment.-In the firf eafe, Mr Crampton has ingenioully recommended that the tarfi be divided at their junction towards the external canthus, and that the cyelids thus liberated be kept in their proper fituation by
platters, compreffes, and when in the upper eyelid by Ot the Dif fixing the fpeculum of Pellier, until fuch time as the eafes of thr wound has healed. In the fecond cafe little can be done but pulling out from their roots any of the cilise which may have taken a wrong direction, and repeating the operation whenever they grow again. In the third cafe the difeafe may be cured by removing an oval portion of the fkin the whole length, and clofe to the tarfus, and uniting the wound by one or two flitches and adhefive plafters. This operation may be allo advifeable along with that of Mr Crampton, when one is not fufficient to cure the complaint.

## Chap. XI.

## Of the Difeafes of the EAr.

The functions and fructure of the internal membrane of the external meatus, and alfo of the euftachian tube and cavity of the tympanum, prove that it belongs to the mucous fyftem, and that it is not a continuation of the periofteum as many anatomifts bave fuppofed. The analogy in the difeales of this organ prove the fame. In catarrhal affections of the pituitary membrane of the pharynx, the ear is always more or lefs affected, and often the function of the organ is much impaired. Polypi alfo grow from the cavity and membrane of the tympanum of a fimilar fructure to thofe found in other mucous furfaces. See Polypi. It is alfo fubject to hremorrhagies, and when it becomes inflamed, inftead of fuppuration taking place, there is a difcharge of a puriform Huid from the furface, the fame as what is obferved in inflammation of the urethra, nofe, \& c .* * See In-

The internal membrane of the ear is alfo fubject tafammatie. the fame kind of thickening and contraction of the ca- of tous $M M_{1}$ nal, as what takes place in the urethra and lacrymal branes. fac, \&c. in confequence of long continued inflammationt. This we might conclude from analogy, but the fact has been proved in one inftance. Bichat diffected tures of the body of a perfon who had been expofed during his Muzcous life to a puriform difcharge from the ear, in which he Memfound a very remarkable thickening of the membrane ${ }^{\text {branes. }}$ of the tympanum, but no mark of erofion could be detected.

The moft common difeafe of the ear, and almof the only one which the furgeon can relieve, is a collection of wax in the meatus externus. Its prefence can always be determined by the infpection of the ear ; and it can be removed by directing the patient to drop forme warm water into the ear for a few fucceflive nights, and afterwards fyringing out the foftened wax; an operation which may be performed with a fyringe, fuch as is reprefented in Plate DXVII.), having fitted for it 2 pipe of confiderable length.

> () Chap. XII.

Of the Difeafes of the Nervous System.
Sect. I. General Remarks on the Pathology of the
Nerves.
A grfat number of difeafes have been confidered under the clafs of nervous; and much obfcurity has been thrown on this depatment of medical ficience,
the Dif- from cur imperfect knowiedge of the laws which regufes of the late this part of the natural fyftem, and from mere fympvervons, toms having often been confidered as primary affecSyftem. tions.

Pathological inveftigations have becn alfo unfucceffful; and in only a few cales has the knife of the moft kilful anatomitt been able to deteet any morbid alteration of itrulure in nerves, which, during life, had been the feat of agonizing difeafe. In a few cafcs, where tumors have been found growing in their fubftance, it is not unlikely, that the cellular Atrufture, connecting their fibrillæ, has been the firt part affected. Their arteries and veins are fubject to the difeafes of thefe fyltems in other organs; and we have feen an aneurifmal tumor as big as a hazel nut formed in the nutrient artery of the popliteal nerve; and Bichât mentions having feen the veins of the ficiatic nerve varicone in a paralytic limb. Mr E. Home has defcribed in the Philofophical Tranfactions a particular tumor of one of the axillary nerves, in which it is difficult to afcertain if the medullary portion be affected; and in the Encyclopedie Methodique there is a defcription of a cafe of a difeafe, refembling in fome refpeets the cafe of Mr Home's. The difeafe was in the middle of the radial nerve ; and as the hand had neither loft its fenfibility nor the movement of any of the fingers, this circumflance led to the fuppofition, that the medullary portion of the nerve was not affected, but merely its neurilema. In the fungus huematodes, it is by no means improbable that there is a morbid alteration in the medullary matter of the nerves; though this fact can only be determined by an accurate examination of the difeafe in various organs.
Mof difeales belonging to this fyftem have been fully treated of in the article Medicive. There is only one which becomes an object of furgical treatment.

## Sect. II. Of the Tic Doleureux (Nevralgie).

Affections of this kind are diftinguifhed by the nature of the pain, which is tharp, gnawing, and, particularly at its commencement, accompanied with torpor, and fometimes with pulfations. It is attended with to heat or rednefs, or any tenfion or fwelling of the part. It comes on in paroxyims, more or lefs long, and at different intervals. Sometimes the attack is periodical.

The pain is always fixed in the trunk or branch of a nerve; and, during the paroxyfm, it darts from the part firl affected through all the ramifications of the nerve.

Many nerves of the body have been found affected with this difeafe. The firft pair of the loins (nevralgie ilio-fcrotale), the pofterior crural (ilchias nervofa poftica), the crural, but particularly the nerves of the face are fubject to it. When the difeafe affects the face, it is generally fituated either in the frontal nerve, in the infra-orbitar nerve, or in the fubmental nerve. Sometimes the pain affeets not only all the branches of thefe nerves, but it extends to their anaftomofing branches, and fpreads to one or more of the trunks.

This difeafe appears to be produced from a variety of caufes, according to which its fymptoms are varied. Sometimes it has been known to fucceed a local irritation, fuch as an injury on the trunl: of the nerve; and
in other cafes, the affection of the particular nerve is OfIcrnix. fympathethic of a difeafe in fome diftant organ.

In fome inftances we have obferved this difeafe arife from an affection of the primes vix; fo that in all cales it beconcs the firft object of the furgeon to trace the caufe of the difeafe.

Treatment. - When the fomach or inteftinal canal are difordered, along with the particular affection of the nerve, the nervous affection will often ceafe when they are reftored to their natural itate. This is to be accomplifhed in moft cafes by emetics, and a courfe of laxative medicines, purfued according to the qualitics and quantity of the evacuated matter.

In fome cafes, particularly in the affection of the frontal nerve, we have found great relief from the repeated application of fmall blifters over the nervous trunk. In fome inflances, too, the patients have experienced great relief, and have even completely recovered, by a continued attention to a very pare vegetable diet, or to a milk diet. The celebrated Marmontel was a remarkable inftance of this kind.

There are, however, cafes where thefe means fail, and where the difeafe appears to depend on fome fixed caufe of irritation in the affected nervous trunk. In fuch cafes, it is the ufual practice to divide the trunk of the nerve. This operation generally gives inflant relief; but its effects have, we believe, in moft cafes, been but of fhort duration. It is a fact completely eflablifhed, that the ramifications of the neevous as well as of the vafcular fyftem, though divided, are gradually regenerated. The numerous anaftomofes preferve the life of the part on which the divided trunk was diftributed, and the divided edges of the trunk gradually coalefee; fo that the nerve is again able to perform its natural functions. This reunion of the nerves does not take place fo rapidly as we obferve it in the arteries, in the fkin, cellular membrane, or mufcle; and months elaple before it is completed : but, from this reunion, it is probable, that the morbid attion in tic doleureux, of the nature of which we are ignorant, the operation, in moft cafes at leaft, brings merely temporary relief.

When the operation is to be performed, the neceffary fteps are extremely fimple. Some have contented themfelves with introducing a fharp-pointed biftoury through the integuments towards one fide of the exit of the nerve, paffing the point underneath it, and then dividing it ; thus leaving only a fmall puncture of the fkin.
When, however, the operation is done in this manner, the divided extremities, from being feparated only a little way, are apt immediately to reunite; a circumflance which thould be prevented. We would therefore advife that a free incifion be made immediately above the nerve; that the nerve be completely divided, and either a portion cut altogether away, or the divided extremities feparated to a diftance, and the wound allowed to heal by fuppuration.

## Chap. XIII.

## Of Herniae.

The word hernia has been ufed to fignify a protrufion of any vifcus, from its proper cavity ; but we fhall only treat in this place of abdominal hernia. The vifcera of this cavity are moff frequently protruded at the inguinal

Of Hernie. and crural rings and the umbilicus. They, however, protrude alfo at the furamen ovale, at the perincoum, through the ifchiatic notch, and diaphragm.

The names that have been given to different kinds of hernia, have been derived both from the contents of the hernia, and from its fituation. If they contain omentum only, they are called omental hernia, or epiplocele; if only inteltine, intefinal hernia; if both, omentum and inteltine, entero-epiplocele; if the fomach is contained in the tumor, gafirocele; if the liver, hepatocele; if the bladder, cyssocele; if the uterus, hysterocele.

The peritonæum generally protrudes prior to any of the vifcera, forming a bag called the hernial fac, in which the protruded vifcera are afierwards contained. The protruded portion of peritonæum is not dragged from its natural fituation, but becomes elongated by gradual diftenfion ; and it is ufually not only lengthened, but more or lefs thickened.

## Sect. I. Of the Inguinal Hernia.

In an inguinal hernia, the protruded vifcus enters the abdominal ring, paffes along the inguinal canal, and comes out either at the inguinal ring, and goes into the fcrotum (ferotal hernia), or burfts through the tendon of the external oblique mufcle (inguino-abdominal). Or, it paffes through the tendon of the tranfverfalis, and internal obliq ie, and appears at the inguinal ring (abdomino-inguinal).

Inguinal hernia is more frequent in men than women, the round ligament of the uterus being of a fmaller fize than the fpermatic cord. It fometimes appears on both fides, but mof frequently on the right fide.

When the flin of the frotum of an inguinal hernia is removed by diffection, a fafcia is found lying underneath it, which varies in thicknefs, according to the bulk and duration of the tumor. This fafcia comes off from the tendon of the external oblique mufcle above the abdominal ring. Below this fafcia is the cremafter mufcle, which is united both to the fafcia and hernial fac, though eafily feparable from them by diffection. When the fafeia and cremafter muicle are removed, the hernial fac is expofed. The epigaftric artery is fituated on the pubic fide of the fac. The fpermatic cord lies generally behind the fac; fometimes to one fide, and fometimes on its anterior part. Often the vefiels of the cord aic fplit, the epididimis paftug along one fide of the fac, and ti.e artery, veins, and abforbents, on the other. Sometimes there are more than one hernial fac on the fame fide. Mr Cooper found, in one eafe, two within the inguinal capal. This arifes in fone cafes from wearing a trufs.

In the inguino-abdominal hernice, the fac enters the abdominal ring ; and, inllead of being continued along the inguinal canal, it paffes through the tendon of the external oblique mufcle. The hernial fac, in this cafe, is compofed of two dillinet layers; the one internal and peritoneal, the other external, and produced by an elongation and gradual thickening of the aponeurofis of

* Merry \& the external oblique mufcle *

Pctut.

In the abdomino-inguinal hernia, the fac paffes through the tendon of the tranfverfalis or the tendons of both the tranfverflis and oblique mufcle, enters the inguinal canal, appears at the inguinal ring, and then paffes
down into the frrotum. In this cafe, Mr Cooper ob- Of Hernis ferves, that the fiermatic co:d lies on the upper or onter part of the fac. The epigaftric artery lies on the outfide of the fac $t$.
f Richiter
The inguinal hernia is generally pyriform, fmall to. Defoult, wards the ring, and enlarging as it defeends. It may Romer be diftinguifhed from other fwellings of the fe parts, by the following fymptoms: 1 . When the patient is defired to cough, the tumor becomes immediately diftended, owing to the preffure of the abdominal mufeles forcing into the fae more of the vifcera or of their contents. 2. When the patient can remember that the tumor ufed to difappear when in the horizontal poftion. 3. When the plogrefs of the tumor has bcen from the groin to the frrotum. 4. When the tumor contains inteftine, it is elaitic and uniform ; and, when puihed up into the abdomen, it returns with a gurgling noife. When omentum is contained, the tumor is lefs equal on its furface, receives an imprefion with the fingers, and does not return with a gurgling noife. Muft commonly, however, both inteltine and omentum are contained in the fae. 5. The functions of the vifcera are fomewhat interrupted, producing cructations, ficknefs, conItipation, colicky pains, and diftenfion of the abdo. men.

The inguinal hernixe ought to be carefully difinguilhed from hydrocele of the vaginal coat, from incyfted hydrocele of the fermatic cord, from enlargements of the tefticle, from hæmatocele, and from varicocele. Hydrocele and hernia, too, are often combined, particularly omental hernix.

## Sect. II. Of Reducible Inguinal Hernice, and of Trufes.

Herniæ are either redurible, irreducible, or ftrangulated. In the reduciole ftate, the pats may be returned into the cavity of the abdomen. To revent the efcape of the bowels, and the danger of fuch an accident, a conftant prefure flould be applied at the part if ee e the hernia opens into the abdomen, to thut the mouth of the fac, and thus oppofe an effectual refiltance to the protrufion of its contents. To accomplilh thefe purpoles, various truffes have been contrived. The truls hould be made of fleel, and the fipring not ftronger than what is fufficient to keep up the buwels; for if the preff.re be great, the abdominal mufcles, where it is ap,lied, are weakened, and even abforbed. Mr Cooper adviles the pad to be made of a conical form, the apex of which fhould reft on the mouth of the fac. But, as there will be found much variety in the fiuation and fize of the opening through which the hernia pafire, it will often be neceffaty to vary the form and bulk of the pad. 'The trufs ought to be applied fo that it makes preffure not on the inguinal ting where the hernia comes out, but upon that part where the fpermatic cord, and with it the hernia, firf quit the abdomen ; and this point may always be determined, by making the patient cough after the her ia has been reduced, and afeertain ing the furthef part from the inguinal ring, where the hernial fac is found to protrude. On this point the pad hoould rell. It the pad be ton large, and prefs merely on the inguinal ring, it will all w the bowels to pals through the intermal or aldoninal ring, ard enter into the inguinal canal. On the other hand, he pad ghould
if inguinal not be too fimall, fo as to prefs into the mouth of the Fernix. fac and plug it up, for that would prevent all chance of a permanent cure; the bowels may be prevented from entering into the fac; but the pad will act as a dilater or bougie, keep the mouth of the fac conflantly open, and even increafe its diameter. The pad, therefore, ought always to be made of fuch a fize and flape, as to make a preflure on the abdominal ring, inguinal canal, and inguinal ring.

Sect. III. Of Irreducible Hernice.
Hernize become irreducible when the protruded parts are fuffered to remain long in the hernial fac and increafe much in bulk, when membranous bands form acrofs the fac and entangle its contents, or when an adhefion takes place between the fac and its contents, or amongft the contents themfelves.

Treatment.-In fuch cafes, a bag trufs ought to be worn, fo as to keep up a uniform and fleady preflure on the fcrotum. The application of ice, too, has been known to procure the return of a hernia which appeared irreducible.

## Sect. IV. Of Strangulated Hernice.

A hernia is faid to be ftrangulated when not only the inteftine and omentum are irreducible, but when the protruded bowels are inflamed, and when the palfage of the freces through the ffrangulated portion is completely interrupted.
The tumor is attended with confiderable pain, which fometimes extends through the abdomen, and is often fituated at the umbilicus. Hiccup and vomiting fucceed; at firf the contents of the fomach only are evacuated, but afterwards thofe of the lower portions of the alimentary canal. The bowels are completely obftructed, except that portion below the feat of firangulation. The pulfe is commonly quick and hard; fometimes, however, it is full. If the difeafe continues, the fkin covering the tumor becomes difcoloured and flightly œedematous, and the abdomen tender and tenfe; the pulfe becomes fmall and thready, the countenance has an expreffion of anxiety; and all thefe fymptoms are fubject to exacerbations. They are greatly mitigated for a while, but foon recur with increafed violence.

After having fuffered gieat pain during the firtt fage of the difeafe, the patient becomes fuddenly eafy, and the tumor becomes of a purple colour, and has a crackling feel. The abdomen becomes more tenfe, a cold fweat covers the body, and the pulfe is weak and intermittent. At laft the patient, deluded with the hopes of a recovery, finks under the complaint.

On diffection, the hernial fac is generally found to contain a quantity of dark bloody ferum. The inteftine is of a dark chocolate brown with black foots interSperfed over it, which are cafily torn on being touched with the finger. The furface is covered with a layer of coagulated lymph. Even when the inteftine is not mortified the colour is extremely dark, but then the black fpots do not appear. Within the abdomen the whole inteftinal canal fometimes appears quite natural; at other times portions of the intellines appear inflamed, and in fome rare cafes they are glued together by an effufion of lymph.

YoL. XX. Part I,

On examining the feat of flricture, it will be found of Inguinal to take place either at the abdoninal or inguinal ring. Herna: In large hernix, Mr Cooper has remarked that the llricture is mofl frequent at the external opening, and then it may be often feen from the particular mape of the (umor, a conftriction being diftinguiflable at that part. In other cafes the fricture is fecii at the entrance of the fpermatic velfels into the inguinal canal; fo that, in operating for hernia, it is not fufficient to dilate the external ring, but it becomes neceffary to dilate the upper part of the canal.

Treatment.-In the treatment of frangulated hernia, the leading object which is to be kept in view, is to return the diliplaced vifcera as fpeedily as poffible, and, at the fame time, while doing this, to diminiths the fymptoms of inflammation or prevent their acceffion. The firl thing to be attempted, except when the tumor Taxis. is much inflamed and painful, is the reduction of the hernia. In doing this, it is necelfary to attend to the pofition of the patient and the mode of applying the pref. fure. The body of the patient flould be placed on an inclined plane, with the head downwards, and the thighs bent towards the trunk of the body. The preffure which is employed on the tumer thould always be directed upwards and outwards along the courfe of the fpermatic cord, and it may be perfevered in from a quarter to half an hour. Befides thefe mechanical means, tobacco clyfters, and cold, have been ufeful in accomplifhing the reduction. Ice is the eafien and beft mode of applying cold to hernial tumors; but, when this cannot be procured, Mr Cooper ufes a mixture of equal parts of fal ammoniac and nitre. To one pint of water in a bladder, ten ounces of the mixed falts are added, the bladder tied up, and then laid over the tumor. If, after four hours, the fymptoms become mitigated, and the tumor leffens, this remedy may be perfevered in for fome time longer; but if they continue with equal violence, and the tumor refill every attempt to reduction, no further trial fhould be made of the application.
The operation which it is now neceffary to perform, Operations confifts in making an incifion through the integuments along the upper part of the tumor, making an opening into the hernial fac, and extending it, fo as to allow the contents to be examined, and the fore finger to reach the feat of fricture. The fricture will be readily detected by the point of the finger, and may be eafily divided by introducing the biftoury along the finger, till the point of it paffes below the fricture. * A very * See Plate flight preffure of the edge of the infrument will be fuf- DXIX. ficient to divide the fricture, and allow the bowels to be returned into the abdomen. If merely the ftricture is divided, and it is never neceffary to extend the incifion further, it is of little importance in which direction the incifion is made; though furgeons have been at great pains to point out the dangers which might arife were it of too great an extent.

Sect. V. Of Femoral Hernice.
349
In femoral hernia, the hernial fac lies beneath the crural arch, being pufhed through an opening between the edge of the broad infertion of Poupart's ligament and the pubic fide of the femoral vein. $\dagger$ As the tumor enlarges, inftead of falling downwards like the inguinal
hernia,
they ought to go rather deeper than half through the Amputa-
of Femoral hernia, it pafies forwards, and often turns over the anHernix. terior edze of the crural arch. As it proceeds, the fwelling increafes more lateraily than upwards or downwards; fo that it affumes an oblong fhape. In the crural hernia, the fac has two coverings befides the integuments; the fup erficial fafcia of the external oblique mufcle, and the fafcia propria of Mr Cooper, which is formed by the protrufion of the fafcia which naturally covers the opening through which the hernia pafles, and the fafcia of the crural fheath. The taxis and ufe of truffes are the fame in femoral as in inguiaal hernia; and the fame feries of fymptoms indicate the neceffity of an operation in both when Itrangulated.

Operation.-Mr Cooper recommends that the incifion of the integuments be made in the form of a T , begimning one incifion about an inch and a half above the crural arch, in a line with the middle of the tumor, and extending it downwards below the arch, and meeting a fecond incifion nearly at iight angles with the other, the whole length of the tumor. The two fafcias are next to be divided, and the hernial fac opened at its lower part, fufficiently large to admit readily the finger. The feat of the fricure is to be afcertained by the introduction of the point of the fore finger under the crural arch, and it may be readily divided in a direction upwards and inwards, of a fufficient extent to liberate the inteftine; generally a very fight motion of the edge of the biftoury will be found fufficient for that parpofe.

## Chap. XIV.

## Of Hare-lip.

The hare-lip is a fiffure in the upper lip, very fel* See Plate dom in the under une. * It is attended with want of DXXIV. fubitance, and has its name from a refemblance to the lip of a hare. In general it is only a fimple fiffure, though fometimes it is double.

In proceeding to the operation, the patient, if a child, thould be fecured upon a table; but if an adult, he is to be feated upon a chair, in a proper light. The frenum connecting the gums to the upper lip is to be divided; if a fore-tooth project fo much as to prevent the parts from being brought properly together, it is to be extracted; or when the fiffure runs through the bones of the palate, if a fmall portion of the bone project, this mult be removed. The operator is then to lay lold of one fide of the fiffure between the thumb and forc-finger, or between the forceps + , then with a pair of haarp and very ftrong fciffars, or with a fcalpel, to cut off a thin portion of the lip, and to repeat the fame thing unon the other fide of the fiffure, fo as to render the whole edges of the fiffure completely raw ; by which, if the operation be properly performed, a piece will be feparated in form like an inverted V. After the incifions have been made, the veffels flould be allowed to bleed freely 10 prevent inflammation; and when the bleeding has ceafed, the fides of the wound are to bo brought accurately together, ar.d kept in that ftate by the twifled future. The firf pin ought to be as near as poflible to the red edge of the lip; another is to be inferted near the upper angle; and if the patient he an adult, a third pin will generally be neceffary, half way between the other two. In paffing thein,
lip, that the edges of the wound may be kept properly in contact. An affifant now keeps the parts logether, while the oporator applies a firm waxed ligature firl to the under pin; and having made three or four turns with it in the form of an eight figure, it frould then be carried about the fecond, and in a fimilar way about the third, care bcing taken that the thread be drawn of a proper tightnels. When, from a gieat want of fubflance, the retraction has been conliderable, fome advantage is derived from the ufe of adhefive platers applied to the cheeks and tied between the pins. During the time of the cure the patient fhould be fed upon fpoon-meat, and prevented from making any exertion with the lips, otherwife the cure might be confiderably retarded. At the end of five or fix days the pins may be taken out, when the parts will commonly be found completely united.

In the cafe of a double hare-lip, the operation flould be firf done upon one fiflure; and when a cure is completed there, it may be done fafely upon the other.

## Chap. XV.

## Of Amputation.

There are two modes generally employed for performing amputation; the common operation by two circular incifions, and the flap operation. We flall defcribe in detail both thefe modes of operating in the thigh.

The patient mould be placed on a table of a conve $25^{4}$ nient heighr, in fuch a manner that the difeafed limb tion of the may hang over the edge of it, and be fecured by an affiftant feated on a low chair before him; the other limb and the arms are alfo to be fecured by proper affiftants. The tourniquet (fee Plate DXVI.) is to be placed on the thigh, three or four inclies below Poupart's ligament, where the femoral artery may be moft eafily and completely compreffed. Deffault preferred to the tourniquet, the finger of a ftrong and intelligent affifant. A cufhion fixed on a handle anfwers very well for making preflure on the artery when a tourniquet is not to be ufed; and it is a ufeful infrument to have in readinefs, in cafe the courniquet fhould go wrong; or when it becomes neceffary to amputate the thigh fo far up, that a tourniquet cannot be fafely fixed.

After the operator has determined on the place for the incifion of the integuments, an affiltant fhould grafp the limb with both hands a little above the place where the flkin is to be divided, and draw it upwards as far as poffible. The operator then with the knife (fee Plate DXXII. fig. 10.) makes a circular incifion through the fkin and cellular membrane, down to the mufcles; and this may be done, either by one firoke of the knife, or by firft making one femicircular incifion round the under part of the limb, and afterwards another incifion upon the upper part correfponding with the formier. When this is made, the integuments retract confiderably from their natural elafticity, and they are to be feparated from the mufces and diffected with the point of the knife, as far back as to leave a fufficient quantity of Ikin to cover the fump. The lein being turned back, the operator,

Amputa- operator, by a fecond incifion carried clofe to its inverttion. ed edge, cuts the mufeles perpendicularly down to the bone. Duting this part of the operation, care fould be taken to avoid wounding the edge of the fkin , by tracing attentively the edge of the knife during the whole courfe of the incifion. After the mufeles are divided, a confiderable retraction takes place, and any mufcular fibres attached to the periofleum mould be feparated from it by the point of the knife, in order to allow the bone to be fawn through as high as poffible, and thus fecure to it a firm flefhy coveling. All the foft parts are next to be drawn upwards as far as their feparation from the bone will admit of. They are to be kept in this fituation by an inftrument called the retrafiors, until the bone is fawn through. The retractors may be either made of iron plates (fee Plate DXXII. fig. 5.), or a piece of linen or leather cut as reprefented in fig. 6. The affiftant who ufes either of thefe intruments, fhould take care when he applies them, that the foft parts are completely out of the reach of the faw, and that they are held back as far as the place where the bone is to be divided. Any Tharp edges which may be left on the end of the bone after it has been fawn through, 'flould be taken away with pliers, Plate DXXII. fig. 8. The arteries are next to be tied, and both the femoral artery and vein may be included in one ligature. The bleeding being ftopped, and the wound cleaned, the tourniquet is to be altogether taken away, and the foft parts drawn down, fo as to cover the extremity of the bone. In order to keep them in this fituation, a bandage of thin flannel or cotton cloth, not exceeding two inches and a half in breadth for an adult, is to make one or two circular turns round the body above the iliun; it is then to be carried obliquely over the groin, and turned round the upper part of the thigh pretty firmly two or three times, forming as it were at this place a point of fupport to the mufcles and fkin. It is afterwards to be pafied in a firal manner downwards to near the edge of the wound, taking care to pull the foft parts towards the ftump, whilit applying each turn of the bandage. The turns hould not be fo tight as to caufe pain, but fufficient to keep the parts in the fituation in which they are placed. The furface of the mulcles and the edges of the k in are now to be accurately brought together in fuch a direction, that the wound forms a fraight line, extending from the anterior to the pollerior afpect of the limb. Strips of adhefive plafter, about half an inch in breadth, and eight or ten inches in length, noould be applied, in order to keep the lips of the wound in this poftion. Thofe over the middle part of the wound ought to be put on frat ; and great attention is neceffary in their application, to prevent the edges of the kin from overlapping and puckering. They fhould be of fuch a number as completely to cover the furface of the wound, leaving only y fmall opening for the ligatures of the arteries to be brought out at that part of the wound neareft the place where the artery is fituated. The wound is to be afterwards covered with a piece of linen or caddis fpread with fimple ointment, and a comprefs of fine tov laid over it, the whole being fecured by a few turns of the roller.

The bedelothes floould be kept from preffing upon, and coming in contact with the flump, by a frame or cradle, as it is called. (See Piate DXXIII. fig. 11.).

When this operation is to be performed, the incifion Lithotmy. of the integuments may be made, either with a common fcalpel, or with the end of the amputating kuife, Flap opera- ${ }^{253}$ as reprefented in Plate DXXII. fig. 10. After the fkin tion is divided, it is of importance to allow it to retract as much as polfible, by cutting the fibres of callular membrane which corncet it ith the fafcia of the thigh, before dividing the mufcles. If the limb be much emaciated, the divifion of the mufcles may be alfo made with the fealpel ; jf, on the contrary, the limb be bulky, the incifion ought to be made by a common amputating knife, in order that the furface of the flaps be plain aud unifurm. After dividing the mufcles obliquely upwards down to the bone, they ftould be fepaparated from it a fufficient way, fo as to leave enough to cover the end of the bone, and they fhould be allowed to contract as much as poffible before the bone is fawn through. After the limb is amputated, and the circular bandage applied, the flaps will be found to meet very accurately together, and to form a round and fmooth flump. From the angles of the $\mathfrak{l k i n}$ being removed, no puckering or corners are left, and the two furfaces and mufcles being applied to each other, and covering the end of the bone, give it a firm and fleflyy covering, whereas in amputations performed in the common mode, the bone is covered by integuments alone. The adhefive plafters are to be applied in the fame manner, and the patient is to be treated afterwards as in the other modes of operating.

The general rules to be attended to in amputation in other parts of the body, are the fame as thoic already mentioned; and in Plate DXXII. and DXXIII. we have delineated the place and direction of the incifions.

## Chap. XVI.

## Of Lithotomy.

The manner of preparing the palient for this operation depends upon a variety of circumllances. If he be plethoric, a few ounces of blord ihould be taken away, and at proper intervals the bowels ougist to be emptied by any gentle laxative which will not gripe. The diet mould confint of light food fur fome time previous to the operation. If the pain be violent, opium is neceffary. Sometimes it is relieved by keeping the patient in bed with the pelvis raifed, fo as to remove the fore from the neck of the bladder. IIe uught not to fit un, or take any excreife, is the time of preparation. The warm bath ought to be ufed two or three times, and the patient huuld remain in it half an hour at each time. A laxative ought to be given on the day preceding the operation, and an injection a few hours before it is performed. The patient ought to drisk plentifully of fome diluent liquor, and to retain the urine feveral hours previous to the operation. If lhis cannot be reddily effected, a llight compreffion, by unans of a ligaiture, may be made upon the penis, fo as to have the bladder fufficiently diftended, that there may be no danger of the polterior furface being lurt by the end of the gorget. The perinæum and parts about the anus ficuld be well thaved.

A table fomewhat more than three feet is height, and of fufficient frength, is to be firmly placed,
$\underbrace{\text { Lithotomy. and properly covered with blankets, pillows, \&c. Up. }}$ on this the patient is to be laid and properly fecured; and for this purpole there ought to be two pieces of broad firm tape, each about five feet in length, which are to be doubled, and a noofe formed upon them. A noole is to be put upon each wrift, and the patient defired to lay hold of the middlc of his foot upon the outfide. One end of the ligature is to go round the hand and foot, and the other round the ankle and hand, and crofs again, fo as to repeat the turns in the reverfe way. A running knot is to be tied, by which the hand and foot will be properly fecured. The buttocks are then to be made to project an inch or two over the table, and to be raifed confiderably higher than the foulders by a couple or more pillows, and one pillow ought to be put under his head.

The operator is now to introduce a grooved ftaff (Plate DXXI. fig. 5.) of proportionable fize, and open to the end, through the urethra into the bladder; and having fully fatisfied himfelf of the exiftence of a ftone, he inclines the ftaff, if he be right-handed, obliquely over the right groin, fo that the convex part of the ftaff may be felt in the perinæum on the left fide of the raphe. He then fixes it, and delivers it to his affittant, who is to hold it with his right hand, defiring him to prefs it gently, in order to make the fulcus of the flaff project in the direction in which he received it. With his ieft hand the fame affiftant is to raife and fupport the fcrotum.

The thighs of the patient being fufficiently feparated by the affitants, and the furgeon being feated upon a chair of a proper height, and in a convenient light, he makes an incifion with a common convex-edged fcalpel through the fkin and cellular fubftance, below the fymphyfis of the offa pubis, which is a little below the fcrotum, and where the crus penis and bulb of the urethra meet, and on the left fide of the raphe, and continues it in a flanting direction downwards and outwards to the fpace between the anus and tuberofity of the ifchium, ending fomewhat lower than the bafis of that procefs, by which a cut will be made of three or four inches in length. This incifion ought not to be fhorter than is here directed, otherwife there will not be room for the relt of the operation. As foon as the integuments are divided, he ought to introduce two of the fingers of the left hand. With one he keeps back the lip of the wound next the raphe, and with the other he preffes down the recीum. He ought likewife particularly to guard againft cutting the crura of the penis, which he can readily feel, and feparate at their under part with one of his fingers. He sext makes a fecond incifion almoft in the fame direction with the firf, but rather nearer to the ranhe and anus, by which he preferves the trunk of the arterin pudica. By this incifion he divides the tranfucrialis penis, and as much of the levator ani and cellular fubtance within thefe as will make the proftate gland perceptible to the finger. If any confiderable veffel be cut, it is immediately to be fecured, though this is feldom neceffary. He is now to fearch for the gronve of the flaft with the fore finger of his left hand, the point of which he preffes along from the bulh of the urethra to the proftate gland, which furrounds the neck of the bladder. He keeps it there; and turning the edge of the knife upwards, he cuts upon the groove of the ftaff, and frecly divides the membranous
part of the urethra, till the faff can be felt perfectly Lithotom: bare, and that there is room to admit the nail of the finger; and as the finger affits in keeping the parts ftretched, and effectually prevents the rectum from being hurt, the incifion into the urethra may be made with perfect eafe and fafety.

The next part of the operation, viz. dividing the proftate gland and neck of the bladder, might, by a dexterous operator, be fafely performed with a common fcalpel, with the edge turned the oppofite way. But to guard againft accidents, a more convenient inflrament, called the cutting gorget, is now in general ufe. It was originally invented by Mr Hawkins of London, and fince his time has undergone various alterations. ${ }^{*}$, The * See Pl: membranous part of the urethra being now divided, and the fore finger ftill retained in its place, the point of the gorget, previoufly fitted to the groove, is to be directed along the nail of the finger, which will ferve to conduct it into the groove of the ftaff; and as this is one of the nicelt parts of the operation, the moft particular attention is required that the point of the gorget be diftinetly felt to rub in the bare groove.

The operator now rifes from his feat, ${ }^{2}$ takes the flafffrom the affiltant, raifes it to near a right angle, and preffes the concave part againf the fymplyy is of the offa pubis; fatisfies himfelf again that the point or beak is in the groove, and then puthes on the gorget, following the direction of the groove till the beak nip from the point of the ftaff into the bladder. The gorget is not to be pufhed farther than this, otherwife it may wound the oppofite fide of the bladder, \&c.

The gorget having now entered the bladder, which is readily known by the difcharge of urine from the wound, the ftaff is to be withdrawn, and the finger introduced along the gorget to fearch for the flone, which, when felt, will point out the direction to be given to the forceps; at any rate, the introduction of the finger ferves to dilate the wound in the bladder; and this being done, a pair of forceps $t$ of a proper fize, and with their blades as nearly together as their form will allow, re to be antuce ne the gorget wihdrawn Dow, DXX. are to be introduced, and the gorget whitrawn llowly, Fig. 6. 8 and in the fame direction in which it entered, fo as to prevent it from injuring the parts in its return. After the forceps are introduced, and paffed till they meet with a gentle refiftance, but no farther, the handles ought to be depreffed till they are fomewhat in an horizontal direction, as this will moft correfpond with the fundus of the bladder. One blade of the forceps is to be turned towards the fymphyfis of the pubes, to defend the foft parts there; the other of confequence will guard the return. After they have diftinctly touched the flone, by moving them a little in various directions, they are then to be opened, and the ftone laid hold of, which may generally be done with confiderable eafe. It frequently happens, however, that when the ftone is fmall, it is not readily felt with the forceps; and inAtances may happen where the under and back part of the bladder may be fo depreffed as to conceal the ftone. In fuch a fituation, nothing will more readily bring it in the way of the forceps than to introduce the fingerin. to the rectum, and elevate this part of the bladder. Straight forceps are generally ufed; crooked ones, in fome very rate cafes, however, may be neceffary, and therefore the furgeon ought to be provided with them.

Lithotory After the forceps has laid hold of the flone, if it be fmall and properly placed, it may readily be extracted: but if, on the contrary, the handles of the foreeps are now obferved to be greatly expanded, it is certain the flone is improperly fixed, or that it is remarkably large : in either cafe it fhould not be held faft, but allowed to move into the moll favourable fituation; or the finger is to be introduced fo as to place it properly for extraction. If this cannot be done with the
finger, it ought to be allowed to flip out of the for- Lithotomy. ceps, in order to get it more properly fixed; and as the moft common form of the fone is flat and oval, or fomewhat like a flattened egg, the forceps fhould have hold of the fralleft diameter, while an end prefents to the neck of the inftrument. The ftone fhould be grafped with no greater firmnefs than is merely fufficient to bring it fairly out, and it thould be extracted in a dow gradual manner.

## EXPLANATION of the PLATES.

## Plate DXIII.

Fig. 1. and 2. Common fcalpels. Fig. 3. A bluntedged filver knife for diffecting clofe to important parts. Fig. 4. and 5. A fharp and blunt-pointed biftoury. Fig. 6. Richter's hernia knife. Fig. 7. Difiecting forceps. Fig. 8. A blunt hook. Fig. 9. and 12. Directories. Fig. 10. and 11 . Diffecting hooks. Fig. 13. Lancet. Fig. 14. 15. and 16. Scton needles. Fig. 17. and 18. Sharp and blunt-pointed needles. Fig. 19. Outline of a fteatomatous tumor, the dotted line pointing out the direction in which the incifion of the integuments ought to be made for its extirpation.

## Plate DXIV.

Fig. I. 2. and 3. Thew the different forms of the points of bougies. Fig. 4. 5. and 6. are different fizes of filver balls ufed by Mr C. Bell for introducing into the urethra in order to determine the form and length of ftrictures. Fig. 7. An outline taken from a caft of the urethra, to fhew the difference of the diameter at different parts of that canal. Fig. 8. and 9. Thew the form of frictures in the urethra. Fig. 10. hhews a flricture in the æefophagus. Fig. 12. and 13. Male and female fyringes. Fig. 14. Scarificator for the throat. Fig. 15 . is the apparatus for injecting hydrocele.

## Plate DXV.

Fig. 1. and 2. Forceps for removing polypi defcribed in Chap. III. Sect. V. Fig. 3. 5. and 6. Inftruments for removing polypi by ligature. Fig. 7. Outline of one large and two fmall polypi in the rectum. Fig. 8. A breath-glafs. Fig. 9. Chefelden's needle. Fig. 10. A fpeculum oris. Fig. i1. Mudge's inhaler.

## Plate DXVI.

Fig. I. Drawing of a femoral aneurifm given by Mr Freer. $a$ is the direction and extent of the incifion as made by Mr Abernethy. The artery, however, may be more eafily tied by making an incifion parallel to Poupart's ligament $(b) . c$ is the place and direction where the incifion ought to be made in the high operation for popliteal aneurifm. Fig. 2. is the inftrument ufed for compreffing the artery or aneurifmal tumor. Fig. 3 . The common tourniquet.

## Plate DXVII.

Fig. x. 2. and 3. Different forms of extracting knives. Fig. 4. Beer's lancet for extracting the capfule of the lens. Fig. 5. Intruments for fcarifying the eyelids. Fig. 6. A thin fealpel for paring the cornea. Fig. 7. Inftrument for holding down the under eyelid. Fig. 8.

Pelier's feculum. Fig. 9. Capfule forceps of Wenzel. Fig. 10. Eye fciflars. Fig. 11. 12. 13.14. and 15. have been referred in $\mathbf{N}^{0}$ 224. Fig. 16. reprefent the wound of the cornea where the knife has been entered too near the inner edge of the pupil ; Fig. 170 where it has been brought out at too great a diffance from the fclerotic coat; Fig. 18. where it has been brought out too clofe to the fclerotic coat. Fig. 19. A curette and Daniel's 〔poon. Fig. 20. Scarpa's needle: Fig. 21. Thews its point magnified. Fig. 22. Common \{pear-pointed couching needle. Fig. 23. Fiftula lachrymalis fyringe. Fig. 24. The ftyle for introducing into the lachrymal duct. Fig. 25. Tube for introducing into the lachrymal duct ; and fig. $2 G$. Inftrument for introducing the tube.

## Plate DXVIII.

Shews the external appearance of herniæ. Fig. I. is a femoral hernia, the tumor being unequal and divided into two portions at $a$; the iliac portion is formed of fwelled glands, and the pubic contains the inteftine. Fig. 2. is a fpecimen of inguinal hernia, and fig. 3. of inguino-abdominal.

## Plate DXIX.

Fig. I. Common inguinal hernia, copied from Mr Cooper's plate. $a$, The abdominal ring. $b$, Poupart's ligament. $c$, The femoral artery. $d$, The epigaftric artery. e, Hernial fac below the ring. $f$, Hemial fac above the ring. $g$, Sharp part of the knife introduced between the ring and the fac, with its fide placed towards the fac. Its edge fhould be turned forwards to divide the ftricture. Fig. 2. The hernia on the inner fide of the epigaftric artery. $a$, The abdominal ring. $b$, Poupart's ligament. $c$, The femoral artery. $d$, The epigaftric artery. e, Internal oblique and tranfverfe mufcles paffing over the fac. $f$, Tendon of the tranfverfe mufcle paffing under it. g, Fafcia from Poupart's ligament, from which the cord has been withdrawn to frew the place through which it pafles. $h, i$, The hernial fac. $k$, Knife introduced to thew the manner of dilating the ftricture, which Mr Cooper direds always. to be done forwards and upwards, oppofite to the middle of the mouth of the hernial fac, in all the varieties of inguinal hernia. Fig. 3: Form of the hernial trufs; and fig. 4. Mode in which it fhould be applied.

## Plate DXX.

Fig. I. Crural hernial fac removed to fhew the hole by which. it defcended in the fermale. $a$, Seat of the pubes. $b$, Crural arch extending taxards the ilium. cc, Abdominal mufcles. d, Crural arch. e, Fafcia:

Explana- lata. $f$, Semilunar edge of the fafcia lata. $g$, Third kion of the infertion of the external oblique. $h$, Crural artery. $i$, $\underbrace{\text { Plates. }}$ Crural vein. \&, Crurai theath. $l$, Abdominal ring. $m$, The orifice by which the crura hernia defcends formed on the outer fide by the crural theath; on the inner by the femicircular infertion of the tendon of the external oblique; and above, in part, by the crural, and in part by the femilunar edge of the fafcia lata. Fig. 2. A fmall crural hernia in the female; fhewing its palfage through the crural theath, and its diftance from the crural arch. $a$, Seat of the \{ymphyfis pubis. $b$, Spinous procefs of the ilium. $c$, Crural arch. d, Abdominal ring. e, Fafcia lata. $f$, Semilunar edge of the fafcia lata. 5 , Portion of the crural fheath. h, Saphena major vein paffing into the crural theath. $i$, Hernial fac inclofed in its fafcia, which is extremely denfe, and is proportionably fo as the hernia is frall. $k$, The hole in the crural theath through which the hernia paffes. Fig. 3. A fmall crural hernia diffected. $a$, Seat of the fymphyfis pubis. b, Seat of the fpinous procefs of the ilium. $c$, Tendon of the external oblique mufcle. $d$, Internal oblique and tranfverfalis. e, Fafcia of the tranfiverfalis. $f$, Tendon of the tranfverfalis. $g$, Inner portion of the fafcia tranfverfalis, paffing to unite itfelf with the tendon. $h$, The crural arch. $i i$, Round lifgament. $k$, The round ligament paffing into the ahdomen. L, Crural artery. $m$, Crural vein. n, Origin of the epigaftric artery. $O$, Courfe of the epigaftric artery behind the round ligament. $p$, Crural nerve. $q$, Superficial fafcia. r, Fafcia propria of Mr Cooper, the hernial fac having been drawn into the abdomen to thew this fafcia diftinctly. Fig. 4. thews the form and mode of applying the trufs in femoral hernia.

## Plate DXXI.

Fig. I. An umbilical hernia trufs. (a), The pad. (b), The fopring added to the pad. (c), An elattic band to affin the preflure of the pad; the lower ( $b$ ) points to the belt which is added to keep this trufs in its place in corpulent people. Fig. 2. 3. 4. Different forms of the gorget, as ufed by Hawkins, Cline, and Cooper. Fig. 5. The faff. Fig. 6. and 7. Different forms of the forceps for the extraction of fones from the bladder.

## Plate DXXII.

Fig. 1. A lateral view of the thigh and leg; the dotted lines fhewing the direction of the incifion in amputation. Fig. 2. An anterior view. Fig. 3. Form of the tlump; and, Fig. 4. More of applying the circular bandage. Fig. 5.6. and 7. Retractors. Fig. 8. Pliers for removing any ficulx of bone. Fig. 9: Head of a trephine, two-thirds of the cutting teeth being removed. This initrument is intended for removing the ends of bones, particularly thofe of the metatarfus and metacarpus. Fig. 10. and II. Amputating knives. Fig. 12. Amputating faw.

## Plate DXXIII.

Fig. I. Lateral view of the arm and hand, the dotted lines thewing the direction of the incifion, in amputation at the fhoulder joint and laft joint of the forefinger. Fig. 2. and 3. Saws ufed in amputations of the hands and feet. Fig. 4. 5. 6. 7. 8. and 9. fuew the different parts of an artificial leg. Fig. i1. Cradle ufed after amoutation in order to prevent the bedclothes preffing upon the limb.

## Plate DXXIV.

Fig. 1. Thews the hare-lip with a fiffure of the pao late. Fig. 2. The fimple hare-lip. Fin. 3. A double hare-lip with two irregular tecth. Fig. 4. thews the part of the lip into which the pins cught to be introduced. Fig. 5. Thews the mode in which the ligatures ought to be applied. Fig. 6. The lip after the operation. Fig. 7. and 8. Pins for the lip. Fig. 9. Lip forceps. Fig. 10. Lip forceps, with one blade broader than the other, which is covered with wood in order to make refiltance, and not injure the edge of the knife. Fig. 1 I. Strong fciflars for dividing the lip. Fig. 12. Sciflars with curved blades to be ufed when the lip is very thick, and not eafily grafped by the common fciffars. Fig. 13. Shews the appearance of the club-foot. Fig. 14. Machine invented by Sarpa for the cure of club-feet. Fig. 15 . Diftorted foot from a relaxed ftate of the ligaments, a deformity which may, in general, be removed by wearing a boot, fig. 16 . to which is fixed a fteel-rod, extending from the fole of the foot to the knee.

\section*{\(S\) U R [ 113\(]\) S U R}

SURINAM, a country of Guiama, which extends alout 75 miles along a river of the fame name, in N. Lat. G. : G. This river is navigable for 92 miles up the country. The chief productions of Surmam are, wood for dyeing, indige, cotton, fugar, tobacco, gums, and different fpecies of fruit. Prodigious numbers of monkeys infelt the woods, as well as viry large ferpents. This fettement was ceded to the Dutch in 1674, as an equisalent for New York, but was retaken by the Britilh in 1799. Paramaribo is the capital. N. Lat. 6. 16. W. Long. 56.0 . The productions of this country, when in the hands of the Dutch, y:elded, in the year 1775, the fum of \(\$ 22,925\). A therling; and it may be prefu:ned that the value of thefe will not diminith in the hands of its prefent proprietors. Population about 100.000 peifons.

Domsrara.-Connected with Surinam we may notice the colony of Demerara, which furrendered to the Britill troops in 1781 ; was taken loon after by a lirench frigate, and afterwards recaptured by the forces of Great Buitain. Its productions cleared from the port of Demerara fiom Januaty 1806 to the fame month of 1807 , were 19,337 hoghteads, 474 tierces, and 801 barrels of fugar ; \(47^{22}\) puncheoas and 17 hoghleads of rum; 23,60 , bales, two bags of cotion ; \(12,390,102\) pourds of coffee; and \(169+\) calks of melaffes; a produce which we hope will be conftantly increafing under the mild and humane conduct of the Britih government, by the troops of which it was laft taken in 5796, under Sir Ralph Abercromby. It is deemed a valuable acquifition, on account of its flourihning condition. Stabroek is the capital of Demerara.

Eflequibo, on the banks of a river of the fame name, was firt founded in 1698 , but came into the hands of the Britifh much about the fame time with the preceding. The unaccountable neglect hewn by Holland towards her colonies rendered them an ealy conqueft.

Berbice is fituated between Demerara and Surinam, containing about 104 fmall plantations, fcattered at confiderable diftances from each other, the produce of which was long ago valued at 50,0001 . fterling, but may be expected to have a rapid increafo. Population between 8000 and 9000 perfons of various deferiptions.

Pomaroon is a country which has a rich and fertile foil; yet the inhabitants chiefly confine themfclres to the cultivation of cetton, for the produce of which it is found to be admirably adapted. It is not fo well fitted to yield good crops of coffce or fugar, as the land is by far too rich, and ffrongly impregnated with faline matters. In 1799 and 1800 ; a thirft for planting cotton was greatly increafed, as the crops of that article were then the largeff ever known to be produced in the colonics.

SURMOUNTED, in Heraldry, is when one figure is laid over another.

SURMullet. See Mullus, Ichthyology Index.

Vol. XX. Part I.

SURNAIIE, that which is addeal to the proper Sitrum. name for diainguilhing perfons and familice. It was originally dittinguilled from firnam:, which denotes tl.e name of the fire or progemitor: thus Mactonald, Rusberton, are fimames expreffing the fon of Donald, the fon of Rubert. The word fiurname, again, fignificed fome name fuperadded to the proper name to dithinguill thec individual, as Artaxerxes Lomgimarur, Harold :Inrefoot, Malcolm Canmorc. From this it is evident that every firmaine was a furname, though the revelfe was not fo. In modern times they are confounded; and as there is now no occafion to preferve the dillinction, Dr Juhafon has rejecied the word firmame altogether. Sie Name.

Surnames were introduced among all nations at an early period, and feem to have been formed at firft by adding the name of the father to that of the fon. This was the practice among the Hebrews, as appears from the fcriptures. Caleb is denominated the fon of Jephumneh, and Jofhua the fon of Num. That the fame thing was cuftomary among the Greeks, every one who has read the poems of Homer muft remember. We have-an inftance of it in the very firft line of the Iliad:
 This is perhaps the general origin of furnames, for it has been common among moft nations (A).

The Romans generally had three names. The firft called procnomen anfivered to our Chriftian name, and was intended to diftinguifh the iudividuals of the fame family; the fecond called nomen correfponded to the word clan in Scotland, and was given to all thofe who were fprung from the fame flock; the third c.illed \(\operatorname{cog}\) nomen expreffed the particular branch of the tribe or clan from which an individual was \{prung. Thus Publius Cornclius Scipio, Publius correfponded to our names John, Robert, William ; Cornelins was the name of the clan or tribe, as Campbell was formerly the name of all the duke of Argyle's clients, and Douglas the name of the retainers of the duke of Familton's progenitors. Scipio being added, conveyed this information, that Publius, who was of the tribe of the Cornelii, was of the family of the Scipios, one of the branches or families into which that tribe was divided. Refpecting the three names which were cemmon among the Romans, we may fay that the firlt was a name and the other two furnames.

Du Chefne obferves, that furnames were unknown in France before the year \(9^{87}\), when the lords began to aflume the names of their demefnes. Camden rclates, that they were firft taken up in England, a little before the conqueft, under King Edward the Confeflor: but he adds, they were never fully eftablihed among the conmon people till the time of Edward II. ; till then they varied with the father's name; if the father, e. gr. was called Richard, or Roger, the fon was called Richardfor, or Hodgson; but from that time they were fettled, fome fay, by act of pariiament. The oldeft furnames are thofe we find in Domefday-Book, moft of P them
(A) This might be fupported by examples borrowed from many nations. The old Normans ufed Fitz, which fignifies fon ; as Fitzhorbert, Fitzfimmons, the fon of Herbert, the fon of Simmons. The Irifh ufed \(O\); as O'Neal, the fon of Neal. The Scotch Highlanders employed Mac; as Macdonald, the fon of Donald. The Saxons added the word fon to the end of the father's name, as Williamfon.

\section*{\(S\) U R [ 114 ] \\ \(S\) U R}

Surname, them taken from places, with the addition of \(d e\); as Surplice. Godefridus de Mannevilla, Walterus de Vernon, Ro-
bert de Oyly, \&c. Oihers from their fathers, with \(f\) fius, as Gulielmus filius Otwerni; others from their offices, as Eudo Dapifer, Gulielmus Camerarius, Ginebertus Cocus, \&c. But the inferior people are noted limply by their Chriftian names, without any furnames at all.

Surnames feem to have been introduced into Scotland in the time of William the Conqueror by the Englifh who accompanied Edgar Atheling when he fled into that kingdom. Thefe had their proper furnames, as Moubray, Lorell, Lille, ufing the particle de before them; which makes it probable that thefe furnames had been derived from the lands which their anceltors or they themfelves had policfied. In Kenneth Il.'s time in 800 the great men had indeed begun to call their lands by their own names; but the ordinary diftinctions then ufed were only perfonal, and did not defeend to fucceeding generations, fuch as thofe employed by the Hebrews and Greeks: For example, John the fon of IVilliam; or the names of office, as Stewart ; or accidental diftinctions from complexion or ftation, as Black, White, Long, Short; or the name of their trade, as Tailor, Weaver.

It was long before any furnames were ufed in Wales, except that of fon, as Evan ap Rice, Evan the fon of Rice; Evan ap Howel, Evan the fon of Howel: but many of them have at length formed feparate furnames, as the Englifh and Scots, by leaving out the \(a\) in \(a p\), and joining the \(p\) to the father's name : thus Evan ap Rice becomes Evan Price; Evan ap Howel, Evan Powel.-We are told, furnames were unknown in Sweden till the year 1514, and that the common people of that country ufe none to this day; and that the fame is the cafe with the vulgar Irith, Poles and Bohemians.

When we come to inquire into the etymology of furnames, we muft allow that many of them were originally fignificant of the qualities of mind, as Bold, Hardy, Meck; fome of the qualities of body, as Strong, Low, Short ; others expreflive of the trade or profeflion followed by the perfons to whom they were applied, as Baker, Smith, Wright; Butler, Page, Marfhal. But the greatelt number, at leaft of the ancient furnames, were borrowed from the names of places. Camden fays, that there is not a village in Normandy but has given its name to fome family in England. He mentions as examples, Percy, Devereux, Tankervil, Mortimer, Warren, \&ec. 'They were introduced with William the Conqueror. Several have been dcrived from places in the Netherlands, as Gaunt, Tournay, Grandifon; and many from the names of towns and villages in England and Scolland, as Wentworth, Markham, Murray, Aberdeen. Many have been formed from the names of animals, as quuadrupeds, birds, fifhes; from vegetables, and parts of vegetables, as trees, fhrubs, flowers, and fruits; from minerals of different kinds. Others are formed from fuch a variety of accidents that it is impoffible to parlicularize them.

SUlPPLICE, the habit of the officiating clcrgy in the church of England. By Can. 58, every minifler faying the public prayers, or miniftering the facrament or other rites of the church, flall wear a decent and romely furolice with neeves, to be provided at the
charge of the parifh. But by 1 Eliz. c. 2. and 13 and I4 Car. II. the garb prefcribed by act of parliament, in the fecond year of King Edward VI. is enjoined; and this requires that in the laying or finging of matins and even fongs, baptizing and burying, the minitter in parifh churches and chapels thall ule a furplice. And in all cathedral churches and colleges, the archdeacon, dean, provolts, malters, prebendaries, and fellows, being graduates, may ufe in the choir, befides their furplices, fuch hoods as pertain to their feveral degrees. But in all other places every minitter fhall be at liberty to ufe a furplice or not. And hence in marrying, churching of women, and other offices not fpecified in this rubric, and even in the adminiftration of the holy communion, it feems that a furplice is not neceffary. Indeed for the holy communion the rubric appoints a white alb plain, which differs from the furplice in being clofe-lleeved, with a vellment or cope.

SURREBUTTER, in Law, is fecond rebutter; or the replication of the plaintiff to the defendant's rebutter.

SURREJOINDER, is a fecond defence of the plaintiff's declaration, by way of anlwer to the defendant's rejoinder.

SURRENDER, in Common Law, a deed, or inftrument, teftifying that the particular tenant of lands and tenements, for life or years, doth fufficiently confent and agree, that he who has the next or immediate remainder or reverfion thereof, fhall have the prefent eftate of the fame in poffeffion; and that he hereby yields and gives up the fame to him, fo that the eftate for life or years may merge or drown by mutual agreement of the parties. Of furrenders there are three kinds; a furrender properly taken at common law; a furrender of copyhold or cultomary eftates; and a furrender improperly taken, as of a deed, a patent, \&c. The firf is the ufual furrender, and it is ufually divided into that in deed, and that in law.

Surrender, in deed, is that which is really made by exprefs words in writing, where the words of the leffee to the leffor prove a fufficient affent to furrender his eftate back again.

SURRENDER, in Law, is that wrought by operation of the law, and which is not actual.-As if a man have a leafe of a farm for life or years, and during the term he accepts a new leafe; this act is, in law, a furrender of the former.

Surrender of a bankrupt. See Commission of Bankruptcy.

SURRENDER of Copyholds is the yielding up of the eftate by the tenant into the hands of the lord, for fuch purpoles as are expreffed in the furrender: as to the ufe and behoof of \(A\) and his heirs, to the ufe of his own will, and the like. This method of conveyance is fo effential to the nature of a copyhold eftate, that it cannot poflibly be transferred by any other affurance. No Blackf. feoffment, fine, or recovery (in the king's courts) hath comment any operation upon it. If I would exchange a copyhold vol. ii. with another, I cannot do it by an ordinary deed of exchange at the common law, but we muft furrender to each other's ufe, and the lord will admit us accordingly. If I would devife a copyhold, I muft furrender it to the ufe of my latt will and teftament ; and in my will I muft declare my intentions, and name a devifee, who will then be entitled to admiffion.

\section*{\(S \mathrm{U} R \quad[11 \mathrm{j}] \quad S \mathrm{U} \quad \mathrm{R}\)}
urrender SURrender of Letters Patent and Offices. A furrender may be made of letters patent to the king, fo that he may grant the eftate to whom he pleafes, \& c . and a fecond patent for years to the fame perfon for the fame thing is a furrender in law of the firl patent. 10 Rep. 66 . If an officer for life accept of another grant of the fame office, it is in law a furrender of the firt grant ; but if fuch an officer take another grant of the fame office to himfelf and another, it may be otherwife.

\section*{SURREPTITIOUS. See Subreptitious.}

SURROGATE, in Law, denotes a perion that is fubflituted or appointed in the room of another.

SURRY, a county of England, bounded on the weit by Berkihire and Hampfhire, on the fouth by Sufiex, on the eaft by Kent, on the north by Middlefex, from which it is parted by the Thames, whence it had the name of Suth-rey from the Saxons, i.e. the country on the louth fide of the river. It is 38 miles in length from eaft to weft, 23 in breadth from north to fouth, and 112 in circumference. It contains 13 hundreds, 140 parifhes, of which 35 are vicarages, 13 markettotwns, 450 villages, 592,000 acres, and about 269,043 inhabitants. The members fent from it to parliament are 14, of which two are fent by each of the following boroughs, viz.Southwark, Bleechingley, Ryegate, Guildford, Gatton, Haflemere, and two for the county.

The air of this county, towards the middle, which confifts mofly of hills and heath, is tharp, but pure and wholefome. About the fkirts , where it is more level, and the foil richer, the air is milder, but alfo falubrious. In the middle parts the foil is barren enough in general; but towards the extremities, and where the country is open and champaign, it is fruitful in grals and corn, particularly on the fouth fide in Holmfdale, in which meadows, woods, and corn-fields, are agreeably intermixed. The foil is alfu very fertile along the Thames, efpecially towards London, where it greatly contributes to maintain plenty in the London markets. It has feveral rivers, abounding with fifh, the chief of which are the Wye, the Mole, and the Wandle.
SURSOLID, or Surdesolid, in arithmetic, the fifth power of a number, or the fourth multiplication of any number, confidered as a root.

SURVEYING. That part of practical mathematics which teac.les the method of afcertaining the limits and extent of lands or eftates, and of reprefenting thefe in raps or plans, is called furveying, or land Jurveying; but this term, in a more extended fenfe, includes the valuing of landed property, the buying and felling of eftates, and the dividing or laying out of landed property to the beft advantage
Confidered as a branch of practical mathematics, furveying depends for its principles on Geometry and Trigonometry, and as far as it is confined to the menfuration of plain furfaces, has already been confidered onder the article Mensuration. It is the object of the prefent article to explain and illuftrate the moft ap. proved methods of applying thefe principles to practice, and in particular to point out the ufe of the field book, and the mode of furveying large eflates, towns, counties, or fimilar extenfive tracts of land. We fhall alfo point out the moft approved mode of furveying fubterraneous works, as coal-pits, mines, \&c. a fubjeet which has hitherto bcen entirely neglected in works of this nature.

Before entering on the practical part of the fubject, Surscying. it may be proper to mention the previous knowledge \(\underbrace{-}\) which a furveyor ought to poffefs, and to notice the in Preliminary fruments which he is to employ in his operations. knowledge

As a furveyor has perpetual occafion for calculation, proper for it is neceflary that he be familiar with the four ferlt fiurveyor. rules of Arithaietic, and the rule of Proporion, both in whole numbers, and in Fractions, efpecially Decimals, with the nature of Logarifims, and the ufe of Logarithmic Tables; and with, at lealt, Asceebranc Notation. As it is his bufinefs to inveftigate and meafure lines and angles, and to defcribe thefe on paper, he fhould be well acquainted with the elements of Geomrtry and Trigonometry, and with the application of thefe principles to the Mensuration of Heighits, DiAances, and Surfaces. In particular, he fhould be familiar with the beft practical methods of folving the ordinary geometrical problems, and flould be expert in drawing lines and defcribing figures. He fhould be acquainted with the principles and practice of Leveleing; fhould know fomething of the principles of OpTICS and Magnetism, and fhould poffefs at leaft a fmattering of the arts of Drawing and Painting.

The inftruments ufually employed in furveying, have \(\mathrm{In}^{2} \mathrm{ru}\) been enumerated under Mensuration, vol. xiii. pp. inems, 511,519 , and of thefe the chain, the plane-table, the crofs, and the theodolite, are there fufficiently defribed, and the Circumperentor, the Compass, Levels, the Perambulator, and Protractors, are defcribed, and their ufes explained under their proper heads in the general alphabet of this work.
The moft fimple methods of furveying, are thofe in which the chain or the plane-table are employed, and of thefe methods a general idea has been given under Mensu* ration. It may be neceflary in this place to defrribe a little more at large the ufe of the plane table, as this infrument is one of the moft convenient for furveying fields, or other fmall plots of ground.

In preparing the plane table for ufe, a theet of paper Practical that will about cover the plane-table, is to be wetted, then directions fpread flat on the table, the marginal frame of which for ufing is to be prefled down on its edges, fo as to keep it the planefmooth and even. On this paper thus ffretched, the plan of the field or other plot is to be traced in the following manner.

Suppofe it be required to make a plan of a field that has the figure reprefented at A, B, C, D, E, F, fig. 1. Plate DXXV. and in fuch a fituation, that all its angles Figs. is arad are acceflible.
The plane table is to be fixed at one of the angles, as at \(A\), in the pofition reprefented at fig. 2 . and its lurface muft be brought to a horizontal plane. A point is then to be made on the paper with a pencil, as at \(a\), to reprefent the point \(A\), where the plane table is ftationed. Fixing a needle perpendicularly at this point, the index of the table is ta be applied to the needle, on that fide which correfponds with the fight vanes, and is to be turned round this point, fliding on the table, till the eye looking through the fights, perceives a mark fet up at the point B . A line is now to be drawn from a along the edge of the index. In the fame manner a line is to be drawn from \(a\), marking the direction of the fide AF. Thus the angle \(b\) a \(f\), (fig. 2.) will be fimilar to the angle BAF (fig. i.): the plane table is now to be removed from the point \(A\), to another corne:

\section*{S U R [ 116 ]. S U R}
\(\underbrace{\text { Surveying. of the field, as } B \text {, and a poie or other mark is to be left }}\) at \(A\). The length \(A B\) is to be meafured by the chain, and a propotional length marked off on the paper, in the direction \(a, b\), from a plotting fcale, or lcale of eriual parts. Proceeding as at firit, a line is to be drawn from \(b\) towards \(c\), in the direction of the fhe BC , and marking the mealure of the angle CBA. In this manner, by placing the glane table fuccellively at each corner of the field or plot of ground, the outline figure of the whole will be transferred to the paper, and \(a, b, c, d, e, f\), will be the plan of the field \(A, B\), C, D, E, F.

If it be not convenient to flace the plane table at the corners of the ground to be furveyed, the plan may be taken by placing the infrument any where within the atea,
Fig. 3 . as at \(E\) (fig. 3.) in the middle of the field \(A, B, C, D\). In this care we can seadily find the direction of the lines EA, EB, EC, ED, and the angles which they form at the point E . By meafuring the diftances from E to the fercral angular points, and transerring the propurtional diftances from the plane fcale upon the paper, and then joining the points thus found, there is cafly traced the outline of the whole feld.

It may happen that no part of the ground to be meafured is acceffible, except one line, as the line \(A E\) in the fpace A, B, C, D, E, F, G, (fig. 4.).

In this cale, the plane table is to be fixed at the point \(A\), of the bafe line \(A E\), and a point made on fome part of the paper at pleafure, to reprefent the fation A , and the bafe line AE is in the utwal manner to be afcertainel and laid down. Then from the fation \(A\), tire fituation or direction of the phints \(B, C, D, E\), F, G, are to be obferved through the fights of the index; and lines correfonding to the linies \(A 13, A \mathrm{C}, \mathrm{AD}\), \(A E, A F, A G\), are to be laid down on the paper, but of an indefinite longth. When this is done. great attenticn mult be paid to preferve the table Ready and perfealy hoizontal. The length of the bafe line AE being determined, the table is now to be remored to the cther extremity E, and fo difpofed that the bafe line on the paper may be exactly over the bare line EA of the field; and proceeding as before, the directions of the lines EA, ER, EC, ED, EF, EG, are to be dctermined, and corref fonding indefinite lines drawn on the paper. The points where thefe laft lines crofs thufe before traced, are to be carefully noted, and the outline joining all thefe paints of fection, will correfpond to the cutline of the plot to be furveyed.

The following general directions to be obferved in ufing the plane table, are given by Dr Hutton. 1. Leet the lines on which fations are made be directed towards objects as far diftant as poffible; and when any fuch object is fel, go round the talle and look through the fights from the other end of the intex, to fee if any other semarkable object he directly oppofite; if there be none fuch. endeavour to find anothier foward object, fuch as fhall have a remark:ble backward oppofite one, and make ufe of it , rather than the other; becaufe the back object will be of ufe in fixing the table in the original pofitign, cither when you have meafured too near to the forward oljecet, or when it may be lid from your fight at any neceffary ffation by intervening heelges, \&c.
2. I.et the faid lines, on which the fations are taken, be furfued as far as conveniently can be done; for that
will be the mears of preferving more accuracy in the Survejing. work.
3. At each fation it will be neceffary to prove the truth of it, that is, whether the table be flraight in the line towards the object, and alfo whether the ditance be rightly meafured and laid down on the paper. To Koow whether the table be fet down Araight in the line, lay the inder on the table in any manner, and more the table about, till through the dights you perceive either the fore or back object; then, without mocring the table, go round it, and look through the fights by the other end of the index, to fee if the cther object can be proceived; if it be, the table is in the line; if not, it mult be fthifted to one fide, according to your judgement, till through the fights both objects can be feen. The aforefuid obiervation only informs you if the flation be ftraight in the line; but to know if it be in the right part of the line; that is, if the diftance has been rightly laid down: fix the table in the original pofition, by laying the index along the fation line, and turning the table about till the fore and back objects appear through the fights, and then alfo will the nced!e point at the lame degree as at firft. Then lay the index crer the fation point and ony other point on tl:e paper reprefenting an objed whicli can be feen from the ifation; and if the faid object appear ftraight through the fights, the flation may be depended on as right; if not, the diftance thould be examined and corrected till the object can be fo feen. And for this very wifful purpofe, it is advifaable to have fome high object or two, which can be feen from the greatett part of the ground accurately laid down on the paper from the beginning of the furvey, to ferve continually as proof objects.

When from any fation, the fore and back objects camot both be feen, the agreement of the necdle with one of them may be depended on for placing the table * See Hutfraight on the line, and fur fising it in the original turis Mrapoftion *.
the foregoing examples are extremely fimple, as the method of bounding lines are ftraight and regular. Here, there- meafuring fore, it is not requifite to meafure what furveyors call offects. the offsets, or the perpendicular diffances between a bafe line, and the feveral angles which it fubtends. It feldom happers, however, that the work can be carried on in fo regular a way, as the bounding lines, even of fmall pieces of ground, are generally more or lefs crooked.

Let us fuppofe \(\mathrm{A}, l, m, n, 0, p, n, r\), (fig. 5.) to be a crocked hedge, or other boundary of a piece of ground, and \(\mathrm{A} B\) the general bafe line fubtending its feveral angles. In meafuring along this bafe, when the furveyor comes oppofite to any of the bendings or comers of the fence, as at \(c, d, c\), \&c. he meafures the perpendicular offisets \(c l, d m, e n, \& c\). either with the offset ftaif, or, if they are of confiderable length, with the chain. Thefe ofisets are to be noted down, as will be explained immediatcly.

When the offets are not very large, their places may be determined pretty exactly by the eye, elpecially when affiled by laying down the offset ftuff in a dircetion perpendicular to the bafe, and oppofite to the angles; but when the ofliets are very large, their pofitions are beft deternined loy the crofs, or the plane table, in the following manner. In meafuing along A B (fig. 5.),

\section*{S U R}

Inere © I is the firf fation, where the angle or Survewint. bearing is \(105^{\circ} 25^{\prime \prime}\). On the lett, at 73 links in the diftance or principal liic, is an offset of \(9^{2}\); and at 610 an offict of 2410 a crofs hed ge. On the right, at 0 , or the beginning, an offset 25 to the coraer of the field; at 248 Brown's boundary helgge commences; at \(G 10\) an offiet 35 ; and at 945 , the end of the firit line; the o denotes its terminating in the hedge. And fo on for the other flations. \(\Lambda\) line is draven at the end of every ilation line, to prevent confufion.

Various improvements have becn made on the field. Crocker's book, efpecially by Mr Abraham Crocker, and Mrf ficlathock. John Bodham. We flall give a fpecimen of each.

Fig. 6. reprcfents a page of Mr Crocker's field-bool, exhibiting a part of the furvey of an eftate called the Mill Eitate; the outlines of which were furveyed with the theodolite, and the interior parts filled up with the chais. In this book the operations are noted down, fo as to begin from the foot of the page, carrying them on upwards.

In-furveying after this method, Mr Crocker advifes to choofe two or more eminences, as principal flations, and meafure a gencral bafc line from one flation to the other, noting each hedge, brook, or other remarkable object as it is paffed by; meafuring alfo fuch lhort perpendicular lines to fucla bends of hedges as may be near the bafe. From the extremitics of this bate-line, or from any consenient parts of it, the furveyor muil proceed with other lines to fome remarkable object fiturited towards the fides of the effate, without regarding the angles they make with the bafe-line or with one another, remembering to note every hedge, brook, or other object by which he pafles. Thefe lines, when laid down by interfections, will with the bafe-line form a priucipal triangle on the ground to be furveyed; feveral of which, if necellary, being thus laid down, the furveyor may proceed to form other fmaller triangles and trapezoids, on the fides of the former; and fo on till the feveral enclofures are finifled.

This principal triangle being completed, and laid down on the rough plan paper, the parts, exterior as well as interior, are to be completed by fmaller triangles and trapezoids.

When the whole plan is laid down on paper, the contents of each part of the eflate may be calculated by the methods already explained under Mexsur.ition.

In countries where the lands are enclofed with high hedges, and where many lanes or roads pafs through an eftate, a theodolite may be employed with advartage, in afcertaining the angles of fuch lands; and by thefe means an outline of the eftate may be obtained, and the lane lines ferve as the bafes of fuch triangles and trapezoids as are neceflary to fill up the interior parts.

To illuffrate this method, let us take \(A B\) in the plan of the eftate, (fig. 8.) for the principal bafe line. From B go off to the tree at \(C\), noting down in the ficld book every crofs hedge as you meafure on, and from C meafure back to A , noting down every thing remarkable, as before directed. This figure alfo illuitrates the method of meafuring the crofs lines, offsets, and interior parts and enclofares:
Fig. 7. reprefents a page from Mr Rodham's field Rodham's book. His method of procedure is as follows:-Like ficikh-book. Mr Crocker, he begins from the bottom of the page, 1 is. 7 and and writes upwards; denoting the croffing of fences, by s.

\section*{\(\mathrm{S} U \mathrm{R} \quad[118] \quad \mathrm{S} \mathbf{U}\) R}

Surveying. lines drawn acrofs the middle column, or only a part of fuch a line on the right and left oppofite the figures, to avoid confufion, and the comers of fields, and other rerarkable turnings in the fences, towards which offsets a:e taken, by lines joining like the fences, as will be bell feen by comparing the fpecimen at fig. 7. with the plan at fig. 9 .

The marks called \(a, b, c, \& c\), are beft made in the fields, by making a fmall hole with a fpade, and placing there a chip or fmall piece of wood, with the particular letter marked on it, to prevent one mark being taken for another, on any return to it, though in genesal the name of a mark is very eafily feen, by referring in the book to the line in which it was made. After the fmall Italic letters have been gone through, the capitals may be next employed, and the Roman letters afterwards, and fo on. Perhaps it would be preferable to diflinguilh the marks by figures,

The letters in the left hand comer at the beginning of each line, denote the mark or place meafured from; and that at the right hand comer of the end, is the mark meafured 10 . But when it is not convenient to go exaetly from a mark, the place meafured from is defcribed fuch a difance from one mark towards another; and where a mark is not meafured to, the exact place is afcertained by writing, turn to the right or left hand, fuch a diflance to fuch a mark, it being always underflood that thofe diftances are taken in the chain line.

The characters ufed are 「 for turn to the right hand, 7 for turn to the left hand, and \(\Lambda\) placed over an offset, to fhew that it is not taken at right angles with the chain line, but in the line with fome ftraight fence, being ufed chietly when croffing their directions, and is a better mode of afcertaining their true places than by offsets at right angles.

When a linc is meafured whole pofition is determined, either by former operations (as in the cale of producing a given line or meafuring from one known place or mark to another) or by itfelf (as in the third fide of a triangle) it is called a faft line, and a double line is drawn acrofs the book at the conclufion of it; but if its pofition be not determined (as in the fecond fide of a triangle) it is called a loofe line, and a fingle line is drawn acrofs the book. When a line becomes determined in pofition, and is afterwards continued, a double line is drawn half through the book.

When a loofe line is meafured, it becomes abfolutely neceffary to meafure fome line that will determine its pofition. Thus, the firft line \(a b\), (fig. 9.) being the bafe of a triangle, is always determined, till the third side \(j b\) is meafured; then the triangle may be conftructed, and the pofition of both is determined.

At the beginning of a line to fix a loofe line to the mark or place meatured from, the fign of turning to the right or left hand muft be added (as at \(j\) in the third line) ; otherwifc a ftranger, when laying down the work, may as eafily conflruct the triangle \(h j b\), on the wrong fide of the line \(a l\), as on the right fide; but this crror cannot be committed, if the fign above named be carefully obferved.

In choofing a line to fix a loofe one, care muft be taken that it does not make a very acute or obtufe angle, as in the triangle \(\rho \mathrm{Br}\); by the angle at B being -very obtufe, a fmall deviation from truth would make
the error at B when conflructed very confiderable; but Survesir by conftrueting the triangle \(p \mathrm{~B}_{g}\), fuch a deviation is of \(\underbrace{-}\) no confequence.

When the words leave off are written in the feld *Iuzton book, it is to fignify that the taking of offsets is from thence difcontinued; and of courfe fomething is wanting ing. \(^{\text {art. }}\) between that and the next offset *.

Math. \(D_{i}\)

9
The general ufe of the theodolite in meafuring fepa-Practical rate plots, has been defcribed under Mexsuration. direction The following practical directions for the ise of this in- of the the ftrument are given by Mr Crocker, and apply to hisodolite. field book, exemplified at fig. 6 . and the plan at fig. Ic.

Suppofe the furveyor to plant his theodolite in the road © 1, and having duly adjufted it, by placing its head exactly horizontal, by the levels; and fetting the index part of the limb exactly at \(360^{\circ}\); and by moving the whole head about till \(360^{\circ}\) in the compafs-box comes to the line in the north end of the needle; there fixing all faft, by the fcrew under the head, between the legs, he will have his inftrument completely adjufled.

The theadolite thus adjutted, the furveyor fends one of his affittants forward as far as he can conveniently fee how to meafure a ftraight line, as at \(\odot 2\). Taking then his angle of obfervation, by his telefcope, to the picket at that flation, he finds it to be \(69^{\circ}\) from the north part of his magnetic meridian line towards the eaft, which he enters in his field book, noting it with NE, as a memorandum on which fide of the magnetic meridian it lies. He is now to faften his limb to the other part of the head, by a fcrew for that purpofe.

His chain-man having laid the chain in the direction to the picket \(\odot 2\), in order to meafure the line, he makes fuch offsets to the right and left, in this firt chain's length, as may be neceffary. At his firf flation, he finds that on the right, the general road fence is 30 links, and alfo a nook of 40 links more, and 30 links broad; and that on the left of his fation he has an offfet of 10 links, all of which he muft note in his field book. Proceeding forward on this line, he finds at 300 he has an offset of 25 on the right, where is a gate, which he has to notice ; and, on the left 20 , which determines the breadth of the road at that fpot. At 400, he will find 10 on the right and 20 on the left to be the breadth ; and at 700 (the end of the line) he will find 35 on the right and 15 on the left to be the breadth of the road; where alfo he will find a finall road branclıing off to the right. Thus the firf flation line is finifh. ed.

To this fpot (which is his fecond fation) he brings the theodolite; and after fetting it level, he unlocks the under fcrew, and turns the whole head about, till, through the telefcope, he fees the back picket or fation ftaff to be cut by the crofs hairs. Here, again, locking the head of his theodolite firm by the under fcrew. he muft unfcrew the limb, and turn it about, till through the telefcope, he has a view of the picket at \(\odot 3\); the bearing of which he will find to be \(253^{\circ} 10^{\prime}\) from the north to the ealtward, which he will enter in his field book. Meafuring on from \(\odot 2\), towards \(\odot 3\), he will find at 130 links, that he is come to a turnpike, where the breadths at the right and left are 30 and 15 . At 200 , he has an offeet of 15 on the left, and a hreak off at the right of another road, at \(2 ;\) from his line, with two other offsets, as expreffed in the field book. It

\section*{S U R [ 119 ] S U R}
urvecing. mult be noted where this road leads to. At 265 he has offsets of 30 on the left, and 20 on the right. Thus ends the fecond ftation line.

Now bringing his inftrument to © \(\odot\), he is to adjuft it in the manner before direfted at \(\odot 2\); and turning the limb about towards the picket forward, he will find the angle of bearing to be \(57^{\circ} 45^{\prime}\), till from the north to the eaftward. At 20 links he will be oppofite to a crofs hedge on the left, belonging to the effate he is furveying. At 293 he ends the line of this flation, where the offsets are 5 and 35 , as noted in the field book.

Coming next to © 4 , and having adjufted his theodolite, he finds his next angle \(=226^{\circ} \mathrm{NE}\). At 120 lis offeets are 20 and 15 . At 410 , they are 15 and 30 , where, on the left, is a crois hedge, of a backward direction. At 480 his offets are 5 and 25 , where is another crofs hedge. At 750, is a break-in of the fence, and the offeets are \(30+15\) on the left, and 10 on the right. At 1050, the offsets are 20 on each hand, and another crofs hedge on the left. At 1150 are offsets of 20 and +20 , where flands a houfe. At 1300 , the offeet of 30 on the right terminates the houre; and at \(s\) on the left is a crofs hedge, of a backward direction. 1350 ends this line, where roads diverge to the right and left.

At \(\odot 5\), the inftrument being adjufted, the angle is found to be \(284^{\circ} 50^{\prime}\) nearly W. At 50 , his offset to the hedge is 15 ; at 220 it is alfo 15 , where is a crofs hedge, the other end of which was noted at 1050 in the laft line. At 320 the offset is 25 ; at 350 , the end of the \(\odot\), the diftance from the fence is 15 .

At \(\odot 6\), the bearing is \(305^{\circ} 35^{\prime} \mathrm{N}\). W. At 130 the offist is 30 , where a crofs hedge goes off to the point which was noted at 750 , in the line from \(\odot 4\) to © 5. At 160 the line is nearly clofe to the fence, ending at 210 .

At © 7 , the angle forward is \(106^{\circ} 25^{\prime} \mathrm{N} . \mathrm{W}\). The line is 14.3 long, with an offset at the end of 15 .

At \(\odot^{8}\) the bearing is \(269^{\circ} 20^{\prime} \mathrm{N}\). W. At 100 and at 300 the offsets are 15 and 10 .

The bearing at \(\odot 9\) is \(70^{\circ} 45^{\prime} \mathrm{S}\). W. At 30 the meafurer finds it expedient to crofs the fence, and proceed within the bounds of the eftate. At 95 he has an offset of 30 to the right, where he croffes a hedge. At 880 he croffes another hedge, having there an offset of 20 : at 940 is an offset of 50 . At 990 he again croffes the hedge; and at 1020 is an offset of 20 to the left : at 1040 he again crofles the hedge : at 1080 he comes to the corner of the farm houfe; and II 65 ends his line, where is a fmall curve at the right.

At \(\odot 10\), the bearing is \(204^{\circ} \mathrm{S}\). W. At 70 is an offset of 5 at the right : at 200 is 15 at the left, and a crofs hedge : at 600 is 25 on the left, and \(20+15\) on the right: 690 ends the line, where are 15 on each fide, where there is alfo a crofs hedge.

The angle at \(\odot 11\) is \(355^{\circ} 30^{\prime} \mathrm{S}\). E. At 280 is an offset of 30 on the right, and 10 with a crofs hedge on the left : at 400 is an offset of 30 , and another crofs hedge on the left; and 470 ends the line, where are offsets of 10 and 20 on the right and the left.

At © 12 the angle is \(155^{\circ} \mathrm{S}\). E. At 60 is a crofs hedge : at 219 the offsets are 10 and 15 ; and at 229 he comes to clofe his work at © r, from which he fet out.

Having thus taken the circuit of this effate, the mea- Survesing; furer mult proceed to plot the fame on paper, with fome *Crocker's convenient fcale *.

Elements.
The fcale ufually employed for this purpole is that e. 235. called the plotting fonle, plane feale, or fcalc of equal 10 parls, reprefented at fig. 11. and 12 .

Defcription
This inftrument contains different fcales or divided and ufe of lines, on both fides. There are on one fide a number tiny plicales. of plane fcales, or feales of equal divifions, each of a Figs.11.and different number to the inch, and alfo feales of chords 12. for laying down angles, and fometimes the degrees of a circle marked on one edge, anfwering to a centre marked on the oppofite edge, by which means it alfo anfwers the purpofe of a protractor. There are feveral diagonal fcales on the other fide, of different fizes, or different dimenfions to the inch, ferving to take off lines expreffed by numbers to three dimenfions, as units, tens, hundreds, as alfo a fcale of divifions which are the rooth parts of a foot. The moot ufful of all the lines which can be laid down on this inftrument, though not always done, is a plane fcale on the two oppofite edges, made thin for the purpofe. This line is very ufeful in furveying; for by laying down the influment on paper, with its divided edge along a line whereon feveral diftances are to be laid off, for the places of offsets, \&c.; thefe diftances are all transferred at once from the infrument to the line on the paper, by making fmall points or marks againf the refpective divifions on the edge of the fale.
The bufinefs of ploting or laying down a plan of an Directions eftate from the memorandd of a field book, is a very im-for plotring: portant branch of the furveyor's office. This will beft or planbe undertood by an example, which we flall take alfo \({ }^{\text {ning. }}\) from Mr Crocker. It is adapted to the page of his field book, already alluded to; and the plan, when completed, is feen at fig. 10.

The vellum or paper on which the plan is to be drawn, being fmoothly laid on a drawing board, the magnetic meridian is to be reprefented by a line drawn from the bottom to the top.

A point is to be made about the middle of this line, on which is to be laid the centre of the circular protractor, placing the ftraight edge in fuch a manner as to coincide with the faid meridian line : draw a pencil line around at the edge of the protractor.

The protractor being thus placed, and firmly fixed by means of pins in that pofition, or by a lead weight, the field book is to be infpected for the quantity of the angle at © 1 , which, in the prefent cafe is ftated at \(69^{\circ}\) north-eafterly. This degree is then to be looked for on the circular edge of the protractor, and a mark made on the paper with a fine plotting-pin, at that number, which is to be marked I , denoting © \(\odot\).

The field-book is then to be infpected for the \(<\) at © 2 , which in this cafe is \(253^{\circ} 10^{\prime}\), where a mark is to be n:ade as before.
A fimilar procels is to be followed with all the other angles, till the furveyor comes to the clofe on \(\odot 1\).

All the angles being thus marked off, the protractor is to be removed.
The place where the beginning of the work fhould be placed is then to be confidered, that the whole may come within the compafs of the paper laid down; whese a mark is to be made, noting it as \(\odot 1\), the begiming of the plot.

The fore edge of the parallel ruler is then laid from

\section*{S U R \([120] \quad \mathrm{S} U \quad 12\)}

Survejing, the centual point where the protractor lay, to the mark on the pencilled circle denoting © . The fore cdge of the parallel ruler is next moved till it touch the point determined on for the beginning of the plot, from which a pencil line in the direction from the north to the calt. warl, is drawn, about the length of the whole line of ilis \(\odot=-50\).

A feather-edge fcale is applied to this pencil or obfcure line, the o divilion of it at the begiming, marking of every progreffive number where any offets have been made, as at 320,400 , and 760 .

The fale is then turned acrofs the line (by fome crofs divifion), and the offsets on each fide of the thation line a:e pricked of. At 0 , or \(\odot 1\), the fild book thews that on the left hand, at so linke, is the boundary line of that fide, where there is likewife a fimall road branching off. The offset on the right hand is 30 , which, with +40 , goes to the extent of a fmall corner, alfo 40 links in breadtl. At 300 on the left there is an offset of 20 , and on the right another of 25 , where there is allo a gate to be noticed. At 760 there is an offiset on the left of 15 ; and on the right, one of 35 , where a fmall roadway branches off. All thele offiets are to be pricked of as the furveyor proceeds. The buundary lines are drawn through thefe offset points, and in this manner the firf ftation is completed.

The parallel ruler is then laid from the centre to the angular point of \(\odot 2\); the limb of it is moved till it teuches the end of the laft flation line, from which another obfcure line is drawn, from the north-eafterly, as noted in the field book.

The edge of the feale is then applied as before, and the numbers 30,200 , and 265 are pricked off. There is a toll gate at 30 links, and a lane of 30 links broad, going off at an acute angle. At 265 , the end of this Itation, the offsets are 30 and 10 .

The line from (0) 3 is then laid off, as before directed, north-eaflerly, and the numbers 20 and 293 are pricked off. Oppofite to \(£ 0\) is a hedge branching off to the left, and at 293 the offsets are 35 and 5 .

The line north-eaflerly is laid off from \(\odot 4\), and the numbers on that line are pricked off as they appear in the field book, and the offsets are made as follows. At 120,15 and 20 are fet off; at 410 are 30 and 15 , where iwo hedges branch off nearly in the direction of the fide fketches. At 480 the offsets are 25 and 5 , where there is a crofs hedge on the left. At 750 on the left, is \(30+15\) with a crofs hedge, and on the right 10. At 1050 on the left, is 20 with a crofs hedge, and 20 on the right. At 1150 on the right, is \(20+20\), where ftands a houfe. At 3300 on the left, is 5 with a crofs hedge; on the right is 30 , with a road branching from it: 1350 completes this line.

At \(\odot ;\) the work takes another direttion, and goes backward towards the weft. 'The ruler is laid from the centre to this ftation, and an obfcure line drawn in the direction mentioned. The dittances and offiets are pricked oft as in the field book. Here are offsets on one fide only, not being in a road way.

At \(\odot 6\) fet off the line fouth-weflerly, pricking of the diftances and offiets as in the field-book.

This fecimen is fulficient to give a complete idea of the prattice of plotting; and more would be otly a tedious repetition. It muft, however, be obferved, that
the accuracy and facility of the work gyeatly depend on Survesing. the judgement and care exercifed in keering a correct and clear field-book.

When a circuit is plotted off, the meafurer muft fill up the interior, by feparately completing the meafure of each field with the chain, fo that they may be laid down on the plan in their peoper lituations and dimenfions. The lines taken with the theodolite will here be of greal fervice, as the bafe lines of a number of interior angles.

The furseyor having thus on paper, a reprefentation of the eftate, muft draw fuch meafuring lines on it , as will enable him to calculate the content of each field feparately. Having made out a fair plot of his work, another line mult be diawn for the true meridian, to the ealtward of the former, according to the variation of the magnetic needle, where the eftate lies. On this true meridian line may be placed any device whatever, as a north point. A title mult allo be given to the map, a fcale diawn of the proportion ufed in the plotting, and a border to the whole *.

Having thus explained the general practice of fur- et's Eleveying according to the lateft improvements, we fhall Thew how a furveyor is to proceed in mealuring and planning counties and towns.

To furvey a County or large Tract of Land.- 1. Chure Method of two, three, or four eminent places for ftations, fuch as furveying the tops of high hills or mountains, towers, or church fieeples, which may be feen from one another, and from which moft of the towns, and other piaces of note, may alfo be feen. And let them be as far diftant from each other as poffible. On thefe places raife beacons, or long poles, with flags of different colours thying at them, fo as to be vifible from all the other ftations.
2. At all the places which are to be fet down in the map, plant long poles with tlags at them of feveral colours, to dittinguifh the places from each otler, fixing them on the tops of church feeples, or the tops of houfes, or in the centres of fmaller towns.

It is not neceflary to have thefe marks at many places at once, as fuppofe ten at a time. For when the angles have been taken at the two ftations, to all thefe places, the marks may be removed to new ones, and fo fucceffively to all the places requircd. Thefe marks being fet up at a convenient number of places, and fuch as may be feen from both fations, go to one of thefe ftations, and with an inftrument for taking angles, flanding at that ftation, take all the angles between the other station, and each of thefe marks, obferving which is blue, which red, \&c. and on which hand they lie; an.l fet all down with their colours. Next go to the other ftation, and take all the angles between the firf fation, and each of the former marks, and fet them down with the rell, each againft thofe correfponding with the fame colour. If practicable, the angles may alfu be taken at fome third fation, which may ferve to prove the work, if the threc lines interfect in that point where any mark flands. The marks mult be allowed to remain till the obfervations are finifhed at both ftations, and then they mut be taken down, and fet up at frefi places. The fame operations mut be performed at both dations, for thefe frefh places, and the like for others. The inflrument for taking angles mult be exccedingly accurate, made on purpofe with telefcopic
fohts,

/in)

21
20

\section*{\(S\) U R \(\quad\left[\begin{array}{lll}121\end{array}\right] \quad S \quad U-R\)}
arveying. fights, and of three, four, or five feet radius. A circumferentor is reckoned a good inftrument for this purpofe.
3. Though it be not abfolutcly neceffary to meafure any dittance; becaufe a ftationary line being laid down from any fcale, all the other lines will be proportional to it; yet it is better to meafure fome of the lines, to afcertain the diftances of places in miles: and to know how many geometrical miles there are in any length; and from thence to make a fcale for meafuring any diflance in miles. In meafuring any diftance, it will not be exact enough to go along the high roads, on account of their turnings and windings, and lcarcely ever lying in a right line between the ftations, which would caule endlefs reductions, and create trouble to make it a right line, for which reafon it can never be exact. But a better way is to meafure in a right line with a chain, between ftation and ftation, over hills and dales, or level fields, and all obftacles. Only in cafes of water, woods, towns, rocks, banks, \&c. where one cannot pafs, fuch parts of the line muft be meafured by the method of inacceffible diftances; and befides, allowing for afcents and defeents, when we meet with them. A good compafs that fhews the bearing of two ftations, will always direct to go fraight, when the two flations are not feen; but when a ftraight progrefs can be made, offsets may be taken to any remarkable places, likewife noting the interfection of the flationary line, with all roads, rivers, \&c.
4. From all the fations, and in the whole progrefs, care muft be taken to obferve fea coafts, the mouths of rivers, towns, caftles, houfes, churches, windmills, watermills, trees, rocks, fands, roads, bridges, fords, ferries, woods, hills, mountains, rills, brooks, parks, beacons, Pluices, floodgates, locks, \&cc. and in general every thing remarkable.
5. When the firt and main ftation lines are done, which coinmand the whole country, innet ftations are then to be taken at fome places already determined, which will divide the whole into feveral partitions, and from thefe ftations may be determined the places of as many of the remaining towns as poffible. If any remain in that part, more flations may be taken at fome places already determined, from which the reft may be determined. Proceeding thus through all parts of the country, flation may be taken after ftation, till all that are required be determined. In general, the fation diffances muft always pafs through fuch remarkable points as have been formerly determined by the preceding ftations.
6. The pofition of the fation line meafured, or the point of the compafs on which it lies, muft be determined by aftenomical obfervation. Hang up a thread and plummet in the fun over fome part in the fation line, obferving when the fhadow runs along that line, and at that moment take the fun's altitude; then having his declination, and the latitude, the azimuth will be found by fpherical trigonometry. The azinuth is the angle which the fation line makes with the meridian, and therefore a meridian may eafily be drawn through the map; or a meridian may be drawn through it by hanging up two threads in a line with the pole ftar, when due north, which may be known from aftronomical tables. Or thus: Obferve the flar Alioth, or Voi. XX. Part I.
that in the rump of the Great Bear, being that next the Surveyins. fquare; or elfe Caffopeia's hip; obferving by a line and plummet when either of thefe ftars and the pole ftar comes into a perpendicular; and at that time they are due north. Therefore two perpendicular lines being fixed at that moment, towards thefe two flars, will give the pofition of the meridian.
A Town or City may be furveyed with any of the Methorl of intruments for taking angles, but beft of all with the furvesing plane table, where every minute part is drawn while in \({ }^{\text {towns }}\) fight. It is alfo proper to have a chain of 50 feet long, divided into 50 links, and an offset-ftaff of to feet long.
Begin at the meeting of two or more of the principal Atreets through which the longeft profpect may be had, to get the longeft ftation lines. Having there fixed the infrument, draw lines of direction along thofe ftreets, ufing two men as marks, or poles fet in wooden pedeftals, or perhaps fome remarkable places in the houleo at the farther ends, as windows, doors, corners, \& c. Meafure thefe lines with the chain, taking offsets with the Itaff, at all corners of Areets, bendings, or windings, and to all remarkable objects, as churches, markets, halls, colleges, eminent houfes, \&ic. Then remove the infrument to another flation along one of thefe line:, and there repeat the fame procefs as before, and fo on till the whole be completed.
Thus, in fig. 13. (part of the New 'Town of Edinburgh) fix the inflrument at \(A\), and draw lines in the direction of all the freets meeting in that place, and meafure AB , noting the itreet on tise left at \(m\). At the fecond flation B, draw the directions of the ffreets meeting there, and ineafure CD. Do the fame at D, and meafure DE , noting the place of the crofs ftreets at p. In this manner go through all the principal ttreets. This being done, proceed to the fmaller and intermediate fteets; and lafty to the lanes, alleys, courts, yards, \({ }^{\text {Lon's Math. }}\) and every part which it may be deemed expedient to re- Surreying prefent *.

We fhall conclude this article with a few practical Subterraremarks on fubterrancous furveying, or the method of neous furfurveying mines, and other works below ground, taken chicfly from Mr. Fenwick's work on fubterraneous furveying, lately publifhed.

The inflruments employed in furveying under ground, are the circurnferentor, the chain (in coal mines) containing 100 links, and an inftrument for taking the angles of elevation or deprefion, to 1 educe the meafurements to horizontal diftances, where the lines are not level. In lead mines, they fometimes employ a cord, divided into 10 feet, inflead of a chain.

In conductirg a fubterraneous furvey, the inftrument ufed is placed where the furvey is intended to commence, and a perfon goes forward in the direction of the line to be furveyed, holding a lighted candle in his hand, to the remotef point at which his light can be feen through the fights of the inftrument ; its bearing is then taken by the circumferentor, and ncted down in the furvey book. The furveyor then proceeds to take the diffance of the light, or objeet, from the inltrument, which is afterwards removed, and a perfon flands on the fot where it flood, holding one erd of the chain in his hand, while another, going towards the objee?, holds the other end, together with a lighted candle, in the fame hand, and being direeied by the former, till the hand bolding the

\section*{\(S\) U R \\ \(S \cup R\)}

Sumajing, cardle and the chain is in a dirca line with tlece object + or light whole bearing was taken. At that place, the ant chain is maked. The perfon who flood where the intrument was placed then coses for: ard to the mark at the end of the firlt chain, the other advancing forward ancther chain, with the chain and candle in the fume hand, as before direcied: here the fecond chain is to be matked. Procecding in this manner till the dif. tance of the object be determined, which being noted domm in chains and links in the furvey book, oppofite to the bearing, the firt bearing and dillance is comple. tod. Fising the inftrument again where the light as an object flood, or at the temmation of the foregcing bearing and difance, and taking the fecond bearing, by directing the perfon to go formand as before, fs far as his light can be feen, or at any convenient difance, the furveyor is to proceed as before, till the whole is completed.
Such furveys wond require five peopie to be cmploy. ed, that the work may be expeditiounly performed; viz. one to carry furward the furvey, and make the requifite obfervations and rema:ks; another to carry the inltuments employed; another to direct the chain; a fourth perfon to lead it, and a fifth to go forward with a light, as an object, from one Itation to another. During the time of making the furvey, care muft be taken not to admit any iron or fleel within four feet of the intrument, for fear of attracting the needle, which has been known to be affected at nearly three times that ditance, by a mally piece of iron. If the glafs of the imtrument bould require cleaning, it muit be rubbed as gently as puftible, and not with any fiken fubltance, by means of which electric matter may be excited, and prevent the needle from traverfing. Should fuch matter be excited, it may be difcharged by touching the furface of the glafs with a wet finger.
'Io render this fyltem of furveying familiar to the voung miner, it would be neceffary for him to put up a number of marks on the furface, taking afterwards theis bealing and difance from each other, according to the method before directed; but to make a nearer appronch to the form of fubterrmecus furresing, it would be better to perform it at night, by the aflitance of candles ; and many evenings migitt be found favourable for this method of practifing. Lanterns may be employed, if ti:e current of air hoould be too ftrong for the flame of a candle *.

The methoo of furveying and recoraing bearings is as follows,

Suppofe the bearing of ABC (fig. I4) is required.
Set the circumferentor on A (the nurth being reprefented by \(N\), and the louth by \(S\) ) ; then turning that part of the infrument having the fleur de lis, or other device, from you, or towards \(B\), turn the inftrument till the otjcet \(B\) is fcen through, and cut by the hair in the fights; and the angle N A B being the angle that the fights and line \(A B\) make with the magnetic meridian, N \(S\) will be the bearing of 13 from \(A\), fuppofe \(30^{\circ}\); which alfo being to the right fide of the north meridian, will be north \(30^{\circ}\) eaft. 'then bring the inftrument forward to B , fixing it there, and directing the fame fight at \(B\) tonards \(C\), as was direeted at \(A\), towards \(B\); then obferve the angle that \(B C\) makes with the magne\(\because=\) mairiaian, which fuppole \(25^{\circ} \mathrm{NBC}\); and being to
the lefi of the maridian, will be moth \(25^{\circ}\) weff. To Surve. prove the work, and try the accuracy of the inftrument \(-r^{-}\) when it is flanding at \(B\), apyly the eye to that fight which was next \(B\) when it flood at \(A\); then take the bearing of \(A\) from \(B\), which, if found to be the re. verfe of B from A , flasw the work to be fo far tiue. The bearing of \(\mathbb{B}\) being taken in like manner from \(C\), will prove the truth of the furvey. The degrees of each bearing mult always be taken by the fame end of the needle.

Suppofe the bearing of B from A, C from B, and D from C, (fig. 15.) be required. Fix the inflrument at A, with the fleur de lis, or other arbitrary dovice, towards B ; then take the bearing of B , as before deferibed, which fuppofe to make an angle of \(30^{\circ} \mathrm{NAR}\) to the right with the magnetic meridian, or north \(30^{\prime \prime}\) eaft ; let the inflrument be remcved to B , and take the bearing of C , which fuppofe \(=30^{\circ} \mathrm{NBC}\) to the left, or north \(30^{\circ}\) wett ; then remore the inffrument to C , and take the tearing of D, which fuppore \(=\sigma_{5}{ }^{\circ} \mathrm{SCD}\) to the left, or fouth \(\sigma_{5}{ }^{\circ}\) ealt: Thus,

> From A to B north \(30^{\circ}\) eaft.
> - B to C north \(30^{\circ}\) weft.
> -C to D fouth \(65^{\circ}\) eaft.

This furvey may be proved in the fame manner as the preceding.

Suppofe the fubterraneous working ABCDA (fig. 16.) to be furveyed, beginning at the pit A: Fix the inftrument at the centre of the pit A; then let a perfon hold a lighted candle at B (being the utmoft diftance at which it can be feen through the fights of the inflrument), the bearing of which being taken from \(A\), fuppole due fouth, or in the direction of the magnetic meridian of \(A\), and its diftance from A fuppole 6 chains 57 links. which is placed in the furvey book as under: liemove the infrument to \(B\), where the candle food, and direct the perfon to place the lighted candle at C; then take its bearing from \(B\), which fuppofe it to make an angle \(C B S=80^{\circ}\) with the magnetic meridian, or to bear fouth \(80^{\circ}\) weff, and its diftance being found 7 chains io links, remove the infrument to C , the candle being removed to D ; then take its bearing and diflance as before, which fuppofe north \(10^{\circ}\) welt 5 chains; remove the infrument to \(\mathbf{D}\), and direct the candle to be placed at the contre of the pit A, where the furvey commenced; then take its bearing from D , north \(70^{\circ}\) eall 8 chains 35 links, and the furvey is finimed.

This furvey may be proved by adding together the degrees contained in the interior angles, which, if they amount to 360 , the work will be right.

The proof may be made by firding the northing, fouthing, eafting and wefling of all the bearings and difances. If the louthings are equal to the northings, and the weflings equal to the caftings, then will the work be right.

Thus,

The fouthings and northings therefore being equal, as allo the eationgs and wellings, the work is thus proved to be right *:

Mr Fenwick gives the following diredtions for planning fubterraneous furveys, and for determining errors that may arife in plotting, through inattention to the magnetic variation.

As the magnetic meridian is always changing, the bcarings of the fame object, taken by fuch a meridian at different times, mult alfo vary from each other, except reduced to bearings with the true meridian. Inet NS (fig. 17.) reprefent the meridian of a plan, which is alfo luppofed to be the true meridian; and it a fubterraneous excavation is to be plutted on it from the pit A, and this excavation is furmd to form a bearing of north \(10^{\circ}\) weft 10 chains, by an inftrmment whole necdle had \(20^{\circ}\) of weft variation; now if the excavation north \(10^{\circ}\) weti 10 chains be plotted on the plau by its meridian NS, which is the true meridian, it will be reprefented by \(A B\); but the bearing being taken by a needle having \(20^{\circ}\) of weft vatiation, it fhould form a bearing of north \(30^{\circ}\) well with the meridian NI, as reprefented by \(A b\); then \(A l\) will be the true direchion of the excavation from the pit \(A\), and \(l, B\) will be the magnitude of the error. Or, inftead uf reducing the excavation to its bearing with the true meridian NI, it will be equally as true if \(n s\) is drawn on the plan, and made to reprefent the magnetic meridian of the needle by which the bearing was taken, with which AB will form a bearing of north \(10^{\circ}\) weft.

We fhall add a few examples illutrative of the error arifing from plotting a fubterraneous furvey on a plan, without attending to the variation of the magnetic meridian, and alfo how its maguitude can be afcertained.

Example I. - The following is a fubterraneous furvey, commencing at a pit called the B pit, north \(30^{\circ}\), weft 6 chains, north \(70^{\circ}\), ealt 10 chains, north \(30^{\circ}\), ealt 5 chains, and north \(25^{\circ}\), weft 8 chains, which was furveyed by an inftrument whofe needle had \(24^{\circ}\) of weit variation ; under what bearings mult the furvey te plotted on a plan whofe delineated meridian has \(15^{\circ}\) of weft variation?

Reduce the bearings, as taken by a meridian having \(24^{\circ}\) of weft variation, to bearings with a meridian having \({ }^{3} 4^{\circ}\) of welt variation: thus,

Bearings with a merilian of \(24^{\circ}\) of wef variation.
\begin{tabular}{|c|c|c|c|}
\hline & Chains & & Cha \\
\hline North \({ }^{3}{ }^{\circ}\) wert & 10 & North 39
Norti 610 weft
cafl & \({ }^{6}\) \\
\hline North \(30^{\circ}\) ealt & 5 & North \(21^{\circ}\) eat & \\
\hline North \(25^{\circ}\) weit & 8 & North \(34^{\circ}\) weit & 8 \\
\hline
\end{tabular}

The furvey mut be plotted under bearings with a magnetic meridian having \(15^{\circ}\) of weft variation, as above, commencing at the \(B\) pit.

Example 11.- If the following fubte rancous furvey, north \(9^{\circ}\) weft 8 chains, north \(30^{\circ}\) eaft 7 chains, and noth \(21^{\circ}\) well 8 chains be made by an ir:frument whofe necdle has \(23^{\circ}\) of weft variation, and plotted on a plan by a meridian having \(5^{\circ}\) of magnetic variation, without being reduced thereto; what will be the magnitude of the error refulting from fuch neglect?

Suppofe A (fig. 18.) the point of commencemert of the fursey on the plan, and let the meridian of the plan be reprefented by \(\mathrm{N} s\), having \(5^{\circ}\) of welt sariation with the true meridian NS ; then the firt bearing, north \(9^{\circ}\) weft 8 chains, will be reprefented by \(A B\); the fecond, north \(30^{\circ}\) eaft 7 chains, by BC ; and the third bearing, north \(21^{\circ}\) weit 3 chains, by CD ; then ABCD will seprefent the furvey plotted, without attending to the maguelic variation: But as the furvey was made by an inftrument whofe needle liad \(23^{\circ}\) of weft varia. tion, therefore each bearing, when truly plotied, mult be fet off from a meridian of that variation, which, let as reprefent; then, north \(9^{\circ}\) weft 8 chains will be reprefented by \(A b\), north \(30^{\circ}\) eaft 7 chains by \(b c\), and north \(21^{\circ}\) welt 8 chains by \(c d\); then Abcd will reprefent the furvey truly plotted, and \(d \mathrm{D}\) will be the magnitude of the error.

Or the furvey may be plotted hy reducing the bearings, as taken by a meridian of \(23^{\circ}\) of wett variation, to bearings with a meridian of \(5^{\circ}\) of variation, as reprefented by \(\mathrm{N}_{s}\), and plotted from it accordingly; which will exactly coincide with \(A b c d\), as before.

To difcover, by calculation, the magnitude of the error, reduce the bearings of the furvey, as taken by a magnetic meridian having \(23^{\circ}\) of well variation, to bearings with the true meridian ; and alfo the fame bearings, as if taken by a meridian having \(5^{\circ}\) of weft variation, to bearings with the true meridian; then determine the northing and eafting of \(D\) frons \(d\) : thus,
\begin{tabular}{|c|c|c|c|}
\hline of wef & \[
\text { of } 23^{\circ}
\] & \multicolumn{2}{|l|}{With the true meridian.} \\
\hline & Chains. & & C \\
\hline 9
\(30^{\circ} \mathrm{W}\). & 8 & N. \(32^{\circ} \mathrm{V}\)
N.
\(7^{\circ} \mathrm{E}\) & 8 \\
\hline N. \(21{ }^{\circ} \mathrm{IV}\). & 8 & N. \(44^{\circ} \mathrm{WV}\). & 8 \\
\hline
\end{tabular}

a \(d 8\) chains 93 links-af 2 chains 48 links \(=f d 6\) chains 45 links.
Ae 21 chains 29 links-A a 19 chains 47 links \(=a \in\) or \(f D_{1}\) chain 82 links.

76. p. 35. Therefore, the amount of the error, or the bearing and diffance of D from \(d\), will be north, \(74^{\circ} 15^{\prime}\) eaft 6 chains 70 links with the true meridian.
SURVEYOR, a perfon who has the overfight and care of confiderable works, lands, or the like.
Surveyor, likewife denotes a gauger; as alfo a perfon who furveys lands, and makes maps of them.

SURVIVOR, in Law, fignifies the longef liver of joint tenants, or of any two perfons jointly interefted in a thing.

SURVIVORSHIP, is that branch of mathematics which treats of reverfions payable provided one or more particular perfons furvive certain otkers. By reverfions are meant payments not to take place till fome future period. Survivorftip forms one of the moff difficult and complicated parts of the dostrine of reverfions and lifeannuities. It has been very fully treated of by Mr Thomas Simpfon in his Select Exercifes, and confiderably improved by Dr Price and Mr Morgan, who bave beflowed a great deal of attention on this fubject; though Fome parts of their principles are erroneous.

The calrulations are founded on the expectation of lives at different ages, deduced from tables formed from bills of mortality. of which fee feveral examples under the arlicle Bills of Montafiltr. By the expectation of life is meant the mean time that any fingle or joint lives
at a given age is found to continue ; that is, the number of years which, taking one with another, they actually enjoy, and may be confidered as fure of enjoying; thofe who furvive that period enjoying as much more time in proportion to their number as thofe who fall fhort of it enjoy lefs. Thus, fuppofing 46 perfons alive all 40 years of age, and that one will die every year till they are all dead in 46 years, half 46 or 23 will be the expectation of each of them. If M. de Moivre's hypothefis were true, that men always decreafe in an arithmetical progreffion, the expectation of a fingle life is always half its complement (A), and the expectation of two joint lives one-third of their common complement. Thus, fuppofing a man 40 , his expectation would be 23 , the half of 46 , his complement; the expectation of two joint lives, each 40 , would be 15 years 4 months, or the third part of 46 .

The number expreffing the expectation, multiplied by the number of fingle or joint lives (of which it is the expectation), added annually to a fociety, gives the whole number living together, to which fuch an annual addition would in time grow. Thus, fince 19, or the third of 57 , is the expectation of two joint lives, whofe common age is 29, twenty marriages every year betwcen perfons of this age would in 57 years grow to 20 times
(A) By the complement of a life is meant what it wants of 86 , which M. de Moivre makes the boundary of buman life. Thus if a man be 30 , the complement of his life is \(j 6\).

\section*{\(S\) U R}

\section*{S U R}
arivor- 19. or 380 marriages, always exiting together. And fince the expectation of a fingle life is always half its complement, in 57 years 20 fingle perfons added annuatly to a town will increafe to 20 times 28.5 , or 570 ; and when arrived at this number, the deaths every year will juft equal the acceffions, and no farther increafe be pofible. It appears from hence, that the particular proportion that becomes extinct every year, out of the whole number conftantly exifing together of fingle or joint lives, muft, wherever this number undergoes no variation, be exactly the fame with the expectation of thofe lives, at the time when their exiftence commenced. Thus, was it found that a 19 th part of all the marriages among any bodies of men, whofe numbers do not vary, are diffolved every year by the deatus of cither the hufband or wife, it would appear that 19 was, at the time they were contracted, the expectation of thefe marriages. In like manner, was it found in a fociety, limited to a fixed number of members, that a 28 ih part dies annually out of the whole number of members, it would appear that 28 was their common expectation of life at the time they entered. So likewife, were it found in any town or dittrict, where the number of births and burials are equal, that a zoth or 3 oth part of the inhabitants die annually, it would appear that 20 or 30 was the expectation of a child juft born in that town or diftrict. Thefe expectations, therefore, for all fingle lives, are eafily found by a table of obfervations, thowing the number that die annually at all ages out of a given numberalive at thofe ages; and the general rule for this purpole is, to divide the fum of all the living in the table, at the age whofe expectation is required, and at all greater ages, by the fum of all that die annually at that age and above it; or, which is the fame, by the number (in the Table) of the living at that age; and half unity fubtracted from the quotient will be the required expectation. Thus, in Dr Halley's table, given in the article Annuity, the fum of all the living at 20 and upwards is 20,724 , which, divided by 598 , the number living at the age of 20 , and half unity fubtracted from the quatient, gives \(34 \cdot \mathrm{r} 5\) for the expectat:on of 20 .

In calculating the value or expectation of joint lives, M. de Muivre had recourle to the hypothefis, that the probabilities of life decreafe in a geometrical progreffion; believing that the values of joint lives, obtained by rules derived from it, would not deviate much from the truth. But in this he was greatly miftaken; they gencrally give refults which are near a quarter of the true value too great in finding the prefent value of one life after it has furvived another in a fingle payment, and about twofifths too great when the value is fought in annual payments during the joint lives. They ought therefore to be calculated on the hypothefis (if they are calculated on hypothefis at all), that the probabilities of life decreafe in arithmetical progreffion, which is not very far from the truth. Even this hypothefis never correfponds with the fact in the firft and laft periods of life, and in fome filuations not in any pcriod of life. Dr Price and Mr Morgan therefore have given tables of the value of lives, not founded on any hyputhefis, but deduced from bills of mortality themfelves. Some of thefe we fhall give at the end of this article. Mr Morgan has likewife given rules for calculating values of lives in this manner.
M. de Moivre has alfo fallen into miftakes in his rules
for calculating the value of reverfions depending on fur- Survirce:vivorhip: thefe have been pointed out by Dr Price in the third eflay in the firt volume of his 'Ireatife on Reverfionary Payments; who has alfo given proper rules for calculating thefe values, the mon important of which are comprended in the following paragraphs.

Suppofe a fet of married men to enter into a lociety in Method of order to provide annuities for their widows, and that it is finding the limited to a certain number of members, and conftantly number of kept up to that number by the admifion of new mem-hat will bers as the old ones are loft; it is of importance, in the come on a finf place, to know the number of annuitants that after fociety. fome time will come upon the eftablifhment. Now fince every marriage produces either a widow or widower; and fince all marriages taken together would produce as many widows as widowers, were every man and his wife of the fame age, and the chance equal which thall die firf ; it is evident, that the number of widows that have ever exifted in the world, would in this cafe be equal to half the number of marriages. And what would take place in the world mult alfo, on the fame fuppofitions, take place in this fociety. In other words, every other perfon in fuch a fociety leaving a widow, there mutt arife from it a number of. widows equal to half its own number. But this does not determine what number, all living at one and the fame time, the fociety may expeet will come to be conftantly on it. It is, therefore, neceffary to determine how long the duration of furvivorfhip between perfons of equal ages will be, compared with the duration of marriage. And the truth is, that, fuppofing the probabilities of life to decreafe uniformly, the former is equal to the latter; and confequently that the number of furvivors, or (which is the fame, fuppoling no fecond marriages) of widows and widowers alive to. gether, which will arife from any given fet of fuch marriages conftantly kept up, will be equal to the whole number of marriages; or half of them (the number of widows in particular) equal to half the number of marriages. Now it appears that in mof towns the decreals in the probabilities of life is in fact nearly uniform. According to the Breflaw Table of Obfervations (fee ANNUITY), almoft the fame numbers die \(\epsilon\) very year from 20 years of age to 77. After this, indeed, fewer die, and the rate of decreafe in the probabilities of life is retarded. But this deviation from the hypothefis is inconfiderable; and its effect, in the prefent cafe, is to render the duration of furvivorflip longer than it would otherwife be. According to the London Table of Obfervations, the numbers dying every year begin to grow lefs at 50 years of age; and from hence to extreme old age there is a conftant retardation in the decreafe of the probabilities of life. Upon the whole, therefore, it appears that, according to the Breflaw Table, and fuppofing no widows to marry, the number inquired after is fomewhat greater than half the number of the fociety; but, according to the London Table, a good deal greater. This, however, has been determined on the fuppofition that the hufbands and wives are of equal ages, and that then there is an equal chance who thall die firt. But in reality hufbands are generally older than wives, and males have been found to die fooner than females, as appears incontctably from feveral of the tables in Dr Price's Treatife on Reverfions. It is therefore more than an equal chance that the hurband will die before his wife, This will increafe confiderably the dusation

\section*{S. U R [ 12 C\(] \quad \mathrm{S} \mathrm{U} \mathrm{R}\)}

Viา \({ }^{3}\) a
man ought to pay in a fingle payment to entitle his widow 10 : certain anr.uity.

Slutribor- of furwivoritip on the part of the women, and confethip.

When the namber of :"nnuitar:s arrives at its maxis mum. quently the number which we have been inquiring af. ter. The marriage of widows will diminifh this number, but not fo mach as the other caufes will increafe it.

If the focicty comprehends in it from the firt all the maried people of all ages in any town, or zmong any clafs of people where the numbers always contirue the fame, the whole collective body of members will be at their greateft age at the time of the eftabliftment of the fociety; and the number of widows left every year will at a medium be always the fame. The number of widows will increafe continually on the fociety, till as many die cvery year as are added. This will not be till the whole collective body of widows are at their greateft age, or till there are among them the greateft pollible number of the oldett widows; and therefore not till there has been time for an acceflion to the oldet widows from the youngelt part.

Let us, for the fake of greater precifion, divide the whole medium of widows that come on every year into different clafles according to their different ages, and fuppofe fome to be left at 56 yeats of age, fotre ai 46 , fome at 36 , and fome at 26 . The widows, conftantly in life together, derived from the firlt clats, will come to their greateft age, ard to a maximum, in 30 years, fuppofing, with M. de Moirre, 86 to be the utmoft extent of life. The fame will happen to the fecoud clafs in 40 years, and to the third in 50 years. But the whole body compofed of thefe clafes will not come to a maximum till the fame happens to the fourth or younget clafs; that is, not till the end of 60 years. After this the affars of tine fociety will become flationary, and the number of annuitants on it of all ages will keep always nearly the fame.

If a fociety begins wih its complete number of members, but at the fame time admits none above a particular age: If, for inftance, it begins with 205 mem bets all under 50 , and afterwards limits ittelf to this number, and keeps it up by admitting cvery year, at all ayes between 26 and 50 , new menbers as old ones drop cff; in this cale, the period neceliary for bringing on the maximum of anmuitants will be juft doubled.
'Io defermine the fum that every individual nuglit to pay in a fongle prefe:t pryment, in order to intitle his widow to a certain amuity for loer life, let us fuppofe the amuity 3 l. per annum, and the rate of interelt four per cent. It is evident, that the value of fuch an ex. pectation is different, according to the different ages of the purchafers, and the proportion of the age of the wile to that of the hufland. Let us then fuppofe that every perfon in fuch a fociety is of the fame age with his wife, and that one with another all the members when they citer may be reckoned 40 years of age, as many entering above this age as belou it. It has been demonflrated by M. de Moivre and Mr Simpfon, that the value of an annuity on the joint continuance of any two lives, fubtracted from the value of an annuity on the life in expectation, gives the true prefent value of annuity on what may happen to remain of the latter of the two lives after the other.

In the prefent cafe, the value of an annuity to be enjoyed during the joint continuance of two livec, each 40 . is, by 'Table 11. 9.826 , according to the probabilities of life in the Tatle of O 'fervations formed by Dr Jalley from the bills of mortality of Breflaw in Silefia.

The value of a fangle life 40 years of age, as given by Surrixc M. de Moivre, agrecably to the fame table, is 13.20 ; fhip. and the formet fubtracted from the latter, leaves 3.37 , or the true number of years purchafe, which ought to be paid for any given annuity, to be enjoyed by a perfon 40 years of age, provided lie furvives another perfon of the fame age, interet being reckoned at four per cent. per anmurn. The annuity, therefore, being 301. the prefent value of it is 35 muluplied by \(3 \cdot 37\), or 101l. 2 s.

If, inftead of a fingle prefent payment, it is thought What h preferable to make annual payments during the mar- ought in riage; what thefe annual payments ought to be is eafliy pay in a determined by finding what anncal payments during mual pa two joint lives of given ages are equivalent to the value of the reverfionaty annuity in prefent money. Suppole, as before, that the joint lives are each 40 , and the reverfionary annuity 301 . per annum. An annual payment during the continuance of two fuch lives is worth (according to Table II.) 9.82 years purchafe. The annual payment ought to be fuch as, being multiplied by 9.82 , will produce 101.1\(]\), the prefent value of the annuity in one payment. Divide then 101.1 by 9.82 , and 10.3 the quotient will be the annual payment. This method of calculation fuppofes that the firl annual payment is not to be made till the end of a year. If it is to be made immediately, the value of the joint lives will be increaled one year's purchafe; and therefore, in order to find the annual payments required, the value of a preiont fingle payment mut be divided by the value of the joint lives increafed by unity. If the fociety prefer paying part of the value in a prefent fingle payment on admiffion, and the reit in amual payments; and if they fix thefe annual payments at a particular fum, the prelent fingle payment paid on admifion is found by lubtrading the value of the annual payment during the joint lives from the whole prefent value of the annuily in one pasment. Suppofe, for intance, the annual payments to be fixed at five guineas, the annuity to be \(s^{2}\) l. the rate of intereft four per cent, and the joint lives cach 40 ; the value of the amuity in one prefent fingle payment is 101.11. The value of five guineas or 5.25 per annum, is \((5.25\) mulliplied by 9.82 the value of the joint lives) 51.55 ; which, fubtracted from 101.1l. gives 49.5l. the anfwer.

If a fociety takes in all the marriages among perfons of a particular profelion within a given diftrict, and fubjects them for perpetuity to a certain equal and common tax or annual payment, in order to provide life annuitics for all the widows that ftall refult from thefe marriages; fince, at the commencement of fuch an efta. blifhment, all the oldeft, as well as the youngeft, marriages are to be intitled equally to the propoled beneft, a much greater number of annuitants will come immediately on it than would come on any finilar ellabilhment which limited itfelf in the admiffion of members to perfons not exceeding a given arre. 'This will check that accumulation of moncy which flould take place at firft, in order to produce an income equal to the difurfenents at the time when the mumber of anntitants comes to a maximum; and therefore will be a particular burden upon the eftablithment in its infancy. For this fome compenfation mull be provided; and the equitable method of providing it is, by levying fines at the begiming of the eftablilliment on cvery meinber ex-

\section*{}
swrivor- ceeding a given are, proportioned to the namber of nip. years whicla he has lived beyond that age. But if fuch fines camot be levied, and if every praynent mult be te equal and common, whatever dilparity there may be in the value of the expectations of difierent members, the tines muी be reduced to one common one, anlwering as nearly as pofir)le to the difadvantage, and payable by every member at the time when the eftablithmont berins. After this, the cffablifment will be the fane with one that takes upon it all at the time they marry; and the tax or annual payment of every member adequate to its fupport will be the annuat payinent during mariage due from perfons who marry at the mean age at which, upon an average, all mariages may be confidered as commencing. Thefines to be paid at firf are, for every particular member, the fame with the difference between the value of the expectation to him at his prefent ags, and what would have been its value to him lad the fohome begun at the time he mas. ried. Or, they are, for the whole body of members, the difference bstween the value of the common expectation, to perlions at the mean arre of all married perlons taken together as thay exit in the world, and to perfons at that age which is to be deemed their mean age when they marry.
rethind of nding the refert viare of an minity to - enjoyed \(r\) one life iter the piration ianother.

Suppofe we with to know the prefent value of an annuity to be enjuyed by one life, for what may happen to remain of it beyond another life, after a given term ; that is, provided both lives continue from the prelent time to the end of a given term of years; the method of calculating is this : Find the value of the ammity for two lives, greater by the given term of. years than the given lives; difcount this value for the given term; and then maltiply by the probability, that the two given lives thetl both continue the given term; and the product will be the anlwer. Thus, let the two lives be ench 30 , the iern leven years, the annuity 10 . intereit four per cent. The given lives, increafed by feren years, become each 37. The value of two joint lives, cach 37, is (by Table II.) 10.25. The vilue of a fingle life at 37 is (by the table under the article Assuity) 13.67 . The former fubiracted from the latter is \(3.4^{2}\), or the value of an amnuity for the life of a perfon 37 years of arre, after another of the fame age, as has been fhown above. 3.42 difcounted for feven years (that is, multiplied by 0.76 the value of 11. dae at the end of fewen years) is 2.6. The probability that a fingle life at 30 fhall contmue feven years is \(\frac{4}{3} \frac{0}{6}(B)\). The probability, therefore, that two fuch lives liall continue feven years, is \(\frac{2407}{34 \frac{7}{6}}\), or in decimals 0.765 ; and 2.6 multiplied by 0.765 is 1.989 , the number of years purchafe which ought to be given for an annuity
to be enjoyed by a life now \(3^{0}\) years of age, after a Surpiworlile of the fame age, provided both continue feven \(\underbrace{\text { Rlip. }}\) years. The annuity then being \(1 \geqslant 1\). its prefent value is 19.8 gl .

Suppofe the value is required of an anruity to be en. Methot of joyed tor what may happen to remain of one life after finding the another, provided the life in expectation continues a gi- annuity for ven time. 1. Tind the prefent value of the annuity for what may the remainder of the life in expectation after the given happen ty time, which is done in this manner: Multiply the pre-remain ot fent value of the life at the given time by the prefent une hife value of il. to be received at that time, and multiply ther, prothe product again by the probability that the life in ex-vided the pectation will continue fo long. Let the given time life in ex. which the life in expectation is to continue be 55 years, pectation and let the perfon then be arrived at 50 years ot age. angiven A life at fitty, according to M. de Moivre's valuation term. of lives, and reckoning interell at fuor per cent. is woth 1:.34 years purchafe. The prefent value of 11 . to be received at the end of 15 years, is 0.5553 , and the probability that a life at 35 will continut 15 years is \(\frac{48}{40}\). Thele three ralucs multiplied into one another give f.ftl, for the prelent value of the life in expectation. 2. Find the value of the reverfion, provided both lives continue the given time, by the rule given in parag. 5 th. 3. Add there values together, and the fum will be the anfwer in a fingle prefent payment. IVc fhall now illullrate this a ule by an example.

An annuty of 10 . for the life of a perfon now 30 , is to commence at the end of 1 I years, it another perlon now 40 fhould be then dead; or, if this thould not happen at the end of any year beyond 11 years in which the former thall happen to furvire the latter: What is the prefent value of fuch an annuity, reckoning interef at four per cent. and taking the probabilities of life as they are in Dr Halley's table, given in the article Mortality?

The value of rol. per anmum, for the remainder of the life of a perfon now 30 , afier 11 years is 69.431 . The probability that a perfon \(q \supset\) years of age fhall live 11 years, is, by Dr Halley's table \(\frac{3}{4} 3^{5}\). The probability, therefore, that he will die in Id years, is \(\frac{3}{4} \frac{3}{3} \frac{5}{3}\) fubtracted from unity (c) or \(\frac{1}{4} \frac{1}{3}\); which multiplied by 69.43. gives 17.161 . - Ihe value of the reverfion, provided both live it years, is \(3 \%\). and this value addel to the former, makies 34.161. the value required in as fingle prefent payment; which payment divided by \(11.43^{\text {l }}\) the value of two joint lives, aged 30 and 40 , with unity added, gives \(3^{1}\).; or the value required in annual payments during the joint lives, the firft payment to be made immediately.

Table
(B) The prohability that a given life fhall continue any number of years, or reach a given age, is (as is well known) the fraction, whofe numerator is the number of the living in any table of obfervations oppofite to the given age, and denominator, the number oppofite to the prefent age of the given life.
(c) For the difference between unity and the fraction expreffing the probability that an cvent will happen, gives the probability that it will not happen.

\section*{\(S \mathrm{U} R \quad\left[\begin{array}{lll}132\end{array}\right] \quad\) S U R}

Survivor- The values of joint lives in thefe tables have been hip. computed for only one rate of interett; and of fingle lives in Table Ill. for only two rates of intereft. The following rules will fhow, that it would be a needlefs labour to compute thele values (in ftrict conformity to the oblervations) for any other rates of intereft.

Account of a method of deducing, from the correct values (according to any obfervations) of any fingle or joint Lives at one rate of Inttreh, the fane values at other rates of Interef.

\section*{Prelininary Problems.}

Prob. I. The expectation given of a fingle life by any table of obfervations, to find its value, fuppofing the decrements of life equal, at any given rate of intereft.

Solution. Find the value of an annuity certain for a number of years equal to twice the expectation. Murltiply this value by the perpetuity increafed by unity, and divide the product by twice the expectation : The quotient fubtracted from the perpetuity will be the value required.

Example. The expectation of a male life aged 10 , by the Sweden obfervations, is 43.94 . Twice this expectation is 87.88 . The value of an annuity certain for 87.88 years is (reckoning iniereft at 4 per cent.) 24.200 . The product of 24.200 into 26 (the perpetuity increafed by unity) is 629.2 , which, divided by 87.88, gives 7.159. And this quotient fublracted from 25 (the perpctuity) gives 17.84 years purchafe, the value of a life aged ten, deduced from the expectation of life at that age, according to the Siveden obfervations. (See the 'Tables in Dr Price on Reverfions, vol. ii.).

Prob. II. Having the expectations given of any two lives by any table of oblervations, to deduce from thence the value of the joint lives at any rate of interelt, fuppofing an equal decrement of life.

Solution. Find the difference between twice the expectation of the youngeft life and twice the expectation of the oldeft life increafed by unity and twice the perpetuity. Multiply this difference by the value of an annu:ty certain for a time equal to twice the expectation of the oldeft life; and by twice the fame expefation divide the product, referving the quotient.

From twice the perpetuity fubtract the referved quotient, and multiply the remainder by the perpetuity increaled by unity. Tlis laft product divided by twice the expectation of the oungef life, and then fubtracted from the perpetuity, will be the required value.

When twice the expectation of the youngeft lifc is greater than twice the expectation of the oldef life increafed by unity and (wice the perpetuity, the referved quotient, inflead of being fubtracted from twice the perpetuity, mult be added to it, and the fum, not the difference, multiplied by the perpetuity increafed by unity.

Example. Let the joint lives propofed be a female life aged 10 , and a male life aged 15 ; and let the table of oblervations he the Sweden table for lives in general, and the rate of intereft 4 per cent. T'wice the expectations of the two lives are 90.14 and 83.28 .
Twice the expectation of the oldeft life, increafed by mity, and twice the perpetuity, is \(\mathbf{3} 3.28\), which leflened by 90.14 (twice the expertation of the youngeft life),
leaves 44.14 for the referved remainder. This remain- Survivorder multiplied by 24.045 (the value of an annuity certain for 83.28 years), and the product divided by 83.28 (twice the expectation of the oldeft life), gives \(\mathbf{1 2 . 7 4 4}\), the quotient to be referved; which fubtracted from double the perpetuity, and the remainder (or 37.255 ) multiplied by the perpetuity increafed by unity (or by 26) gives 968.630 , which divided by 90.14 (twice the expectation of the youngef life) and the quotient fubtracted from the perpetuity, we have 14.254 for the required value.

The value of an annuity certain, when the number of years is a whole number with a fraction added (as will be commonly the cafe) may be beft computed in the following manner. In this example the number of years is 83.28 . The value of an annuity certain for 83 years is 24.035 . The fame value for 84 years is 24.072 . The differenee between thefe two values is 0.37 ; which difference multiplied by .28 (the fractional part of the number of years), and the product (.0103) added to the leaft of the two values, will give 24.045 the value for 83.28 years.

Geveral Rule. Call the correct value (fuppofed to be computed for any rate of intereft) the frif value. Call the value deduced (by the preceding problems) from the expectations at the fame rate of intereff, the fecond value. Call the value deduced from the expectations for any other rate of interent the third value.

Then the difference between the firft and fecond values added to or fubtracted from the third value, juft as the firtt is greater or lefs than the fecond, will be the value at the rate of intereft for which the third value has been deduced from the expectations.

The following examples will make this perfectly plain.
Example I. In the two laft tables the correet valucs are given of two joint lives among mankind at large, without diffinguifhing between males and females, according to the Sweden obfervations, reckoning intereft at 4 per cent. Let it be required to find from thefe values the values at 3 per cent. and let the ages of the joint lives be fuppofed 10 and 10 .

The correct value by Table IV. (reckening intereft at 4 per cent.) is 16.141 . The expectation of a life aged 10 is 45.07 . The value deduccd from this expectation at 4 per cent. by Prob. II. is 14.539 . The value deduced by the fame problem from the fame expectation at 3 per cent. is 16.808 . The difference between the firlt and fecond values is 1.602 , which, added to the third value (the firf being greater than the fecord), makes 18.4 10, the value required.

Example II. Let the value be required of a fingle maite life aged 10 , at 3 per cent. interent, frons the correct value at 4 per cent. according to the Siveden otfervations.

Firft, or correct value at 4 per cent. (by Table III.) is 18.674 . The expectation of a male life aged 10 is 43.94 .

The fecond value (or the value deduced from this ex. pectation by Prob. I.) is 17.838 .

The third value (or the value deduced from the fame expectation at 3 per cent.) is 21.277 .

The difference between the firt and fecond is .836 ; which (fince the firft is greater than the fecond) mult be added to the third; and the fum (that is, 22.113) will be the value required.

\section*{\(S\) U R}
rvivor- The thind value at 5 per cent, is 15.296 ; and the fuip, difference added to 15.286 makes 16.122 the value of iurya. a male life aged 10 at 5 per cent. according to the

Sweden obfervations. The exact value at 5 per cent. is (by Table 111.) 16.014.

Again: The difierence between 16.014 (the correct value at 5 per cent.), and 15.286 (the value at the fame interelt deduced from the expectation), is .728; which, added (becaufe the firit value is greater than the fecond) to 13.335 (the value deduced at 6 per cent. from the expectation) gives 14.063 , the value of the fame life, reckoning intereft at 6 per cent.

Thefe deductions, in the cale of fingle lives particularly, are fo eafy, and give the ture values fo nearly, that it will be fcarcely ever neceffary to calculate the exact values (according to any given obfervations) for more than one rate of intereft.

If, for inftance, the correct values arc computed at 4 per cent. according to any oblervations, the values at 3 , \(3^{\frac{x}{2}}, 4^{\frac{3}{4}}, 5,6,7\), or 8 per cent. may be deduced from them by the preceding rules as occafion may require, without much labour or any danger of confiderable errors. The values thes deduced will feldom differ from the true values fo much as a tenth of a year's purchafe. They will not generally differ more than a 20 th or 30 th of a year's purchafe. In joint lives they will differ lefs than in fingle lives, and they will come equally near to one another whatever the rates of intereft are.

The preceding tables furnih the means of determining the exact differences between the values of annuities, as they are made to depend on the furvivorllip of any malc or female lives; which hitherto has been a defideratum of confiderable confequence in the doctrine of life-annuities. What has made this of confequence is chiefly the multitude of focieties lately eftablifhed in this and foreign countries for providing annuities for widows. The general rule for calculating from thefe tables the value of fuch annuities is the following.

Rule. "Find in Table III. the value of a female life at the age of the wife. From this value fubtract the value in Table IV. of the joint continuance of two lives at the ages of the hurband and wife. The remainder will be the value in a fingle prefent payment of an annuity for the life of the wife, mould the be left a widow. And this laft value divided by the value of the joint lives increafed by unity, will be the value of the fame annuity in annual payments during the joint lives, and to commence immediately."
E.xample. Let the age of the wife be 24 , and of the hufband 30. The value in Table Ill. (reckoning intereft at 4 per cent.) of a female life aged 24 , is 17.252 . The value in Taole IV. of two joint lives aged 24 and 30 , is 13.455 , which fubtracted from 17.252 leaves 3.797 , the value in a fingle prefent payment of an annuity of Il. for the life of the wife after the hufband ; that is, for the life of the widow. The annuity, therefore, being fuppofed 20l. its value in a lingle payment is 20 multiplied by 3.797 , that is, 75.941 . And this laft value divided by 14.455 (that is, by the value of the joint lives increafed by unity), gives 5.25 , the value in annual payments beginning immediately, and to be continued during the joint lives of an annuity of 201 . to a wife aged 24 for her life, after her hutband aged 30 .

SURTA, the orb of the fun perfonified and adored
by a feet of Hindoos as a god. He feems to be the fame divinity with the Phobus of Greece and Rome; and the fect who pay him particular adoration are called Sauras. Their poets and painters defcribe his car as drawn by feven green horfes, preceded by \(\Lambda\) run, or the Dawn, who acts as his charioteer, and followed by thoufands of genii worfhipping him and modulating his praifes. He has a multitude of names, and among them twelve epithets or titles, which denote his diftinct powers in cach of the twelve months; and he is be-fearches lieved to have defcended frequently from his car in a vol. i. p. human lhape, and to have left a race on earth, who are 262 and equally renowned in the Indian ftorics with the Heliadai \({ }^{263}\) of Greece: it is very fingular, that his two fons called Afwinau or Afwinicumarau, in the dual, fhould be confidered as twin-brothers, and painted like Caflor and Pollux; but they have each the character of Efculapius among the gods, and are believed to have been born of a nymph, who, in the form of a mare, was impreg. nated with funbeams.

SUS, the Hoc, a genus of quadrupeds belonging to the clafs of mammalia and order of bellure. See Mammalia Index.

SUSA, the ancient royal refidence of the kings of Perfia, built by Darius Hyltafpis, according to Pliny; though he probably only reftored it, being a very ancient city, founded by Tithonus father of Memnon. It was in compals 120 ftadia, of an oblong quadrangular form, with a citadel called Memnoneum. In fcripture it is called Sufan, the royal citadel, from the great number of lilies growing in that diftrict (Athenæus); fituated on the river Uhlai, or Eulkeus (Daniel) : and the Spaniards call at this day a lily afufena (Pinedo). Sufa was the winter, as Ecbatana was the fummer, refidence of the kings of Perfia, (Xenophon, Strabo, Pletarch). Here the kings kept their treafure, (Herodotus). Now called Tufer.
- SUSPENSION, in Scots Law. See Lav, No clexxy. 5, 6, and 7 .

SUSSEX, a county of England, deriving its name from its fituation in refpect of the other Saxons, and called Suffex, i. e. the country of the South Saxons, has Hamplhire on the weft, the Britih chanuel on the fouth, Surry on the north, and Kent on the eaft. Its length is 65 miles, its breadth 30 , and its circumfer. ence 170 . It is divided into 6 rapes, and thefe into 65 hundreds, in which are \(34^{2}\) parifhes, of which 123 Gougio's are vicarages, one city, 16 market-towns, \(1,140,000\) edition of acres, and about 159,3 I I Touls. It has few good ports, Camitn's though it lies along the channel for 65 miles, which is its greateft length, the coalt being encumbered in many places with rocks; and where it is more open, fuch quantities of fand are thrown upon it by the fouth-went winds, and the harbours fo choked up, that they will not admit veffels of any great draught or burden. The county is well watered by the rivers Arun, Adar, Oufe, Rother, Lavant, Cuckmeer, Afhburn, and Aften, by which it is well fupplied with filh, as well as from the fea. Hence different places of the county are famed. for different forts of fih, as the Arun for mallets, which enter it from the fea in fummer in fhoals, and by feeding upon a particular kind of herb become extremely delicious: Chichelter for lobiters, Selfey for cockles, Arrberley for trout, Pulborough for eels, Rye for herring

Stryaz
Suffer.

\section*{\(S\) U R \([13!] \quad\) S U T}
and the county in general for carp. It is remarkable, that all the rivers above mentioned rife and fall into the fea within the county.

The air, as well as the foil, is various in different parts of the county. Upon the coant the air is aguifh, upon the hills and downs pleafant and wholefome; hut fomewhat moift and foggy in the valleys, the foil being deep and rich, and the vegetation in fummer very vigorous. The downs in fome places are very fetile in corn and grafs; in others they feed great flocks of theep, whofe fleth and wool are very fine; but of the latter no incoafiderable quantity is clandeftinely exported to France. In the Weald and the valleys the roads are very deep, efpecially in winter. In the north quarter are many woods, and fome forefts in other places; whence the king's yards are fupplied with the largeft and beft timber in England, befide what is made into charcoal and confumed in the iron-works; for on the ealt fide is plenty of iron ore, with furnaces, forges, and mills for manufacturing it. The gunpowder of this county is faid to excel that of any other. Thofe delicious birds called wheat-ears are bred in this fthire; they are not bigger than a lark, but very fat. That part now called the Wild or Weald of Suffex, was anciently a mere defert for hogs and deer, of great extent, taking in a part of Kent and Surry ; and was called Anderida Silva, Coid Andred, and Andradfwald, from Anderida an adjoining city. This county is in the home circuit and diocefe of Chichefter, giving title of earl to the family of Yelverton, and fends 28 members to parliament, viz. two for the county, two for the city of Chichefter, and two for each of the following lowns, Horfham, Lewes, Bramber, Eaft-Grinftead, Midhurf, Shoreham, Staining, Arundel, Haftings, Rye, Winchelfea, and Seaford; of which the four lait are cinque ports.

SUTHERLAND, one of the moft northerly counties of Scotland, bordering on Caithnefs to the eaf, and bounded by the ocean on the north, the country of Affynt on the well, Refs fhire on the fouth, and by the German fea on the fouth-eaft. It fretclies about 70 miles in length, and 40 in breadth; is generally hilly, though in many parts arable; well watered with fmall livers and ftreams replete with fifh, and containing about 60 lakes, the habitation of various fifh, fwans, ducks, geefe, \&c. One of the largeft of thefe is Lochhin, extending 18 miles in length. Some of them are interfperfed with fmall verdant iflands, which in fummer yield a very agreeable profpect. On the coaft are many commodious harbours, and all the bays fyarm with filh. Sutherland affords iron-ftone, freeflone, limeftone, marble and flate, in abundance. Turf and peat are the common fuel. Lead ore, and fome copper ore have been met with in fome parts of the county.

The air is fo temporate, and the foil fo good, that faffron has here been brought to perfection. Many parts of the country are remarkably fruitful in corn, and the pafturage is everywhere excellent. Deer and forre other grame ate abundant in Sutherland. On the hills are fed mumerous flocks of ficep and black cattle. The northern part, called Strathnaver, and feparated from the relt by a ridge of mountains, is bounded on the north by the Deucaledonian fea, on the wefl by the chamuel called the Minch, on the eaft by Caithnefs, and on the fouth by Alfynt. The length from eaft to wcit, is \(3 t\) miles; but the breadeh from norts to fouth does
not exceed I 2 in fome placer. It is very hilly; and the Sutherlat. mountains are fo high, that the fnow remains on the tops of them till midfummer. It is watered by the Naver, from whence it derives its name : this diftrict gives a title to the eldeft fon of the eari of Sutherland. Strathnaver has many freiln-water lakes or lochs; the chief of which are Loch Naver and Loch Lyel: there are fereral illands on the northern coait. In varicus parts of the country there are monuments of victories obtained over the Dares or other foreign invaders. The inhabitants are hardy, bold, and enterprifing; courteous to ftrangers; cheerful, open, fiugal, and induftious. The falmon-filiery in this county is confiderable, as well as the trade in black cattle, Meep, and horfes, at the neighbouring fairs; corn, barley, falmon, butter, cheefe, wool, hides, and tallow, are exported. Domoch is the capital of the county. The population of Sutherland in 1801 amounted to 23,000 . The following table Mews the population at two different periods *.
\begin{tabular}{|c|c|c|}
\hline Parijues. & Population in 1755. & Population in x . 1790-1-9S. \\

SUTLER, in Har, one who follows the army, and furnihes the troops with provifion. Sutlers pitch their tents, or build their huts, in the rear of each regiment, and about head-quarters.

SUTRIUM, in Ancient Geosraphy, a famous city, and an ancient colony of the Romans, the key of Etruria; founded ahout leven ycars after the taking of Ronse by the Gauls (Velleius). Now Sutri in St Peter's patrimony, on the siver Pozzolo; furrounded on every fide with rocks, 24 miles to the north-weft of Rome.

SUTTON, Samuer, was born at Alfreton in Derbyhire, and going into the army ferved under the duke of Marlborough in Queen Anne's wars with great credit. He afterwards came to London, commenced brewer, and kept a coffee houfe in Alderfgate-ftreet, which was well frequented by the learned men of that time, by whom Mr . Sutton was much refpected, as a man of flrong natural parts and uncultivated genius. \(\Lambda\) bout the year 1740 he fohemed a very fimple and natural method for extracting the foul air from the wells of hips, by pipes communicating with the fire-places of the coppers; which operated as long us any fire was kept burning for the ftip's ufe. He took out a patent in 1744 , to fecure the profits of his invention; and died about the year 1752.

SW A MMERIDAM, Joun, a celebrated and learned natural philofopher, was the fon of John James Swammerdam, an apothecary and fimous naturalif of Amfterdam, and was born in 1637 . His father intended him for the church, and with this view had him influcted in Latin and Greek; but he, thinking himfelf unequal to fo important a tak, prevailed with his father to confent to his applying himfelf to phyfic. As he was kept at home till he fhould be properly qualified to engage in that fudy, he was frequently employed in cleaning his father's curiofities, and putting every thing in its proper place. 'This infpired our author with an early tafte for natural hiftory; fo that, not content with the furvey of the curiofities which his father had purchafed, he foon began to make a collection of his own, which he compared with the accounts given of them by the beft writers. When grown up, he ferioufly attended to his anatomical and medical fudies; yet fpent part of the day and the night in difcovering, catching, and examining the flying infects proper to thofe times, not only in the province of Holland, but in thofe of Guelderland and Utrecht. Thus initiated in natural hiftory, he went 10 the univerfity of Leyden in 1651 ; and in 1653 was admitted a candidate of phyfic in that univerfity, His attention being now engaged by anatomy, he began to confider how the parts of the body, prepared by diffec. tion, could be preferved, and kept in conftant order for anatomical demonftration; and herein he fucceeded, as he had done before in his nice contrivances for diffecting and managing the minutert infects. Our author afterwards made a journcy into France, where he fpent fome time at Saumur, and where he became acquainted with feveral learned men. In 1667 he returned to Leyden, and took his degree, of Doctor of Phyfic. The next year the grand duke of Tufcany being in Holland in order 10 fee the curiofilies of the country, came to view thofe of our author and his father; and on this occafion Swammerdam made fome anatomical diffections of infects in the prefence of that prince, who was ftruck with admiration at our author's great fkill in managing them, efpecially at his proving that the future buttertly lay with all its parts neatly folded up in a caterpillar, by actually removing the integuments that covered the former, and extricating and exhibiting all its parts, how-
ever minute, with incradible ingenuity, by means of in- swammerflruments of inconceivable finenefs. On this occafion the duke offered our author 12,000 floims for lis thare of the colliction, on condition of his removing them himfelf into 'lufcany, and coming to live at the count of Flurence; but Swammerdam, who hated a court life, declined his highnefs's propofal. In 1663, he publifhed a Gencral Hiftory of Infects. About this time, bis father began to take offence at his inconfiderately neglecting the practice of phyfic, which might have fupported hin in affuence; and would weither fupply him with money nor clothes. This reduced him to fome dificulties. In 1675 lie publifued his Hiftory of the Ephemeras; and lis father dying the fame year, left him a fortune fufficient for his Gupport; but le did not long furvive him, for he died in 1682 . Gaubius gave a tranf lation of all his works from the original Dutch into Latin, from which they ware tranhated into Englifh, in folio, in \(175^{8}\). The celebrated Bocrhave wrote his life.

SWEATING SICKNESS, a diforder which appeared in England about the year 1481 , and was by foreigners called the Englifb fweat. See Medicine, \(\mathrm{N}^{\circ} 51\).

SWEDEN, the finalleft of the northern fates of Eu-situation rope, occupies the greater part of the north-weftern cor-and extentner of that portion of the globe, lying between Norway and the gulf of Bothnia. Before the treaty concluded in 1809 , between Sweden and Ruflia, the Swedifh territory extended over a confiderable tract of country on the eaft of the gulf of Bothria; but by that treaty, the whole of thefe provinces were ceded to Ruflia. At prefent the boundaries of Sweden are, Norway and Lapland to the nortb; to the weft Norway, from which it is feparated by the mountains; the Baltic to the fouth; and to the ealt the gulf of Buthnia, the fea of Aland, and the rivers of Tornea and Muonio, which feparate it from the Ruffian empite. From north to fouth it lies between the latitudes of \(69^{\circ} 30^{\prime}\) and \(55^{\circ} 20^{\prime}\); and it extends from the 12 th degree to about the 24 th degree of longitude eaft from Greenwich. Formerly its extent in Britih miles was computed at 1150 in length, and 600 in breadth, and its area at about 210,000 fquare miles. Its length continues undiminifhed; but its breadth is probably leffened at leat one half, and we can farcely eftimate its prefent extent at more than 110,000 fquare miles. The following table will thew the prefent divifions of the Swedifh territories.

3
Face of

The only colonial territory belonging to Sweden is the ifland of St Bartholomew, in the Weft Indies.

Sweden is diverfified in a moft picturefque manner, with extenfive lakes, large rivers, winding ftreams, cataraets, gloomy forefts, fertile vales, Aupendous rocks, and cultivated fields. It poffeffes more navigable rivers than the neighbouring countries of Norway and Denmark.
Sweden is by no means remarkable for the fertility of its foil, moft of the country being rock \(y\) and unproductive. The valleys and the banks of the rivers afford the beft land for tillage.

The principal mountains belonging to Sweden are thofe of the elevated chain which divides it from Norway, and which branch off in a fouth-eafterly direction. One of the highef of thefe is Swucku.
The chief rivers are the Gotha connecting Lake Wener with the Categat ; the Motala, forming the outlet of Lake Weter; the Dahl rifing in the Norwegian mountains, and flowing through Dalecarlia into the gulf of Bothnia, and the Tornea forming the north-eaftern boundary, and emptying itfelf into the gulf of Bothnia at the town of the fame name.

There are feveral confiderable lakes in Sweden, chiefly in the province of Sweden Proper. The moft re-
markable are Wener, Weter, and Maela, on the banks of which laft flands the city of Stockholm.

Sweden abounds with forefts, efpecially in Dalecarlia, Forefts. and on the borders of the lakes.

9
The climate and feafons of Sweden nearly refemble Climate thofe of the fame latitudes in Ruffia. The winters are and feafen in mof places extremely fevere, and the fummers fhort and fudden. The gulf of Bothnia is generally frozen over during winter, fo as to admit of travellers pafing over into Finland, and Eaft Bothnia. The fummer, though fhort, is generally hot, and feldom cloudy or inconfant. In the higher latitudes the fun of courfe is feen in the middle of fummer for feveral days together, and the nights of winter are proportionably long. See Lapland.

Much of the natural hiftory of Sweden has been al- Natural ready given under the article lafland. In the morehifory. fouthern provinces there are found in the forefts the bear, lynx, wolf, beaver, otter, glutton, and flying fquirrel. The Swedifh horfes are commonly fmall, but fpirited, and are confidered as fuperior to thofe of Germany for cavalry. The cattle and cheep prefent little remarkable, being fimilar to thofe of the neighbouring nations. Seals are found in the gulf of Bothnia; and the lakes and rivers of Sweden produce pikes that are remarkably large, and which are falled and pickled for exportation. The
(A) That diftrict of Germany, called Swedifb Pomerania, was long in poffeffion of the Swedifh monarchs; till, in the contefts with France and Ruflia, it was taken poffeffion of by the former. By the late treaty (in 18:の) between France and Sweden, Pomcrania has been reflored to its old mafter.

The map of Sweden is attached to that of Denmark and Norway, in Plate CLXX.
jweden. The forefts produce a great variely of game, cfpecially the large black cock, called in Scotland the cock of the foreft. Among the reptiles the rana bombina, and the coluber cherfen, are confidered as almon peculiar to Sweden.

The principal vegetable productions of Sweden are its immenfe forefts of pine and fir trees, though the country is not deflitute of a great variety of fhrubs and plants common to it with Denmark and liuffia.

The principal riches of the natural hillory of Sweden are tu be found in the mineral kingdom. It produces cryftals, amethyfts, topazes, porphyry, lapis lazuli, agate, cornelian, marble, and other follils. The chief wealth of the country, however, ariles from her mines of filver, copper, lead, and iron. The laft mentioned metal employs not fewer than 450 forges, hammering. mills, and fmelting houfes. A kind of a gold mine has likewife been difcovered in Sweden, but lo inconfiderable, that from the year 174 I to 1747 , it produced only 2398 ducats, each valued at 9 s. 4 d. Aterling. 'The firf gallery of one filver mine is 100 fathoms below the furface of the earth; the roof is fupported by prodigious oaken beams, and from thence the miners defcend about 40 fathoms to the lowent rein. This mine is faid to produce 20,000 crowns a year. The product of the copper mines is uncertain; but the whole is loaded with vaft taxes and reductions to the government, which has no other refources for the exigencies of the flate. Thofe fubterraneons manfions are aftonithingly fpacious, and at the fame time commodious for their inhabitants, fo that they feem to form a hidden world. 'The waterfalls in Sweden afford excellent conveniency for turning mills for forges; and for fome years the exports of iron from Sweden brought in 300,0001 . Alerling.

There are likewife in Stweden fome filver mines, of which that of Sahlberg is the richeft, as well as the moit ancient. It exifted fo early as 1188 , and during the whole of the \(14^{\text {th }}\) century, it yielded 24,000 marks of filver per annum. Jn the 15 th century the quantity was diminifhed to 20,000 . In the reign of Charles X. it gave only 2,000 ; and it furnifhes at prefent fill lefs, the ore yielding only one ounce of pure metal per quintal. The chief gallery, where the purelt filver was obtained, having fallen in, is not yet cleared, notwithtanding their inceffant labour. They are allo digging pits in a perpendicular direction, in order to arrive at the principal vein, which extends itfelf from the north to the fouth-eaft. Formerly lead employed in feparating the metal was imported from England; but the mine furnifhes at prefent a fufficient quantity for the purpofe. The moft remarkable mineral waters in Sweden are thofe of Medewi in Eaft Gothland.

The early hiftory of Sweden is not lefs involved in fable than that of moft other nations. Some hiftorians have pretended to give regular catalogues of the princes who reigned in Sweden in very carly times; but they differ fo much that no credit can be given to them. All indeed agree that ancient Scandinavia was firlt governed by judges elected for a certain timc by the voice of the people. Among thele temporary princes the country was divided, until, in the year of the world 2054 , according to fome, or \(193^{1}\), according to others, Eric, or, if we believe Pufiendorf, Sueno, was raifed to the fupreme power, with the prerogatives of all the temporary

Vol. XX. Part I.
magiftrates united in his perfon for life, or until his con- Sweden. duet fhould merit depofition.

From this very early period till the year 1366 of the An. \({ }_{3} 66\). Chrifian era, the hillories of Sweden prefent us with nothing but what is common to all nations in their carly periods, viz. the endlefs combats of barbarians, tending to no other purpofe than the effufion of blood. At the time juft mentioncd, however, Albert of Mecklen-Albert of burg, having concluded a peace between Sweden and MecklenDenmark, which had been at violent war for fome time burg debefore, was proclaimed king of Sweden. The peace clared king. was of thort duration, being broken in 1368 ; on which Albert entered into an oflenfive and defenfive league with the earl of Holftein, the Jutland nobility, the dukes of Slefwick, Mecklenburg, and the Hanfe towns, againt the kings of Denmark and Norway. Albert proved War with very fuccefsful againft Waldemar king of Denmark at Dermark that time, driving him entirely out of his dominions; and Norbut he himfelf was defeated by the king of Norway, way. who laid fiege to his capital. Soon after this, a new treaty was concluded, by which Albert was allowed to enjoy the crown of Sweden in peace. Having formed a defign however of rendering himfelf abfolute, he fo difpleafed his fubjects that Margaret of Norway was pro- 14 claimed queen of Sweden by the malecontents. \(\Lambda\) war Is defeated immediately enfued, in which Albert was defeated and and taken taken prifoner; but as the princes of Mecklenburg, the prifoner by earls of Holfein, and the Hanfe-towns, entered into a of Norwaret league in his favour, the war raged with more fury than of Norway. ever.

At length, in \(\mathbf{1} 394\), the contending parties were re-set at \({ }^{15}\) liconciled. Albert was fet at liberty, on condition that berty. he fhould in three years give up to Margaret all pre-An. \(\left.\begin{array}{l}\text { I } \\ 3\end{array}\right)\). tenfions to the city of Stockholm; and the Hanfetowns engaged to pay the fum of 60,000 marks of filver if Albert fhould break that treaty. Not long after this, Eric the fon of Albert died; and he, having no other child, did not think it worth his while to contend for the kingdom of Sweden : he therefore acquiefced in the pretenfions of Margaret, and paffed the remainder of his days at Mecklenburg.

Margaret died in 1415 , and was fucceeded by Eric Margaret of Pomerania. This prince's reign was cruel and op-isfucceeded prefive. The confequence of this was a revolt ; and by Eric, a Charles Canutfon, grand marefchal of Sweden and go-rant. vernor of Finland, having joined the malecontents, was An. i4rs. declared commander in chief of their army. Eric was now formally depofed: Canitfon was cliofen regent; but beginning to opprefs the people, and afpiring openly to the crown, the Swedes and Danes revolted; in confequence of which a revolution took place, and Chirftopher duke of Bavaria, nephew to Eric, was chofen king of Denmark, Sweden, and Norway, in 1442.

On the acceflion of the new prince, complaints againft Charles Canutfon were brought from all quarters; but, through Canutfon. the intereft of his friends, he efeaped punifment; and An. \(144^{8 .}\) in \(144^{8}\), Chriftopher laving died after a tyrannical reign of about five years, he was raifed to the throne to which he had fo lons alpired. The kingdoms of Denmark and Norway however refufed allegiance to him; on which a war immediately commenced. In I 454 peace was conciuded, and Denmark for the prefent freed from the Swedifh yoke. Nor did Canutfon long enjoy even the crown of Sweden. Having quarrelled with

\section*{S W E [ I33 ] S W E}
sweden. magiffates and the archbiniop of \(\mathrm{U}_{\mathrm{p}}\) fal, the latter formed fuch a tlrong party that the king could not refil him. Canutfon died in 1475 after a lang and turbulent reign. An. 15:0. The Swedihalfairs continued to be involved in dreadful confufion till the year \(1 ; 20\), when a great revolution was effected by Gultavus Eicion, a nobleman of the fill ralk, who reflored the lingdom to its liberty, and
18
Chrifterm
king of Qenmark
iuvades
Sweden,
but is de-
feated and driven out. laid the foundation of its future grandeur. The oecafron of this great revolution was as fullous: \(\ln 1518\), Chrillienking of Denmatk invaded Sweden, with a defign to fubdue the whole country; but being defeated with great lofs by young Sicen Sture, at that time regent, lue fet fail for Denmark. But meeting with contrary winds, he made feveral defcents on the Swedilh coalt, which he ravaged with all the fury of an incenfed barbarian. The inhabitants, however, bravely defended themfelves, and Chriftiern was reduced to the utmoft dillrels; one half of his forces having perifhed with hunger, and the relt being in the moft imminent danger by the approach of a rigorous winter. He then thought of a Itratagem, which had almoll proved fatal to the regent; for having invited him to a conference, at which he defigned either to alfanmate or take him prifoner, Sture was about to comply, had not the fenate, who fufpeeted the plot, interpoled and prevented him. Chrittiern then offered to go in perfon to Stochholm in order to confer with Sture, on condition that fix hoftages fliould be fent in his room. This was accordingly dane; but the wind happening then to prove favour-
19 Hetreache-whom Guilavus Ericfon was onc. Next year he rerouly car- turned; and having drawn Sture into an ambuth, the rics of fix hoitzages, of whom Guf tavus Eric. for is one. An. 1519. regent received a wound of which he died fome time after. The kingdom being thus left without a head, matters foon came to the moll defperate crifis. The army ditbanded itfelf; and the fenate, inftead of taking proper meafures to oppofe the enemy, fpent their time in idle debates. Cliritiern in the mean time advanced into the heart of the kingdom, deflroying every thing with fire and fioord; but on his arrival at Stragnez, he

20
If: chofen
king, and proves a mett bloody event: granted a fufpenfion of arms, on condition that they weuld elect him king. This they accordingly did; and Chiltiern proved one of the moft bloooy tyrants that ever fat on the throne of any kingdom. Immediately after his coronation, he gave grand entertamments for three days; during which time he projected the diabolical delign of extirpating at once all the Swedint nobility, and thus for ever preventing the people from revolting, by depriving them of their proper leaders. As the tyrant had figned articles, by which he promifed indemnity to all who had borne arms againt him, it became neceffary to invent fome caufe of offence agaiuft thofe whom he intended to deltroy. To accomplih his purpofe, Gullavus 'Trolle, formerly archbillop of Upfal, but itho had been degraded fiom that dignity, in an oration before his majefty lamented the demolition of Stectia, his place of refidence, and the loffes fultained by the lee of Uphal, amounting to near a million of money. He then proceeded in a bitter accufation agninlt the nichow and the fon-in-law of Sture the late regent, comprehending in the fame accufation about 15 of the principal mobility, the whole fenate, and the burghers of Stockholm. In confequence of this, about 6o of the principal nolility and people of frrt rank in Sweden were hanged as trators. Innumerable other crucltics
were committed ; part of which are owned by the Danifl hitorians, and minutely related by thole of Sweden. At latt he departed for Denmark, ordering gibbets to be erected, and cauling the pealants to te hanged on them for the flighteft offences.
the notili-
1y, and
This monftrous crnclty, inflead of fecuring him on the caufes gitthrune, exafperated the whule nation againlt him. It has already been mentioned, that Gulavus Eriction, or erecterlas as he is commonly called, Guflavus Vafa, was among along. the number of the hutages whom Chritiern had perfidioully carried to Denmark in 1519 . Large promifes sdventures had been made in order to reconcile him to Chriltiern, of Gultarm had been made in order to reconcile him to Chrittiern, Vafa or and all means had been employed, but in vain. Secret Ericfon. orders were given to ftrangle him in prifon; but the officer to whom the affanation was committed remonfrated to the king about the condequences of it, and prevailed on him to change the fentence of death into clofe conffuement in the caftle of Copenhagen. Some of the holtages perihed in confequence of the rigorous treatment they met with; but Guftavus withftood all hardhips. At latt one Banner, a Danimh nobleman, prevailed on the king to put lim into his hands, in order to try whether or not be could prevail on him to change his fentiments. The king, however, told Banner, that he muft pay 6000 crowns if the prifuner flould make his efcape. Banner generoully confented; and having brought the noble ptifoner to his fortrefs of Calo in Jutland, foon allowed him all the liberly lic could defire, and otherwife heaped favours on him. All this, however, could not extinguith his remembrance of the cruelties of Chriftiern, and the defire he lad of being ferviceable to his country. He thercfore determined to He effapes make his elcape ; and the liberty he enjoyed foon put from Denhim in a capacity of effecting it. Having one day mark. mounted his horfe, under preience of hunting as ufual in the forth, when he got at a proper dillance, he changed his drefs to the habit of a peafant : and quitting his horfe, travelled for two days on foot through by-pathe, and over mountains almoft impaffable, arrivirg on the third at Flenfough. Here no one was admitted without a paffpost: and Gultavus dreaded prefenting himfelf to the governor or the chicer on guard, for fear of being difcovered. Guftavus hired himfelf to a cattle merchant; and in this difguife efcaped out of the Da-Arrives at nifh territories, and arrived at Lubec.

Banner was no fooner acquainted with his efcare, than he fet out after him with the utmof diligence, found him at Iubec, and reproached him with great warmth as ungrateful and treacherous; but he was foon appeafed by the arguments urged by Gufavus, and elpecially by a promife of indemnifying him in the lofs of his ranfom. On this Banner retumed, giving out that he could not find his prifoner. Chriftiern was en. raged at his efcape, appreliending that he might reverfe all his defigns in Sweden; and gave orders to Otho his general to make the ftricteft fearch, and leave no means untried to arreft him. Gullavus applied to the regency for a hip to convey him to Sweden, where lie hoped the flould be able to form a party againft the Danes. He Attempts likewife endeavoured to draw the regency of Iubec in- in wain to to his meafures; and reafoned with fo much zeal and ability, that Nicliolas Gemins, firit conful, was entirely reqency of gaind ; but the regency could never be prevailed on to to hus fle declare for a party without friends, arms, money, or credit. Before his departure, horrever, the conful gave

\section*{S it E [ I 39 ] S W E}
sweden. him affurances, that if he could raife a force fufficient to make head againft the enemy in the field, he might depend on the lervices of the republic, and that the regency would immediately declare for him. Guftavus defired to be landed at Stockholm; but the captain of the hip, either having fecret orders to the contrary, or bufinefs elfewhere, fleered a different courfe, and put him on fhore near Calmar; a city then garrifoned by the troops of Chrillina widow of the regent. In fact, the governor held this place for his own purpofes, and only waited to make the bef terms he could with the Danes. When Guftarus arrived, he made himfelf known to him and the principal officers of the garrifon, who were moltly Germans, and his fellow-foldiers in the late adminittrator's army ; but the mercenary band, feeing him without troops and without attendants, regarded him as a defperate perfon devoted to deffruction, refufed to embrace his propofals, and even threatened to kill or betray him, if he did not inftantly quit the city.

Difappointed in his expectations, Guftavus departed ; and his arrival being now publicly known, he was again forced to have secourfe to his peafant's difguife to conceal him from the Danith emiffaries difperled over the country to fearch for him. In a waggon loaded with hay he paffed through the Danifh ariny, and at laft repaired to an old family caftle in Sudermania. Hence he wrote to his friends, intimating his return to Sweden, and befeeching them to affemble all their forces in order to break through the enemy's army into Stockholm, at that time befreged ; but they refufed to embark in fo hazardous and defperate an attempt.

Guftavus next applied himfelf to the pearants; but they anfwered, that they enjoyed falt and herrings under the goverument of the king of Denmark; and that any attempts to bring about a revolution would be attended with certain ruin, without the profpect of bettering their condition; for peafants they were, and peafants they thould remain, whoever wasking. At length, after feveral attempts to throw himfelf into Stockholm, after that city was furrendered to the king, after the horrid maflacre of the fenate, and after rumning a thoufand dangers, and undergoing hardfhips and fatigues fcarcely to be fupported by human nature, he formed the refolution of irying thic courage and affection of the Dalecarlians. While he was in the decpet obfcurity, and plunged in almolt infurmountable adverfity, he never relinquified his defigns nor his hopes. The news of the maffacre had, however, nearly funk him into defpondency, as by it he loft all his friends, relations, and connections, and indeed almof every profpect of fafety to himfelf or deliverance to his country. This fuggefted the thought of going to Dalecarlia, where he might live with more fecurity in the high mountains ard thick woods of that country, if he fhould fail in the attempt of exciting the inhabitants to revolt.

Attended hy a peafant, to whom he was known, he travelled in difguife through Sudermania, Nericia, and Weitermania, and, after a laborious and painful journey, arrived in the mountains of Dalecarlia. Scarcely had he finilhed his journey, when he found himfelf deferted by his companion and guide, who carried off with him all the money which he had provided for his fubfitence. Thus forlorn and deftitute, he entered
among the miners, without relinquining his hopes Sweden. of one day afcending the thione of Sweden. His whole object for the prefent was to live concealed, and gain a maintenance, till fortune fhould effect fomething in his favour : nor was it long before this happened. A. wo- Is dicover m.an in the mines perceived, under the habit of a pea-cil and ru. fant, that the collar of his thirt was embroidered. 'This licwed. circumftance excited curiofity; and the graces of his perfon and converfation, which had fomething in thens to attract the notice of the meanell of the vulgar, affoided room for fufpicion that he was fome perfon of quality in difguife, forced by the tyramy of the government to feck thelter in thefe romote parts. The itory came to the ears of a neighbouting gentleman, who immediately went to the mines to offer his protection to the unfortunate franger; and was aftoniftied on recog. nizing the features of Gultavus, to whom he had been known at the univerfity of Upfal. Touched with compaffion at the deplorable fituation of fo difinguihed a nobleman, he could fcarcely refrain from tears. At night be fent for Guftavus, made him an offer of his houfe, and gave him the ftoongeft affurances of his friendihip and protection. He told him, he would there mect with better accommodations, and as much fecurity as in the mines; and that, fhould he chance to be difcovered, he would, with all his friends and vaffals, take arms in his defence.

This offer was embraced by Guftavus wilh joy, and he remained for fome time at his friend's houfe; but finding it impoffible to induce him to take part in his defigns, he quitted him, and thed to one Petcrfon, a gentleman whom he had formerly known in the forvice. This man roceised Guftavus with all the appearance of kinduefs; and, on the very firt propolal; offered to raife his vaffals. He even named the lords and peafants whom he pretended to have engaged in his fervice; but in a few days, he went fecretly to a Danifh officer, and gave hins information of what had paffed. The officer immediately caufd the houfe to be furrounded with foldiess, in fuch a manner that it feemed impofible for Guftavus to efcape. Being wasned, HIAs a very by Peterfon's wife of the treachery of her hulband, he, narrow ef by her direction, contrived to flee to the houfe of a cape from clergyman, her friend, by whom he was received with the Danes. all the refpect due to his birth and merit; and left the domeftic who condusted him flould follow the treacherous evample of his malter, he removed him to the church, and conducted him to a fmall clo!et, oi which he kept the key. Having lived for fome time in this manner, Guitavus began to confult with his friend concerning the moft praper method of putting their fchemes in execution. The prielt advifed him to apply directly to the peafants themfelves; told him that it would be prover to fpread a report, that the Danes were to enter Dalecarlia in order toeftablih nevv taxes by force of arms; and as the annual feaft of all the neighbouring villages was to be held in a few days, he could not have a more favourable opportunity: he alfo promifed to engage the principal perfons of the diocefe in his interelt.

In compliance with this advice, Guftavus fet ont for His caufe Mora, where the fenf was to be held. He found the efpoufed by peafants already informed of his defigns, and impatient the peaf.rits to fee him. Being already prepoffifed in his favour, of Dalerys. they were foon excited to an enthufiafm in his caufe,

\section*{S W E [140] S W E}

Sweden. and inftantly refolved to throw off the Danilh yoke. In this defign they were more confirmed by their fuperftition; fome of their old men having obferved that the wind had blown from the north while Guftavus was fpeaking, which among them was reckoned an infallible omen of fuccefs. Guftavus did not allow their ardour to cool, but inftantly led them againf the governor's caftle; which he took by affault, and put the garrifon to the fword. This inconfiderable enterprife was attended with the mof happy confequences. Great numbers of the peafants Hlocked to his ftandard; fome of the gentry openly efpoufed his caufe, and others fupplied him with money. Chrifiern was foon informed of what had pafled; but defpifing fuch an inconfiderable enemy, he fent only a flender detach- ment to affit his adherents in Dalecarlia. Guftavus advanced with 5000 men, and defeated a body of Danes; but he was ftrenuoufly oppofed by the archbilhop of Upfal, who raifed numereus forces for Chriftiern. The fortune of Guftavus, however, fill prevailed, and the archbifhop was defeated with great lofs. Guftavus then laid fiege to Stockholm ; but his force being unequal to fuch an undertaking, he was forced to abandon it with lofs.

This check did not prove in any confiderable degree detrimental to the affairs of Guftavus; the peafants from all parts of the kingdom flocked to his camp, and he was joined by a reinforcement from 34 Lubec. Chrifiern, unable to fupprefs the revolt,
Horrid
cruelty of wreaked his vengeance on the mother and fifters of King Chri- Guftavus, whom he put to death. His barbarities ferstiern. ved only to make his enemies more refolute. Guftavus having aflembled the ftates at Wadhena, he was unanimoufly cliofen regent, the diet taking an oath of fideJity to him, and promifing to affit him to the utmont. Having thus obtained the fanction of legal authority, he puffued his advantages againf the Danes. A body of troops appointed to throw fuccours into Stockholm were cut in pieces; and the regent fending fome troops into Finland, furuck the Danes there with fuch terror, that the archbinhop of Upfal, together with the Danifh governors, fled to Denmark. Chrifiern then fent exprefs orders to all his governors and officers in Finland and Sweden to maffacre the Swedifh gentry without diftinction. The Swedes made reprifals by maflacring all the Danes they could find; fo that the whole country was filled with flaughter.

In the mean time Guftavus had laid fiege to the towns of Calmar, Ato, and Stockholm; but Norby found means to oblige him to raife them with lofs. Gullavus, in revenge, laid fiege to the capital a third time, and applied to the regency of Lubec for a fquadron of llips and other fuccouss fur carrying on the fiege. This was granted on condition that Guftavus thould oblige himfelf, in the name of the fates, to pay 60.000 merks of filver as the expence of the armament; that, until the kingdom floould be in a condition to pay that fum, the Iubee merchantstrading to Sweden floould be exempted from all duties on imports or exports; that all nther nations flould be prohibited from trading with Sweden. and that fuch traffic floculd be deemed illicit ; that Guffavus thould nei her conclude a peace, nor even agree in a truce, with Dermark, without the concurrence of the regency of Lubec ; and that if the repubkic flould be atiacked by Chrintiern, he mould enter

Denmark at the head of 20,000 men. On thefe hard Sweden. terms Guftavus obtained affittance from the regency of Lubec; nor did his dear-bought allies prove very faithful. They did not indeed go over to the enemy; but in a fea-fight, where the Danes were entirely in the power of their enemies, they fuffered them to efcape, when their whole force might have been entirely deftroyed. This treachery had nearly ruined the affairs of Guftavus; for Norby was now making preparations effectually to relieve Stockholm; in which he would probably lave fucceeded: but at this critical period news arrived that the Danes had unanimoully revolted, and driven Chriftiern from the throne; and that the king had retired into Germany, in hopes of being reftored by the arms of his brother-in-law the emperor. On hearing this news, Norby retired with his whole fleet to the ifland of Gothland, leaving bot a flender garrifon in Calmar. Guftavus did not fail to improve this opportunity to his own advantage, and quickly made himfelf mafter of Calmar. Mean time Stockholm continued clofely invefted; but Guftavus thought proper to protract the fiege till he thould get himfelf elected king. Having for this purpofe called a general diet, he firft filled up the vacancy in the fenate occafioned by the maflacres of Chritiern. Guftavus had the addref to get fuch nominated as were in his intereft. The affembly was no fooner met, than a fpeech was made, containing the higheft encomiums on Guftavus, fetting He is cho forth in the flrongeft light the many eminent fervices he fen king of had done for his country, and concluded that the flates would fhow themfelves equally ungratcful and blind to their own intereft if they did not immediately elect him king. This propofal was acceded to by fuch tumultuous acclamations that it was impoffible to collect the votes; fo that Guftavus himfelf acknowledged, that their affection exceed his merit, and was more agreeable to him than the effects of their gratitude. He was urged to have the ceremony of his coronation immediately performed: but this he delayed, in confequence of fome defigns which he had formed to reduce the exorbitant power of the clergy. Gultavus had himfelf embraced the doctrines of the reformed religion, and did all in his power to eftablifi the reformation in his new kingdom. His defign could not fail to raife againft him the enmity of the clergy, and of all the more fupertitious part of his fubjects. Accordingly, the firt years of his reign were embittered by internal difturbances and revolts, which were aided and fomented by the depoled Chrifliern, who was at one time very near regaining poffeffion of the Swedifh dominions.

Chriftiern having eftabliflled a powerful intereft in Unfuccerso Norway, once more made an attempt to recover hisful attempt kingdoms, and was joined by the Dalecarlians; but be- of Chriftiing defeated by the Swedifl forces, we forced return to Norway, where, being obliged to capitulate with the Danifh generals, he was kept prifoner all his life.

In 1542, Guftavus having happily extricated himfelfUurficerefo out of all his troubles, prevailed on the flates to make ful negnthe crown hereditary in his family; after which he ap tianion for the crin a marriage plied himfelf to the encouragement of learning and com- with Cuecus merce. A treaty was fet on foot for a marriage between Elizabith. his cldell fon Eric and Elizabeth queen of England; but An. \(15 t^{2}\). this negociation failed of fuccefs.

Guftaves Vara died in 1560 , and was fucceeded by
woden. his fon Eric XIV. The new king was poffenied of all however was far from being the greatef difafter whicli befel the nation at this time. It was known that the king had embraced the Popihh religion, and it was with good reafon furpected that he would attempt to reftore it upon his arrival in Sweden. Sigifmund was all. obliged, on leaving Poland, to promife that he would flay no longer in Sweden than was neceflary to regulate his affairs. Thefe circumflances ferved to alienate the minds of the Swedes from their fovereign even before they faw him ; and the univerfal diffatisfaction was increafed, by feeing him attended, on his arrival in Sweden in 1593 , by the pope's nuncio, to whom he made a prefent of 30,500 ducats to defray the expences of his journey to Sweden.

What the people had forefeen was too well verified : the king refufed to confirm the Proteftants in their religious privileges, and fhowed fuch partiality on all occafions to the Papits, that a party was formed againt him; at the head of which was Duke Charles his uncle. Remonftrances, accompanied with threats, took place on both fides. Sigifmund was apparently reconciled to his brother, and promifed to comply with the inclinations of the people, though without any inclination to perform what he had promifed. The agreement, indeed, was fcarcely made, before Sigifmund conceived the horrid defign of murdering his uncle at the Italian comedy acted the night after his coronation. The duke, however, having notice of the plot, found means to avoid it. This enraged the king fo much, that he had refolved to accompliih his defigns by force; and therefore commanded a Polinh army to march towards the frontiers of Sweden, where they committed all the ravages that could be expected from an enraged and cruel enemy. Complaints were made by the Proteftant clergy to the fenate : but no other reply was made them, than that they fhould abitain from thofe bitter invectives and reproaches, which had provoked the Catholics, till the king's departure; at which time they would be at more liberty.

In 1595 Sigifmund fet fail for Dantzic, leaving the Swrden. adminiftration in the hands of Duke Charles. 'Ithe con. fequence of this was, that the difienfions which had already taken place being continually increafed by the obAtinacy of the king, Duke Charles aflumed the fovereign power ; and in 1604 Sigifmund was formally depofed, Sigifmund and his uncle Charles:IX. raifed to the throne. He pro-depofed, ved a wife and brave prince, reltoring the tranquillity of and is fucthe kingdom, and carrying on a war with vigour againft ceeded by 1 C . Poland and Denmark. He died in 1611 , leaving the An. 160\%. kingdom to his fon, the celebrated Guflavus Adolphus.

Though Charles 1X. by his wife and vigorous con-State of duct had in a great meafure retrieved the alfairs of Swe-Sweden on den, they were ftill in a very bad fituation. The finan-the accefces of the kingdom were entircly draincd by a feries of fion of wars and revolutions; powerful armies were preparing in Adtalphus. Denmark, Poland, and Rufia, while not only the Swe-Ano 1621. difh troops were inferior in number to their enemies, but the government was deftitute of refources for their pay. ment.

Though the Swedifh laws required that the prince thould have attained his 18 th year before he was of age, yet fuch Atriking marks of the great qualities of Guita- He is alvus appeared, that he was allowed by the fates to take lowed to on him the adminiftration even before this early period. affume the His firt act was to refume all the crown-grants, that he adminiftramight be the better able to carry on the wars in which yet a mihe was engaged ; and to fill all places, both civil and nor. miltary, with perfons of merit. At the head of domeftic and foreign affairs was placed Chancellor Oxenttiern, a perfon every way equal to the important truft, and the choofing of whom impreffed Europe with the higheft opinion of the young monarch's penetration and capacity.

Soon after his acceflion, Guftavus received an embafy from James I. of Britain, exhorting him to make peace with his neighbours. This was feconded by another from Holland. But as the king perceived that the Danith monarch intended to take every opportunity of cruhing him, he refolved to act with fuch vigour, as might convince him that he was not eafily to be overcome. Accordingly he invaded Denmark wilh three \(4^{8}\) come. Accordingly he invaded Denmark wilh three \({ }_{H e}\) invades different armies at once; and though the enemy's fupe- Denmark, riority at fea gave them great advantages, and the num- and obliges ber of the king's enemies diftracted his attention, he car - the king to ried on the war with fuch fpirit, that in 1613 a peace concluce. was concluded on good terms. This war being finified, the king applied himfelf to civil polity, and made fome reformation in the laws of Sweden. In 1615 , hoftilities were commenced againft fiufia, on account of the refitfal of that court to reftore fome money which had been formerly lent them. The king entered Ingria, took Ruffia inKexholm by form, and was laying fiege to Plefcov, vaded with when, by the mediation of James I. peace was conclu-fuccefs. ded, on condition of the Ruflians repaying the money, and yielding to Sweden fome part of their territory. In this and the former war, notwithfanding the ftortnefs of their duration, Guftavus learned the rudiments of the military art for which he foon became fo famous. He is Extraordifaid, indeed, to have taken every opportunity of im-nary miliprovement with a quicknefs of underfanding feeminglytary genius more than human. In one campaign, he not only of the kine. learned, but improved, all the military maxims of La Gardie, a celebrated general, brought the Swedith army to a more fteady and regular difcipline, and formed an

\section*{S W E [ 142 ] S WV E}
S. \({ }^{7}\) den. invincible body of Finlanders, who had afterwards a very confiderable thare in the victones of Sweden.

Peace was no fooner concluded with Ruflia, than Gulavus was crowned with great folemnity at Upfal. Soon after this he ordered his general Li Gardie to acquaint the Polifi commander Coulekowitz, that as the truce between the two kingdoms, which had been concluded for two years, was now expired, he delired to be certainly informed whether he was to expect peace or war from his mater. In the mean time, having borrowed money of the Dutch for the redemption of a town from Denmark, he had an interview on the frontiers with Chriftiern the king of that country. At this interview, the two monarchs conceived the utnolt efteem and friendihip for each other; and Gultavus obtained a promife, that Chrifiern would not affill Sigifmund in any defign he might have againf Sreden. In the mean time, receiving no fatisfactory anfwer from Poland, Guftavus began to prepare for war. Sigifmund citered into a negociation, and made fome pretended conceflions, with a view to feize Guflavus by treachery; but the latter having intimation of his defign, the whole negocidtion was changed into reproaches and threats on the part of Guftavus.

Marries
Eleonora, daughter of the elector of Brandenburg.

Riga be-
fieged and
talien.
Immediately after this, Guftavus made a tour in difguife througli Germany, and married Eleonora the daughter of the elector of Brandenburg. He then refolved to enter heartily into a war with Poland; and with this view fet fail for Riga with a great tleet, which canied 20,000 men. The place was well fortified, and defended by a body of veterans enthufiaftically attached to Sigifmund; but after a vigorous fiege, the garrifon being reduced to extremity, were obliged to capitulate,
and were treated with grant clemency.

After the reduction of Riga, the Swedilh monarch entered Courland, where he reduced Mittan; but ceded it again on the conclufion of a truce for one year. Sigifmund, however, no fooner had time to recover himfelf, than he began to form new enterpriles againft the \(S\) veles in Prulfia; but Guflavus fetting fail with his whole fleet for Dantzic, where the king of Poland then refided, fo defeated his meafures, that he was obliged to prolong the truce for another year. Sigifmund, however, was not yet apprifed of his danger, and refuled to lilken to any terms of accommodation : on which Ciulla.

The Iroles
defeatel. and feveral places taken. vis entering Livonia, defeated the Polilh general, and took Derpt, Hockenhaufen, and Ceveral other places of lefs importance; after which, entering Lithuania, he took the city of Birfen.

Notwithtanding this fuccefs, Guftavus propofed peace on the fame equitable terms as before; but Sigifmund was fill infatuated with the hopes that, by means of the emperor of Germany, he fhould he able to conquer Sweden. Gultavus finding him inflexible, refolsed to The Poles again defeated, and a great number of ywns reduced by Cufavus. pull his good fortune. His generals Horn and Thurn dcfeated the Poles in Semigallia. Guftavus himfelf with 150 thips fet fail for Pruflia, where he landed at Pillaw: This place was immediately delivered up to him; as were feveral other places. Sigifmund, alamed at the great progrefs of Gultavus, fent a body of forces to oppofe him, and to prevent Dantaic from falling in- to his hands. In this he was attended with as little fuccefs as before; and in May 1627 , Guftavus arrived with frefli furces before Dantaic, which he would probalily bave carried, had lie not been wounded in the belly by
a cannon-frot. The States of Holland fent ambafadors 3wedent. to mediate a peace between the two crowns; but Sigif murd, depending on the affiltance of the emperor of Germany and king of Spain, determined to hearken to defeated a no terms, and relolved to make a vinter campaign. third time. Guflawus, however, was fo well intrenched, and all his An. 1627. forts were fo flrongly garrifoned, that the utmon efforts of the Poles were to no purpofe. The city of Dantzic in the mean time made fuch a defperate refiftance as greatly irritated Guftavus, In a lea engagement the the \({ }^{57}\) Yo.cs Swedith fleet defated that of the enemy; after which defeated Guttavus, having blocked up the harbour with his Heet, by fea, and puthed his advances on the land fide with incredible vigour. He made a furprifing march over a morafs 15 miles broad, affifted by bridges of a peculiar conftruction, over which he carried a rpecies of light cannon inrented by himfelf. By this unexpected manccuvre he got the command of the city in fuch a manner, that the garrion were on the point of furrendering, when, by a fudden fwell of the Viftula, the Swedifh works were The king ruined, and the king was obliged to raife the fiege. Inobliged by other refpects, however, the affairs of Guftavus went on an in und with their ulual good fortune. His general Wrangel tion of the defeated the Poles before Brodnitz. At Stum the king raife the gained another and more confiderable victory in perfon. fiege. The emperor had fent 5000 foot and 2000 horfe under Arnheim, who joined the main army commanded by the Pulith general Conjecfpolfki, in order to attack the Swedilh army encamped at Ouidzin. The enemy wer mans defo much fuperior in number, that the friends of Gufta-great vus warm!y diffuaded him from attacking them. But laughter the king being determined, the engagement began. The Swedill cavalry charged with fuch impetuofity, contrary to their fovercign's exprefs order, that they were almolt furrounded by the enemy; but Guftavus, coming up to their affillance, pullied the enemy's infantry with fo much vigour, that they gave way, and retreated to a bridge that had been thrown over the Werder. But here they were difappointed; for the Swedes had already taken poflefion of the bridge. Ont this a new action enfued more bloody than the former, in which the king was expofed to great danger, and thrice narrowly efcaped being taken pifoner; but at laft the Poles were totally defeated, with inmenfe lofs. The flaugher of the German auxiliaries was fo great, that Anhleim farcely carried of one half of the troops which he brought into the field. This defeat did not hinder the Polifh general from attempting the fiege of Stum; but here again he was attended by his ufual bad fortune. Arnheim was recalled, and fucceeded by Menry of Saxe Lawenburg and Philip Count Mansfeldt. The change of general ofticers, however, produced no good confequences to the Poles; a famine and plague raged in their camp, fo that they were at laft obliged to conlent to a truce for fix years, to expire in the month of June 1635 . Gultarus kept the port and citadel of Memel, the harbour of Pillau, the town of Elbing, Bruntherg, and all that he had conquered in Livonia.

Gultavus having thus brought the war with Poland Gutavus to an honourable conclufion, began to think of refenting refolves an the conduct of the emperor in aflifing his enemies and oppreffing the Proteftant ftates. Before embarking in fuch an important undertaking, it was neceflary that he mould confult the dict. In this the propriety of enera-

\section*{\(S\) E \(\quad\) E 143\(] \quad S \quad W\) E}
weden. ging in a war which Germany was warmly debated ; but, after much allercation, Gulavus in a very noble fipecch decermined the matter, and fet forth in fuch flrong terms the virtuous motives by which he was aluated, that the whole affembly wept, and every thing was granted which he could require.

It was not dillicult for Guftavas to begin his expedition. His troops amounted to 60,000 men, hardened by a fuccellion of fevere campaigns in Rullia, Finland, Livomis, and Pruftia. His Heet excceded 70 fail, carrying from 20 to 40 guns, and manned with 6000 feamen. Embarling his troops, he landed at Uiedom on the 24 th of June 1630 , the Imperialits having evacuated all the forterfies which they poffefied there; and the itle of Rugen had been before reduced by General Lefliy, in order to fecure a setreat if fortune thould prove unfavourabie. Pafing the frih, Guftarus ftormed Wolgaft and another Atrong forteffs in the neighbourhood, leaving a garrifon for the defence of thefe conquelts. He then proceeded to Sletin; which confented to rece:ve a Sived \(n_{1}\) garrifon, and the king perfuaded the duke of Pumerania to enter into an alliance with him. In coilfquence of this the Swedifl troops were received into feveral towns of Pomerania; and the molt bitter enmity touk place between the Imperialits and Pomeтаніапs.

Thefe fuccefies of Guftavus flruck the empire with conflernation; for being already overwhelned with civil diffentions, they were in no condition to reffl fo impetuous an enemy. At laft Count Tilly was invelled with the dignity of veldt marifchal. In the mean time the king being reinforced by a confiderable body of troops in Fiwland an:l Livonia under the conduct of Guftavus Horn, defeated the Imperialiats before Griffenhagen; taking the place foon after by affiult. By this and fome other conquells he opened a pallige into Iufatia and S:lefia; but in the mean time Count Tilly cut off 2000 Swedes at New Brandenburg, This advantage, however, was foon overbalanced by the cunquelt of Franckfort on the Oder, which Guthavus touk by aflault, making the whole garrifon prifoiers. Thus he commanded the rivers Elbe and Oder on buth fides, and had a fair paffage not only to the countrics already mentioned, but alfo to Saxony and the hereditary dominions of the houle of Auftia. Soon after this, Guftavus laid fiege to Landikerg, which he took by affault.

About this time the Proteflant princes held a diet at Leipfic ; to which Guflavus fent deputies, and conducted his negociations with fuch addrefs, as tended greatly to promote his interefts. lmmediately after this he reduced Gripfwald, and with it all Pomerania. Then marching to Guftrow, he reflored the dukes of Mecklenbarg to their dominions.

All this time Count Tilly was employed in the fiege of Magdeburg ; but now, being alarmed at the sepeated fucceffes of the Sivedes, he left Pappenheim with part of the army before that city, while he marched with the re!t into Thuringia, to attack the landgrave of Hefie-Caff: 1 and the elector of Saxony. After a mott obftinate defence, Magdeburg fell into the hands of Pappenleim, who committed there all imaginable cruelties. Guftavus furmed a plan of recovering the cily; but was obliged to abandon it, by Pappenheim's throwing hiraflelf into the place with his whole army, and by
the progrefs which Tilly was making in Thuringia. Swedert Relinquilhing this enterprife, thercfore, lic ordered an \(\underbrace{\text { s- }}_{08}\) attack on Havelfurg; which was done with fuch refo- Havelfourg lution, that the place was fonced in a few hours, and and Werall the garvifon made ; riicners. Werben was next obli. ben reged tu fubmit after an obflinate conllich, in which many duced, and fell on both fides.- Tlisefe fucceffes obliged Count 'lilly the cavalry to attempt in perfon to cleck the progets of the Swedes. perialifts He detached the vanguand of his ammy, compofed of the defeated by flower of the Imperial cavalry, within a few miles of the Swodso the Swedifh camp. An action enfucd, in which EernAein the Imperial general was defeated and killed, with 1500 of his men. Guftavus, after this advantage, placed himfelf in a fituation fo much fuperiur to his enenies, that Count Tilly was fired with indignation, and marched up to the Siwedilh lines to give him battle. Guftavus kept withia his works, and 'tilly attacked his camp, though almoft impregnably fortified, keeping up a molt terrible fire from a battery of 32 pieces of cannun ; which, however, produced no oller effeet, than obliging the Swedith monarch to draw up his atmy behind the walls of Werben. Tilly had placed his chief Connt Tre hopes in being able to fpike the enemoy's cannon, or fetly defeate \& fire to their camp; after which he propofed naking his by Gufagrand attack. With this view he bribed fome prifor. *us. ers ; but they betrayed him, and told his defign to Gufavus. The king ordered fires to be lighted in different parts of his camp, and his foldiers to imitate the noife of a tumultions diforderly rabble. This had the defired effect. The count led his army to the breach made by the cannon; where be was received with fuch a volley of grape fhot as cut off the firt line, and pat the whole body in diforder, fo that they could never be brought back to the charge. In this confufion the Inperial army was attacked, and, after an obflinate cunflie, obliced to quit the feld.

Soon after this action the queen arrived at the camp wih a reinforcement of 8000 men ; at the fame time a treaty was concluded with Charles I. of England, by A hody of which that monarch allowed the marquis of \(H\) amition to Britifl iolraife 6000 men for the fervice of Gultavus. Theie ausi- diers comes liaries were to be conducted to the main army by a body ance of the of 4000 Swedes; and were in every thing to obey the swedes. king while he was perfonally prefent, but in his abience were to be fubject to the orders of the marquis. With thefe troops the king had refolved to make a diverfion in Bremen: hut the marquis finding it impofible to effeet a junction with the Swedilh army, refolved, without debarking his troops, to fleer lis courfe for the Oder, and land at Ufedom. Guftavus wis very much difpleafed at finding his project thus difconcerted; but, making the beft of the prefont circumflances, he commanded the Britifl troops to act on the Oder inftead of the Wefer. The number of this little army was magnified exceedingly by repori, infomuch that Count Tilly had fome thoughts of marching againft them with his whole force; but on the departure of the marquis for Silefia, he reinforced the army in that country with a large detachment, which was thought to comtribute not a little to the defeat he foon after received.

Since the late action Guftavus had kept within his intrenchments, where his army was well provided with every thing. Tilly made feveral attempts to furprife or draw him to an engagement ; but finding all his endeavours fruitlefs, he marched into Saxony, and laid fiege

\section*{S W E [ 144 ] S W E}

Sweden. to Leipfic. This precipitate meafure proved highly advantageous to the Swedifh monarch. A treaty offenfive and defenfive was immediately concluded with Guftavus: and the eleftor willingly promifed every thing that was

7
Saxony ravaged by Count Til ly, who takes LeipEc.

Battle of
Leipfic.
Ап. 163 \%. required of him. Tilly, in the mean time, carried fire and fword into the electorate. At the head of an army of 44,000 veterans, he fummoned the city of Ieipfic to furrender; denouncing the fane vengeance againit it as had been executed on Magdeburg, in cafe of a refufal. By this the governor was fo much intimidated, that he inftantly fubmitted; and alfo furrendered the caftle of Paffenberg, which was in a condition to have flood out till the arrival of the Swedith army. The elector, enraged at the lofs of thefe valuable places, ordered his army to join the Swedes with all expedition, and prefled the king fo warmly to engage, that at laft he yielded to his defire. On the \(7^{\text {th }}\) of September 1631, Guftavus led out his army in the fineft order, the Swedes forming one column on the 1ight, and the Saxons another on the left; each amounting to 15,000 men. Tilly drew up his men in one vaft column, probably with a view of furrounding the flanks of the king's army. Guftavus led on his troops againf that wing of the Imperialifts commanded by Pappenheim, whom he drove back to a confiderable diftance. General Bannicr in the mean time cut in pieces the troops of Hollein, and mortally wounded the duke who commanded them. Pappenheim led on his troops feven times to the charge, but was as often repulfed by the Swedes. Tilly all this while was engaged with the Saxons; but having at laft driven them off the field, the whole Arength of the Imperial army was turned againtt the Swedith left wing. The Swedes fuftained the attack with the greatelt firmnefs, until the king detached the centre to affirt them. The Imperialifts then were no longer able to fland their ground; but gave way everywhere except in the centre, which was

73
The Impe-
rialifts defeated with great naughter. compofed of 18 regiments of veterans accuftomed to victory, and deemed invincible. They made incredible efforts to maintain their reputation; and, though fwept off in great numbers by the Swedifh artillery, never flrunk or fell into confufion. Four regiments, after their officers had been killed, formed themfelves, and retired to the fk irt of a wood. Tilly retired at the head of 600 men, and efcaped by the coming on of the night. Seven thoufand Imperialifts lay dead on the field of battle; 4000 were taken prifoners; a fine train of artillery was loff, with upwards of 100 ftandards, enfigns, and other military trophies.

Guflavus now determined to penetrate into Franconia, where he roduced feveral places. efpecially the fortrefs of Workburg. Tilly having collected his fcattered troops, which formed an army fill fuperior in number to that of Guftavus, marclied to the relief of this place; but came too late. He then directed his march towards Rottenberg, where four regiments were cut in pieces by a Swedilh detachment. After this the king reduced Hanau, Franckfort on the Maine, and Mentz; dellroying a body of Spaniards, who had attempted in obftruet his paffage.

The court of Vienna was now thrown into the utmoft confufion; and fent everyuhere begging afliftance, and foliciting the Catholic princes to arm in defence of their religion. The emperor was mof embarrafled in firding out a general capable of oppofing Guftavus in the field; for the late misfortunes of Count Tilly had entirely funk
his reputation. Walleftein, an old experienced officer, Sweden. was felected; but as he had formerly bcen difgraced, it \(\underbrace{76}\) wa, apprehended that he would not accept of the com- Walleftein mand of which he had once been deprived. This objec-choren getion, however, was got over; and Walleftein not only neral by the accepted of the command, but, at his own expence, emperor. augmented the army to 40,000 men.
During the whole winter the Swedifh army kept the a great field ; and before the approach of fummer had reduced nurnber of a great number of places, while the landgrave William towns takea made great progrefs in Weftphalia. Guftavus Horn was by the tede. repulfed before Eamberg; but foon had lis revenge, by entirely deftroying two regiments of imperialifs. To prevent the troops from being affected by the lofs before Bamberg, the king refolved to give batte to Tilly, who was marching into Bavaria to prevent the Swedes from gaining a footing in that eleftorate. He purfued the Imperial general through a vaf tract of country, defeated his rear-guard, and, having reduced a variety of towns and fortreffes on the Danube, penetrated as far as Ulm. Advancing to the river Leck, Count Tilly Count Tilpofted himfelf in a wood on the oppofite fide, to difputely defeated his paflage. Guftavus endeavoured to diflodge him by and killed. a regular fire from 70 pieces of canron. The flaughter was dreadful; and Tilly himfelf, being wounded by a cannon-ball in the knee, died a few days before he was to have been fuperfeded by Walleftein. The following night the Imperial army evacuated the poft. Guftavus immediately croffed the river, and feized the towns of Rain and Newburg, which the encmy had abandoned, and Augiburg next fubmitted.

From Aughurg the Swedes advanced towards Ratifbon; but were difappointed in their defign of getting poffefion of that city, as the Bavarians had thrown a numerous garrifon into the place.-In the mean time, ambaffadors arrived from Denmatk, offering the mediation of that crown for obtaining a lafting peace between the contending parties. This negociation, however, failed of fuccefs, as the ambaffadors had not been inftructed to offer terms favourable to the Proteftants. Guftavus now, refolving to retort on themfelves the cruelties towns laid which the Bavarians had inflifted on the Proteftants, in antes by laid the towns of Morzbourg, Friefengen, and Land the Swedes fhut, in afhes. The inhabitants of Munich faved themfelves by fubmiffion; Guffavus alfo defeated the forces of the elector, who had been joined by a confiderable body of militia.

While Guftavus was thus employed, Walleftein had affembled a vaft army. He was frongly folicited by the elector of Bavaria to come to his affillance; but, in revenge of the elector's having formerly obtained the command for Count Tilly in preference to himfelf, he drew off towards Bohemia to enccunter the Saxons. Arnheim, who commanded the Saxon forces in that place, was an enemy to Guftavus, who had formerly rallied him for his cowardice. He therefore permitted The so Walleftein to gain an eafy victory, in hopes that his roops demafter, the clector of Saxony, a prince entirely devoted feated by to his pleafures, might be induced to relinquifh the friend hip of fuch a reftlefs and warlike ally as Guftavus; and indeed the ufed all the eloquence of which he was mafter to detach him from the Swedilh caufe. Several advantages, in the mean time, were gained by the Imperialifts. Pappenhein defeated the arclibifitop of Bremen's cavalry at Werden; and three Swedilh regiments

\section*{S W E [ 145 ] S W E}

Sweden. were cut off near Kadingen. Pappenheim, however, the the greatelt defeat. The crown devolved on Chrittina the daugbter of Guflavus, an infant of fix years old; the nation was engaged in an expenfive foreign war, without any perfon equal to the arduous talk of commanding the armies, or regulating domeftic affairs, as Guftavus had done. Chriltina was immediately proclaimed queen. The regency devolved on the grand bailiff, the marifchal, the high admiral, the chancellor, and the treafurer of the crown. Oxenftiern was invef. ted with the chief management of affairs, and conducted himfelf with the greateft prudence. The reign and character of Chrifina have been fully detailed under the article Christina, to which we may refer our readers.
From the treaty of Weftphalia, Sweden enjoyed fome years of repofe. Charles Guftavus, Count Palatine, having gained the favour of Chriftina, was appointed generaliflimo of the forces, and heir-apparent to the crown. A marriage was propofed between them; but the queen would never liften to this or any other propofal of the kind. In 1650, the ceremony of the queen's coronation was performed; but in four years after, fhe refigned the crown in favour of Guftarus. (See the article Cifristina).
YoL. XX. Part I.

The new king found himfelf involved in confiderable dillicultics on his acccffion to the throne. 'I'he trealury was quite exhauted; great part of the revenue was appointed for the fupport of Chriflina's houfehold ; the state of people were oppreffed with taxes; and the nation having the accefbeen difarmed for feveral years, began to lofe its reputa- fion of tion among foreigners. Fo remedy thefe evils, Charles Charles \(\boldsymbol{X}\). propofed to refume all the crown-lands which had been alienated by grants to favourites during the late reign; to repeal a duty which had been laid on falt; to put the kingdom in a poflure of defence; and to enter on a war with fome neighbouring flate. Under a pretence that War with Cafimir king of Poland had quellioned his title to the Poland rethrone, he prepared to invade that kingdom. Several folved on. embaffies were fent from Poland to Stockholm; but fome point of ceremony always difappointed them of an audience of the king; fo that they were obliged to return without their errand. As foon as matters were in readinefs, General Wittemberg made an irruption into Puland from the fide of Pomerania. The Poles oppofed him with an army of 15,000 men ; but inllead of fighting, they began to negociate, and in a ftort time entirely difperfed. Charles himfelf foon followed with a powerful army, and purfued his march without obflruction, all the cities throwing open their gates to him as he approached. As he advanced to Cracow, Calimir refolved to make one effort to fave his capital. His \(\$ 9\) army amounted only to 10,000 men; and thefe were defeated, unfortunately fuch as had never flood fire. After a and the feeble refiftance, they Hed with precipitation, having loft kingdons 1000 men killed and taken prifoners. A few days after this Charles defeated the Polcs a fecond time, about eight leagues from Cracow; on which Cafimir fled with his family to Oppelen in Silefia. The capital was then inveited; and though defended with the utmoft valour, was in a fhort time obliged to capitulate. Thus in lefs than three months Charles apparently became mafter of Poland; but it was foon evident that the Poles had no intention of abandoning their former fovereign.

In 1656 a war took place with the elector of Bran-War wite denburg. While Charles was employed in the con-the elector queft of Poland, that prince had invaded loyal and Du- of Erandercal Pruffia, and reduced the mof confiderable towns with little oppofition. The king of Sweden took umbrage at his progrefs; and having marched againft him, defeated his forces in feveral flight encounters, and oblised him to acknowledge himfelf a vaffal of Sweden. Thefe rapid conquefts alarmed all Europe; and the different powers fought for means of driving the Swedes out of Poland, which they had fo unexpectedly and unjuftly feized. The Poles were no fooner affured that The Poles they flould be affifted, than they everywhere revolted revolt. and maffacred the Swedes. Cafimir returned from Silefia; and thofe very troops and generals who had before fubmitted to Charles without oppofition, now ranged themfelves under the banners of his antagonift. Charles Charles immediately marcbed from Pruffia to chaftife the info- gains a vic. lence of the Poles, and totally defeated a body of orty, but is \(\mathbf{1 2 , 0 0 0}\) men. This did not hinder all the Poles incor-retire. porated with his troops to defert ; which confiderably reduced his army; and the campaign being performed in the depth of winter, he was at laft obliged to retreat to Pruflia. In his march he was haraffed by the Poles; and a body of 4000 Swedes was furprifed and defeated by them at Warka. This lofs, however, was foon after

The Poles and Tartars defeated with grea月aughte:
os
The Rurfrans in-
:ade the
Swedith do pinious. the Viftula. The Poles were driven from their entrenchments with prodigions flaughter. The Poles and Tartars then laboured to break the alliance; with which riew they entered Ducal Pruffia, and riefeated the electoral army, taking many prifoners. The Swedes foon had their revenge. General Steinboek attacked the fame Polinh army at Philippowa, and overthrew it with fuch flaughter as obliged the Poles for that feafon to quit the field. A more formidable encmy than the Poles now began to make their appearance. The Ruffians invaded the provinces of Carelia, Ingermania, and Livonia; while the elector of Brandenhurg began to waver in his fidelity. 'To preferve this only ally at fuch a critical juncture. Charles was obliged to give him more advantageous terms than thofe already mentioned; while the Ruffians were repulfed in the provinces of Carelia and Ingermania. But in Livonia they had better furcefs. See Russia. For feven months, however, they battered the wallis of Riga, without venturing to pafs the ditcly or florm the praticable breaches.

Charles, notwithfanding the number of his enemies, was now become fo formidable by the valour and difcipline of his troops, that whole armies often fled on bis An 1657. approach. At laff, in 1657 , the Poles, finding they could not refift him in the field, contented themfelves
95 with haraffing the Swedes on their march, and cutting Charles en- off the foragers and convays. This proved much more ters into
an alliance with Ragotiki prince of Ir ranfyivaנia. defruefive to the Swedes than their former method; fo that Charles was obliged to enter into an alliance vith RagotRi prince of Tranfylvania, by affigning him certain provinces in his neighbourhood, in order to furnith himfelf with irregular troops, who might fight the Poles in their own way. This, however, proved of no real advantage ; for the confederates, after wafting a whole campaign in Lithuania, were obliged to return without accomplifing mote than the redudtion of a fingle fortrefs; on which Charles rcturned with the Swedilh army to Pruffa.

Leopold, the young king of Hungary, having long beheld the Swedes with a jealous eve. now refolved to declare for Poland. The more efictually to cubl) the ambition of the Swedifh monarch, be follicited the king of Jonmark to come to a ruplure with him. This was infantly complicd with, and the Danes invaded Bremen. Charles hafened to oprofe this new enemy; which gave furt offence to Ragotiki, that he nentected to take the proper meafures for hi:s ome defence in the
abfence of the Swedes, and fuffered his army to be deAroyed by the Poles and Tartars. At the fame time the Turks invaded Tranfylvania, under prctence that Ragotki, being a valfal of the Grand Signior, had no 99 right to invade Poland without his lcave. Ragotrki op- He is depoled them in the field; where he was defeated and fatced and killed, leaving Charles deflitute of the only ally on the Turks. whom he could depend.

The king, however, not difinayed by this misfortunc, traverfed Pomerania and the duchy of Mecl:lenburg ; after which he attacked Holltein, while General Wrangel with another corps entered the duchy of Bremen. The latter executed his meafures with the utmof vigour. Jn 15 days be retook all the towns which the Bravery enemy had reduced; defeated and drove the Danifland fucceis anmy out of the country, killing 3000 of their beit fol- wf Ceneral diers. In Holftein the king reduced feveral fortreffes, Wrangel. laid Izehoe in athes, defeated a body of Danes, and laid fiege to Irederic Udda, into which the Danes had thrown a ftrong garrifon. The condud of this fiege he left to Wrangel, he himfelf retiring to Wifmar in order to obferve the fituation of affaits in Poland ; but no fooner was he gone than Wrangel attacked the place with fuch fury, that he became mafter of it in two hours. In the province of Halland the Swedes were defeated; but the enemy derived no advantane from their victory: at fea the fleets met, and maintained an engagement for two days, without any confiderable advantage on cither fide. In Poland affairs were not better The houfe conducted. The houfe of Auflia had now declared of Auftria for Cafimir ; a German army entered Poland, and re-deciares duced Cracow, though not without great lofs to them- againft felves.

The king of Sweden was now furrounded by enemies. The elector of Brandenburg had declared againft him; and he liad befides to engage the armies of Auftria, Poland, Ruft roz tion he refolved to attack Denmark, fo as to oblige vades Denthat power to come to a fpeedy accommodation. His de- mark with figns were forwarded by a very early frolt, which enabled him to tranfport histroops without flipping. Having paffed over on the ice to the ifland of Funen, he cut in pieces a body of 4000 Danifh foldiers and 500 peafants. The whole ifland was reduced in a few days; after which he paffed to L.angland, then to Laaland, after that to Falftre, and lally to Zealand. The Danes were terrified at this unexpected invafion, and were giving themfelves up to defpair, when Charles offered to conclude a peace on equitable terms. The king of Den-Peace mark gladly confented; iutending to renew the war ascluded. foon as be thought it could be done with fafety.

An. \({ }^{6}{ }_{5} 5\).
Charles was no fooner setired, than the king of Denmark began to act fccretly againf him ; on which, refolving to anticipate him in his defigns, he appeared unexpectedly with a fleet before Copenhagen. The Swe-The win dith monarch laid fiege to the capital, but with fo little renewed, prudence that he made no progrefs, and was at lengitiand Copencompelled to turn the fiege into a blockade, which con- hagen betinued to the end of the war. Charles X. died of an epidemic fever, and was fucceeded by his fon Charles XI.

The new king Charles XI. was a minor at the time CharlesXI. of his father's death; and as the kingdom was involved Ar. 166. in a dangerons war with fo many cnemies, the regency determined to conclude a peace, if it could be obtamed

firs every where go to wreck.
on reafonable terms. A treaty was accordingly concluded at Oliva; by which Calimir renounced his pretenfions to the coown of Poland, and that republic gave up all pretentions to Livonia. Burnholm and Dronthein were ceded to Denmark; and an equivalent in Schonen remained with Sweden. During the minority of the king, nothing remarkable occurs in the hillory of Siveden. In 1672 he entered into alliance with Louis XIV. which two years after involved him in a war with the clector of Brandenburg. At firt the Siwedes carried all before them. Almof all the towns in Brandenburg were reduced, when the elector arrived with es an army to the relief of his diftreffed fubjects. He retook feveral towns, defeated the Swedes in a general erigagement, and foon after forced them to abanden all their conquefls. In conjunction with the Danes, he then invaded the Swediflh dominions; many places of imporance were reduced; and, in 1676 , Sweden received a molt deflructive blow by the defeat of her ileet in an engagement with the combined fleets of Donmark and Holland. Soon after this the king took the gorocrument into his own hands, and in fome degree reflored the fortune of Sweden; but though matters went on in a more profperous way where the king commandcd in perfon, the fame loffes and difgrace attended the Swediliz arms in every other quarter. In 1678 , the Swedift flect was defeated in two engagements. At Landfcroon a molt oblinate battle was fought from ten in the morning till fix at night; when both parties were obliged, by fatigue, to retire to their refpective camps. At Oldeval in Norway, the Swedes were defeated; and the Danes laid defolate the iflands of Oeland, Smaaland, Unno, and Kuno; while the electoral troops and Imperialifts reduced Count Konigfmark to the utmoft diffrefs in the neighbourhood of Stralfun?.

In this deplorable fituation of affairs Count Konigf. mark found an opportunity of attacking his enemies to fuch advantage, that he oblained a complete vifory; after which he ravaged the duchy of Mecklenburg. Notwithfanding this fuccefs, he could not prevent the elector from reducing Strallund ; after which he was obliged to evacuate Ponserania; and, to complete his diftrefs, the fleet which tranfported the Swedilh army from Pomerania was wrecked on the coant of Born: holn.

In this unprofperous fituation of affairs a peace was concluded at St Germain's between France and her enemies, by which the Swedes and Danes were left to decide their quarrel by themfelves. Denmatk was by no means a match for Sweden, even in the dillreffed fituation to which the was reduced; and therefore a treaty was concluded, on terms much more favourable to Sweden than could have been expected; and the peace was confirmed by a marriage between Charles and Ulica Eleonora, daughter to the king of Denmark. From this time the Swedilh monarch applied himfelf to the reformation of the fate; and by artfully managing the difputes between the nobility and peafants, he obtained a decree empowering him to alter the confitution as he pleafed. The proceedings of the king after this decree were fuch as to exafperate the nobility, and produce violent commotions. See Patrul.

On the 15 th of April 1697, died Charles X1. leaving his crown to his fon, the celebrated Charles XII. at
that time a minor. On his acceffion l.c found himfelf sweder. under the tuition of his grandmother Elenonora, whohad governed the hingdonn during the minority of the late charles \(x\) I. king. Though Charles was at that time only 15 years dies, ind is of age, he howed a defice of taking the government fuccected into his own hands. His counfellors, Count Piper and by his fun Axel Sparre, fignified lis delire to the queen regent. ©harles 'I'hey were by her referred to the llates; and there all Xif. 113 were unanimuns: fo that the queen, finding that oppo-Ite takes fition would be vain, refigned her power with a good the governgrace; and Charles was invelled with alsfolute authority his ownto in three days after he had expreffed his defire of reigning hatands at alone. He was fearcely feated on the throne मhen a the age of powerful combination was formed againt him. Augu- \(5_{5}\). flus king of Poland formed defigns on Livonia; the king a 114 of Denmark revived the difules he had with the duke convinat of Holltein, as a prelude to a war with Sweden; and tominarmPeter the Great of liuflia began to form defugns on In-cd agaimit gria, formerly a province of Rulfia. In 1699 the king him. of Denmark marched an army into Holltein. Charles fent a confiderable body of troops to the dulse's affiltance; but before their arrival the Danes had ravaged foltein rethe country, taken the calle of Gottorp, and laid clofe vagrel by fiege to Monningen. Here the king of Denmark com \({ }^{\text {hice Dance, }}\) manded in perfon; and was aftitled by the troops of Saxony, Brandenburg, Wolfenbuttle, and Heffe Cafiel. England and Holland, as guarantees of the laft treaty with Denmark, in concert with Sweden, joined Charles againft this confederacy, and fent fiets to the Baltic. They propofed a termination of the war on equitable terms ; but thefe were haughtily refufed by the Danifl monarch, who defpifed the youth and inexperience of Charles, and relied too much on the alliance he had formed with Saxony, Brandenburg, Poland, and Ruflia. Tonningen, however, refilled all his effurts; and when They are he ordered the place to be ftormed, he had the mortifi- repulfed at cation to fee his troops driven headlong from the walls Tonningen. by a handful of Sivedes.

In the year 1700 , Charles, having entrutted the af- Charles fets fairs of the nation with a council chofen out of the fe- out fiom nate, fet out on the 8th May from his capital, to which Stockholm, he never afterwards returned. He embaiked at Carlf- the fleet of croon, and defeated the feet of the allies. Having made the allies. a defcent on the inland of Zealand, he defeated a body of An. 1700. cavalry that oopofed his march, and then proceeded to invelt Copenhagen by fea and land. The king of Denmark then faw the neceffity of either having his capital deffroyed, or of doing juftice to the duke of Holltein. He chofe the latter; and a treaty was concluded on Oblizes the much the fame terms as formerly. Charles, being thus Danes to at liberty to turn his arms againf the other princes who make had confpired his deftruction, refolved to lead his army peace. againft Auguttus king of Poland. On the road, how- Marches ever, he received intelligence that the tzar of Ruffin was againft the on his march to oppofe him, and had laid fiege to Narva Ruflans. with an army of 100,000 men. The conteft that enfued between Charles and Peter, with the celebrated batiles of Narva and Pultava, have been already related under Russia, fo that we thall here confine ourfelves chiefly to thofe events in which Peter the Great was not immediately concerned.

The Tzar Peter was the chief fupport of Auguftus, and he took the mofl active meafures to oppofe the progrefs of the Swedifh monarch. His want of fuccefs, and the fub-

Wariaw ta
En. having received a reinforcement from Sweden, took the field, and appeared fuddenly on the banks of the Duna, along which the Saxon army was pofted to receive him. The king of Poland being at that time fick, the army was commanded by Ferdinand duke o! Courland, Marifchal Stenau, and General Paykel, all officers of valour and experience. They had fortified certain iflands in the mouth of the river, and taken every other precaution againit an attack; the foldiers were hardy, well difciplined, and nearly equal to the Swedes in number; yet Charles, having paffed the river in boats with high fides, to fcreen the men from the fire of the enemy, attacked them with fuch fury, that they were entirely defeated with great lofs.

This victory was followed by the furrender of all the towns and fortreffes in the duchy of Courland. Charles then paffed into Lithuania, where every town opened its gates to him. At Birfen, an army of 20,000 Rufians retired with the ntmoft precipitation on the news of his approach. Here Charles, perceiving that the kingdom of Poland was greatly difaffected to Auguftus, began to project the fcheme of dethroning him by means of his own fubjects. This fcheme he executed with more policy than he ever fhowed on any other occafion.

Auguftus, in the mean time, finding his fcheme of peace frultrated, had recourfe to the fenate; but met with fuch a rough anfwer from them, that he determined to apply to Charles. To him therefore he fent his chamberlain; but a paffport being forgotten, the ambaffador was arrefted. Charles continued his march to Warfaw, which furrendered on the firlt fummons; but the citadel held out for fome days. Auguftus, finding at laft that no dependence was to be placed on the Poles, determined to trut his fortune wholly to the Saxon army and the nobility of the palatinate of Cracow, who offered to fupport him to the utmoft of their power. The Saxon army was now advanced to the frontiers, and Auguftus immediately put himelf at its head. Being joined by the nobility of Cracow, he found his forces to amount to 30,000 men, all brave and well-difciplined. With thefe he marched in quelf of his enemy; who did not decline the combat, though he had with him only 12,000

The Saxons entirely de-
fated. men. Though the Saxons were ftrongly pofted, having their front covered by a morals, befides being fortified with pallifadoes and chevaux de frife, they were attack-
126 ed with irrefiftible impetuofity, and entirely defeated. Cracow ta- This viftory was followed by the lofs of Cracow : after ken. This victory was followed by the lofs of Cracow : after
which Charles fet out in purfuit of the flying army, with a defign of preventing them from re-affembling ; but his horfe falling under him, he had the misfortune to break his thigh, by which he was confined fix weeks; and thus Auguflus obtained fome refpite. He improved this interval. Having convoked a diet firft at Marienburg, and then at Lublin, he obtained the following refolutions; that an army of \(50,0 c 0\) men hlould be raifed by the republic for the fervice of the prince; that fix weeks Phould be allowed the Swedes to determine whether they were for war or peace; and that the fame time fhould be granted to the turbulent and difcontented nobles of Poland to make their conceffions. To counteras the effeels of thefe refolutions, Charles affembled anothcs
diet at Warfaw; and while the two affemblies difputed Swerte. concerning their rights and privileges, he recovered from \(\underbrace{}_{127}\) his wound, received a frong reinforcement from Pome-Remains of rania, and utterly defeated and difperfed the remains of the Sason the Saxon army.

The ill fortune of Auguftus continued fill to prevail. tirely deIn 1704 he was formaliy depofed by the diet, and the crown conferred by Charles on Staniflaus Lecfinfly pa- \(\begin{gathered}\text { An. } 1784^{\circ} \\ 128\end{gathered}\) feated. latine of Pofnania. Auguttus, however, did not yet Auguftus tamely give up his kingdom. His adherents daily Akir-formally mithed with the Swedes; and Auguftus himfelf, being and Stanirreinferced by 9000 Ruffians, retook Warfaw, and was taus raired near furpriling the new king, who lived in perfect fe-to the curity in the city while Charles fought in his caufe. rhrone. Count Horn, with 1500 Swedes, vigoroufly defended 129 the citadel ; but at lall, finding it no longer tenable, he Warfaw re. was obliged to furrender at difcretion. The reduction taken hy of Warfaw was among the laft advantages gained by Auguftus in the courfe of this war. His troops were now compofed of Saxon recruits and undifciplined Poles, who had no attachment to his perfon, and were ready on all occafions to forfake him. Charles and Staniflaus advanced with the victorious army ; the Saxons fled before them, and the towns feveral miles round fent him r30 their fubmiffions. The Poles and Saxons were under Excellent the command of Schullemberg, a moft fagacious and ex- conduct oi perienced general, who ufed every expedient to clieck his general the progrefs of the Swedes. With all his conduct and berg. caution, he found himfelf outwitted, and Charles in the neighbourhood of his camp ready to fall on him, while he thought him at 50 leagues diftance. The Swedifh His enmonarch attacked him with a fuperior army, but en-gagement tirely compofed of horfe. Schullemberg had pofted his with the men in fuch a manner as rendered it impolfible to furround them. IIis firft rank being armed with pikes and fufees, prefented a kind of rampart of bayonets; the fecond line fooping over the firf who kneeled, fired over their heads, while the third rank, who ftood upon their feet, kept up an inceffant fire, by which the Swedifh horfe were exccedingly galled and put in diforder. Charles loft the opportunity of cutting off the whole Saxon army, by omitting to order his men to difmount. This was almoft the firft time that infantry had been regu. larly oppofed to cavalry, and the fuperiority of the former was evident. After the engagement had continued His fine about three hours, the Saxons retreated in good order; treat. which no enemy had ever done before in any engagement with Charles. The Swedes purfued their enemies towards the Oder, and forced them to retreat through thick woods, alnoft impervious even to infantry. The Swedith horfe, however, puthed their way, and at laft inclofed Schullemberg between a wood and the river, where Charles had no doubt of obliging him to furrender at difcretion, or die fword in hand, as having neither boats nor bridges; but the genius of Schullemberg fupplied every defect. In the night he ordered planks and floats of trees to be fattened together ; on which he carried over his troops, while the Swedes were employed in diflodging 300 men , which he had placed in a windmill, for the purpofe of defending his flank and keeping the enemy in play. Charles fpoke of this retreat with admiration, and faid he had been conquered by Schullemberg.

No material advantage, however, refulted from this to Augutus Augultus; who was again obliged to leave Poland, and leaves Pofortify

\section*{S W E [ I49 ] S W E}
fortify the capital of his hereditary dominions, which he expected every moment to fee invefted. In the mean time the Ruffians having recovered their fpirits, attacked the Sivedes in Livonia with the utmoff fury. Narva, Dorpt, and feveral other towns, were taken, and the inhabitants and garrifons treated with great barbarity. Soon after, an army of 100,000 Ruffians entered Poland. Sixty thoufand Coffacks under Mazeppa entered the country at the fame time, and ravaged cvery thing with the fury of barbarians. Schullemberg, too, perhaps more formidable than either, advanced with 14,000 Saxons and yoכว Ruffians, difciplined in Germany, and reputed excellent foldiers. Could numbers have determined the event of war, the Swedes muft certainly have been at this time overpowered. Intead of this, however, Charles feemed to triumph over his enemies with more eafe the more numerous they were. The Ruflians were defeated fo faft, that they were all difperfed before one party had notice of the misfortunes of another. The defeating an army of 40,000 men fcarcely obftructed the march of the Sivedes, while their aftonifled enemies looked on thefe actions as the effects of witchcraft, and imagined that the king of Sweden had dealings with infernal fpirits. With thefe apprehenfions they fled beyond the Dniepr, leaving the unhappy Augullus to his fate. Schullemberg, with all his fhill and experience, fucceeded no better. The Swedifh general Renfchild engaged and defeated him in half an hour, though the Swedes were valtly inferior in number, and their enemies pofted in a moft advantageous fituation. Nothing could be more complete than this victory. This extraordinary victory, indeed, is faid to have been orving to a panic which feized the troops of Schullemberg : but it was regarded with admiration, and thought to make the renown of Renfchild equal to that of his fovereign. Charles himfelf was jealous, and could not help exclaiming, "Surely Renfchild will not compare himfelf with me!"

Soon after this vistory, which was gained on the 12 th of February, 1706, Charles entered Saxony at the head of 24,000 men. The diet at Ratifon declared him an enemy to the empire if he croffed the Oder. But to this declaration no regard was paid. Charles purfued his march; while Auguftus was reduced to the condition of a vagrant in Poland, where he poffefied not a fingle town except Cracow. Into this city he threw himfelf with a few Saxon, Polifh, and Ruflian regiments, and began to erect fome fortifications for its defence; but the approach of the Swedifh general Meyerfeldt, and the news of the invafion of Saxony, difconcerted all his meafures, and threvv him into defpair. The Ruffians indecd were his faithful allies; but he dreaded them almolt as much as the Swedes: fo that he was reduced to the neceffity of writing a letter to Charles with his own hand, begging for peace on whatever terms he thought proper to grant. However, as he was then at the mercy of the Ruflians, this tranfaction was concealed with the greateft care. His cmifiaries were introduced to the Swedilh court in the night-time; and being prefented to Charles, received the following anfwer: That King Auguflus fhould for ever renounce the crown of Poland, acknowledge Stanillaus, and promife never to reafcend the throne, Chould an opportunity offer ; that he fhould relenfe the princes Sobielki, and all the Swedifh prifoners made in the courfe of the war; furrender Pathul,
at that time refident at his court as ambaflador for the Sweden. tzar of Ruffia, and ftop proceedings againft all who had palfed from his into the Swedih fervice. Thefe articles, Charles wrote with his own hand, and delivered to Count Piper, ordering him to finih them with the Saxon ambaffadors.

After his defeat at Pultava by the Ruffians, Charles fled in a mean calalh, attended by a little troop inviolably attached to his perfon, fome on foot, and fome on horfeback. They were obliged to crofs a fandy defert, where neither herb nor tree was to be feen, and where the burning heat and want of water were more intolerable than the extremities of cold they had formetly fuffered. The whole had almoft perimed for Charles ar want of water, when a fpring was fortunately difcover- rives in ed ; after which they reached Otchakoff, a town in the after his Turkinh dominions, the baflaw of which fupplied the defeat at king with every necefiary. It was fome time, however, Pultava. before boats could be got ready for tranfporting the whole of the king's attendants; by which accident 500 Swedes and Collacks fell into the hands of the enemy. This lofs affected him more than all his other misfortunes. He fhed tears at feeing, acrofs the river Bog, the greater part of his few remaining friends carried into captivity, without having it in his power to affift them. The bathaw waited on him to apologife for the delay, and was feverely reprimanded by Charles, as if he had been his own fubject.

The king remained but a few days at Otchakoff, when the ferafquier of Bender fent an aga to compliment him on his arrival in the Turkih dominions, and to invite him to that city. Here he was treated with Is kindt: hofpitality: the Turks practifed to its full extent their received. generous maxim of regarding as facred the perfons of unfortunate princes who had taken fhelter in their dominions : and perhaps regarded him, notwithftanding his misfortur p Ruflia beCelvertunes, as an ally that might be uleful to them- gin to refelves againit the Ruffians. Every one, indeed, regarded him in his diftrefs. The French king offered him a fafe paffage from the Levant to Marfeilles, from whence he might eafily return to his own dominions. But Charles was too obflinate to receive advice. Puffed up with the notion of imitating Alexander the Great, he difdained to return except at the head of a numerous army; and he yet expected, by means of the Turks, to dethrone his adverfary the tzar. Negotiations for this purpofe were carried on in the Turkifh divan; and it was propofed to efcort Charles with a numerous army to the frontiers of Poland: but the revolution which took place there, put an end to all fuch projects. Augutlus thought himfelf no longer bound to ob Cerve the treaty which he had made, than white Charles was at hand to compel him. After the battle of Pultava, he entered Poland, and took every meafure, in concert with the tzar, for the recovery of his kingdom. Staniflaus was not able to fland before fuch enemies, but was obliged to leave his dominions and tly to Bender, in the difguife of a Swedifh officer, in order to thare the forturie of Charles.-It was not in Poland alone that the Swedifh affiars began to fuffer in confequence of the defeat at Pultava. The Danes invaded the province of Schonen with an army of 13,000 foot and 2500 horfe. Only 13,000 Swedih forces remained to defend all the territories poffeffed by Charles in Gernany ; and of thefe only a fmall part was allotted for the defence of Scho-

\section*{\(S \mathrm{E}\) [150 \(] \quad\) S \(\begin{aligned} & \text { V } \\ & E\end{aligned}\)}

Sweder. nen. The regency of Sweden, however, esertcd themfelves to the utmort to repel this ungenerous invafion: and having collected an army of 12,000 militia and 8000 regulars, difpatched them under General Steenboek into Schonen. Some Saxon troops were incorporated in this army; and among thefe a prodiyious defertion took place, which the general found it impolible to prevent; and thus the Danes gained Ceveral advantages, and at laft took Chritiantadt. Their infolence on this fuccefs was fo great, that the Swedss demanded

144
but are utterly defeated. to be inftantly led againt them. Here the good fortune of Sweden feemed once more to revive. The Danes were driven from a very frong fituation, with the lofs of 8000 killed and taken prifoners, befides a valt number wounded. The king received the intelligence of this victory with the greateft exultation; and could not help exclaiming, "My biave Swedes, flould it pleafe God that I once more join you, we thall conquer them all !"

In the mean time, Charles, by means of his agents the count Poniatoffski and the fieur Neugebar, ufed his utmoft efforts to procure a rupture between the Porte in 1711, the grand fignior, influenced by his mother, who was ftrongly in the interelt of Charles, and had
been ufed to call him her lion, determined to fupport his quarrel with Peter. He therefore gave orders to the vizir to fall on the Ruffians with an army of 200,000 men. The vizir promifed obedience; but at the fame time profeffed his ignorance in the art of war, and diflike to the prefent expedition. The khan of Crim Tartary, who had been gained over by the reputation and prefents of the king of Sweden, had orders to take the field with 40,000 of his men, and had the liberty of antembling his army at Bender, that Charles might fee that the war was undertaken on his account. See Russia, \(\mathrm{N}^{\circ} \mathrm{irg}\).

The treaty of the Pruth was moft rioiently oppofed by Count Poniatofiki and the khan of Tartary. The former had made the king acquainted with the fituation of both armies; on which be inftantly fet out from Bender, filled with the hopes of fighting the Ruffians, and taking ample vengeance. Having ridden 50 leagues polt, he arrived at the camp juft as the tzar was dirawing off his half-famiftied troops. He alighted at Poniatofski's tent; and being informed of particulars, inAlan:ly flew in a rage to the vizir, whom he loaded with reproaches, and accufed of treachery. Recollecting himfelf, howetcr, he propofed a method by which the fault might be remedied; but finding his propofal rejected, he polted hack to Bender, after having ty the grofict infults fhowed his contempt of the vizir.

The violent belaviour of Clarles did net promote his interef. The vizir perceived that his flay in Turkey might prove fatal to himfelf; and therefore determined to get him out of the commiry as foon as poffible. Succeeding vizirs adopted the fame plan; and at laft the grand fignior himfelf wrote a letter to Charles, in which lie defired him to depart by next winter, promifing to fupply him with a fuflicient guard, with money, and
every thing elle neceftary for his joumey. Charles gave Sweder. an evafive anfwer, and determined to procrallinate his jou.ney, as well to gratify his own hubborn temper, as becaufe he difcovered a correfpondence between Auguftus and the lihan of Tartary, the object of which, he had realon to believe, was to betray fim to the Saxons. When he was again prefied to fix the day of his departure, he replied, that he could not think of goirs befure his debts were paid. Being alked how much was neceflary for this purpole, he replied, \(10: 0\) purfes (A). Iwelve hundied purfes were inllantly fent Mcanami to the ferafquier at Bender, with orders to deliver them unjutt boto the king of Sweden, but not before be thould have haviour of begun his journey. By fair promifes, Char!es perfuaded him to part with the money; after which, inttead of fetting out, he fquandered array his treafure in prefents and gratifications, and then demanded 1000 purfes more before he would fet out. The ferafquier was aftomilhed at this behaviour. He fhed tears; and, turning to the king, told him, that his head would be the forfeit of having obliged him with the money. The grand fignior, on being acquainted with the hameful behaviour of Charles, Hew into a rage, and called an extraordinary divan, where he himfelf fpoke, a thing very unufual for the Turkifn monarchs. It was unanimoully agreed that fuch a troublefone gueit ought to be re- \({ }_{14} \mathrm{~S}\) moved by force, thould other means fail. Pofitive or. The Turks ders were therefore fent to Charles to depart ; and, in refolve to cale of refufal, to attack him in his quarters. Nothing force hiru could equal his obttinacy on this occafion: in fpite of the menaces of his enemies, in fite of the intreaties of his friends, he perfilted in his refolution; and at laft ather 300 Sweces, being all the rate refolioattendants he had, an army of 20,000 janifaries welltion to tearmed and furnithed with camon. At length he was firt attacked in good earneff; though it muft be nwned, that even in this extremity, the Turks thowed their regard to him, and were tender of his life, which the king did not return at all in a fimilar manner. Moft of the Swedes furrendered at once, perhaps as thinking it the only method of faving the king's life. This mifconduct, however, had a quite contray effect. Charles became the more obftinate, the more defperate his affairs feemed to be. With 40 menial fervants only, and the generals Hord and Dardorfi, he determined to defend himfelf to the laft extremity. Sceing his foldiers lay down their ers except arms, he told the generals," WVe mult now defend the 40 . houfe. Come, (adds he with a fmile), let us fight pro aris et focis." The houfe had been already forced by the Tartars, all but a hall which was near the door, and where his domeftics had aflembled. Charles forced his way through the janifaries, attended by the generals Hord and Dardorff, joined his people, and then barricaded the door. 'Thormoment he entered, the enemy, who were in the houfe, thres down their booty, and endeavoured to efcape at the windows. Charles purfued them fiom room to room with much bloodnied, and cleared the houfe in a few minutes. He then fred \(\mathrm{Fi}^{151}\) furioully from the windows, killed 200 of the Turks in a madman, a quarter of an hour, fo tl:at the bafhaw who command, but is talica ed them was at length forced to fet the houfe on fire. withen all his

\section*{S W E \\ [151] S W E}
sweden. This was done by arrows with lighted matches flot into the roof; but Charles, inflead of quinting it, gave orders for extinguifhing the fire, in which he himtelf affiled with great diligence. All efforts, however, were vain: the roof fell in' and Charles, with his few faithful companions, was ready to be buried in the ruins. In this extremity one called out, that there was a neceflity for furrendering. "What a flrange fellow! (cries the king), who would rather be a prifoner with the Turks than mix his afhes with thofe of his fovereign." Another had the prefence of mind to cry out, that the chancery was but 50 paces off, had a ttone roof, and was proof againt fire. Pleafed with the thoughis of again coming to blows, the king exclaimed, "A true Swede! Let us take all the powder and ball we can carry." He then put himfelf at the head of his troops, and fallied out with fuch fury, that the 'lurks retreated 55 paces; but falling down in the hurry, they rufhed in upon him, and carried him by the legs and arms to the bafliaw's tent.

This extraordinary adventure, which favours not a little of infanity, happened on the 12 th of February 1713. He was now kept prifoner, with all his retinue; and in this fituation he was vilited by the unfortunate Staniflaus.

Charles at laft feemed inclined to fubmit to his fate, and began ferioufly to think of returning to his kingdom, now reduced to the molt deplorable fituation. His habitation was now fixed at Demotica, a fmall town about fix leagues from Adrianople. Here he was allowed provifions for his own table and thofe of his retinue; but only 25 crowns a-day in money, inftead of 502 which he had received at Bender. During his refidence here he received a deputation from Hefle Caffel, foliciting his confent to the marriage of the landgrave with Elecnora, princefs royal of Sweden; to which he readily agreed: a deputation was alfo fent him by the regency of Sweden, requefting that he would prepare for returning to his own dominions, which were ready to fink under a ruinous war in his ablence.
O.s the \(14^{\text {th }}\) of October 1714, Charles fet out for Sweden. All the princes through whofe territories he was to pafs, had given orders for his entertamment in the moft magnificent manner; but the king, perceiving that thefe compliments only rendered his imprifonment and other misfortunes more confpicuous, fuddenly dif. miffed his Turkilh attendants, and aflembling his own people, bid them take no care about him, but inake the beft of their way to Stralfund. After this he fet out polt, in the habit of a German officer, attended only by Colonel During. Keeping the bye-roads through Hungary, Moravia, Auftria, Bavaria, Wirtemberg, the Palatinate, Wellphalia, and Mecklenburg, he arrived on the 21 tt of November at midnight before the gates of Sitalund. Being unknown, he was admitted with difficulty; but being foon recognifed by the governor, the greaten tokens of joy were thown all over the town. In the midn of the tumult Charles went to bed.

Sweden was now in the greatef ditrefs. On the news of the defeat at Pultava, the Danes had invaded Schonen, but were defeated by General Steenboek. This vitory, however, did not put an end to the war. On the contrary, the kings of Denmark and Polnd, with the tzar of Ruflia, entered into fricter bonds of
amity than ever. They dreaded the return of Charles to has own dominions, and apprehended that numberlels victories would loon ellice the rememurance of Pultava. 'They determined, therefore, to make the belf utc of their time; and perhaps Chales neticr toois a more imprudent retolution than obilinately to remana fo long in the Turkith dominiuns. The return of Charles leemed to give new life to the whole nation. Though the number of inhabitanis was vilibly diminibicd, the levies he had ordered were completed in a few weeks: Lut the hands leti to cultivate the earth confuled of the infirm, aged, and decrepid; fo that a fanine was threatened in confequence of the military rage which had leized all the youth of the kingdom.
'I'he prefence of Charles did not now produce thofe confequences which the allies had feared. 'The kingdom was too much reduced to furnifh the necelfary tupplies of men and money; and though the king's cou-fairs rage and military fkill were not in the laft diminifled, the efforts he made, inilead of reftoring Sweden to its fplendour, ferved more completely to ruin it. In 1715 Pruftia declared againft him, on account of his demanding back the town of Stetin, which that monarch had feized. To complete his embarraffment, the elector of Hanover, George I. of Britain, alfo became his enemy.
\({ }^{1} 57\)
The fing is mable to
retionve the 'The forces of Denmark, Pruflia, Saxony, and Hanover, Is \(15^{5}\) joined to invelf Wifinar, while a body of 36,000 men pafted on formed the fiege of Stralfund; at the fame time that all fides by the tzar, with a fleet of 20 large fhips of war, and I 50 enemies. tranfports, carrying 30,000 men, threw every part of the Swedilh coaft into the greateft conflernation. The heroifm of Charles could not prevail againtt fo many enemies; yet he was fill fo much dreaded, that the prince of Anhalt, with 12,000 brave troops, did not think himfelf a match for this furious enemy when at the head of only 2000, till he had entrenched his army behind a ditch, defended by chevaux de frize. It appeared, indeed, that his precaution was not unneceflary: for in the night Charles with nis men clambered up the ditch, and attacked the enemy in his ufual manner. Numbers, however, at laft prevailed; and Charles was obliged to retirc, after having feen his favourite Grothufen, General Dardorff and During, the companions of his exile, killed by his fide, he himlelf being wounded in the brealt.

This rath attempt was made in order to fave Rugen, 160 whence the town of Stralfund was fupplied with pro-befiegel, vifions. The place was well forlifed, and garrifoned with 9000 men, with Charles himfelf at their head; but nothing could refif the efforts of the enemy. By the 17th of December it was propofed to give the affault. The attack on the horn-work was defperate : the enemy was twice repulfed; but at laft, by dint of numbers, cffected a lodgement. The next day, Charles headed a fally, in which be dealt terrible deftruction among the befiegers, but was at length overpowered and obliged to retreat into the town. At lant his officers, apprehending that he mult cither fall into the hands of the enemy, or be buried in the ruins of the place, intreated him to retire. A retreat, however, was and taken, now almoft as dangerous as to remain in the town, on in fpiec of account of the fleets of the enemy with which the fea the ntmof was covered; and it is thought that this very circum- cforss of fance induced the king to coufent to it. Setling out,

\section*{S W E \\ \(S\) W E}
sweden. therefore, in a fmall boat with fails and oars, he pafied all the enemy's flips and batteries, and arrived fafe at Yhedt in Schonen.
Charles in-
vades Nor-
way to no pupore.

To revenge himfelf for thefe loffes, Charles invaded Norway with an army of 25,000 men. The Danes were every where defeated and purfued with that vigour for which the king of Sweden was fo remarkable ; but Itrong reinforcements arriving from Denmark, and provifions failing, he was at laft obliged to setire. Soon after this the Swedes lof Wifmar ; but when every thing feemed hopelefs, Baron Goertz the chief minifter and favourite of Charles contrived to fet on foot a midable of all Charess's enemies was taken off. The minifler found means to work on the isflexible temper of Charles, by reprefenting to him that the ceffion of certain provinces to Peter would induce him to affif him in his projects of again dethroning Auguftus, and of replacing James on the throne of Britain; which laft fcheme he had projected out of revenge for the elector of Hanover having feized on the duchies of Bremen and Verden. In confequence of the conferences between the tzar and Goertz, the former engaged to fend into Poland an army of 80,000 men, in order to dethrone that prince whom he had fo long defended. He engaged alfo to furnihh flips for tranfporting 30,000 Swedes to Germany and 10,000 into Denmark. This treaty, however, was not ratified ; and the king's death, which happened in 1718, put a final ftop to all the great profpects of Sweden.

The king had refolved on the conqueft of Norway before he dethroned Auguftus; and as no difficulties ever deterred him, he marched his army into that cold and barren country in the month of October, when the ground was covered with froft and frow. With 18,000 men he formed the fiege of .Frederickfhall, though the feverity of the froft rendered it almofl impoffible to break ground. Charles refolved to form trenches; and his foldiers cheerfully obeyed, digging into the ground with the fame labour as if they had been piercing a rock. On the IIth of December the \(? \mathrm{king}\) vifited the
165 trenches in the midft of a terrible fire from the enemy,
imagining that his men might be animated by his prefence. He took his pof in the moft dangerous ftation he could choofe, ftarding on a gabion and leaning with his arm over the parapet, while the enemy were firing chain thot at the very fpot where he flood. He was intreated to change bis fation ; but he remained obflinate. At laft he was feen to fall on the parapet with a deep groan, and foon afterwards expired, having been mortally wounded, as is fuppofed, by a cannon ball. See Charles XII.

Charles XII. was fucceeded by bis fifter the princefs Ulrica Eleonora, wife to the hereditary prince of Heffe. On this occafion the fates took care to make a previous flipulation for the prefervation of their liberties, and obliged the princefs to fign a paper to this purpofe before entering on the government. Their firft care was to make a peace with Great Britain, which the late king intended to have invaded. The Swedes then, to prevent their farther loffes by the progrefs of the Ruflian, the Danifh, the Saxon, and other arms, made many great facrifices to obtain peace from thofe powers. The French, however, about the year 1738 , formed a dangerous party in the kingdom, which not only broke its
internal quite, but led it into a ruinous war with Ruflia, sweden. by which it loft the province of Finland. Their Swedith majefties having no children, it was neceffary to fettle the fucceffion; efpecially as the duke of Holitcin was defcended from the queen's eldef fifter, and was, at the fame time, the prefumptive heir to the empire of Ruffia. Four competitors appeared; the duke of Holftein Gottorp, Prince Frederic of Heffe-Caffel nephew to the king, the prince of Denmark, and the duke of Deux-Ponts. The duke of Holitein would have carried the election, had he not embraced the Greek religion, that he might mount the throne of Ruffia. The tzarina interpofed, and offered to reflore all the conquefts fhe had made from Sweden, excepting a fmall diftrict in Finland, if the Swedes would receive the duke of Holftein's uncle, Adolphus Frederic bifhop of Lubec, as their bereditary prince and fucceffor to their crown. This was agreed to ; and a peace concluded at Abo, under the mediation of his Britannic majefty. This peace was fo firmly adhered to by the emprefs of Rulia, that his Daniih majefly thought proper to drop all refentment for the indiguity done his fon. The prince-fucceffor married the princefs Ulrica, third fifter to the king of Pruffia; and in 1751 entered into the poffeflion of his new dignity, which proved to him a crown of thorns. The French had acquired vaft influence in all the deliberations of the Swedifh fenate, who of late had been little better than penfiuners to that crown. The intrigues of the fenators forced Adolphus to take part in the war againft Pruffia: but as that war was difagreeable not only to the people, but alfo to the king of Sweden, the nation never made fo mean an appearance; and on Ruffia's making peace with the king of Pruffia, the Swedcs likewife made peace. Adolphus died difpirited in 1771, after a turbulent reign of twenty years; and was fucceeded by his throne.
fon Guftavus. The moft remarkable tranfaction of this An. 1775.
reign is the revolution which took place in the government in the year 1772, by which the king, from being the moft limited became one of the moft defpotic monarchs in Europe. Ever fince the death of Charles XII. the whole power of the kingdom had been lodged in the ftates; and this power they bad much abufed. Guftavus therefore determined either to feize on that power of which they made fuch a bad ufe, or perift in the attempt. The revolution was effected in the fol lowing manner. On the morning of the igth of Au gult 1772, a confiderable number of officers, as well as other perfons known to be attached to the royal caufe, had been fummoned to attend his majefty. Before ten he was on horfeback, and vifited the regiment of artillery. As he paffed through the freets he was more than ufually courteous to all he met, bowing familiarly to the loweft of the people. On the king's return to his palace, the detachment which was to mount guard that day being drawn up together with that which was to be relieved, his majetty retired with the officers into the guard room. He then addrefled them with all that eloquence of which he is faid to have been a perfeat maller; and after infinuating to them that his life was in danger, he expofed to them in the flrongeft colours the wretched flate of the kingdom, the flackics in which it was held by means of foreign gold, and the diffenfions aad troubles arifing from the fame caufe which had diffraked the diet during the coulfe of fnur-

\section*{S W E [ 153 ] S WV F}

Sweden. teen months. He aftured them that his only defign was to put an end to thefe diforders; to banifı corruption, reftore true liberty, and revive the ancient luftre of the Swedilh name, which hard been long tarnithed by a venality as notorions as it was difigraceful. Then afturing them in the ltrongeft terms that he difclained for ever all abfolue power, or what the Siwedes call fovercignty, he concluded with thefe words: "I am obliged to defend my oun liberty arid that of the kingdom, aguintt the arillocracy which rcigns. Will yuu be faithfil to me, as your furcfathers were to Gultavis Yafa and Guftavus \(\Lambda\) dolphus? I will then rifi my life for your welfare and that of my country."

The oflicers, mot of them young men, of whafe attachment the king had been long fecure, who did not thoroughly perhaps fee into the nature of his majeity's requeit, were allowed no time to refleet, inmediately confented to cvery thing, and took an oath of fidelity to him.

} faswedifh ficer.

Only three refufed. One of thefe, Frederic CederArom, captain of a company of the guards, alleged he had already, and very lately, taken an oath to be faith- ful to the fates, and confequently could not take that which his majefty then exacted of him. The king, looking at him ilernly, anfwered, "Ihink of what you are doing." "I do, (replied Cederftrom); and what I thisk to day, I flall think to morrow: and were I carable of breaking the onth by which I am already bound to the flates, I thould be likewife capable of breaking that which your majelty now requites me to take."

The king then ordeted Cederftrom to deliver up his frord, and put him in arref.

His majefty, however, apprehenfire of the impreflion which the proper and refolute condust of Cedertrom might make on the minds of the other afticers, fhortly afterwards foftened his tune; and again addrefing himfelf to Cederftrom, told him, that as a proof of the opinion he entertained of him, and the confidence he placed in him, he would return him his liword without inflling on his taking the oath, and would only defre his attendance that day. Cederffom continued firm; he anfirered, that his majefty could place no confidence in lim that day, and that he begged to be excufed fiom the fervice.

While the king was fhut up with the officers, Senator Ralling, to whom the command of the troops in the town had been given two days before, came to the door of the guard-room, and was told that he could not be admitted. The fenator infilted on being prefent at the dittribution of the orders, and fent to the king to defire it; but was anfwered, he mult go to the fenate, where his majefty would foeak to him.

The officers then received their orders from the king; the firt of which was, that the two regiments of guards and of atillery fhould be immediately affembled, and that a detachment of 36 grenadiers ftould be pofted at the door of the council-chamber to prevent any of the fenators from coming out.

But before the orders could be carried into execution, it was neceffary that the king fhould addrefs hinnfelf to the foldiers; men wholly unacquainted with his defigns, and accultomed to pay obedience only to the orders of the fenate, whom they had been taught to hold in the higheft reverence.

Vol. XX. Part I.

As his majefly, followed by the officers, was advan- Swetm. cing fiom the guard room to the parade fur this pur- \(\underbrace{}_{17!}\) pole, fome of them more cattions, or perhaps more The king timid than the reft, became, on a thart reflection, ap- pain, over prehenlive of the conlequences of the m"afure in which the foldicte. they were engaged: they began to exprets their fear; to the l:ing, that unlefs fone perfons of gieater weight and intluence than themlelves were to take a part in the fame caufe, he could fcarcely hope 10 fucceed in his enterprife. The king ilopped a while, and apposied to hefitate. A ferjent of the guards overheard their diicourfe, and cried aloud,--" It thall fucceed-l. .ong live Guttavus !" His majcily immediately faid, "Then \& will venture;"-and tiepping forward to the foldiers, he addrefied them in terins noarly fimilar to thote which he had expreffed to the officers, and with the fame fuccefs. They anfwered him with loud acclamations: one voice only faid, Nu ; but it was not attended to.

In the mean time fome of the king's emiflaries had fpread a report about the town that the king was arrefled. This drew the populace to the palace in great numbers, where they arrived as his majelty had concluded his harangue to the guards. They teftified by reiterated thouts their joy at feeng him lafe; a joy which promifed the happieft conclufion to the bufinels of the day.

The fenators were now immediately fecured. They serires the had from the window of the council-chamber beheld icnators, what was going forward on the parade beiore the pa. and belace; and, at a lofs to know the meaning of the thours comes mathey heard, were coming down to inquire into the caute whole of them, when 30 grenadicrs, with their bayonets fix-power in ed, infunned them it was his majelly's pleafure they the kingAould continue where they were. They began to talk dom. in a high tone, but were anfwered only by having the door that and locked on them.

The moment the fecret committee heald that the fenate was arrelted, th \(y\) feparated of themfelves, each individual providing tor his own fafcty. The king then mounting his horfe, followed by his officers with their fwords drawn, a large body of foldiers, and numbers of the populace, went to the other quarters of the town where the foldiers lie had ordered to be affembled were polted. He found them all equally wiiling to fupport his caufe, and to take to him an oath of fidelity. As he paffed through the Areets, he declared to the people, that he only meant to defend them, and lave his country; and that if they would not confide in him, he would lay down his fecptre, and furrender up his kingdon. So much was the king beloved, that the pcople (fome of whom even fell down on their knces) with tears in their eyes implored his majefty not to abandon them.

The king proceeded in his courfe, and in lefs than an summ 173 hour made himfelf mafter of all the military fosce in an alfermStockholm. In the mean time the beralds, by procla- bly of the mation in the feveral quarters of the city, fummoned an affembly of the States for the enfuing morning, and declared all members traitors to their country who fhould not appear. Thither his majefly repaired in all the pomp of royalty, furrounded by his guards, and holding in his hand the filver fceptre of Guftavus Adolphus. In a very forcible feech, he lamented the unliappy flate to which the country was rednced by the concuct of a

\section*{S W E}

Sureder. party ready to facrince every thing to its ambition, and reproached the flates with adapting their actions to the views of forcign courts, from which they received the wages of perfidy. "If any one dare contradict this, let him rife and fpeak."-Conviction, or fear, kept the affembly filent, and the lecretary read the new form of government, which the ling fubmitted to the approbation of the fates. It confifted of fifty-feven articles; of which the five following were the chief.
1. The king has the entire power of convoking and valuch accepts a nevo form of gotermment. diffolving the affembly of the fates as ofien as he thinks proper. 2. His majefty alone has the command of the army, fleet, and finances, and the difpofal of all offices civil and military. 3. In cale of an invafion, or of any prefling neceffity, the king may impofe taxes, without waiting for the affembly of the ftates. 4. The diet can deliberate on no other fubjects than thole propofed by the king. 5. The king flall not carry on an offenfive war without the confent of the fates. When all the articles were gone through, the king demanded if the flates approved of them, and was anfwered by a general acclamation. He then difmiffed all the fenators from their employments, adding, that in a few days he would appoint others; and concluded this extraordinary fcene \(\mathrm{L} ;\) drawing out of his pocket a fmall book of pfalms, from which, afier taking off the crown, he gave out Te Deum. All the members very devoully added their voices to his, and the hall refounded with thankfgiving.

The power thus obtained was employed by the king for the good of his fubjects. He took care that the law flould be adminititered with impartiality to the ricleat noble and the pooreft peafant, making a fevere example of fuch judges as were proved to have made juffice venal. He gave particular attention and encouragement to commerce, was a liberal and enlightened patron of learning and fcience, and laboured ftremuoully to introduce into his lingdom the moft valuable improvements in agriculture that had been made in foreign countries.

But while thus active in promoting the arts of peace, he was not inatlentive to thofe of war. The fleet, which he found decayed and frebie, he in a few years seftored to a refpetable footing, and, befides changing the regulations of the navy, he raifed a new corps of failors, and formed them to the fervice by continual exercife. The army, which, as well as the navy, had been neglected during the ariftocracy, was next to be reformed. The king began by giving cloaks, tents, and new arms to all the regiments. Afterwards, under the direaion of Field Marthal Count de Heffenflein, a new exercife was introduced, and fceeral camps were formed, in which the foldiery were manceuvred hy the l:ing himfelf. The fale of military offices, which had been piermitted for many years, was entirely fuppreffed; and the king provided not only for the te-eflabiffument of difcipline and good order in the army, but for the foture welfare of ti:e individuals which compofed it. Thefe warlike preparations were necefifiry to a plan which he had formed for entirely abolifining the power of the ariforracy, and frecing Sweden from the fations which had long been formed in it by the court of St Peterfurgh. The change which he had introduced was very ininical to the intrigues of that court; and the liuffian ambafifidor exerted himfelf openly to bring about a rupture between the king and the difcontented robtes. Gutaves ordered lim to quit the hingdom in

\section*{154 J S W E}
eight days, and immediately prepared for war with Ruffia. To this apparently rafl enterprife he was in. citea by the Ottoman Porte, at that time unable to oppofe the armies of the two cmpires; and his own ambition, logether with the internal ftate of his kingdom, powerfully concurred to make him lend every affiftance to his ancient ally. It is needlefs for us to enter into a detail of the particulars of that war, the principal circumflances of which have already been noticed under duet in the Russia, \(\mathrm{N}^{\circ}{ }_{157}\). Suffice it to fay, that neither Gufla- war with vus Adolphus nor Charles XII. gave greater proofs of Ruffia. undaunted courage and military conduct in their long and bloody wars than were given by Guffavus the 111. from the end of the year 1787 to 1790 , when peace was reflored between the courts of St Peteriburgh and Stockholm. When the court of Copenhagen was conpelied, by the means of Eugland and Pruffia, to withdraw its troops from the territoiies of Sweden, tlie king attacked Ruffia with fuch vigour both by fea and land, difplayed fuch addrefs in retrieving lis affairs when apparently reduced to the laft estremity, and renewed lis attacks with fuch pertinacious courage, that the emprefs lowered the haughtinefs of her tone, and was glad to treat with Gultavus as an equal and independent fovereign.
The king of Sweden was now at liberty to cherifh \({ }^{1778}\) again the arts of peace, and to humble the haughty fpi- bitrary rii of the nobles. For his attempling to deprive thofe difpor, men of that power which they had for many ycars em- though ployed againft their country, he has been held up to the a cioions artworld as a defpot who trampled on the liberties of his fula ard infubjects; as a man without fincerity or patriotifm; and, filions. in one word, as a perjured tyrant, who overhrecw the conflitution which he bad fivorn to maintain. That he was not troubled with a frupullous confcience, when fo artfully conducting the revolution of 1772 , miuft be acknovledged ; nor can it be denied, that in his treatics with other powers, he fometimes endeavoured to over. reach them; but if the neceflities of fate could in any cafe be an apology for falfehood, they would fufficiently apologife for the duplicity of Guftavus. He was engaged in the arduous enterprife of freeing his fubjects from an ariftocratic tyranny, fupported by a foreign powter the mofl formidable in the north; he had been forced into a war with that power, and, as there is reafon to believe, promifed affiffance which he never received ; and it camnot exciie wonder nor great indignation, that, as foon as he could make an hoolourable peace, he embraced the opportunity without paying much regard to the interefts of an alliance, which tamely looked on while he was ftruggling with difficulties apparently infurmountable. That the revolution which be effected in The \({ }^{17}\) his own country was calculated to promote the gencral lution begood of the people is unquefionable; and to gain fuch reficial. an oljeet he might furely reftore the crown to its ancient fplendour, without bringing on his goverument the odions epithet of defforifim.

The nobies, however, continued difcontented, and a prodices confpiracy was planned againft Guftavus under his own courpirace roof. He had entered into the alliance that was formed againt th againf the revolutionary government of France ; and to kings' life raife an army, which he was to lead in perfonto co-operate with the emperor and the king of Prufla, he was obliged to negociate large loans, and to inpofe on his fubjects heavy taxes. 'I he nobles took advantage of that circumftance to projudife the minds of many of the

\section*{S W E [ 15.3\(]\) S W E}

Sireden. people againt the fovereign who had laboured fo long for their grood. Un the 16 th of March 1792 he rectived :n atwoymous letter, warning him of his immediate danger from a plot that was laid to take away his life, requelling him to remain at home, and avoid balls for a year; and alfuring him that, if he fhould go to the maliquerade for which he was preparing, he would be affallimated that very night. The king read the note with contempt, and at a lite hour entered the ball-room. After fome time he fat dorm in a box with the compte d'Eften, and obferved that he was not deceived in his contempt for the letter, fiuce had there been any defign againt his life, no time could be more favourable than that moment. He then mingled, widhout apprelienfion, among the crowd; and jutl as he was prepaing to retire in company with the Prullian ambaffador, he was furrounded by feveral perfons in matks, one of whom fired a pittol at the back of the king, and lodged the contents in his body. A fcene of dreadful confulion immediately enfued. The confpirators, amidt the general tumult and alarm, had time to relire to other parts of the room; but one of them had previounly dropped his piltols and a dagger clofe by the wounded ling. A general order was given to all the company to unmalk, and the doors were immediately clofed; but no perfon appeared with any particular diftinguifhing marks of guilt. The king was immediately conveycd to his apartment; and the furgeon, after extracting a ball and fome flugs, gave f.vourable hopes of his recovery.

The favourable reports of his medical attendants foon appeared to be fallacious, and on the 28 th of March a mortification was found to have taken place. He expired on the following day, and on opening his body there were found within the ribs a fquare piece of lead and two rufty nails.

The king had by his will appointed a council of regency; but convinced by recent expcrience how little dependence was to be placed on the attachment of his nobles, and aware of the neceffity of a vigorous government in times of fuch difficulty and danger, he appointed his brother, the duke of Sudermania, fole regent, till his fon, then a minor, fhould attain the age of 18 years. In his dying moments he defired that all the confirators, except the perpetrator of his murder, might be pardoned.
Accefion The young ling, who was about 14 at his father's of Guftavus death, was proclaimed by the name of Gu!lavus IV. The iv. regent foon took the mof vigorous and active meafures to apprehend and punifh the projectors and perpetrators of the murder of his brother. A nobleman of the name of Ankerftom confeffed himfelf the affafin, and gloried in the action, which he called liberating his country from a monfler and a tyrant. He was executed in a moft cruel manner on the ryth of May. Two other noblemen, and two ofticers, alfo fuffered death; but the reft of the confpirators were either pardoned, or punihed only by fine and imprifonment.

From the acceffion of Guftavus IV. till the revolution which has been recently effected in Sweden, few tranfactions of any importance have occurred. Soon af.
ter the king had taken on himelf the adminilration of affiors, he cngaged warmly in the war againll France, and till the time of his depofition, continued a molt faith. ful ally of Britain. The efforts of the Swedill monarch towards humbling the power of Bonaparte, have been already noticed under the articles Britais and France; and the war with Ruffa, ia which his alliance with Britain had involved hin, has been fufficiently touched in the article Russia. This prince feems to have been endowed with great and amiable qualities, but he was certainly rafla and imprudent in a high degree. He thus materially injured his kingdom, and alienated the affections of his principal nobles, efpecially of his uncle the duke of Sudermania.

In the begiuning of March 1809, the plan which ap-Revolutiont pears to have been concerted between the duke of Su- in favour dermania and the principal nobility, was carried into ef. of he dukerta-
fect. The king was arrefted; the duke affumed the reins ni of government, and iflued the following proclamation.
"We, Charies, by the grace of God, Hereditary Prince of Sweden, the Goths, Vandals, \&cc. Duke of Sudermania, Grand Admiral, \&c. \&c. do declare, that under exilling circumftances, his majefty is incapable of acting, or of conducting the important affairs of the nation. We have therefore (being the neareft and only branch of the family of age) been induced, for the time being, as adminittrator of the kingdom, to take the reius of government into our hands, which, with the help of the Almighty, we will conduct fo that the nation may regain peace, both at home and abroad, and that trade and commerce may revive from their languihing fate.
"Our inviolable intention is, to confult with the ftates on the means to be taken to render the future time happy to the people of Sweden. We invite and command, therefore, all the inhabitants of our nation, our forces by fea and land, and alfo the civil o!ficers of all degrees, to obey us, as our real intention, and their welfare demand.
"We recommend you all to the protection of God Almighty.
"Done at Stockholm palace, the \(1_{3}\) th March, 1809.
(Signed) \(\left\{\begin{array}{l}\text { " Charles. } \\ \text { " C. Laberlering." }\end{array}\right.\)
Soon after Guftavus was prevailed on to abdicate the Depofition government, and the duke of Sudermania was declared of Cuftaking of Sweden, by the title of Charles XIII.

The new king foon made propofitions to the emperors acceffion of France and liuffia for a ceffation of hofilities between XIII. thefe powers and Sweden. Peace was fpeedily obtained, but on terms the moft humiliating and difadvantageous to Sweden, as fhe has been compelled to furrender to the emperor Alexander all her territory to the eaftward of the gulf of Bothnia and the river Tornea. A new confitution has been promulgated by King Charles; but the particulars of this code, which, from the enfeebled ftate of Sweden, reduced almoft to the condition of a Ruffian province, is not likely to be of long continuance, can fcarcely be interefting to our readers (B).

U 2
The
(B) It is underftood that the health of the reigning monarch is in a declining fate, fo that a new vacancy in the throne of Sweden may be expected foon to take place. It is not impofible, that on fuch an event, the ambitious

Sweden．The ropulation of Sweden，even before the late Ireaty，was very inconfiderabie，and is ufually luppofed

こ6
Population of Sweden． not to have excecded 3，000，000，of which number Swe－ dith Lapland fearcely contained \(\frac{30}{}{ }^{3} 00\) part．As Fin－ lmd appears to have been among the mott populcus di－ ftricts，we may conjecture that the lofs of that territory mult have reduced the population by at leall 500,000 ； fo that it is probable the prefent population of the coun－ tries fubject to the crown of Sweden does not exceed \(2,500,000\) ．The molt numerous part of this population is of courfe formed by peafants，who have been compu－ ted at \(\frac{2}{3}\) of the whole．Of the relt the nobility was fup－ poled to form \(\frac{1}{x} \frac{\mathrm{~T}}{0}\) part，comprehending at leatt 2,520 families．

We have feen，that from the reign of Charles XII． to the revolution under Guftavus II1．in 1772，the go－ vernment of Sweden was a limited monarchy，and that fince that time，till the acceffion of the prefent king （Charles XILI．）the power of the monaschs has been abfolute．The new conftitution aims at bringing affairs bark to their former flate；but how far it will be pro－ dutive of that effect time alone can deternine．

The revenue of Sweden，fince the unfortunate reign of Chatles XII．has been much reduced．Her gold and filver fpecie，in the reign of Adolphus Frederick， arofe chicfly from the king＇s German dominions．For－ merly the crown lands，poll－money，tithes，mines，and other articles，are faid to have produced \(1,000,000\) ． ftering，and probably the whole prefent revenue does not amount to a million and a half．The national debt of this country，due chiefly to the moneyed men in Ham－ burgh，is fuppofed to amount to about \(10,000,000\) fler－ ling．

The Swedin army is compofed of national troops， and of foreign auxiliaries；the latter being eftimated at about 12.000 ，while the former do not amount to 40．000．The foldiers are of dillinguithed valour，and very hardy，and fill retain the remembrance of the he－ raic deeds of their anceftors．

Before the year \(179^{2}\) ，the Swedifh fleet confifled of about 30 hips of the line；but at prefent it is reduced to not more than one－half，and thefe but ill appointed．

The only gold coin in Sweden is the ducat，worth about \(9^{\text {s．flerling．Of the filver currency，the crown is }}\) valued at \(4^{\text {s．} 6 d . ~ f t e r l i n g ; ~ a n d ~ t h e ~ i h e l l i n g ~ a t ~ a b o u t ~} 1 \mathrm{~d}\) ． of Endill money．The copper coinage confints chietly of half and quarter fhellings；but formorly the copper money confinted of heavy fieces nearly as large as tiles， fo that a cart or barrow was fometimes required to carry home a moderate fum that had been received in payment for merchandife．Thefe large pieces are now ravely feen．

Cliriftianity was introduced into Sweden in the gth century．Their religion is Lutherm，which was propa－ gated amang them by Gullavas Vafa about the year 5523．＇lhe Swedes are furprifingly uniform and unre－ mitting in religious matters：and have fuch an averfion to Popery，that if a Koman Catholic prief be difonvered in the country，be is treated with the greatert indignity．

The archbiniop of Upfal had a revenue of 4001．a year， and had under lim is fuilragans with modetate fipends． No clergyman had the lealt direction in the alle irs of flate．Their morals，and the landlity of their lives， were fuch as \(t 0\) endear them to the people．＇Their churches are neat，and often ornamented．A body of ecclefaftical laws and canons direct their religious eco－ nomy．A converfion to Popery，or a long contunance under excommunication，which cannot pals without the king＇s permiffion，was punifhment and exile．

The langunge of Sweden is a dialect of the Gothic， and nearly allied to thole of Denmark，Nurmay，and and ittera Iceland．In the two grand divifions of the Gothic，con－ture． finting of the German and Scandinavian dialects，the latter is dillinguithed by greater brevity and force of ex． preffion．In the fouth of Sweden，which contains the chief mals of population，fome German and French words have been adopted；while the Dalecarlian，in the north．rrett，is elleemed a peculiar dialect，felhaps oraly becaufe it contains more of the ancient temen and idion．

In the antiquity of literature，Sweden canrot pretend to vie with Denmark，Norway，or Iceland；the nolt early native chronicle，or perhaps literary compofition． being not more ancient than the \(14!h\) century．In re－ turn，while the Danes feem occupied with internal po－ licy and public regulation，the Swedes have，in modern times，borne the pa！m of genius in many depariments of literature and phitofophy．

But Swedith literature can \｛carcely be faid to have dawned till the middle of the 1 yth century，when Queen Chrillina，finding the country immerfed in ignorance， invited Grotius，Defcaltes，and other celebrated men， who，though they did not refide long in the kingdom， fowed the leed of letters，which gradually began to pro－ fper in the wife and beneficent reign of Charles XI．In the fucceeding or 18 th century，the name of Linne alone might diftinguilh the national literature；and it is joined in natural hiftory with thofe of Scheele，Bergman， Tilas，Wallerius，Quirt，Cronttedt，and others．In hi－ Itory，Dalin and Lagerbring have dillinguifhed them－ felves by a precifion and force，which the Danes feem to facrifice to antiquarian difcuffons．Siveden alfo boalts of native poets and orators；and the progrefs of the fci－ ences is fupported by the intlitution of numerous acade－ mies．

The Swedes，fince the days of Charles XII．hare Produce been at increditle pairs to correct the nature and bar．and auri－ rennefs of their country，by erecting colleges of agri－cuiture． culture，and in fome places with great fuccefs．Till of late，they had not fufficient indultry to remedy or in－ prove the difadvantages of their foil．＇The pealants now follow the agriculture of France and England ；and fome late accounts fay，that they rear almoft as much grain as maintains the batives．Gothland produces wheat，rye，barley，oats，peale，and beans；and in cafes of deficiency，the people are fupplied from Livonia and the Baltic provinces．In fummer，the fields are ver－ dant，and covered wit flowers，and produce frawber－ ries，rafpberijes，currants，and other fmall fruits．＇The commorl
views of the emperors of the north aud fouth of Europe will ultimately deftroy the fmall remains of Swedifi inde－ pendence．

\section*{S W E [ 157 ] S W E}

Swelen. common people know, as yet, little of the cultivation of appirots, peaches, nectarines, pinc-ipples, and other high-llavoured fruts; but melons are brought to the greatell perfection in dry feafons.

The Swedilh commonaliy fuhfits by agriculture, mining, hunting, grazing, and filhing. Their materials for tratice are the bolky and ufful commotities of mafts, beans, and other kinds of timber fur chipping ; tar, pitch, bark of trees, potafh, wooden utenfils, hides, thax, hemp, peltyy, furs, copper, lead, iron, cordage, and fith.

Even the manufacturing of iron was introduced into Sweden fo late as the ath century; for till then they fold their own crude ore to the Hanfe fowns, and bought it back again manufactured into utenfils. About the middle of the \(17^{\text {th }}\) century they fet up fame manafactures of glafs, tharch, tin, woollen, filk, foap, leatherdrefling, and haw-mills. Bookelling was at that time unknown in Sweden. They have fince had fugar making, tubacco plantations, and manufactures of fail cloth, cotton, fultian, and other flufs; alfo of liven, alum, brimane, paper mills, and gunpowder-mills. The iron mine of Dannemora is faid to yield 6olbs. of metal in 10olls. of ore, and others albout zolbs. The iron extracted from this is known in Europe by the name of Oregrond, which name is derived from a leaport on the Baltic. A larse portion of it is employed by different nations for mathing the beft flect. 'Whe minc wars difcovered in 1470 . The unwrought ore was firt fold to the merchants of Lubeck. It is faid that the mine of Dannemora yields 40,000 flones of bar-iron per year, which is fuppord to be \(\mathrm{T}_{1}^{-1}\) - th of the quantity produced by all the iron mines of Sweden. Of this product of 400,000 ftones, 300,050 are annually exportel, and the remainder is \(m\) mufafured at home. It is computed that not fewer than 25,600 men are employed in mining, and the branclies immediately conneted with it, viz. 4000 for breaking the rocks; 10,800 for hewing timber and burning it into charcoal; 2000 are employed in funeling ; 1800 in tranfpoting the metal from the furnaces to the forges; 600 in tranfiporting fand, fuel, \&c. 4000 for tranfporing the charcoal, and 2400 at forges. They have alfo founderies for cannun, manufatories for fire-arms and anchors, armories, wite and flating mills, alfo mills for fulling, and for boring and famping; and of late they have buit many fhips for fale.

Certain towns in Sweden, 24 in number, are called Aaple-towns, where the merchants are allowed to import and export commodities in their own fhips. Thofe towns which have no foreign commerce, though lying near the fea, are called land-rowhs. A third kind are termed mine-towns, as belonging to mine difnicks. Ab ut the year 1752 , the Swedes had greatly increafed their exports, and diminihed their imports, moft part of which arrive or are fent off in Swedilh fhips; the Swedes having now a kind of navigation act like that of the Faglifh. According to the tables drawn up by Mr Caxe, the Swedifh exports amounted, about 30 years amo, to \(1,368.8301\). while the imports amounted to \(1,0<8.3011\). leaving a balane in favour of Sweden of 360,000 !. The imporis are chiefly corn, hemn, tohacco, fingar, cof. fee: druge, filk, wine, and brandy.

There is a ercat die fity of char sete among the people of Swaden ; and what is peculiarly remarkable
among them, they have been known to have different characters in different ages. At prefent, thecir peafants feem to be a heavy plodding race of men, llrong and laardy, but without any oiber ambition than that of fubrilling themelves ad as can: they are honcf, fimple, and hofpitable; and the of the mercantile clafles are much of the fame cali; but great \({ }^{\text {Swedes. }}\) application and perfeverance is difoovered among them ail. One could form no idea that the madern Siwedes are the defcendants of thofe who, under Cliarles XII. and Guftavas Adolphos, carried terror in their names through the moll diliant countries, and hook the foundations of the greatell empires. The principal nobility and gentry of Sweden are naturally brave, polite, and holpitable; they have high and warm notions of honour, and are jealons of their national interefts. "The, drels of the cormmon people is almolt the fame with that of Denmark: the better fort are infatated with Frenci! modes and faltions. The conmmon diverfons of the Sweds are flating, ranning races in lledges, and failing in yachts
 ters when young, as they have litule to lpare in their own
life-time. The women go to plough, throth out the corn, ters when young, as they have litule to pare in their own

SW E.DENBOIGG, Emixuel, was born at Stoch-
holm in Sweden, in January 1659 . His father was billop of Weft Gothland; member of a focicty for the projagation of the golpel, formed on the plan of that of England; and prefident of the Swedifh charch in Pemmfylvania and London. To this latk uffice he was appointed by Charles XII. Who feems to have bad a great regard for the bithop, and to have continued that regard to hiis fon.

Oi the courfe of young Swedenborg's education we have procured no account; but from the chatacter of the Eather, it may be fuppoled to have been pious; and by his appearing with repatation as an author, when but 20 years of age, it is proved to have been fuccefffol, 20 years of age, it is proved to have been fuccefstol,
Hi, firlt work was publifled in 2,709 ; and the year following he fent into the world a collection of pieces on different fubjects, in Latin verfe, under the title of
Ludur Heticonius, five Cormina Bijfcellama qua variis on different fubject, in Latin verfe, under the title of
Ludus Heficonizs, five Cermina Itijcellanca guce variis in locir cecint. 'The fame year' he began has travels, firl into England, afterwards into Holland, France, and Gernany; and returning to Stockt:olm in 175 , he Gernany; and returning to Stocktolm in IV \(^{1}\), he
was two years afterwards appointed to the office of affeffur in the Metallic College by Chates X1I. who ho-
noured him with frequent converfations, and beforved feffur in the Metallic College by Chatles X1I. who ho-
noured him with frequent converfations, and befored upon him a large flare of his favour. At this period of his life Swedenhorg devoted his attention principally to phy fic and mathematical fludies; and in 1718 he accompanied the king to the fiege of FrederickPhall, where he gave an eminent proof that he had not lludied in rain. Charles could not fend his heavy arillery to Frederickfhall from the badnefs of the roads, which were then rendered much worfe than ufual by being
deeply covesed with fnow. In this extremity Swedenwere then rendered much worfe than ufual by being
deeply covesed wih fnow. In this extremity Swedenborg brougltt the friences to the aid of valoar. By the help of proper inftruments he cut through the mountains, ard raifed the valleys which feparated Sweden from Norway, and then font to his mafier two galleys, fixe large beats, asd a lloop, loaded with battering pieces, to be employed in the fiege. 'The length of this

Sweden- canal was about two miles and a ha!f. The execution borg. of this great work, however, did not occupy all his time. In 1716 he had begun to publini eflays and obfervations on the mathematical and phylical feiences, under the title of Decdalus Hyperboreus; and he found leifure during the fiege to complete his intended collec. tion, and allio in the fame year to publith an introduction to algebra, under the whimfical title of The Art of the Rules.

At the fiege of Frederick?nall he loft his patron Charles; but found another in Ulrica Eleonora, the filer and fucceffor of that hero, by whom in 1759 he was ennobled, and took of courle his feat among the fenators of the equeltrian order in the triennial aftemblies of the tlates. His promotion did not leffen his ardour for the fciences; for he publithed in the fame year \(A\) Method to fox the Value of Money, and to determine the Sivedifh Meafures ins fuch a way as to fupprefs all the Frations and facilitate the Calculations. About the fame time he gare the public a treatife on the Pofuion and Courfe of the Planets; with another on the Herght of the Tides, ard Flur and Reflux of the Sea; which, from information gathered in different parts of Sweden, appeared to have been greater formerly than when he wrote.

As Swedenborg continued, under the new fovereign, to hold the office of affeffor to the Fletallic College, he thought it neceffiary, for the difcharge of his duiy, to make a fecond journey into lorcign countries, that he might himfelf examine their mines, patticulanly thofe of Sarony and Harts. During thefe travels, which were

European
Alazazine,
3787, July. undertaken for the improvement of the manufactures of his native country, he printed at Amfterdan, 1. Prodromus princiniortum Naturahium, five novorum tentaminum, Chemiain at Phyficant experimentatem geometricè explicandi. 2. Nova obfervata et inventa circa Ferrum et Ignem, pracipue natuam Ignis Elementarum, una cum nova Camini inventione. 3. Methodus nova inveniendi Longitudines locorum terre marique ope Lunce. 4 . Modus confluendi receptacula navalin, vulgo en Sucdois, Dockybynadder. 5. Nowa conftuctio aggeris aquatici. 6. Modus explorandi virtutes Navigiortion. And at Leiplic and Hamburg, 7. Mifcellanea obfervata circa res naturales, profertim Mincralia, Ignem, et Montiun Mrata.

This journey was made, and thefe tracts publihed, in the compals of a year and a half; and perhaps there has not been another man, Linnæus excepted, who has done fo much in fo fhort a time. After his return in 1722, Swedenborg divided his time fo equally between the duties of his office and his private fludies, that in 1733 he finimed his grand work, entitled Opera Philofophica et Mineralia, and had it printed under his orn direction in 17.34, part at Drefden and part at Leipfic ; in which year he alfo went to infpect the mines of Aufria and Hungary. This work is divided into three volumes folio; the title of the firlt is Principia rerm Naturalium five novorum tentaminum, Phenomena Mundi elcmentaris phifofoplicè explicandi. 'The fecond, Regnum Subserrancun five Mincrale de Ferro; and the third, Regnum Subierraneum five Minerale de Cupro, et Orichalco; all of them written with great ftength of judgement, and ormamented with plates, to facilitate the comprchenfion of the text.

In the year 1729 he was enrolled among the members
of the Society of Sciences at Upfal, and was, probably about the fame time, made a Nellow of the Royal Aca. den.y of Sciences at Stockholar ; nor were firangers lels wiling than his own countrymen to acknowledge the greatnels of his merit. Wolfius, with many other learned foreigners, was eager to court his cunefpondence. The Acadary of St Peterbury fent him, on the 17th of Decenber 1734, a diplema of aftociation as a correfpondent member; and loon afterwards the editors of the ACla Eruditorum at Letiplic found in his works a valuable fupplement to their own collec. tion.

By many perfons the approbation of learned acadedemies would have been highly valued; tut by Baron Swedenborg it was confidered as of very little importance. "Whatever of worldly honour and advantage may appear to be in the things before mentioned, I Short Acs hold them (fays he) but as matters of low entimation, count of when compared to the honour of that holy office to whin nourable ..ich the Lord himelf hath called me, who was gra-E. Sivecioully pleafed to manifent himfelf to me, his unworthy denborg. fervant, in a perfonal appcarance, in the year 1743, to open in me a fight of the fpiritual world, and to enable me to converle with firits and angels; and this privilege has continued with me to this day. From that time I began to priut and publifh various unknown Arcana, which have been either feen by me or revealed to me, concerning heaven and hell, the flate of men after death, the true worlhip of God, the Epiritual Cenle of the Scriptures, and many other important truths tending to falvation and true wifiom."

We lhall not affront the underflandings of our readers by mahing upon this account of the Baron's call fuch reflections as every perfon of a found mind will make for himelf; but it is rather remarkable, that a man who had devoted the better part of his life to the ftudy of fuch feiences as generally fortify the mind againf the delufions of fanaticifm, and who had eren cxcelled in thefe fciences, flould have fallen into fuch a reverie as this. After this extraordinary call, the Baron dedicat. ed himfelf wholly to the great work which, he fupppofed, was aftigned him, nudying diligently the word of God, and from time to time publihing to his fellowcreatures fuch important information as was made known to him concerning another world. Among his various difcoverics concerning the fpiritual world, one is, that it exifts not in fpace. "Of this (fays he) I was convin- Sze elen. ced, becaufe I could there fee Africans and Indians very borg's L'rio near me, although they are fo many miles diftant here on earth; nay, that I could be made plefent with the vologys inhabitants of other planets in our fy fem, and allo with 57. the inhabitants of planets that are in other worlds, and revolve abont other funs. By virtue of fuch prefence (i. c. without real fpace), not of place, I have converfed with apolles, departed popes, emperors, and kings; with the late rcformers of the church, Luther, Calvin, and Melancthon, and with others from diftant countries."

Nutwithftanding the want of fpace in the fpiritual world, he tells us, "that after death a man is fo little changed that he even docs not know lut he is living in the prefent world; that he eats and drinks, and even enjoys conjugal delight as in this world; that the refemblance between the two worlds is fo great, that in the frititual world these are cities, with palaces and boufes,

Sweden- houfes, and alio writings and books, cmployments and liorg. merchandifes; that there is gold, filver, and precious flones there. In a word (he iays), there is in the fyiritual world all and every thing that there is in the natural woold, but that in heaven fuch things ate in an infinitely more perfect flate."

Such was his zeal in the propagation of thefe whimfical and fometimes fenfual doctrines, that he frequently left his native country to vifit ditant cities, particularly London and Amfterdam, where all his theological works were printed at a great expence, and with little profpect or probability of a reimburfement. "Whereever he refided when on his travels, he was (fays one of his admirers) a mere folitary, and almoft inacceffible, though in his own country of a free and open behaviour. He affected no honour, but declined it; purfued no worldly intereft, but fpent his time in travelling and printing, in order to communicate inftruction and benefit to mankind. He had nothing of the precife in his manner, nothing of melancholy in his temper, and nothing in the leaft bordering on enthufiafm in hio converfation or writings." This is too much. We believe he was an inoffenfive vifionary; of his converfation we cannot judge; but the fpecimens that we have given of his writings are frantic enthufiafm. He died at London, March 29th, in the year \(177^{2}\); and after lying in flate, his remains were depofited in a vault at the Siredifh church, near Radelift-Highway.

Though Baron Swedenborg's followers appear not to have been numerous during his life, they have increaled fince his death; and a fect fubfifts at prefent in England which derives its origin from lim, and is called the New Jerufalem Church. The difriminating tenets of this feet feem to be the following: "Holding the doctrine of one God, they maintain that this onc God is no other tha: Jefus Chrift, and that he always exifted in a human form; that for the fake of redeeming, the world, he took upon himfelf a proper human or material body, but not a human foul ; that this redemption confins in bringing the hells or evil firits into fubjection, and the heavens into order and regulation, and theteby preparing the way for a new fpiritual church; that without fuch redemption no man could be faved, nor could the arigels xetain their frate of integrity; that their redemption was effected by means of trials, temptations, or conflicks with evil firirits; and that the laft of them, by which Chrin glorified his humanity, perfecting the union of his divine with his human nature, was the paffion of the crofs. Though they maintain that there is but one God, and one divine perfon, they hold that in this perfon there is a real Trinity; confifing of the divinity, the humanity, and the operation of them both in the Lord Jefus; a Trinity which did not exif from all eternity, but commenced at the incarnation. They believe that the Scriptures are to be interpreted not only in a literal but in a fpiritual fenfe, not known to the world till it was revealed to B. Swedenborg; and that this firitual fenfe extends to every part of Scripture, except the Acts of the Apofles. They believe that there are angels attending upon tnen, refiding, as \(B\). Swedenborg fiys, in their affections; that temptation confins in a ftruggle between good and bad angels within men; and that by this means God affifs men in thefe temptations, fince of themfelves they could do nothing. Indeed B. Swedenberg maintains, that there
is an univerfal infux from God into the fouls of men, infpiring them cfpecially with the belief of the divine unity. This efllux of divine light on the figitual world he compares to the cflux of the light from the fun in the natural world.
" There are (fays B. Swedenborg) two worlds, the natural and the firitual, entirely ditinet, though perfectly correfponding to each other; that at death a man enters into the fpiritual world, when his foul is clothed with a body, which he terms fulyfantial, in oppofition to the prefent materinl body, which, he fays, is never to rife out of the grave."

SWEEP, in the fea-language, is that part of the mould of a flup where fhe begits to compafs in the rung-heads; alfo when the haufer is dragged along the bottom of the fea to recover any thing that is funk, they call this action fuceping for it.

SWEET, in the wine trade, denotes any vegetable juice, whether obtained by means of fugar, raifins, or other foreign or domeftic fruit, which is added to wines with a defign to improve them.

\section*{SWEIN-mot. See Forest Courts.}

Siverita, Marsh Gentian, a genus of plants belonging to the clats pentandria, and in the natural fyflem ranging under the 22 th order, rotacece. See Botany Iadex.

SIVIETENIA, Mahogany, a genus of plants belonging to the clafs decandria, and in the natural fyfem arranged under the 54 th order, mifocllanece. See Botary and Materia Medica Index.

The firf ufe to which mahogany was applied in England, was to make a box for holding candles. Dr Gibbons, an eminent phyfician in the latter end of the 17 th and beginning of the I8th century, had a brother, a Wen India captain, who brought over fome planks of this wood as ballaft. As the Doetor was then building a houfe in King-Areet, Cavent Garden, his brother thought they might be of Cervice to him. But the carpenters, finding the wood too hard for their tools, they were laid afide for a time as ufelefs. Soon after, Mrs. Gibbons, wanting a candle-box, the IJuctor called on his cabinet-maker to make him one of fome wood that lay in his garden. Wollaflon, the cabinet-maker alfo complained that it was too hard. The Doctor faid he muft get ifronger tocls. The candle-box was made and approved; infomuch, that the Doctor then infifted on having a bureau made of the fame wood, which was accordingly done; and the fine colour, polifh, \&c. were fo pleafing, that he invited all his friends to come and fee it. Among them was the duchefs of Buckinghanz. Her Grace begged fome of the fame wood of Dr Gibhons, and employed Wollafton to make her a bureau aifo; on which the fame of mahogany and Mr Wollafton was much raifed, and things of this fort became general.

SWIFT, Dr Jonathan, fo univerfally admired as a wit and claffical writer of the Englifh language, was born in Dublin on November 30th 1667. His father was an attorney, and of a guod family; but dying poor, the expence of his fon's education was defrayed by his friends. At the age of fix young Swift was fent to the fchool of Kilkenny, whence he was removed in his 15 th year to Trinity College, Dublin.

In his academical Pudies (fays Dr Johnfon) he was either not diligent or not happy. The teath appears to

Swift.

\section*{S TV I}

Gint. be, that he defpifed them as intricate and ufelefs. He told Mr Sheridan, his laft biographer, that he had made many effort, upon his entering the college, to read fome of the pld treatifes on logic writ by Sineglefius, Kieckermannus, Burgerdicius, \&c. and that he never had patience to go through three pages of any of them, ke was fo difgutied at the tlupidity of the work. When te was urged by his tutor to make himfelf matter of this branch, then in high effimation, and held ellentially necefiary to the taking of a degree, Swift afked him, That it was he was to learn from thofe books? His tutor told him, The art of reafoning. Swift faid, That he found no want of any fuch art; that he could reafon sery well without it; and that, as far as he could obferve, they who had made the greatelt proficiency in logic had, inflead of the art of reafoning, acquired the art of wrangling; and inflead of clearing up obfcurities, had learned how to perple.x matters that were clear enough before. For his own part, he was contented with that portion of reafon which God had given him ; and he would leave it to time and experience to flrengthen and direet it properly; nor would he run the rifls of having it warped or falfely biaffed by any fytem of rules laid down by fuch ftupid writers, of the bad effects of which he had but too many examples before his eyes in thofe reckoned the moft acute logicians. Accordingly, he made a firm refolution, that he never would read any of thofe books; which be fo pertinacionfly adkered to, that though his degree was refufed him the firft time of fitting for it, on account of his not anfwering in that branch, he went into the hall a fecond time as ill prepared as bcfore; and would alfo have been flopped a fecond time, on the fame account, if the intereft of his friends, who well knew the intlexibility of his temper, had not fepped in, and obtained it for him ; though in a manner litcle to his credit, as it was inferted in the College Regiftry, that he obtained it fpeciali gratia, "by fpecial favour ;" where it remains upon record. But this circumfance is explained by others, that the favour was in confequence of Swift's dillinguifhed talents.
"He remained in the college near three years after this, not through choice, but necdfly, litte known or regarded. By fcholars he was reckoned a blockhead; and as the lownefs of his circumkances would not permit him to keep company with perfons of an equal rank with himfelf, upon an equal footing, he fconned to take up with thofe of a lower clafs, or to be obliged to thofe of a higher. He lived therefore much alone, and his time was employed in purfuing his courfe of reading in hiftory and poetry, theri very unfaftuionable fudies for an academic ; or in gloomy meditations on his unhappy circumflances. Yct, under this heavy preflure, the force of his genius broke out, in the filt rude dranght of the Tale of a Tub, written by him at the age of 19, though communicated to nobody but his clamber.fellow Mr Waryng; who, after the publication of the hook, made no fcruple to declare, that he had read the firll iketch of it in Swifl's hand writing when he was of that age."

In 1688 , being, by the death of Godwin Swift his uncle, who had chiefly fupported lim, Icfr without (i:b). fiffence, he went to confult his mother, who then lived at Leicencr, about the future courfe of his life; and, I y her direstion, folicited the advice and patronage of Sir

Swif̂. hip with Gope sura remple recived him wh great kindnefs, and was fo much plealed with his converfation, that he detained him two years in his houfe, aud recommended hira to King William, who offered to make him a captain of horle. This not futing his dilpuftion, and 'I'emple not having it quickly in his power to provide for him otherwile, Swifi leti his patron ( \(169 \frac{1}{4}\) ) in difcontent; having pteviounly taken his mafler's degrec at Oxford, by means of a teftimonial from Dublin, in which the words of difgrace were omitted. He was refolved to enter into the church, where his firt preferment was only icol. a-year, being the prebend of Kilroot in Conner; which fome time afterwards, upon Sir Williom "'emple's earnefly inviting him back to his houle at Mourpark, he refigned in favour of a clergyman far advanced in years and burdencd wiha a numerous family. For this man he folicited the prebero, to which he himelf inducted him.

In 1690 Swift lof his patron Sir William 'temple, who left him a legacy in money, with the property of his manulcripts; and, on lis death-bed, obtaincd for him a promife from the king of the firt prebend that fhould become vacant at Wellminler or Canterbury. That this promile might not be forgotten, Swift dedicated to the king the pothumous works nith which he was entruited, and for a while attended the court ; but foon found his folicitations hopelefs. He was then invited by the earl of Perkeley to accompany him into Ircland, where, after fuffering fome crucl difappointments, he obtained the livings of Laracor and Rathbeggin in the diocele of Meath; and foon afterwads invited over the unfortunate Stella, a young woman of the name of lohufon, whofe life he contrived to embitter, and whole days, though he certainly loved her, we may confidently alfirm, he thortened by his caprice.

This lady is generally belicred to have been the daughter of Sir Willinm Temple's fleward; but her nicce, a Mrs Hearn, aftured Mr Berkeley, the editor of a volume of letters intilled Iitcrary Relics, that her father was a nerchant, and the youngeft brother of a good family in Nottingham-ftire; that her mother was the intimate fuiend of Lady Giflord, Sir William's fifter; and that flie herfelf was educated in the family with his niect, the late Mr Temple of Morpark by * Ses In* Farnham *. This nory would be intilled to the fulleft qu"y into credit, had not Mrs Hearn allirmed, in the fame letter, the fife that, before the death of Sir William Iemple, Mrs of Dean Johnfon's li:tle fortune had been greatly injured by the swift a to \(L_{i-}\) South fea Lubbles, which are known to lave injured noterary Reperfon till the year 1720: (See Company, II. 1.). lics, printed When one part of a narrative is fo palyably falfe, the in 1759, remainder will always be received with liefitation. But and Kay, whether Mifs Johnfon was the dauglater of Temple's fteward or of the friend of Lady Gifford, it is certain that Sir William left her 10001 .; and that, accompanied by Mrs Dingley, whole whole forture amounted to an annui \(y\) of 27 . for life, the went, in confequence of Swift's invitation, to Laracor. With thefe two ladies he pafied his loours of relasation, and to them he opened his bofom; but they never refided in the fame houfe, nor did he fee cither uithout a wituefs.

In I号:, Switt publithed A Difcourle of the Con:-fis on' Difenfions in Athens and Rome. It was his firt noik, and indeed the ouly which he ever exprefly acknowledged. knowledged. According to his conftant practice he had concealed lis name; but after its appearance, paying a vifit to fome Iriilh bilhop, he was afked by him if he had read that pamphlct, and what its reputation was in London. Upon his replying that he believed it was very well liked in London; "Vcry well liked!" 〔aid the bihhop with fome emotion. "Ycs, Sir, it is one of the fineft tracts that ever was witten, and Biflop Burnet is one of the bef writers in the world." Swift, who always hated Burnet with fomething more than political rancour, immediately queflioned his right to the work, when he was told by the bifhop that he was " a young man :" and fill perfilting to doubt of the jullice of Burnet's claim, on account of the diffimilarity of the ftyle of the pamplalet from that of his other works, he was told that he was "a very pofitive young man," as no perfon in Eugland but Bifhop Burnet was capable of writing it. Upon which Swift replied, with fome indignation, I am to alfure your lordhip. however, that Bifhop Burnet did not write the pamphlet, for I wrote it myfelf. And thus was he forced in the heat of argument to avow what otherwife he would have for ever concealed.

Early in the enfuing fpring King William died; and Swift, on his next vifit to London, found Queen Anne upon the throne. It was generally thought, upon this event, that the Tory party would have had the afcendant ; but, contrary to all expectation, the Whigs had managed matters fo well as to get entirely into the queen's confidence, and to have the whole adminittration of affairs in their hands. Swift's friends were now in power; and the Whigs in general, knowing him to be the author of the Difcourie on the Contefts, \&c. which was written in defcnce of King William and his minilters againt the violent proceedings of the houfe of commons, confidered themfelves as much obliged to him, and looked upon him as faft to their party. But Swift thought with the Whigs only in the flate; for with refpect to the church his principles were always thofe of a Tory. He therefore declined any intimate connection with the leaders of the party, who at that time profeffed what was called low church principles. But what above all hoocked him, fays Mr Sheridan, was their inviting Deifts, Freethinkers, Atheifts, Jews, and Infidels, to be of their party, under pretence of moderation, and allowing a general liberty of confcience. As Swift was in his heart a man of true religion, he could not have borne, cven in his private charaker, to have mixed with fuch a motley crew. But when we confider his principles in his political capacity, that he looked upon the church of England, as by law eftablifhed, to be the main pillar of our newly erected conflitution, he could not, confitently with the character of a good citizen, join with thofe who confidered it more as an ornament than a fupport to the edifice; and could therefore look on with compofure while it was undermining, or could even open the gate to a blind multitude, to try, like Sampfon, their ftrength againt it, and confider it only as fport. With fuch a party, neither his religious nor political principles would fuffer him to join ; and with regard to the Torics, as is ufual in the violence of factions, they had run into oppofite extremes, equally dangerous to the fiate. He was therefore during the earlier part of the qucen's reign of no party, but employed himfelf in difcharging the duties of his function, and in publiuling from time to

Vor. XX. Part I.
time fich tracts as he thought might be ufeful. In ti:c ycar 1704 he publimed the Tale of a Tub, which, confidered merely as a work of genius, is unqueftionably the greatell which he ever produced; but the levity with which religion was thought to be there treated, raifed up enemics to him among all partics, and eventually precluded himi from a bilnopric. From that period till the year 1708, he fcems to have employed himfelf in foli. tary ftudy; but he then gave fucceflively to the public The Sontiments of a Church of England man, the ridicule of attrology under the name of Bickerflaff, the Argument againf abolifling Chrifiamity, and the defence of the Sacramental Tef.

Soon after began the bufy and important part of Swift's life. He was employed ( 1710 ) by the primate of Ireland to Colicit the queen for a semiftion of the firf fruits and twentieth parts to the Irih clergy. This introduced him to Mr Harley, afterwards earl of Oxford, who, though a Whig himfelf, was at the head of the Tory miniltry, and in great need of an auxiliary fo able as Swift, by whole pen he and the other minitters might be fupported in pamphlets, poems, and periodical papers. In the year 1710 was commenced the Examiner; of which Swift wrote 33 papers, begiming his firlt part of it on the 10th of November 1711. The next year he publimed the Conduct of the Allies ten days before the parliament affembled; and foon afterwards, Reflections on the Barrier Treaty. The purpofe of thefe pampl:lets was to perfuade the nation to a peace, by fhowing that "mines had been exhauted and millions deftroyed" to fecure the Dutch and aggrandize the emperor, without any advantage whatever to Great Britain. Though thefe two publications, together with his Remarks on the Bijbop of Sarum's Introduction to the thirdVolume of his Hiflory of the Reformation, certainly turned the tide of popular opinion, and cffectually promoted the defigns of the miniftry, the beft preferment which his friends could venture to give him was the deanery of St Pa trick's, which he accepted in 1713 . In the midt of his power and his politics he kept a journal of his vifits, his walks, his interviews with minifters, and quarrels with his fervant, and tranfmitted it to Mrs lohnfon and Mrs Dingley, to whom he knew that whatever befel lim was interefting: but in 1714 an end was put to his power by the death of the queen, which broke down at once the whole fyftem of Tory politics, and nothing remained for him but to withdraw from perfecution to his deanery.

In the triumph of the Whigs, Swift met with every mortification that a fpirit like his could poffibly be expofed to. The people of Ireland were irritated againft him beyond meafure; and every indignity was offerel him as he walked the ftreets of Dublin. Nor was he infulted by the rabble only; for perfons of diflinguifhed rank and character forgot the decorum of common civility to give lim a perfonal affront. While his pride was hurt by fuch indignities, his more tender feelings were alfo often wounded by baie ingratitude. In luch a fituation he found it in vain to ftruggle againf the tide that oppofed him. He filently yielded to it, and retired from the world to difcharge his duties as a clergyman, and attend to the care of his deanery. That no part of his time might lie heavy on his hands, he employed his leifure hours on fome hiftorical attempts relating to the change of the miniters and the conduct of the minitry;

\section*{S W I [ 162 ]}

Switt. and completed the hiflory of the four laft ycars of the queen, which had been begun in her lifetime, but which he never publithed. Of the work which bears that title, and is faid to be his, Dr Johnfon doubts the genuinenefs; and it certainly is not fuch as we thould have expected from a man of Swift's fagacity and opportunities of information.
In the year 1716 he was privately married to Mirs Johnfon by Dr Athe bihhop of Clogher ; but the marriage made no change in their fituation, and it would be d:fficult to prove (fays Lord Orrery) that they were ever afterwards together but in the prefence of a third perfon. The dean of St Patrick's lived in a pivate manner, known and regarded only by his friends, till about the year 1 ', 20 that he publithed his firit political pamphiet relative to Ireland, intitled a Propofal for the Univerfal Ure of Irifls Manufąhures; which fo roufed the indiguation of the minitry that they commenced a profecution againtt the printer, and thus drew the attention of the public to the pamphlet, and at once made its author popular.
Whilf he was enjoying the laurels which this work had wreathed for lim, his felicity, as well as that of his wife, was intcrrupted by the death of Mrs V'an Homrigh, and the publication of his poem called Cadenus and Vanefa, which bro:ght upon him much merited obloquy. With Mrs Van Homrigh he became acquainted in London during his attendance at court; and finding her poffened of genius and fond of literature, he took delight in directing her fludiee, till he got infenfibly poffefian of her heart. From being proud of his praife, fhe grew fond of his perfon; and defpiling valgar reftaints, the made him ferifible that the was ready to receive him as a hufband. She had wit, yout, beauty, and a competent fortune to recommend her; and for a while Swift feems to have been undeterained whether or not he Thould comply with her wilh. She had followed him to Ireland, where fhe lived in a houfe about twelve miles diftant from Dublin; and he continued to vifit her occafionally, and to direet her fludies as he had done in London; but with thefe attentions fhe was not fatisfied, and at latt fent to him a letter written with great ardour and tendernefs, infifting that he thould immediately accept or refufe her as a wife. His anfiwer, which probably contained the fecret of his marriage, he carried himfelf; and having indignantly thrown it on the lady's table, infantly quitted the houfe, we believe without fpeaking to her, and returned to Dublin to reffect on the confequences of his own conduc. Thefe were dreadful. Mrs Van Homrigh furvived her difappointmert hut a few weeks; during which time the cancelled a will that fhe had made in his favour, and ordered the poem to be publilled in which Cadenus had proclaimed ber excellence and confeffed his love.

His partiotifm again burf forth in 1724 to obfluct the currency of Wood's halfpence; and his zeal was crowned with fuccefs. Wrood had obtaired a patent to coin 180, cool. in halfpence and farthings for the king. dom of Ireland; and was about to turn his lorafs into gold, when Swift, finding that the metal was debafed to an enormous degree, wrote letters under the name of MI. B. Drapier to flow the fully of giving gold and filver for coin not worth a third part of its nominal valuc. A profecution was carried on againd the printer;
and Lord Carterct, then lord-lieutenant, iffued a proclamaticn, offiering 3 col. for difcovering the author of the :ourth letter. 'The day after it was publithed there was a full levee at the caftie. The lord-lieutenamt was goirg round the circle, when Swift abruptly entered the chamber, and pufing his way through the coowd, never ftopped till he got within thic cincle; where, with marks of the higheftitdignation in his countenance, he addreffed the loid-licutenant with the voice of a Stentor, that re-echoed through the room, "So, rny lordlieutenant, this is a glorious exploit that you pertormed yctierday, in iffuing a proclamation againtl a poor flupkecper, whofe only crime is an haneft endeavour to fave
 men of what this devoted nation is to hope for from your government. I fuppofe you expect a fitatue of copper will be erested to you for this fervice done to Woad." He then went on for a long time, inveighing in the bitterelt terms againt the patent, and dif laying in the ftrongeft colours all the fatal confequences of intioducing that execrabie coin. The whole affembly were fluck mute with wonder at this unprecedented fcene. For fome time a. profound filence enfued. When Lord Carteret, who had liftened with great compofure to the whole \(f_{\text {reech }}\), made this fine reply, in a line of Virgil's:

\section*{Res dura, ei segni novitas me talia coguns Moliri.}

From this time Swift was known by the name of the Dean, and was achnowledged by the populace as ite champion, patron, and inftructor of Ireland.

In 1727 he returned to England; where, in conjunction with Pope, he collected thrce volumes of mifcellanies; and the fame year he fent into the world his Gulliver's Travels, a proiuction which was read by the ligh and the low, and filled every reader withe a mingled emotion of merriment and amazement. Whill he was enjoying the reputation of this work, he was fuddenly called to a home of forrow. Pcor Siella was finking into the grave; and after a languifling decay of about two months, died in her \(44^{\text {th }}\) year, on lanuary 28.1728. How much he wifhed her life is thown by his papers; nor can it be doubted that he dreaded the death of her whom he loved moff, äggravated by the confcioufnefs that himfelf had liaftened it. With her vamiked all his domeftic enjoynients, and of courfc he turned his thoughts more to public affairs; in the contemplation of which he could fce nothing but what ferved to increafe the malady. The advances of old age, with all its attendant infirmities; the death of almoft all his old friends; the frequent returns of his molt difpiriting maladies, deafnefs and giddinefs; and, above all, the dreadful apprehenfions that he fhould outlive his underllanding, made life fuch a burden to him, that he had no hope left but a fpeedy diffolution, which was the object of his daily prayer to the Almighty.

The feverity of his temper increafing, he drove his acquaintance from his table, and wordered why he was deferted. In 1732 , he complains, in a letter to Mr Gay, that " he had a large houfe, and flould hardly find ore vifitor if he was not able to hire him with a bottle of wine :" and, in another to Mr Pope, "that he was in danger of dying poor and friendlefs, cven his female friends having forfaken him; which," as he fays, "ves-

\section*{S W I • [ 163 ] S W I}

Swill. \(-\) ed him mont." Thee complaints were afterwards replated in a drain of yet greater fenfibility: " All my friends have fortaken me.
"Vertiginofus, inops, furdus, male gratus amicis.
"Deaf, giddy, helpless, left alone,
"To all my friends a burden grown."
The fits of giddiness and deafness to which he had been lubjected from his boyih years, aud tor which he thought walking or riding the bell remedy, became more frequent and violent as he grew old ; and the presfentiment which he lad long entertained of that wretchednefs which would inevitably overtake him towards the clone of life, clouded his mind with melancholy and tinged every object around him. How miferable he was rendered by that gloomy profpect, we may learn from the following remarkable anecdote mentioned by Mr Faulkner in his letter to Lord Chettertield. "One time, in a journey from Drogheda to Navan, the dean rode before the company, made a fudden flop, difmounted from his horle, fell on his knees, lifted up his hands, and prayed in the moil devout manner. When his friends came up, he defied and infifted on their alighting; which they did, and afked him the meaning. "Gentlemen," said he, " pray join your hearts in fervent prayers with mine, that I may never be like this oak-tree, which is decayed and withered at top, while the other parts are found." In 1736 , while he was writing a fatire called the Legion Club againft the Irith parliament, he was feized with fo dreadful a fit of his malady, that he left the poem unfinifhed; and never after attempted a compoficion that required a courfe of thinking. Erom this time his memory gradually declined, his pallions perverted his undertanding, and, in 1741 , he became utterly incapable of converfation ; and it was found neccflary to appoint legal guardians to his perfon and his fortune. He now loft all fenfe of diftinction. His meat was brought to him cut into mouthfuls; but he would never touch it while the levant ftaid; and at lat, after it food perhaps an hour, would eat it walking; for he continued lis old habit, and was on his feet ten hours a day. During next year a thor interval of reafon enfuing, gave hopes of his recovery; but in a few days he furk into lethargic flupidity, motionlefs, heedless, and fpeechlefs. After a year of total filence, however, when his housekeeper told him that the ufual illuminations were greparing to celebrate his birth, he anfwered, " It is all folly; they had better let it alone." He at lat funk into a perfect filence, which continued till the \(29^{\text {th }}\) of October 1745, when he expired without a ftruggle, in his \(7^{8 \text { th }}\) year. The behaviour of the citizens on this occafion gave the flrongeft proof of the deep impreffion he had made on their minds. Though he had been fo many years to all intents and purpofes dead to the world, and his departure from that fate feemed a thing rather to be withed than deplored, yet no fooner was his death announced, than they gathered from all quarters, and forced their way in crowds into the house, to pay the lat tribute of grief to their departed benefactor. Nothing but lamentations were heard all around the guarter where he lived, as if he had been cut off in the viyour of his years. Happy were they who firft got into the chamber where he lay, to procure, by bribes to the servants, locks of his hair, to be handed down as faced relics to their posterity; and fo eager wore numbers to
obtain at any price this precious memorial, that in lets than an hour, his venerable head was entirely flipped of all its filver ornaments, fo that not a hair remained. By his will, which was dated in May 1740 , jult before he ceafed to be a reafonable being, he lett about 12001. in frecific legacies; and the refl of his fortune, which amounted to about 14,0 col. to erect and utidow mole pital for lunatics and idiots. He was buried in the mott private manner, according to directions in his will, in the great aille of St Patrick's cathedral, and, by way of monument, a flab of black inarble was placed against the wall, on which was engraved the following Latin epitaph, written by himfelf:
himself:

Swift undoubtedly was a man of native genius. His fancy was inexhauftible; his conceptions were lively and comprehenfive; and he had the peculiar felicity of convexing them in language equally correct, free, and perfpicuons. His penetration was as quick as intuition; he was indeed the critic of nature; and no man ever wrote fo much, and borrowed fo little.

As his genius was of the frit claps, fo were forme of his virtues. The following anecdote will illuftrate his filial piety. His mother died in in 10, as appears by a memorandum in one of the account-books which, Dr Swift always made up yearly, and on each page entered minutely all his receipts and expences in every month, beginning his year from November 1. He observed the fame method all his lifetime till his lat illness. At the foot of that page which includes his expences of the month of May 1710 , at the glebe houfe of Laracor in the county of Meath, where he was then refident, are the fe remarkable words, which how at the fame time his filial piety, and the religious fe which he thought it his duty to make of that melancholy event. "Mem. On Wednefday, between fever and eight in the evening, May 10 . 1710 , I received a letter in my chamber at Laracor (Mr Percival and Jo. Beaumont being by) from Mrs F-, dated May 9, with one inclofed, rent by Mrs Worral at Leicefter to Mrs F-_, giving an account that my dear mother, Mrs Abigail Swift, died that morning, Monday April 24 1710, about ten o'clock, after a long ficknefs: being ill all winter, and lame; and extremely ill about a month or fix weeks before her death. I have now loft my barrier between me and death. God grant I may live to be as well prepareed for it as I confidently believe her to have been! If the way to heaven be through piety. truth, justice, and charity, flu is there. J. S." He always treated his mother, during her life, with the utmoit duty and affectron; and the fometimes came to Ireland to vifit him after his fettlement at Laracor.

The liberality of the dean hath been a topic of jut t

\section*{S W I [ \(\left.1 \sigma_{4}\right] \quad\) S W I}
encomium with all his admirers; nor could his enemies deny hm this praife. In his domeltic affairs, he always acted with flrict economy. He kept the moft regular accounts ; and he feems to hare done this chiefly with a view to increale his power of being ufeful. "His income, which was little more than jool. per annum, he endeavoured to divide into three parts, for the following purpofes. Firlt, to live upon one-third of it. Secondly, to give another third in penfions and charities, according to the manner in which perfons who received them had lived: and the other third he laid by, to build an hofpital for the reception of idiots and lunatics." "What is remarkable in this generous man, is this (fays Mr F.), that when he lent money upon bond or mortgage, he would not take the legal interelt, but one per cent. below it."

His charity appears to have been a fettled principle of duty more than an inflinctive effort of good nature: but as it was thus founded and fupported, it had extraordinary merit, and feldom failed to exert itfelf in a manner that contributed moft to render it beneficial. He did not lavih his money on the idle and the worthlef. He nicely difcriminated characters, and was feldom the dupe of impofition. Hence his generofity always turned to an ufeful account ; while it relieved diftrefs, it encouraged induftry, and rewarded virtue. We dwell with great pieafure on this truly excellent and diftinguilhing part of the dean's charafter : and for the fake of his charity we can overlook his oddities, and almolt forgive his faults. He was a very peculiar man in every refpect. Some have faid, "What a man he would have been, had he been without thofe whims and infirmities which fhaded both his genius and his character!"" But perhaps the peculiarities complained of were infeparable from his genius. The vigour and fertility of the root could not fail now and then of throwing out fuperfluous fuckers. What produced thefe, produced alfo the more beautiful branches, and gave the fruit ali its richnefs.

It mut be acknowledged, that the dean's fancy hurried him into great ablurdities and inconfiftencies, for which nothing but his extraordinary talents and noble virtues, difcovered in other inftances, could have atoned. The rancour he difcovered on all occafions towards the diffenters is totally unjuftifable. No fect could have merited it in the degree in which he always flowed it to them; for, in fome inftances, it bordered on downright ferfecution. He doubtlefs had his reafons for expofing their principles to ridicule, and might perhaps have fufficient grounds for fome of his accufations againft their principal leaders in Ireland; but nothing could juttify his virulence againit the whole body. In a fhort poem on one clafs of diffenters he beftowed a fricture upon Bettefworth, a lawyer eminent for his infolence to the clergy, which, from a very confiderable reputation, brought him into immediate and univerfal contempt. Bettefworth, enraged at his difgrace and lofs, went to the dean, and demanded whether he was the guthor of that poem? "Mr Bettefworth (anfwered he), I was in my youth acquainted with great lawyers, who, knowing my difpofition to fatire, advifed me, if any fcoumblel or llockhead whom 1 had lampooned thould aft, 'A Are you the author of this paper ?' to tell him that I was not the author; and therefore, I tell you,

Mr Bettefworth, that I am not the author of thefe lines."

Ewift has been accufed of irreligion and mifanthropy, on account of his Tale of a Tub, and his Yahoos in Gulliver's Travels; but both charges feem to be illfounded, or at leaft not fupported by that evidence. The Tale of a Tub holds up to ridicule fuperftitious and fanatical ablurdities; but it never attacks the effentials of religion : and in the flory of the Tahcos, difyuting we contels, there appears to us as little cvidence that the author hated his own fpecies, as in the poems of Sircplion and Chloe, and the Ladies Drefling Room, that he approved of groffnels and filth in the female lex. We do not indeed, with his fondeft admirers, perceive the moral tendency of the Voyage to the Houyhnhnms, or confider it as a fatire admirably calculated to reform mankind ; but neither do we think that it can poffibly corrupt them, or lead them to think meanly of their rational nature. According to Sheridan, "the defign of this apologue is to place before the eyes of man a picture of the two different parts of his frame, detached from each other, in order that he may the better eftimate the true value of each, and fee the neceffity there is that the one fhould have an abfolute command over the other. In your merely animal capacity, fays he to man, without reafon to guide you, and actuated only by a blind inftinet, I will how you that you would be degraded below the beafts of the field. That very form, that very body, you are now fo proud of, as giving you fuch a fuperiority over all other animals, I will fhow you, owe all their beauty, and all their greatelt powers, to their being actuated by a rational foul. Let that be withdrawn, let the body be inhabited by the mind of a brute, let it be prone as theirs are, and fuffered like theirs to take its natural courfe, without any affiftance from art, you would in that cafe be the moft deformed, as to your external appearance, the moft deteftable of all creatures. And with regard to your internal frame, filled with all the evil difpofitions and malignant paffions of mankind, you would be the moft miferable of beings, living in a continued fate of internal vexation, and of hatred and warfare with each other.
"On the other hand, I will how another picture of an animal endowed with a rational foul, and acting uniformly up to the dictates of right reafon. Here you may fee collected all the virtues, all the great qualities, which dignify man's nature, and conftitute the happinefs of his life. What is the natural inference to be drawn from the ee two different reprefentations? Is it not evidently a leffon to mankind, warning them not to fuffer the animal part to be predominant in them, left they refemble the vile Yahoo, and fall into vice and mifery; but to emulate the noble and generous Houyhnhnm, by cultivating the rational faculty to the utmolt; which will lead them to a life of virtue and happinefs."

Such may have been the author's intention; but it is not fufficiently obviuus to produce the proper effect, and is indeed hardly confiftent with that incapability under which he reprefents the Yahoos of ever acquiring, by any culture, the virtues of the noble Houyhnhnme.

With relpect to his religion, it is a fact unqueftionable, that while the power of fpeech remained, he continued conftant in the performance of his private devotions; and in proportion as his memory failed, they

\section*{S W I}
were gradually flortened, till at laft he could only repeat the Lord's prayer, which he continued to do till the power of utterance for ever ceafed. Such a habit as this could not have been formed but by a man deeply imprefied with a conviction of the truth and importance of revelation.
The molt inexcufable part of Swifi's conduct is his treatment of Stella and Vancfia, for which no proser apology can be made, and which the vain attempts of his fricuds have only tended to aggravate. One attributes his fingular conduet to a peculiarity in his confltution; but if he knew that he was incapable of fulfilling the duties of the married flate, how came he to tie one of the ladies to himfelf by the mariage ceremony, and in the moft explicit terms to declare his paffion to the other? And what are we to think of the Penfibility of a man who, ftrongly attached as he ferms to have been to both, could, without fpeaking, fing a papcr on the table of the one, which "proved (as our author expreffes it) lier death-warrant," and could throw the other, his beloved Stella, in her laft illnefs, into unfpeak able agonies, and " never fee her more, for only adjuring him, by their friendflip, to let her have the fatistaction of dying at leaft, though the lad not lived, his achnowledged wife ?" Another apologift infinuates, upon fomething like evidence, that Stella bore a fon to Swift, and yet labours to excufe him for not declaring her his wife, becaufe the had agreed at the marriage that it flould re\(\operatorname{main}\) a fecret from all the world unlefs the difcovery Mould be called for by urgent neceffity; but what could be meant by the term urgent necefity, unlefs it alluded to the birth of children, he confeffes that it would be hard to fay. The truth we believe to be what has been faid by Johnfon, that the man whom Stella had the misfortune to love was fond of fingularity, and defirous to make a mode of happinefs for himfelf, different from the general courfe of things and the order of Providence; he wilhed for all the pleafures of perfect friendihip, without the uneafnefs of conjugal relitaint. But with this flate poor Stella was not fatisfied; the never was treated as a wife, and to the world the had the appearance of a miftrefs. She lived fullenly on, hoping that in time he would own and receive her. This, we believe, he offered at haft to do, but not till the change of his manners and the depravation of his mind made her tell him, that "it was too late."

The natural acrimony of Swift's temper had been increafed by repeated difappointments. This gave a fplenetic tincture to his writings, and amidnt the duties of private and domettic life it too frequently appeared to ilade the luftre of his more eminent virtues.- The dean hath been accufed of avarice, but with the fane truth as he hath been accufed of infidelity. In detached views, no man was more liable to be miftaken. Even his genius and good fenfe might be queftioned, if we were only to read fome paffages of his writings. To judge fairly and pronounce juflly of him as a man and as an author, we fhould examine the uniform tenor of his difpofition and conduct, and the general nature and defign of his productions. In the latter he will appear great, and in the former good; notvithftanding the puns and puerilities of the one, and the abfurdities and inconfiftencies of the other.
Swift, a fpecies of fwallow. See Hirundo, OrniFhology Index.

SWIMMING, the art of fufpending one's felf on Swimning: water, and at the fame time making a progreffive motion through it.
As fuimming is not natural to man, it is evident that Swimming at fome period it muft have been unknown among the not natural human racc. Neverthelefs there are no accounts of its origin to be found in the hiftory of any nation; nor are there any nations fo barbarous but that the art of fwimming is known among them, and that in greater perfection than among civilized people. It is probable, therefore, that the art, though not abiolutely natural. will always be acruired by people in a favage flate from imitating the brute animals, moft of whom fwin naturally. Indecd fo much does this appear to be the cafe, that very expert livimmers have recommended it to thofe who wifhed to learn the art, to keep fome frogs in a tub of water conftantly befide them, and to imitate the motions by which they move through that element.

The theory of lwimming depends upon one very fim- Depernds on ple principle; namely, that if a force be applied to any a fimple body, it will always move towards that fide where there principle. is the leaft refiftance. Thus, if a perfon flanding in a boat puhlhes with a pole againf the fide or any other part of the vefiel in which he ftends, no motion will enfue; for as much as he preffes in one direction with the pole, juft fo much does the adion of his feet, on which the preflure of the pole mull ultimately reft, puft the veflel the other way: but if, inflead of the fide of the veffel, he pufhes the pole againf the hore, then only one force ads upon it, namely, that of the feet; which bcing refifted only by the fluid water, the boat begins to move from the thore. Now the very fame thing takes place in fwimming, whether the animal be man, quadruped, bird, or fifh. If we confider the matter fimply, we may fuppofe an animal in fuch a fituation that it could not polifibly fwim : thus, if we cut off the fins and tail of a fith, it will indeed float in confequence of being feecifically lighter than the water, but cannot make any progreffive motion, or at leaf but very little, in confequence of wriggling its body; but if we allow it to keep any of its fins, by ftriking them againft the water in any direction, the body moves the contrary way, jult as a boat moves the eontrary way to that in which the oars ftrike the water. It is true, that as the boat is but partly immerged in the water, the refiftance is comparatively lefs than when a frog or even any other quadruped fiwims ; but a boat could certainly be rowed with oars though it was totally iminerged in water, only with lefs velocity than when it is not. When a man fwims, he in like manner frikes the water with his hands, arms, and feet; in confequence of which the body moves in a direction contrary to the flroke. Upon this principle, and on this only, a man may either afcend, defcend, or move obliquely in any poffible direstion, in the water. One would think, indeed, that as the frength of a man's arms and legs is but fmall, he could make but very little way by any ftroke he could give the water, confidering the fluidity of that clement. Neverthelefs it is incredible what expert fwimmers will perform in this way; of which Mr Forter gives a moft remarkable inflance in the inhabitants of Otaheite; whofe agility, he tells us, was fuch, that when a nail was thewn overboard, they would jump after it into the fea, and never fail to catch it before it reached to the boitom.
As to the prantice of fwinming, there are but few direations

Swimming. diredions which can be giver. The great obflacle is the natural dread which people have of being drowned ; and this it is impoffible to overcome by any thing but accuffoming ourfelves to go into the water. With rcgard to the real danger of being drowned, it is but little; and on innumerable occafions arifes entirely from the terror above mentioned, as will appear from the lollowing obfervations by Dr Tranklin.
" ift, That though the legs, arms, and head, of a human body, being folid parts, are fpecifically lomewhat heavier than frefh water, yct the trunk, particularly the upper part, from its hollownefs, is fo much lighter than water, as that the whole of the body, taken together, is too light to fink wholly under water, but fome part will remain ahove until the lungs become filled with water; which happens from drawing water into them inflead of air, when a perfon in the fright attempts breathing while the mouth and nultrils are under water.
" 2 dly, That the legs and arms are fpecifically lighter than falt water, and will be fupported by it ; fo that a human body would not fink in falt water though the lungs were filled as above, but from the greater fpecific gravity of the head.
" 3 dly, 'That therefore a perfon throwing himfelf on his back in falt water, and extending his arms, may eaflly lic fo as to keep his mouth and noflrils free for breathing; and by a fmall motion of his hands may prevent turning, if he fhould perceive any tendency to it.

4 thly, That in frefh water, if a man throw's himfelf on his back near the furface, he cannot long continue in that fituation, but by a proper action of his hands on the water. If he ufes no fuch action, the legs and lower part of the body will gradually fink till he comes into an upright pofition; in which he will continue fufpended, the lollow of the breatt kecping the head uppermoit.

5thly, Rut if in this erect pofition the head is kept upright above the floulders, as when we fand on the ground, the immerfion will, by the weight of that part of the head that is out of the water, reacli above the month and notrils, perhaps a little above the eycs; fo that a man cannot long remain fulpended in water with his head in that pofition.
" 6thly, The body continued fufpended as before, and upright, if the head be leaned quite back, fo that the facc looks upwards, all the back part of the head being then under water, and its weight confequently in a great meafure fupported by it, the face will remain above water quite free for breathing, will wife an inch ligher evely infpiration, and fink as much every expiation, but never fo low as that the water may come over the nouth.
"- -1hly, If therefore a perfon unacquainted with fwimning, and falling accidentally into the water, could liave prefence of nimd fufficient to avoid Itruggling and 1,lu.ging, and to let the body take this natural pofition, he might continue long fafe from drowning, till perhaps help would come; for as to the clothes, their additional weight while immerfed is very inconfiderable, the water fupporting it; though when he comes out of the
belly, keeping the head and neck pereenly upright, the brealt advancing forward, the thorax inftated, and the brek bent; then withdrawing the tegs from the bottom, and fretching them oat, trike the arms forwards in unifon with the legs. Swmming on the back is fomewhat fimitat to that oa the belly; but with this difference, that although the legs are employed to move the bedy frwards, the arms are generally unemployed, and the proglellive motion is derived from the movement of the legs. In diving, a perfon mut clofe his hands together, aid, prefling his chin upon his breall, make an exertion to bend with force foruards. While in that pofition, he mult continue to move wih rapidity under the furface; and whenever he chootes to return to his former fituation, he has nothing to do but bend back his head, and he will immediately return to the furface.

It is very common for noviccs in the art of fwimming to make ule of corks or bladders to affit in keeping the body above water. Some have utterly condemued the ufe of thefe ; however, Dr Franklin allows that they may be of fervice for fupporting the body while one is leaming what is called the froke, or that manner of drawing in and friking out the hands and feet that is neceflary to produce progrellive motion. "But (fays he) you will be no fwimmer till you can place confidence in the power of the water to fupport you: I would therefore advile the acquiring that confidence in the firt place, efpecially as I have known feveral who, by a little of the practice neceflaty for that purpole, have infenfibly acquired the flroke, taught as it were by nature.
"The practice I mean is this: Choofing a place and of acwhete the water deepens gradually, walk coolly into it quiringco till it is up to your breaft : then turn round your face fidence. to the fhore, and throw an egg into the water, between you and the thore; it will fink to the bottom, and be eafly feen there, if the water is clear. It muft lie in the water fo deep as that you cannot reach it to take it up but by diving for it. 'Jo encourage yourfelf in order to do this, reflect that your progrefs will be from deeper to thallower water; and that at any time you may, by bringing your legs under you, and flanding on the bottom, raife your head far above the water: then plunge under it with your eyes open, throwing yourfelf towards the egg, and endeavouring, by the action of your hands and feet againf the water, to get forward till within reach of it. In this attempt you will find that the water buoys you up againt your inclination ; that it is not fo eafy a thing to fink as you imagined; that you cannot but by active force get down to the egg. Thus you fee! the power of the water to fupport you, and learn to confde in that power; while your endeavours to overcume it, and to reach the egg, teach yon the manner of aeting on the water with your feet and hands; which action is afterwards ufed in fivinming to fupport your bead higher above water, or to go forward throngh it."

As fwimming is a bealthy exercife and a pleafant swimmin amulement, and as a dexterity in it may frequently put a phatam it in a man's power to fave his own life and the lives of and ufefin his fellow-creatures, perhaps of his deareft friends, it exercic can neither be ufelefs nor minterefling to confider a few of the evolutions which a fwimmer mult be mafter of, that he more in any direction without diliculty, without danger, and without being unneceflarily fatigued.

\section*{S W I 「 167 ] S W I}
immine.

There ase feveral different ways of turning one's felf in fivinening. You may do it in this way: Tlun the paln of the right hand outwards, extend the arm in the fame manner, and make a contrary movement with the left hand and left arm; then, by a gradual motion, incline your hend and whole body to the left fide, and the evolution will be finithed. There is another way which is eafier lill: Bend your head and body toward that fide to which you are going to lurn. If you wifh to turn to the left, incline the thumb) and the right hand tovard the bottom, bend the fingers of the right hand, ftrech it out, and ufe it for driving away the water fidewile, or, which is the fame thing, fur pulhing yourfelf the contrary way. At the fame time, with your left hand, the fingers being clofe, puth the watcr behind you, and all at once turn your body and your face to the left, and the nanocuvre will be accomplinhed. If you wih to turn to the right, yon mond do with your right hand what you did with your left, and with your left what you did with your right. You mult be careful when turning yourfeif never to ftrctch out your legs, and be fure that the water be fo deep that you be in no danger of hurting yourfelf.

When you are fivimming on your belly, and wifh to turn on your back, draw your feet in quickly, and throw them before your ; ffetch out your hands behind you, and keep your body firm and fteady. When you with to turn from fwimning on your back, fold your feet at once under your body as if you were throwing them to the bottom, and at the fame inflant dart your body forvards, that you may fall upon your belly.
In fwimming, the eyes ought to be turned towards heaven. This is a moft important rule, ard to the negleft of it many of the accidents which bcfal fwimmers are owing. For when they bend their eyes downwards, they infenfibly bend their head too, and thus the mouth being too deep in the water, may admit a quantity of it in breaking ; befides, the more the body is fletclied, it covers a greater part of the furface of the water, and confequently its fpecific gravity is lefs. Any perfon who will make the experiment will find it imponible to dive while he keeps his head ereft and his eyes fixed on the heavens ( A ).

The eafieft polure in fwimming is lying on the back. When you wifh to fwim in this pofture, lay yourfelf foftly on your back, and raife your breaft to the ferface of the water, keeping your body extended in the fame line. Put your hands eafily over the upper part of your thighs, and throw out your legs and draw them in alternately, keeping them within two feet of the furface. In this way you may advance in any direction you pleafe. You may perhaps not like having fo much of your head under water; there is, however, no way of fivimming fo cafy, fo fafe, and fo little fatiguing. If you wilh to
fwim with great rapidite, you may ufe your arms as well swimming. as your feet; and you will find this the cafieft way of \(\xrightarrow{\text { and }}\) breahing the furce of the waves.
fin furmming on the back, one may advance forwared and adt as well as backward. For this purpufe the hody mult vanis form be kept flraight and extended; the breaft ir,lated, fo \% urds. that the hollow of the back may afume a femicicclar form. The hands muft recline over the upper parts of the thighso It is allo neeeflary to raife the legs one ato ter another, and draw them in flrongly towards the hams, and then leave them fufpended in the water. This way of fwimming is not only pleafant, but may ferve to reff you when fatigucd.

When you are tired with fivimming on your back and How to belly, you may fivim on one fide. When you with to fwim on do this, fink a little ynur left fide and raife your right; you will inmediatcly find yourfelf on your left fide. Move then your left hand without either raifing or finking it; you have only to ftretch it and draw it back, as in a firaight line, on the furtace of the water. Independent of the pleafure which this kind of motion will give you, you will have the fatisfaction of feeing both lides of the river.
It is poffible to fisim on the belly without the affir- How to ance of the lands. For this purpofe you nouf keep your fwim on breaft erect, your neck flraight, and fix your hards be we helly hind your head, or upon your back, while you move withent ilitt forward by employing your feet. This way is not with ance of the out its advantages. It is an excellent refource when the hands. arms are feized with a cramp, or with any indifofition which makes it painful to exert them. This in fome cales may be preferable to fwimming on the back; for while in that attitude, one cannot fee before them without turning every inflant. If one of your legs be feized with a cramp, take hold of it with the hand oppofite to it, and ufe the other hand and leg to advance or fupport yourfelf.

A very ancient and graccful mode of fwimming, is How to \({ }^{\text {T}} 4\) that of fuinming with the hands joined. When you fwim with will to put this in practice, join your hands, keeping the hands the thumbs and fingers towards heaven, fo that they joined. may appear above the water; then draw them back and pulf them forwards alternately from your breaft. This method of fxinuming may be ufeful in feveral circumftances, but above all if you are entangled with grafs or weeds. Your hands will then open a paffage for you.

As a perfon may fometimes have occafion to carry with the fomething in his hand in fwimming, which he is anxious hands eleto preferve from the water, he may firim eafily with vated. one hand and hold a parcel in the other, as Cæfar fwam . with his Commentaries at Alexandria; or one may fuim with both hands elevated. To perform this well, the fyimmer mult rai!e his breaft, and keep it as much inflated
(A) An interefing queftion occurs here, which deferves to be confidered. Since the body, when fpread upon the fufface, can be fupported with if little exertion, and frequently without any at all, as in fwimming on the back, how comes it to pais that a perfon when drowned fimks and frequently rifes again fome time afterwards? The reafon is this: In the act of droinning, the lungs are filled with water, and confequently the body, being fpecifically heavier, finks. It is well known that the human body contains a great quantity of air : this air is at firft comprefied by the, water; and while this is the cafe the hody remains at the hottom: but as foon as the air by its elaficity endeavours to difengage itfelf from the compreflion, the body is fwelled and expanded, becomes fpecif. cally lighter than the water, and confequently rifes to the top.

How to rife When a man plunges into the water, and has reached
to the fur- the bottom, he has ondy to give a finall itroke with his
face after diving. above the water. It mult not be concealed, that this method of fwimming is attended with fome danger to one who is not dextcrous at the art; for if one thould imprudently draw in his breaft, when his arms are raifed, he would immediately fink to the bottom. foot againf the ground, in order to rife; but an experien- ced fwimmer, if he miffes the ground, has recourfe to another expedient, which is very pretty, and which has not been much confidered. Suppofe him at a confiderable depth, when he perceives that he cannot reach the bottom. In fuch a cafe, he filf puts his hands before his face, at the height of his forehead, with the palms turned outwardly; then holding the fore part of his arm vertically, he makes them more backwards and forwards from right to Ieft; that is to fay, theie two parts of his arms, having the elbow as a kind of pivot, defcribe very quickiy, both the hands being open, and the fingers jomed, two fmall portions of a circle before the forchead, as if he would make the water retire, which he in fact does; and from thefe flrokes given to the water, there refults an oblique force, one part of which catries the fwimmer upwards.

There are many artificial methods of fupporting one's felf in water, but we have not room to defcribe them. Thofe who wifh to fee a full account of them may confult the Encyclopédie Metiodique.

SWimming of Fijh. A great proportion of the inhabitants of the waters have an air-bladder, by which they poife themfelves. Their movements chiefly depend upon their tail. See Anatomy, Part II.; and IchTHYOLOGY.

SWINDLER, a word which has been lately adopted into the Englifh language, derived from the German word fchwindel, "to cheat." Swindling has now become fo common in feveral of the great towns of this country, that it is unfortunately too well known to require any defcription.

SWrang-Whec, in a royal pendulum, that wheel which drives the pendulum. In a watch or balance clock it is called the crown-wheel.
SWING LE, in the fireworks in England, the wooden fpoke which is fixed to the barrel that draws the wire, and which, by its being forced back by the cogs of the wheel, is the occafion of the force with which the barrel is pulled.

SWITZ, or Schwerts, the capital of one of the cantons of Switzerland, to which it gives name, feated on the eaft fide of the lake Lucerne, in N. Lat. 46.55 . E. I.ong. 8. 30.

SWISSEliLAND, or Switzerland, a mountainous diftrict of the fouth of Europe, which at the latter end of the 18 d century, formed a republic compofed of feveral independent ftates or cantons, but which may nlow be regarded as a province of France.

Switzerland is bounded on the north and eaf by Ger- Switzermany, on the fouth by Italy, and on the weft by the deparmerts of the Higher and Lower Alps, and the mouths of the Rhone. Its extent from eaft to well is Boundarics computed at about 200 Britill miles, and its breadth and extern. from north to fouth at about 130 Britifh miles. Its contents in Fquare miles are eflimated at 14,960.

Before it was reduced to the condition of a French \({ }^{3}\) province, Switzerland contained 13 independant cantons, and a number of fmall diftricts, which were dependent on the cantons. The independent cantons were, 1. Berne, including the Pays de Vaud; 2. Friburg ; 3. Basil ; 4. Soleure; 5. Schaffhausen; 6. Zurich; 7. Appenzel.; 8. Lucerne; 9. Zug ; 10. Schweitz; 11. Underwaleden ; 12. Uri; 13. Glaris. The diffichs dependent on thefe cantons were, the principality of Neufchatet; the bifhopric of Bafit; county ot Baden; the free Baillages; Turgovia; Tokenburg; the Rhieinthal; lands of the Abbey of St Gal; country of the Grijons; Valteline; Italian Baillages; the Vallais. Since its fubjection to France, the country has been divided into the following 19 cantons; viz. Appenzel, Argovia, Bafil, Friburg, Claris, Grifons, Lucerne, St Gal, Schaffhaufen, Schweitz, Soleure, Teffin, Thurgovia, Underwald, Uri, Vaud, Zug, and Zurich. An account of the moft important of thefe cantons, and of their capitals, will be found under their proper heads in this work.

With refpect to the air, foil, and produce, that part Air, \(\frac{4}{4}\), of the canton of Berne to the eaft of the lake of Ge-produce, neva, together with the cantons of Uri, Schweitz, Un- \& c c. derwalden, Glaris, and Appenzel, and part of the canton of Lucerne, confift of ftupendeus mountains, whofe fummits are faid to be from 9000 to 12000 feet above the level of the fea, confifing of inacceffible rocks, of which fome are quite bare, while others are always covered with ice and fnow. Among the mountains are many excelient medicinal and other fprings, cold and warm baths, water-falls, precipices, deep narrow valleys, and caverns. The higheft are thofe in the canton of Uri. Many of the valleys are covered with lakes, or watered by brooks and rivers.

In fome of them are towns, viliages, woods, vineyards, and corn-lands. Both on the mountains and in the valleys the air is extremely cold in winter; but in fummer it is very pleafant, cool, and refrefluing in the former, but exceffively hot in the latter. Sometimes it is winter on the north fide of a mountain when it is fummer on the other; nay, Howers may be gathered fometimes with one hand and fnow with the other. Prodigious malles of ice and frow often fall from them in winter, and do a great deal of damage; and moft of the fteams and rivers take their rife from the thawing of the ice and fnow on their fides and tops. From the rifing or defcending of the clouds, with which they are commonly enveloped, the inhabitants can, for the moft part, pretty, exactly foretel the changes of the weather; fo that they ferve them intlead of weather glafles.

The other and lower parts of Switzerian d are very pleafant and fertile, being diverfified with vineyards, cornfields, meadows, and pallure-grounds. The mountains in thefe are but mole-hills in comparifon of the others: there is neither fnow nor ice on them in funn:ncr ; and they frequently aflord not only good paffurage, but arable ground. Many petrifactions are found both amons

Switzer Rand.
theie and the others, with a variely of folfils. The fands of the rivers yicid guld duft, particularly thofe of the Rhine, the linmet, and the Aar, the Reufs, the Arve, and the Inn.
The metals of this country being gencrally found to be brittle, the only mines that are worked are a few of irorl. In the lower parts of Switzerland they fow rye, oats, barley, lpelt, flax, hemp. Wines of various forts are allo produced in fome of them, with a valiety of fruits. Of woud for fiucl and other ufes there is generally plenty'; in forme places, however, they are obliged to lurn theep's dung, and in others a kind of heath and finall mrubs. In the valleys they cultivate faffion with fuccefs. The Swifs derive their principal fubfitence from their Hocks and herds of catlle, which in fummer graze on the mountains. Their cheefe is much elleemed, eipecially that of Berne and Griers in the canton of Friburg. Great numbers of horles are allo bred here, and bought up for the French cavalry. Befides the above-mentioned rivers, the R hone and the Tefin have their fources in this country. The lakes are very numerous; but the chief are thofe of Geneva, Neufchatel, Biel, Zurich, Thun, Brien, Conllance, and Iucerne. Both rivers and lakes abound with fill, and afford a cheap water carriage. Switzerland is not fo populous as many other countries in Lurope; and the Popilh cantons lefs fo than the Proteftant. The total number of the inhabitants is computct at \(2,000,000\).

The language generally fpoken here is the German, in which alfo public affairs are tranfacted; but in thofe parts of the country that border on Italy or France, a corrupt French or Italian prevails. The two predominant religions are Calvinifm and Popery. Of the former are the cantons of Zurich and Berne, the towns of St Gal, Geneva, Muhlhaufen, and Biel, the principality of Neufchatel, the greater part of Bafle, Schaff hauren, the country of the Grifons, the Thurgau, 'loggenburg, Glaris, and the Rhine valley; the frontiers of Appenzel, with a fmall part of Solothurn, and fome places in the mountains of Baden and Sargans. The refl of the Swifs cantons, allies, and dependents, are Popifh. For the education of youth there is an univerfity at Banle, and academies at Zurich, Berne, Laufane, and Geneva; befides gymnafiums and fcholæ illutres, both in the Fopinh and Yroteflant cantons. There are alfo focieties among them for the improvenent of the German language, and the fciences.

The principal manufactures are fnuff and tobacco, linen of feveral forts, lace, thread, filk, and worfed flockings, neckcloths, cotton lluff, gloves, haudkerchiefs, filks of feveral forts, gold and filver brocades, a varicty of woollen manufactures, hats, paper, leather of all forts, carthen wares, porcelain, toys, watcles, clocks, and other hardwarcs, \&cc. The trade of Switzerland is generally prumoted by many navigable lakes and rivers. In fome of the above manufakures, and in cheefe, butter, meep, horfes, black cattle, hides, and flins, the exports are confiderable; and as the imports are chiefly grain and falt, with fome American and Afiatic goods, there is probabiy a lirge balance in thicir favour. In fome parts of Sivitzerland drefs is refrained by fumptury laws.
The Swifs are a brave, boncf, liofpitable, hardy people; very true to their engagements, friendly and humane. In flort, there is not a people in Earope Vot. XX. Past I.

\section*{\(69]\) \\ \(S\) W I}
whofe national character is better. In their perfuns Switzerthey are generally tall, robult, and wed1-made; thut land. their complexions are none of the beft, and thefe that live in the ncighbourhood of the mountains are fuljoct to wens. The women are taid to be generally handfome and well-lhaped, fenfible, and modelt, yet frank, eafy, and agreeable in converlation. Ferv of the peafants are miterably poor; many of them are rich, efpecially in the Protellant cantons, and that of Berne in particular.

In the very confined limits 10 which we are now re- Outline of duced, we cannot give nore than a faint outline of the the histrory linoly of Switzerland. In the lirft century before the of and Chritlian era, we find the natives insolved is frequent wars with the lomans, by whom the Helvetii and the kixetii, two of the molt powerful tribes, were entirely fubjugated. In the begiming of the \(4^{\text {th }}\) century of the Chritian era, the Allemanni, a German tribe, made an irruption into Switzerland, occupied the country, and, as is fuppofed, extirpated the Helvetii. Soon after we find the wellern part of Switzerland, as far as the Reufs, occupied by the Franks, by whom it was annexed to Burgundy, while the eaflem part, or the Grifons, was fubjeet to Theudoric the Goth, and other Itailian princes. In the beginning of the 7 th century, Chriftianity was introduced, chielly by two Inth morks, Calumbausus and Gallus. In the beginning of the soth rentury, that part of Switzcrland which was ocrupied by the Allemanni, was invaded by the Huns cr Ugars, who in particular ravaged the abbey of St Gal , at that time famons for its power and its literature. The Huns were defeated by Conrad king of Burgundy, about the year 928 . Som after the commencement of the isth century, the diftricis of Switzerland began to be regatded as a part of the German empire, and in the two following centuries they gradually became fubject to the houfe of Hapiburgh. In 1307 commenced the flruggles of the Swifs with the houfe of \(\Lambda\) ull ria, thofe glorivus fruggles which finally terminated in the complete emancipation of that brave pecple, and in the formation of a confederacy which continued to be the admitation of Europe for nearly five centuries. The tranfactions which mark this contelt between the inlaabitants of a fmall diffrict and a mighty monarch, and in particular the heroifm of their great champion William Tell, are familiar to moft of our readers. We fhall therefore only give a fhort account of the governnent ard inftitutions of the Swifs cantons, as they exined previous to the late revolution, and hall conclude this article with a brief narrative of the proceedings of the French, when they entered Switzerland in \(1^{1797 .}\)

With refpect to the government and conflitution of Conflituthe Swifs cantons, it muft be remarked that fome of tion of the them were aritlocracies and fome democracies. In the Suifs canformer, both the legillative and exccutive power were the late relodged in the burghers or citizens of the capital of each volution. canton; and of thole there were feven, viz. Zurich, Kerne, Batle, Friburg, Soleure, and Schaff hauien; an account of the moil important of which may be feen under their refpective mames. In the others, the legilative power was lodged in the whole body of the people, and every male above 16, whether mafler or fervant, had a vote in making laws and in the choice of magiftrates. For what conccrued the whole Helvetic body, there were diets ordinary and extraordinary; the former were Y
held.

\section*{S W I [ I70 ]}

Switzir- held amually, and the others on particular emergentand. cies; and both were fummoned by the eity of Zurich,
which appointed the time and place of their meetings. Befides the gereral diets fince the Reformation, there were particular diets of the two teligions, at which all public affairs of eonfequence, that regarded the two parties were treated Separately; for though a fenfe of \({ }^{-}\) their common interef obliged them to ftudy the maintaining the league and union, yet it is certain that the mutual confidence between the cantons was in fome meafure loft through the zaal of each party for their parcicular opinions, efpecially of the Roman Catholics. The annual general diets were held almays at Fratenfield or Baden, princivally to regulate the affairs of the common baillages. Lucerne took the lead of the Romar, Catholic cantons, being the moft powerful of that denomination; but Zurich, though lefs powerful than that of Berne, took the precedence of all the other cantons, both Proteftant and Popith. Thefe cantons did not make one conmonwealth, but were fo many independent liates, united together by firict alliances for their mutual defence. The extraurdinary diets or congrefles were held at Aldorf. Each canton ufually deputed two envoys, both to the ordinary and extraordinary, to which allo the abbot and the town of St Gal, and the town of Biel, fent reprefentatives. To the 13 cantous belunged in common 21 baillages, 2 towns, and 2 lordinips. The allies, as they were calld, were the abbot and town of St Gall, the three Grifon leagues, the republic of the Valais, the towns of Muhlhaufen and Bie!, the principaiity of Neuenburg, Geneva, and the bithop of Balle. Of thefe, the abbot and town of St Gal, and the town of Biel, were regarded as members of the Helretic body, but the ref only as allies.

The public revenues were in general very inconfilderable, though they have been computed at about \(1,000,00=1\). frerling, arifing chietly from the ufual regalia, appropriated every where to the fovercign, the demefnes, and public granaries, voluntary contributions, the fale of falt. and a land-tax ; in the Protellant cantons, from the church lands alfo that were feized at the reformation. Except in Zurich, Berne, Balle, and fchaffhaufen, where the people are more induftrious, inve a greater trade, and are richer than in the others, they defrayed only the ordinary char, ts.

The cantons never kept any ftanding troops except for a few garrifons; but their militia was reckoned to be the belt regulated of any in Europe. Every male from 16 to 60 was enrolled, and about one-third of them formed into regiments. They were all obliged to provide theinfelves with arms, cluthing, accoutrements, and to appear on the fated days for exercife; and the levcral cantons and diftricts were obliged to furnils themfelves with a fufficient train of artillery, and all the uther implements of war. The Swils of the feveral tat:ons wore allowed to engase in the fervice of fuch foreign princes and ftates as were in alliance with tho:e cantul or with whom they had made a previous agneerient. Suc? flate, paying an amual fabfidy to the refrective conice were allowed to make levics. Every man e lifled vetuntarily, for what number of years he plealerl, at the exriretion of which he was at liberty to seturn hore. Mary thes always retuming from formign furvie, Sulizerlatd wase never unpurided with able wrd eaperiencod allices and fudiers.

It was fcarcely to be expected that a country fo long and fo intimately conrected with France, ty its pofition, by perpetual alliance, by commerce, and partly by language, flould efcape the intluance of the principles Origir of its revolution, when thates far more remote and di- the di ilinet were ftrongly imbued with their fpirit. But betwe previous to the epoch of the French revolution, various the ca parts of, the Smifs confederation had been the feat of frencl civil difcord, and popular murmurs. In fome cantons public the indignant fpirit of the fubject had led him to tevolt againft what he deemed the oppreffive adminiflration of the ruler; in others, the diftinctions which exilt in fociety, and which form the different claffes of privileged and umprivileged individuals, were ftrangely and inverfely diftributed. The French revolution, declaring the principle of equality, found a wide predifpofition among the fubjects of the Swifs confederacy to embrace the caufe, and as Arong a refiflance on the part of the governors, who were deeply interefted in oppofing the progrefs of opinions fo immediately fubverfive of authority. Confcious that with fuch a fyftem no brotherhood could be cherifhed, many of the leading cantons kept themfelves in a tiate of watchfulnefs, bordering on hoftility, againf the principles eflablithed by the French national affembly. But with fo, powerful a fanction, the frowns of power were ineffectual to calm the murmurs of difcontent; and claims, which fear or policy had hitherto thut up in filence, were now produced, with confidence that they would be admitted from the fentiment of fear, if not of juftice.

Among thofe who were moft active in demanding a review of their grievances were the inhabitants of the French part of the canton of Berne, known by the name of the Pays-de-Vand. The nobles and the higher claffes of this province had long tranfmitted to their children a hereditary hatred of the government of Berne. This difaffection was not coneealcd; nor is it fingular that the defire of ehange fhould operate on the titled and the rich, while they faw their political exifence depending on the will of a felf-elceted fovereign, and their provinces fubjected to the adminiftration of an emiflary of thofe whom they confidered as ufurpers of their rights.

But however flrungly the fenfibility of the fubjeet inhabitants of the Pays-de-Vaud was excited by this political degradation, they were compelled to fubmit, or brood over their grievances in filence. They were incapable of procuring redrefs by force; and the fovereign burghers of Berne were too firnly feated to regard the remonfrances of impotent claimants, or to liften to the murmurs of difcontent. Partial infurrections againft the governments of certain cantons lad often taken place in Switzerland. Thefe diforders had fometimes been fupprefled and punifhed with the interpofition of the neighbouring cantons, where the danger was not exceflive; but when thefe infurrections wore the ferious characters of rcbellion ur revolt, the whole confederation marchal againtt the confpirators. France before the revolution had even lent its aid to the fupprefion of thofe dumeftic quarrels, and had become the inflrument of vengeance to the infulted fovercign; fo that, whatever was the degree of oppreffion, or whatever the defire of refiflance, redrefs was beconc hopelefs, and change impolible.

It was chietly anong the claftes of hurghers and artizans who inhabited the towns, that difcontent againit

\section*{S W I [ ipr ] S W I}
caer- the ruling power prevailed. The peafants, lefs opperefnd. fed, becaufe more ignorant of their rights and privileges, not only did not themfelves oppofe the aggreffions of the chief men in power, but even affted them in quelling infurtections which arofe anong their rival clafics.

All writers agree in the exiftence of vexatious and oppreflive abufes among all the goveruments of the Swifs cantons, at the time of which we are now writing. The defpotifm of their inftitutions; the abufes of election to fovereign councils; the daily and encroaching fipirit of authority; the overgrown influence of patrician families; the Itriking inequality which prevailed, even on this balis, of ariftocratical power ; the monopoly of places of profit to the exclution of worth and talent; the undefined limits of proconfular adminiftration; the want of encouragement to the arts and fciences; the neglect of education among thofe who were deftined to rule, the void of which was filled up by idlenefs, arrogance, ignorance, and difipation, -are fo many features prefented by writers of different characters and difoordant fentiments, to fill up the picture of this vaunted region of happine!s and liberty.

The feverity exercifed by the government of Berne over thofe inhabitants of the Pays-de-Vaud who hat affembled on the 14th of July 1791, to commemorate the taking of the Battile at Paris, and exprefs their approbation of the French revolution, had created in the ininds of the French people fenfations of jealoufy towards their Swifs neighbours; while the dibbanding and difinital of the Swifs regiments in the fervice of France, had contributed to exafperate the government of the cantons againit the new republic.

All the cantons, except that of Berne, appeared for a long time difpofed to preferve a neutrality towards revolutionary France; but that canton, under pretence of fupporting the people of Geneva againft the aggrefions of the French, firft difplayed an avowed holiility, and marched a body of 15,000 troops towards the frontiers of the French republic. The true caufe of this movement in the canton of Berne, has been by otliers itated to be the hopes entertained by fome individuals of that government, of Tharing in the plans of emolument and preferment which were expected to arife on the re-eftablifhment of monarchy in France. The mutual jealoufy fubfinting between the Swifs cantons and the ruling power in France, was heightened by the protection given by fome of the cantons to the French enrigrants, and by the correfpondence which others of the cantous had held with the bloody tribunal of Robefpierre. After the retreat of the allied armies from the fiontiers of France, the Swifs found it politic to make at leaft a fhow of amity towards the victorious republic ; and accordingly recognifed the exifting government of the republic, and openly received IM. Barthelemy as its charge d'affaires. Still, however, the fincerity of the cantons was juitly doubied by the French directory, who appear to have long formed defigns againft the independence of Switzerland.

The directory, confirmed in power, and reliesed from the controul of a popular legilature, haftened, towards the clofe of the year 1797 , to put in force their project of fubjugating the Swifs republics. The firf l:oftile movement on the part of the French, was to take pofieflion of the Helvetic part of the bilhopric of Bafle, under fome frivolous pretence, and contrary to an ex-
prefs treaty concluded with the Swifs in the year 1792. Switzer. Fither too weak or too pruslent to relent this infraction of their rights, the Helvetic body fill Hattered themfelves with an amicable termination of their difference with France ; when an infurrection, which broke out in the Pays-de Vaud, probably through Irrench inftigation, or at leaft through the influence of Fiench principles, afforded a fuller pretext for the overthrow of the government. In the month of December, the French directory thought proper to interfere in this domeftic difpute, and demanded from the government of Berne, what they termed the reftoration of the rights of that peoplc, and the affembling of the fates of the Pays-deVaud in their ancient form. Jhis demand they imme. diately prepared to enforce by arms; and General Menard was ordered to march, with a body of 15,000 men, to fupport the claims of the petitioning party in the Pays-de-Vaud. The defigns of the French were for the moment fruftrated by the timidity or generofity of the fupreme council of Berne. On the jth of January, \(179^{8}\), they iflued a proclamation, enjoining the citizens of the Pays-de. Vaud to affemble in arms, to senew the oath of allegiance, to proceed immediately to the reform of every abule in the government, and 10 affert and re-eftablifh all their ancient rights. \(A\) commiftion had been previoully appointed at Laufanne, for determining on the claims of the petitioners, and for reinftating the country in its former tranquillity. From what caules it happened, we have not as yet been correctly informed, but the proceedings of the commiffion feemed involved altogether in embarrafiment and deiay. The people became impatient, and the infurrection at once broke out into actual hoftility. The caftle of Chillon was feized by the infurgents; and the commotions which took place in the fouthern difticts of the province appeared no lefs formidable. The government of Berne now determined to reduce the infurgents by force; and a body of 20,000 troops under the command of Colonel Weifs, was difpatched to difperfe them. Whether the lenient meafures purfued by this general, were confifent with found policy or not, it is impofible, from the materials which have hitherto fallen under our infpection, to determine. Suffice it to fay, that though it is not certain that more precipitate movements would have faved the country, yet his inactivity undoubtedly ferved to increafe at once the power and the audacity of the infurgents. Thus fituated, the approach of the French decided the conteft. On pal. fing the boundary, Menard difpatched an aide-de camp, attended by two hufiars, to General Weifs, at Yverdun; on their return, a fatal affray took place at the village of Thicrens, in which one of the huflars was killed. Who were the aggreffors in this unfortunate bufinefs is not correctly afcertained, but it was regarded by Menard as a declaration of war. His troops immediately adranced, while thofe of Weifs retreated, and the whale of the Pays de-Vaud was, by the beginning of February, in the polfelition of the French.

The government of Berne ftill hoped, it appears, to avert the deftruction which now feemed to awit them; the centinels who had killed the huffar at Thierens were delivered up, and frefh negotiations were entered on. In the mean time, however, new infurrections were planned in different parts, and the revalutionaty mania appeated to increafe. In the foditious aftemblages

\section*{5 W I [ Iク2 \(]\) S W I}

Switzer- on thefe occafions, the French envoy, Niengaud, was land. obferved to take a decided part; and, on the \(2 d\) of January, he formally reclaimed fome perlons who had been arrefted for trealonable practices by the government of Berne, as the friends and allies of the French zepublic. To this reclamation the government of Berne paid little attention; and the ftandard of revolt having been crested at Arau, they determined on effective meafures for its fuppreflon and their onn defence. The Argovian militia marched to Arau; the town and province were immediately reduced, and the leaders of the infurrection were taken into culfody.

War now appeared inevitable. To conciliate the minds of the people, and induce them more freely to lend their affiftance, the government of Berne decreed, that 52 deputies from the principal towns and communes fhould be added to the fupreme council; and, on the zd of February, thefe new deputies took their feats. A general reform of all the abules of the government was the firft refolution agreed on in their deliberations; and the example of Berne was followed by the cantons of Lucerne, Fribourg, Soleure, Schaffhaufen, and Zurich.

While, in this ftate of things, frefh negotiations were commenced with the French direfory, a defenfive force of about 20,000 men was collected. The other Swifs cantons difpatched their quotas to the defence of Berne, which amounted to about 5,500 men. A truce had been concluded with the French general in the Pays.deVaud, where an ollicer of the name of Brune had fucceeded Menard in the command. The truce was to have expired on the If of March ; but General d'Err. lach, fearful left the fpinit of his troops fhould flacken, demanded, on the 26th of February, pofitive orders to put his army in motion, and the council immediately made a decree to that effect. The plan of the campaign was now arranged by M. d'Ertach, and notice had been given to the pofts that hoftilities were to commence on the evening of the rit of March; when the movements of the Swils general were frultrated by the repeal of the derree which had been fo haftily paffed, and the negotiation was renewed with the French commander.
M. Mallet du Pan afferts, that the French general Brune, had agrced to prolong the truce for 30 hours; ut, on the 2 d March, the calle of Dornach, at the sorthern extremity of the canton of Soleure, was attacked and carried by the French; and at the fame time, 13.000 men were marched under the walls of Soleure, which capitulated to General Schawenbourg on the firft funimons. Fibourg was immediately after reduced by General Brune, and the S.ifs army was forced to retreat.

While difaffection prevailed in the army of General d'Erlach, the inhabitants of Berne faw the rapid approach of the victorions army. On the \(3^{d}\) of \(\mathbb{M a r c h}\), the levy of the Landfhurm, or the rifing of the people in a mafs, was proclaimed. The expedicnt did not ficcced in favour of the magiftrates; the people were no fooner affembled in arms, than they of themfelves diffolved the government ; a provifonal regency was elected for the occafion; the event was notified to General Brune ; and to facilitate a pacification, an order was iffued to difmifs the army, on condition that the lirench would l.sep the polts liey at prefent oscupied.

Unfatisfied with this concefion, the French general Switze: infifted on the town receiving a l'rench garrifon. In the mean time all was confufion, both in Berne and in the army ; the left divifion of which had mutinied, deferted their pofts, and put to death come of their offcers. By defertion, the Swifs army was now reduced to \(1,4,000\), to which might be added the undifciplined rabble which the Landithurm had called forth. About 8000 of the regular forces were ftationed at Neweneg, and 6400 held the pofition of Frauenbrun, againft which General Schawenbourg advanced from Soleure, at the head of 18,000 men. On the morning of the 5 th March, both pofts were attacked by the French, and a momentary fuccefs feemed to crown the valorous efforts of the divition at Neweneg; but thofe ftationed at Frauenbrun were, after a vigorous refiftance, obliged to retreat ; M. d'Erlach rallied his men at Uteren, where a fecond engagement took place, but with no better fuccefs on the part of the Swifs. At Grouholtz, however, they again made a fland, whence they were driven to the gates of the capital, where they were completely routed. The Swifs, in this engagement, loft 2000 in killed and wounded; while the lols of the French was about I800.

On the evening of the \(5 h_{1}\), General Brune entered Berne enthe city of Berne by capitulation. The divifions of the tered by Swifs army fationed at Neweneg and Guminen retreat. \({ }^{\text {the French. }}\) ed; the foldiers of this laft column, in defpair, put their officers to death; and the unfortunate d'Erlach, in flying from the field of battle, was murdered by his countrymen and foldiers.

The fubmifion of nearly the whole of Switzerland followed the defeat of the Bernefe. The democratic republics, however, flill made a glorious fand, defeated General Schawenbourg, and forced him to retire- with the lofs of 3000 men.

The Swils confederacy, after this revolution, changed Helvetic its conftitution, and even its name. Provilional govern-republic ments, under the direction of the French generals, were formed. eftablithed in the different difticts, and the whole affumed the name of the Helvetic republic. Contributions were levied as ufual, by the French commifioners; and fome fhocking enormities ate reported to have been committed, chieffy by the army of the Hhine; for *ee Ne:u the divifions which belonged to the army of Italy are siffer for faid to have conducled themfelves with fuperior humani. 1795 and ty and jutice *.
1799.

In the beginning of 1802 , a new conftitution was Conftituframed for the Helvetic republic, under the direction of tion of Bonsparte. Its leading features are as follows.
1802.

The Helvetic republic is one. Every citizen has a right of fettling in any canton of the republic, and of exercifing all the civil and political rights in the fame manner as the citizens of the canton.

Berne is the capital of Helvetia. The Helvetic territory is divided into 21 cantons. The ecclefiaftical property, in general, can be employed only for eftabliftments of religious inftruction, or of charity.

There is a central adminiftration of the republic for the exercife of the national fovereignty, and an adminiftration of the cantons. The adminifration of the cantons is compofed of a diet and a lenate. The diet is formed by the union of reprefentatives from all the cantoric, in the following proportions.-Berne, fix; \%urich, two; Lucerne, five; Uri, one; Schweitz, three; Underwalden,

\section*{S W O}

Switzerland 11

Underwallen, one; Zug, one; Glaris, one; Solemre, two; Fribourg, three; halle, two; Schaflhaufen, ourc; Appenzel, one; St Gal, four; Turgovia, two ; Argovia, two; Baden, two; Vaud, four; Grilons, one; 'Leilin, three; Valais, two. The members of the diet remain five years in office. The diet is to affemble regularly every year ou the ift of March. It fhall be extraodinarily convoked by the fenate when the majority of the cantons require it, or when itfelf ilhall judge that meafure necelfary. The prefident of the diet flall be the landamtman who is not in office. He has a cafting vote, in cafe the votes thall be equally divided. A deputation of four members from the fenate flall affilt at the diet, and fhall take part in its deliberations, but without having a right to vote.

The fenate is compofed of two landamtmans, two fladtholders or lieutenants, and 26 counfellors. Each canton muft have at leaft one member in it. The fenate forms the projects of laws and regulations, and fubinits them to the fanction of the cantons. The two landamtmans and their lieutenants have the direction of foreign affairs. The fenate nanmes and recalls diplomatic agents, on a propoition from the landantmans. The handamtitan in oflice is to receive a filary of 16,000 livres, Swifs currency; the fecond landamtman, his two liente:ants, and the members of the petty council, 6000 livres; thofe of the fenate 4000 . The fenate may adjuurn for three months. During this interval, the petty council exercifes the executive power.

SIVIVELS, a kind of ring made to turn round in a faple, or other ring. Thefe are ufed when a thip lies at her moorings; alfo in tedders for cattle, that they may turn round without unwarping the tedder.
\(\dot{S}\) WITEL-Cannon, is a frall piece of artillery belonging to a fhip of war, which carries a hhot of half a pound, and is fixed in a fockes on the top of the flip's fide, ftern, or bow, and alfo in her tops. The trunnions of this piece are contained in a fort of iron crotch, of which the lower end terminates in a cylindrical pivot refting in the focket, fo as to fupport the weight of the cannon. The focket is bored in a ftrong piece of oak, reinforced with iron hoons, in order to enable it to fuftain the recoil. By means of this frame, which is called the fwivel, and an iron handle on its cafcable, the gun may be directed by the land to any object. It is thercfore very neceflary in the tops, particularly when loaded with muket balls, to fire down on the upper decks of the adverfary in action.
SWOONing. See Medicine, N \({ }^{0} 274\).
SWORD, an offenfive weapon worn at the file, and ferving either to cut or ftab. Its parts are, the handle, guard, and blade; to which may be added the bow, fcabbard. pummel, \&c.

SWORD of State, which is borne before the king, lords, and governors of counties, cities, or boroughs, \(\& \mathrm{c}\). For or befure the king, it ought to be carried upright; the hilt as low as the bearer's waift, the blade up between his eyes. For or before a duke, the blade muft decline from the head, and be carried between the neck and the right fhoulder. For or before an earl, the hlade is to be carried between the point of the fhoulder and the elbow: and for or before a baron, the blade is to be borne in the bend of the arm. This ce-
remonial form no lefs denotes the dignity of a governor Sword-Fint than the coronct fet on his coat of arms.
Smond-Fifh. See Xirmas, Iemmyology Index.
SWORN brothers (jratice jurati), perfons who, by mutual oalh, covenanted to hiare each others fortune. Formerly, in any notable expedition to invade and concuuer an enemy's country, it was the cuilom for the more eminent foldiers to engage themfelves by reciprocal oaths to thare the rewards of their fervice. This practice gave occalion to the proverb of fworn brothers or bretleren in iniquity, becaufe of their dividing plunder and fpoil.
SyCAMORE tref. Sec Acer, Botany Index.
SYCOPHAN1', an appellation given by the ancient Athenians to thofe who informed of the exportation of figs contrary to law; and hence it is till ufed in general for all informers, parafites, flatterers, cheats, \& c .

SYDENHAM, Dr Tuovas, an excellent Englith phyfician, was the Con of William Sydenlam of Winford Engle in Dorfethirc, and was born there about the year 162\%. He ftudicd at Magdalen-hall, Oxford; but left that univerfity when Oxford was garrifoned for King Charles I. and went to Loondon: where, becoming acquainted with Dr Thomas Cox, an eminent phy. fician, that gentleman perfuaded hims to apply himfelf to the ftudy of phyfic; accordingly, after thic garrifon was delivered up to the parliament, he retired adgain to Magdaten-hall, entered on the fuly of medicine, and in 1648 was created bachelor of phyfic. Soon after, he was madc a fellow of All-Souls college, and contimued there feveral years: when, leaving the univerfity, he fettled at Wefuninfler, became doctor of his faculty at Cambridge; grew fanous for his practice; and was the chicf phyfician in London from the year 1660 to 1670 ; at which period he began to be difabled by the gout. He died in 1689. His works are highly efteemed both at home and abroad. He was famons for his cool regimen in the frnall-pos; for giving the baik after the paroxyfin in agues; and for his ufe of laudanum. He regulated lis praclice more by his own obfervations and inquiries, than by the method either of his predeceffors or contemporaries.
SYENE, an ancient city of Egypt, fituated, according to Mr Bruce, in north latitude \(24^{\circ} 0^{\prime} 45^{\prime \prime}\). Pliny and Strabo both fay that it lay directly under the tropic of Cancer. Whether Mr Bruce's authority be fufficient to overturn the evidence of Pliny and Strabo, we flall leave to others to determine.

Syene is remarkable for being the place where the firlt attempt was made to meafure the circumference of the earth. This was done by Eratothenes, whom Ptolemy Euergetes had invited from Athens to Alexandria. In this attempt two politions were affumed, viz. that Alesandria and Syene were exactly 5000 fladia diftant from each other, and that they were preciffly under the fame meridian; but both thefe are denied by Mr Bruce, who has made many obfervations on the fub. jed, which our limits will not allow us to take notice of at prelent. He tells us, that there is at Afum an obclifk erected by Ptolemy Euergetes, the patron of Eratoflhenes, without hieroglyphics, direclly facing the fouth, with its top firf cut into a narrow neck, then fread out like a fan into a femicircular form,

\section*{S Y I [ I74 ] S X I}
with pavements curio 弐y levelled to receive the fhade, ard aake the feparation of the true hadow from the penumbra as ditinct as pofible. This is fuppofed by Mir Bruce to have beea conftrufted with a defign to vary the experiment of Eratollhenes with a larger radias; and the inquiry concerning the dimentions of the er.eth. in our author's opinion, was the occafion of many obelifks being erected in this kingdom; a demontration of which is, that the figure of the toy is varied; being fometimes very tharp, and fometimes a portion of a circle, in order to get rid of the great impediment ariing from the penumbra, which makes it difficult to determine the length of the fhadow with precifion. It is now called A Aouan.

SYLLA, Lucius Cornelius, was defcended from the illuftrous family of the Scipios. His behaviour in his younger years by no means correfponded with the excellent efucation which he had received. But debauchery, inftead of bringing along with it infamy and ruin, its ufual attendants, lerved only to increafe the wealth of this fortunate Roman; for Nicopolis, a rich courtezan, whofe affegions he had gained, left him heir to her great eflate.-He learned the art of war under Marius, whom he attended to Numidia in quality of quefor. Ihough hitherto unaccuftomed to arms, he became in a fhort time the moft fillul foldier in the ar\(m y\), while by his polite and obliging belaviuur he gaincd the love and efteem of evely body. His courage and dexterity contributed a great deal torsats the fuccefs of the war; it was his eloquence in pasticular that perfuaded Bacchus to deliver up Jugurtha. He ferved afterwards in the Social war, where his actions entirely eclipfed thofe of every other commander. As a reward for this conduct he was raifed to the pretormip. It is pretended by fome that Sylia purchafed this dignity; and that when he threatened one day to make ufe of the powers of his office againlt Strabo the father of Pornpey, that Roman replied with a fmile, "You are in the right to fay fo; your office is certainly yorms, fince yon purchafed it." Be this as it may, after the conclufton of the Social war he was made conful, and foon after declared general of the army which was to be fent againlt Mithridates king of Pontus. Marius, at that time the mont renowned of the lioman generals, expected that the management of this war would have been committed to him, and was therefore much exafperated at the difappointment. The people were perfuaded by his intrigues to reverfe the former decree, and fubftitute him in place of Sylla. Upon this he fent down officers to take the command of the army; but Sylla by this time had gained over the foldiers; who, inftead of obeying the decree of the people, flew Marius's oficces, and intreated Sylla to lead them inftantly to Rorse. Accordingly he entered the city fword in hand, flew Sulpicius the conful, obliged Marius to flec, ne:v-modelled the lawc, and afterwards marched into the Eaft, and irmmediately laid fiege to Athens; for that city. togethor with the reft of Grecce, latal fallon into the porver of Mithidates. He wrote to the Amphyctyens. whon were affernbled at Delphi, 10 fend him all the gold which was depofited in the temple of Apollo, becaufe he ftood in need of moncy; promiling, at the fame time, to reftore it again at the end of the war. When he received this treafure, he obferved, with an air of raillery, that he now no longer defpaired of vic-
tory, fince the gols thomfelves furniftied him with money to pay his troops. Famine foon obliged the Athenians to think of a furrender. Their ambaffadors waited on Sylla, and hegan to harangue about Thefeus and Codrus, and Marathon and Salamis, -When he interrupted them, and exclaimed, "Go, repeat thefe fine orations in your fchools; I have come hither, not to leazts your hiltory, but to chaftife rebels." Athens was at laft taken by affault, and Sylla was upon the point of deflroying it, when he recolleeted its ancient glory, and fpared (as he faid) the living for the fake of the dead. After burning the Pirteus, he gained two decifive victories over the generals of Mithridates. In the fecond battle, which was fought at Orchomenus, he was almolt defeated; his troops began to flee, when, leaping from his horfe, he fnatched up a llandard, and advanced againft the enemy, crying out, "I will die here glorioully; and, foldiers, when you are afked where you abandoned your general, anfwer, At Orchomenus." This reproach recalled the courage of the Fomans; they followed him to the charge, and gained a complete victory. Mithridates, humbled by alhe difafters, lent ambafladors to fue for peace.

Mean time Cinna had declared againf Sylla in Italy; and Marius returning from banilhment, had taken the moft ferere vengeance on all his enemies. Sylla was dsclared a traitor; his laws were reverfed, his friends murdered, and the government new-modelled. The news of thefe tranlactions induced Sylla to conclude a treaty with Mithridates, and march directly to Rome. His approach terrified the Romans. Marius and Cinna were bath dead; but the confuls made vigorous preparations to oppofe him. A civil war was begun; but Sylia in the end fubdued all his enemies, and entirely ruined the Marian faction. He entered Rome at the head of his victorious army, and publicly affumed the furname of Happy. Happy, indecd, had he ceafed to live when he cealed to conquer. The remainder of his life contains nothing elfe but a catalogue of the moft abominable cruelties. He declared that every one who expected a pardon for their late offences, muft gain it by deftroying the enemies of the ftate. The fword of the affafin was thus unfteathed, and murder encouraged as the path to power and diftinction. The nobleft of the Romans were everywhere maffacred; flaves were rewarded for cutting off their mafters; children were feen dragging their parents to execution; and brothers claiming a recompenfe for the murder of brothers. Sylla ordered 8000 wretches, who had thrown themfelves upon his clemency, to be butchered in the Campus Martius. In the mean time he entered the fenate-houle, and began to talk with great coolnefs about his exploits. The fenate, alarmed at the horrid outcries of the fufferers, at firf thought that the city was given up to be plundered; but Sylla informed them, with an unembarralled air, that it was only fome criminals punihing by his orders, and that they needed not be apprehenfive about their own fate.

Fo carry on thefe cruelties with the appearance of juftice, he commanded the people to eleet him dictator. He kept this office fur more than two years; and then, to the amazement of all, laid it down, and offered to frand his trial before the peopie. Suon aftegwards lie retired into the country, and plunged headlong into every kind of debauchery. Nor did he relinquith bis"

\section*{S Y L}

Sylla cruelty together with his power: His wife falling ill in the midft of a funptuous featt, he divorced her inmediately; and ordered her to be carried away, left her death fhould interrupt the fellivity of his houfe.

He died of the morbus pedicularic, in the 6oth year of his age. His body, according to his orders, was burnt. A little before his death he wrote his epitaph; the tenor of which was, that no man had ever exceeded him in doing good to his friends or injury to his enemies.

His perfon was elegant, his air noble, his manners eafy and apparently fincere. He was fond of pleafure, hut fonder of glory; indulging without feruple in fenfual delights, but never fuffering them to interrupt his ferious bufinefs: He was eloquent, liberal, crafty, infinuating; a profound mafter of difimulation; he fpoke of himfelf with modefly, while he lavifled praifes on every other perfon: He ftooped even to an acquaintance with the meanell foldier, and conflantly adapted himfelf to the humours, purfuits, and opinions, of thofe with whom he converfed. Such was his charafter during the carlier part of his life; but when fuccefs had raifed him above the neceffity of diffimulation, he difplayed a hideous train of vices, which his ambition had formerly taught him to conceal.-It was Sylla who recovered the works of Arifotle at the taking of Athens.

SYLLABLE, in Grammar, one or more letters pronounced by a fingle impulfe of the voice, forming a complete found, and constituting a word or a part of a
word. No fingle letter can form a fyllable except a vowel. The longeft fyllable in the Englith language is the word Arength.

The mol natural way of dividing words into fyllables is, to feparate all the fimple founds of which any word confifts, fo as not to divide thofe letters which arejoined clofe together according to the moft accurate pronunciation.

SYLLABUB, a kind of compound drink, moft ufed in the fummer feafon; ordinarily made of white wine, fugar, and nutneg, into which is milked a quantity of new milk from the cow. Sometimes it is made of canary in place of white wine; in which cafe the fugar is fpared, and a litule lemon and nutmeg are added inftead of it. To prepare it the beft way, the wine and other ingredients, except the milk, are to be mixed over night, and the milk or cream added in the morning. The proportion is, a pint of wine to three of milk. For

Syllabub, whipt, to half a pint of white wine or Rhenifh is put a pint of cream, with the whites of three eggs. This they feafon with fugar, and beat with birchen rods, or work with a fyringe. The froth is taken off as it rifes, and put into a pot; where, after flanding to fettle two or three hours, it is fit to eat.

SYLLLABUS, in matters of literature, denotes a table of contents, or an index of the chief heads of a book or difcourfe.

SYLLOGISM, in Logic, an argument or term of reafoning, confifing of taree propofitions; the two firt of which are called premifes; the laft, the conchufion. See Locic, Part II!.
SYLVIA, a gonus of birds, belonging to the order of pafferes, formed by Dr Latham by limiting the motacilla to the wagtail, and arranging the other lpecies, formerly clafed under that genus, under the fylvia. He
makes 13 fpecies of the motacilla, and 174 fpecies of Symbol the fylvia. See Motacilia, Ornithorocy Inder. SYMBOL, a fign or reprefentation of fomething \(\underbrace{\text { Sympathy. }}\) moral, by the figures or propertics of natural things. Hence fymbols are of various kinds; as hieroglyphice, types, enigmas, parables, fables, \&c.
SYMMACHUS, a citizen and ferator of ancient Rome, and conful in the year 391, has left us ten bouhs of epifles; from which, as well as from other things, we collect, that he was a warm oppofer of the Chrifitian religion. He was banifhed from Rome by Valentinian or fome account or othcr, but afterwards recalled and reccived into favour by Theodofus. Ammianus Marcellinus fpeaks of him as a man of great learuing and modelly. Scioppius, Pareus, and other learned men, have written notes upon the epifiles of Symnachus: we know of no later editior of them than that of Frankfort, \(1642,8 \mathrm{vo}\). Ambrofe bifhop of Milan wrote againft Symmachus, and fo did the Chriftian poet Prudentius.

SYMMETRY, the juft proportion of he feveral parts of any thing, fo at to compofe a heautiful whole.

Symmetry, in Painting. See Pafnting, Part I. Sect. III.

SYMONDSBOROUGH, a remarkable large barrow of Flints, near Wellington in Devonftuire, in the northern extremity of Hemyock. The common people have a notion that a ling called Symon was buried here. The tradition of the country plainly flows that it was the buial-place of fome fcrion or perfons of eminence.

SYMPATHETIC, fomething that acts or is acted upon by fympathy. Thus we fay, fympathetic difeafes, inks, \&:c.

SYMPAThettr Inks. See Sympathetic Inn.
SYMPATHY, an agreement of affections and inclinations, or a conformity of matural qualities, humours, temperaments, which make two perfons delighted and pleafed with each other.

Sympathy, alfo denotes the quality of being affected by the affection of another; and may fubfill either between different perfons or bodies, or betwcen different parts of the fame budy. It is cither fimilar or diflimilar; fimilar, when the affection or action in the fympathifer is fimilar to the affection or action in the fympathant ; and diffimilar, when thofe are different.-Sympathy too, is often an imitative faculty, fonietimes involuntary, frequently without confciouffiefs: thus w.e yawn when we fee others yawn, and are made to laugh by the laughing of another.

Sympathy, according to Dr Jackfon *, relates to the *T,eatije operations of the affections of the mind, to the opera- on \(S_{3}\) mefations of the imagination, and to the affections of the ex- thj: ternal fenfes.
1. The paffions and affections of the mind produce in the body different fenfations and impreffions, and, as fympathies of conlcioufiefs, determine in general the fpirits to thofe parts which labour moft, or are molt apt to be affected. Thus fear and anger determine to the heart; luft to the eyes, \&c.; joy, pity, wonder, and the like, to the head. See Passion, page \({ }_{1}\).

The affections of the mind of one perfon will ofter work upon the fpirits of many. Thus whele ccimpanies are fometimes difpofed to be fad and melanchay, or merry and jovial, when any one is prefent mach, inc:ined to cither of tho.e nates of mind; and it horen obferved,

\section*{\(S \quad\) M \(\quad\lceil 17\)}

Sympathy; obferved, that old people, who have loced the company of the young, and have been converiant continually with thera, have generally lived long. But yourg people mult not conclude from this, that the company and converfation of the grave and old will operate upon the living and fenfitive principle, through the affections of their mind, and difpofe them to be hlort-lived. On the contiary, by thus improving their undentanding, they will be more enabled to fortify their con?itution and refift the ravages of youthful indultence.
It may alfo be further obferved, that thofe tender fympathetic affections which lay hold of the mind, at the reprefentation of theatrical performances, originate from the fame principle, while they are to be confidered as the fureft teft of juft execution in the achor, and of the expreflive language of the author. Indeed all ftage effect depends on fympathy.

It las been faid, that the paffions of the mind are oecafionally infectious, particularly fome of them. Thus foar and frame are fometimes very fuddenly fo. We frequ:ently may have occafion to fee, that the farting of one will make another ready to flart. Again, when one man is out of countenance in company, others will often blufh in his behalf. However, the ferious paffions may furely be fo under the controul of reafon as to refint infection, whatever may be the cafe of temporary, mufcular, or nervous attraction.
2. Our author is inclined to thisk, that a connection between the affections and fenfations of the female mind and uterus, is very materiaily concerned in the procefs of generation, and probably can alone give efficacy to thofe actions and impreffions fubfervient to conception, through the fympathizing affections of the mind. But this is a fubject of which we know fo little, that the fpeculations of even the mof diflinguifhed philofophers refpeeting it have been nothing but the wild ravings of imagination.

With refipect to the depravity and force of the imagination in the production of fympathies, they always operate moft upon "weak minds and firits, and therefore molt on women, fuperfitious and fearful perfons, fick people, children, and young creatures." Their effects, however, fometimes fail to appear, becaufe they are encountered and overcome by the mind and Spirit before they work any manifeft effects."

Such effects are obviated upon the fame principle which eflablilhes the prevention of bodily difafe: "for in infection and contagion from body to body (as, for example, during the plague), the miafma may be received; but from the frength and good difpofition of the borly, it is expelled and wrought out before it has had fufficient time to form the difeafe."

It has been faid, and many are of the op:nion, that the force of imagination doth often forward the end propofed. Thuc, for inflance, it has been put as a queftion," Whether a mann, when he conflantly and Ilrongly believes that fuch a thing thall be (as that fuch at one will love lim, and the like), helps any thing to the effecting the thing defired:" Certainly not in the manncr which has been advanced, namely. "hy a fecret operation on the fipitit of another." If he fuccecds, it is cither becaufe he perfevered, or becauife his perfeverance and carneflnefs (and not any occult operation) makes him at length be attended to.

The:c is not a doubt but the force of imagination of.
ten gives ciectyy to cur aftions. It mar, however, un- Sympathy. lefs we are mich on our guard, eafily delude us afide \(\underbrace{\text { - }}\) fron reafun. It has been the tree which taas yielded the frtits of fuperfition in former times, and which has often fed the human mind with the mofe extravagant notions of lympathy. Sympathics of this kind, fuch as the power of charms, and the like, ate now pretty generally cxpledec.
3. The fise fenter, haring, tafing, finclling, focling, and feeing, are conlcicus of a fympatietic impreftion from odicus oljects. "I. A difagreeable found will fet the tee:h on edge, and make ail the body lliver. 2. The fwallowing of a naufeous nedicine will be attended with a flaking of the head and neck. 3. Difagreeable fimells produce ricarly the fame effect, which arc lefs perceived, becaure there is a remedy at hand by ftopping the nofe. 4. If you come luddenly out of the fun into the flade, the fenfe of fecling is diflurbed by a chillnefs or flivering of the whole body. 5. And even ludden darknefs produces a propenfity to hivering.

There is a very apparent reafon why a fympathy flould take place between the cyes. Hence their motions are fynchionous. It may be faid, that culfom and habit difpore the eyes to move one and the fame way; " for when one moveth towards the nofe, the other eye moveth from the nofe."

Though the cyes are by nature prone to move in concert, cuftom will, however, deffroy this natural conrert, and produce the contrary effect. Thus fone people can fquint when they will. Our anthor therefore gives this caution to mothers and nurfes: "Let them not fuffer infants to fit with a candle placed behind them; for both their eyes will be difpofed to move outwards, as aftecting to fee the light of the candle, which may bring on the habit of dquinting."
It appears as a quality in the fenfes of hearing and feeing, "that the infrument of each feparate fenfe bas a fympathy and fimilitude to that which giveth the retlection." Thus it has been oblerved, "that the eye will fympathize with a cryftal glafs or water, and the ear with caves and fuch hollow places as are fuited to report echo."

Sympathies have becn compared to unifons of found in mufic. Unifons of found produce agreeable fympathetic feelings; the reverfe produce difagreeable feelings. "All concords and difcords of mufic are (no doubt) fympathies and antipathies of found." Moreover, "they are faid to work as well by report of found as by motion."

The moft agreeable as well as odious objects operate in a fecondary way, in producing thofe fympathetic imprefions and actions which they conlmonly give rife to. An increafed fecretion of faliva often takes place at the fight of a favourite difl; and the running of water from a bottle, or otherwife, will fometimes affect individuals of a particular temperature, with an involuntary propenfity to woid urine.

Many have attempted to account for the remakable rympatly which takes place between parts of the body feemingly unconneeted with cach other; but as thele attempts are merely corjecturce, without any folid principles to refl on, we pats them over as the dreams of ingenious men. It wou'd be fortunate for feience, if men would confine themfelves to thofe fubjeets which can be
kinown,

\section*{S Y N [ 177 ] S Y N}
ymphonia known, and never draw conclufions till they have eflablifted principles. See Physiology, chap.ii.

SYMPHON1A, a genus of plants belonging to the clafs of monadelphia. See Botany Index.

SYMPHONY, in Mufic, properly denotes a confonance or concert of feveral founds agreeable to the ear, whether vocal or inftrumental, called alfo harmony. See Harmony.

SYMPHYSIS, in Anatomy, one of the kinds of junctures or articulations of the bones. See \(\Lambda\) natomy, \(n^{\circ} 2\).

Cutting the Srarrursis of the Pubes. See MidWIFERY, \(\mathrm{N}^{\mathrm{O}}{ }_{13} 6\).

SYMPHY IUM, Comfrey, a genus of plants belonging to the clafs pentandria ; and in the natural fyftem ranging under the 4 ift order afperifoliz. See Botany Index.

SYMPLOCE, \(\sigma \mu \pi \pi \Delta \propto x\), in Rhetoric, a figure, where the fame word is repeated feveral times in the beginning and end of a fentence, including the aNAPHORA and EPITROPHE : thus, शuis legem tulit ? Rulus. Quis majorem populi partom fuffragiis privavit? Rullus. शैं comituis prafuit? Idem Rullus.

SYMPLOCOS, a genus of plants belonging to the clafs polydelphia. See Botany Index.

SYMPOSIARCH, in antiquity, the director or manager of an entertainment. This office was fometimes performed by the perfon at whofe charge the entertainment was provided; fometimes by another named by him; and at other times, efpecially in entertainments provided at the common expence, he was elected by lot, or by the fuffrages of the guells.

SYMPTOM, in Medicine, any circumftance which indicates the exiftence, nature, or ftage of a difeafe. Pain, waking, drowfinefs, convulfions, fuppreffion of urine, difliculty of breathing and fwallowing, coughs, diftaftes, naufeas, thirft, fwoonings, faintings, loofenefs, coftivenefs, drynefs and blacknefs of the tongue, are the principal fymptomes of difeafes. See Medicise, \(n^{0} 4 \mathrm{I}\). and 58 .

SYMPTOMATICAL, in Medicine, is a term often ufed to denote the difference between the primary and fecondary caufes in difeafes: thus a fever from pain is faid to be fymptomatical, becaufes it rifes from pain only.

SYNARESIS, COntraction, in Grammar, a figure whereby two fyllables are united in one; as vemens for vehemens.

SYNAGOGUE, among the Jews, is a place where that pcople met to worhip God. Authors are not agreed about the time when the Jews firt began to have fynagogues:-Some fuppofe them as old as the ceremonial law, and others fix their beginning to the times after the Babylonith captivity. They erected fynagogues not only in towns and cities, but alfo in the country, elpecially near rivers, that they might have water for their purifications and ceremonious wafhings. No fynagogue was built in any town, unlefs there were ten perfons of leifure in it; but there might be many in one town, or in one quarter of a town, provided it was very populous. Jerufalcm is faid to have contained 480 . The chief things belonging to a fynagogue were, I. The ark or cheft, made after the model of the ark of the covenant, containing the Pentateuch. 2. The pulpit and defk in the middle of the fynarogue, in which ke that was

Vol. XX. Part I.
to read or expound the law ftood. 3. The feats or pews Synaromue for the people. 4. The lamps to give light at evening fervice, and the feall of dedication. 5. Kooms or apartments for the utenfils and alms chefts. 'The fynagoguc was governed by a council or affembly, over whom was a prefident, called The Ruler of the Synagogue. Thefe arc fometimes called Chiefs of the Jews, The Rulers, The Priefls or Elders, The Governors, The Overfeers, The Fathers of the Synagogue. Their bulinefs was to panill the difobedient, by cenfures, by excommunication, or by penallies, fuch as fines and fcourging ; to take care of the alms, which are frequently called by the name of righteoufnefs. The chief ruler, or one of the rulers, gave leave to have the law read and expounded, and appointed who hould do it. In every fynagogue, there were feveral minifters who had different offices affigned to them. Service was performed three times a day. viz. in the morning, in the afternoon, and at night; at the time of morning facrifice, evening facrifice, and after the evening facrifice on Mondays, Thurfdays, and Saturdays, there was a more forcible obligation upon the people to attend than upon the other days. There are fynagogues at London, Amfterdam, Rotterdam, Avignon, Metz, \&c.

SYNALOEPHA, in Grammar, a contraction of fyllables, performed principally, by fuppreffing fome vowel or diphthong at the end of a word, on account of another vowel or diphthong at the beginning of the next. As, ill' ego, for ille ego, \&c.

\section*{Conticuer' omnes intentiqu' ora tenebant. Virg.}

It is called by the Latins collifio.
SYNARTHROSIS,
SYNCHONDROSIS, \(\}\) See Anatomy, \({ }^{\circ}{ }_{2} . ~ . ~ . ~\)
SYNCELLUS, or SINCELLUS, an ancient officer in the family of the patriarchs, and other prelates of the eaftern church. The word, in the corrupt Greek, ouraninos, fignifies a perfon who lies in the chamber with another; a chamber-fellow, or chum. The fyncellus was an ecclefiaftic, who lived with the patriarch of Conftantinople, to be a witnefs of his conduct; whence it is, that the fyncellus was alfo called the patriarch's eye, becaule his bufinefs was to oblerve and watch. The other prelates had alfo their fyncelli, who were clerks living in the houfe with them, and even lying in the fame chamber, to be witneffes of the punity of their manners. Afterwards the office degenerated into a mere dignity; and there were made fyn. celli of churches.-At laft it became a title of honour, and was beftowed by the emperor on the prelates themfelves; whom they called ponifical fyncelli, and fyncelli Ausufales.

SYNCHRONISM denotes the happening of feveral things at the fame time. See Chronology.

SYNCOPATION, in Mufic, denotes a friking or bcating of time, whereby the diftinction of the feveral times or parts of the meafure is interrupted. However, it is more properly ufed for the conneeting the laft note of any meafure, or bar, with the firft of the following meafure, fo as only to make one note of both. A fyncope is fometimes allo made in the middle of a meafure. Syncopation is alfo ufed when a note of one part ends ar terminates on the middlc of a note of the other past. This is othersile denominated binding. It is likewife ufed for a driving note; that is, when fome fhorter note at the begimning of a meafure, or half meafure, is fol

\footnotetext{
\(Z\) lowed
}

Syncopasion.
to vifit and hold their diocefan fynods once. - For the fame reafon, they are fometimes alfo denominated fynodalica; but more ufually, procurations.

SYNODICAL, fomething belonging to a fynod. Thus, fynodical epifies are circular letters written by the fynods to the abfent prelales and churches; or even thofe general ones directed to all the faituful, to inform them of what had paffed in the fynod.

SYNOECIA, in Grecian antiquity, a feaft celebrated at Athens in memory of 'Thefeus's having united all the petty communities of Attica into one fingle commonwealth; the feat whereof was at Atbens, where all the affemblics were to be held. This feaft was dedicated to Minerva; and, according to the fcholiaft on Thucydides, it was held in the month Metagimion.

SYNONYMOUS, is applied to a word or term that has the fame import or figuification with another.

Several works have been compoled for the exprefs purpofe of explaining fynonymus words. In 1777 a work was publifhed on the Latin Cynonyma at Paris by M. Gardir Dunefnil. The abbé Girard publified one on the fynonymous terms of the French language many years ago. Another was publithed on the fame fubject in the year \(17^{8} 5\) by the abbe Roubaud. An account of the Englith linonyma was publifhed by an anonymous author in 1766 ; which is a clofe imitation, and in fome parts a literal tranflation, of the abbé Girard's Synomymes Francoits. Mrs Piozzi has written fome eflays on the fame tubject.

SYNOVIA, in Medicine, a term ufed by Paracelfus and his fchool for the nutritious juice proper and pect:liar to each part. Thus they talk of the fynovia of the joints, of the brain, \&c.

SYNTAX, in Grammar, the proper conftruction or due difpofition of the words of a langnage into fentences and phrafes. See Grammar and Lavguage.

SYNTHESIS, in Logic, denotes a branch of method, oppofite to analyfis.

In the fynthefis or fynthetic method, we purfue the truth by reafons drawn from principles before eftablifhed or aflumed, and propofitions formerly proved: thus proceeding by a regular chain, till we come to the conclufion. Such is the method in Euclid's Elements, and mof demonftrations of the ancient mathematicians, which procecd from definitions and axioms, to prove propofitions, \&c. and from thofe propcfitions proved to prove others. This method we alfo call compofition, in in oppofition to analyfis or refolution. See Analysis.

SYPHILIS. See Medicine, \({ }^{\circ} 350\).
SYPHON. See Hydrodynanics. Some uncommon phenomena in nature may be accounted for upon the principles of the fyphon; as, for inflance, that of reciprocating fprings. See Pneumatics. No 37.3.

SYRACUSE, a celebrated city of Sicily, and oncc At what the capital of the ifland. It was built, according io time built. Thucydides and Strabo, by Archias, one of the Heraclidæ, who came from Corinth into Sicily in the fecond year of the 11 th Olympiad, and derived its name from a neighbouring mailh naned Syraco. What form of government firt prevailed in the city is not known. Many have fuppofed it originally to have been governed by kings: but if this were the cale, the monarchical government continued only for a very flort time ; fince Arifotle, Diodorus Siculus, and Jullin, mention it as being very early fubject to a democracy. The hillory

\section*{S Y R [ I79 ] S Y R}
jyracufe is obfcure and unimportant till the time of Gelon, when

\(-\)elon fei.s on the vercignty

Cule firft began to make a confpicuous figure.
Gelon was born in the city of Gela in Sicily, of the family of Telines, who had been created prieft of the infernal gods. He fignalized himielf in a war carried on againft the Syracufans, by Hippocrates tyrant of Gela, whom he defeated in a pitched battle. Having thus become very powerful among his countrymen, he foon found means to feize on the lovereignty for himfelf. In a thort time, having put himfelf at the head of lome Syracufan exiles, he marched towards that place, where he was received with loud acclamations and obtained poffeffion of the city.
Gelon, in order to people the capital of his now dominions, firit demolilhed the neighbouring city of Camarina, and tranfplanted the inhabitants to Syracufe. Soon after, entering into a war with the Megareans, he defeated them, took and rafed their cities, and in like manner transplanted the people. Syracufe thus became powerful, and full of inhabitants; and the fiendfhip of Gelon was courted both by Athens and Lacediemon at the time of the Perfian invafion. In the mean time the Carthaginians had entered into a treaty with the Perfians; by which it was agreed, that the former fhould attack thofe of the Greek name in Sicily and Italy, in order to divert them from affilting each other. Sicily was accordingly invaded by the Carthaginians with a vaft army ; but they were utterly overthrown by Gelon, as is related under the article Carthage, \(\mathrm{N}^{\circ}\) 7-9. After this vietory, the people out of gratitude obliged him to affume the title of king; which till that time he had refufed. A decree alfo paffed by which the crown was fettled on his two brothers Hiero and Thrafybulus after his death.

The new king, inftead of kecping his fubjects in greater awe, fudied to make them bappy, and was the firft man who became more vistuous by being raifed to a throne. He was particularly famous for his honefty, truth, and fincerity; is faid never to have wronged the meanett of his fubjects, and never to have promifed a thing which he did not perform.

Gelon died in the year 471 B. C. after having reigned three or four years; and was fucceeded by his brother Hiero, whofe character ig diferently drawn by difierent hiftorians. He is highly celebrated in the odes of Pindar; and it is certain that his court was the refort of men of wit and learning, to whom he belaved in the moft courteous manner and with the greateft liberality.

In 459 B. C. Hiero was fucceeded by Thrafybulus; who proving a tyrant, was in ten months driven out, and a popular government refored; which continued for the fpace of 55 years.

Alout this time the Syracufans entered into a war with the Siculi, which terminated in the total fubjection of the latter; after which Syracufe became fo powerful, that it in a manner gave law to the whole ifland. The Greek cities indeed enjoyed a perfect liberty; but they all acknowledged Syracufe as their metropolis: by de. grees, however, the latter began to affume fuch an authority over them as was totally inconfiftent with IIberty; and this occafioned many wars, which involved them in much diffrefs and darger. They began with the Leontines, whofe territory they laid wafte, and reduced their city to great fraits. Leontini was an tficcerf. Athenian colony : and this furnifhed the Athenians,
who had already meditated the conqueeft of Sicily, with Syrarifo. a pretence to attack the Syracufans with their wiz ol \(\underbrace{\text { Sur }}\) force. Under colour of affifting their countrymess therefore, they fent a Heet of 250 fail to Sicily; but the Leontines, fenfible that their pretended allies aimed at nothing lefs than the conqueft of the whole inand, concluded a pace with Syracufe ; and the difappointed Athenians vented their rage on thofe who had advifed and conducted the expedition.

During the continuance of the popular government, the Syracufans took part in the long war between A . thens and Sparta. The circumfances which took place in this conteft are futhiciently detailed under Atrica, \(\mathrm{N}^{\mathrm{o}} 126\) - 150.

This war was farcely cnded, when a new and for- New invamidable invafion by the Carthaginians took place; but fion by the the event of that expedition was as unfortunate to the Cuans. Carthaginians as the former had been, as has been particularly related under the article Carthage, \(\mathrm{N}^{\mathrm{o}} 12\). et foq.

In the mean time, a confiderable revolution had hanpened in Syracufe. The city of Agrigentum had been taken by the Carthaginians, and of the few inhabitants who efcaped, fome fled to Syracufe, where they accufed the Syracufan commanders of having betrayed the city into the hands of the enemy. Dionyfius, a man of great Rife of valour and addrefs, but who had become very obnoxious Dionyllius, to the popalace, took this opportunity of attempting to retrieve his credit. He therefore fupported the accufations brought againft his countrymen by the Agrigentines, and even impeached the magiftrates as having a fecret intelligence with the enemy, and attempting to introduce an oligarchy. As his fpeech was entirely levelled againft the more wealthy citizens, it was very agreeable to the lower clafs: the commanders were inftantly degraded; and others, among whom was Dionyfius, were appointed. Having once gained this point, he began to confider how he might get all his colleagues turned out. For this purpofe he never joined in any council of war with the other comnanders, nor imparted to them his refolutions, giving out that he could not trult them, and that they had more regard for their own intereft than the welfare of their country. But while he was proceeding in this manner, the more prudent part of the citizens, perceiving what he aimed at, complained of him to the fenate and magiftates, and fined hinn as a difurber of the public peace. According to the laws, the fine was to be paid before he could \(\mathrm{f}_{\mathrm{F}} \mathrm{Cak}\) in public, and the circumflances of Dionyfus did not allow him to difcharge it. In this dilemma he was afinined by Philifus the hiftorian, a man of great weat h, who not only paid this fine for him, but encouraged him to fpeak his mind freely, as it became a zealous citizen to do, promifing to pay all the fines that fhould be laid upon him.

Being extifated out of this dificulty, Dionyfus next proceeded to inveigh, with all the eloquence of which he was mafter, againft thofe who by means of their power or intereft were able to oppofe his defigns, and by degrees brought them into difcredit. His next fcheme was to get thofe exiles recalled whom the nobility had banifhed at different times; as thinking that they would fupport him with all their power, as well out of gratitude as out of hatred to the oppofite party. Haring gained this point alfo, he next found means to ingratiate him-

\section*{S Y R [ 180 ] S Y R}

Syracule. felf with the foldiery to fuch a degree, that, under pretence of taking proper meafures for refifting the Carthaginians, he was chofen commander in chief, wi:h abfolute and unlimited power. This was no fooner done, than, pretending his life was in danger, he chofe out 1020 men for his guard, whom he attached to his interelt by great promifes. As no perfon durft now oppofe him, he pofeffed himfelf of the citadel, where all the arms and prorifions were kept ; after which he publicly took the title of king of Syracule in the year \(40+\) B. C.
The Syracufans did not tamely fubmit to their new mafter: but Dionyfius managed matters fo well, that their frequent revolts anfivered no other purpofe than more certainly to entail flavery on themfelves; and he was allowed to poffefs the throne without much oppofition till his death, which happened in the year 366 B. C.
who becomesking of Syracue.
 B. C.

On the death of Dionyfus, he was fucceeded by his fon, called alfo Dionyfius. He was naturally of a mild and peaceable temper, averfe to cruelty, and inclined to learning; but his father, to whom all merit, even in his own children, gave umbrage, ftiffed as far as poffible his good qualities by a mean and oblcure education. He no fooner afcended the throne, than Dion, brother to Ariftomache the other wife of Dionyfius the Elder, undertook to correct the faults of his education, and to infpire him with thoughts fuitable to the high fation in which he was placed. For this purpofe he fent for the philofopher Plato, under whofe care he immediately put the young king. This inftantly produced a reformation on Dionyfius; but the courtiers, dreading the effects of the philofopber's inftructions, prevailed on him to banifh Dion, and to keep Plato himelf in a kind of imprifonment in the citadel. At laft, however, he fet him at liberty; upon which Plato returned to his own country.

Dion, in the mean time, vifited feveral of the Grecian cities, and at laft took up his refidence in Athens; but the honours which were everywhere paid him, raif. cd fuch jealoufies in the breaff of the tyrant, that he ftopped his revenue, and caufed it to be paid into his own treafury. In a fhort time Dionyfius again fent for Plato; but finding it impoffible to difiolve the friendhip between him and Dion, difgraced, and placed him in a very dangerous fituation, in the midn of affaffins who hated him. Not daring, however, to offer him any violence, he allowed him foon after to depart; revenging limfelf on Dion, whefe eftate lic fold, and gave his wife \(A\) rcte in marriage to Timocrates one of his own flatterers.

Dion now refolved to revenge himfelf on tre tyrant for the many injuries he had fuftained, and at once to deliver his country from the oppreflion under which it groaned. He began with raifing foreign troops privately, by proper agents, for the better crecution of his defign. Many Sy:acufans of diffinction entered into his fcheree, and gave him intelligence of what paffed in the city; but of the exiles, of whom there were upwards of \(10 ว 0\) difperfed up and down Grecee, only 25 joined him; formuch were they awed by the dread of the tyran:. The troops were affembled at the illand of Zacynthue, in number only about 830 ; but who had all been tried on many occalions, were well difciplined, and capable of animating ly their example the forces which

Dion hoped to find in Sicily. When they were about Syracufe. to fail, Dion acquainted them with his defign, the boldnefs of which at firf occafioned among them no fmall contternation; but Dion fuon removed their fears, by telling them that he did not lead them as foldiers, but as officers, to put them at the head of the Syracufans and all the people of Sicily, who were ready to receive them with open arms. Having then embarked in two fmall trading veffels, they arrived in 12 days at Cape Pachynum near Syracufe. At lan they arrived at the port of Minoa, not far from Agrigentum. Here they received intelligence that Dionyfius had fet fail for Italy, altended by a fleet of 80 galleys. On this Dion refolved to take advantage of the tyrant's abfence, and immediatcly fet fail for Syracufe. On his march he prevailed on the inhabitants of Agrigentum, Gela, Camarina, and other cities, to join him. As foon as he Enters entered the territories of Syracufe, multitudes flocked racufe with. to him ; and as nobody appeared to oppofe him, he out oppofiboldly entered the city, where he quickly found himfelf at the head of \(50,000 \mathrm{men}\). As foon as he had landed in Sicily, Timocrates, to whom his wife Arete had been given by Dionyfius, and to whom the care of the city had been left,' difpatched a courier to let the tyrant know the danger in which he was. Dionyfius was, however, accidentally prevented from receiving a timely account of Dion's arrival ; fo that when he entered the citadel by fea, feven days after Dion's arrival, he found his affairs in a defperate fituation. Upon this he had re-Dionyfius courle to artifice; and having amufed the Syracufans by arrives, but a feigned negotiation, until he obferved that they kept is totally a negligent guard, he attacked them all at once with defeated. fuch fury, that he had almoft taken the city. But Dion encouraged the foldiers by his example fo much, that he at laft obtained a complete victory; for which they prefented him with a crown of gold.

It was not long, however, before the ungrateful Syracufans began to think of conferıing quite different re-of the Syra wards on their benefactor. Dionyfius had the addrefs culans to to render him fufpected by the multitude; at the fame time that Heraclides, an excellent officer, but a fecret enemy to Dion, did all that lay in his power to fink his credit. Dionyflus was foon obliged to fly into Italy, but left Heraclides to oppole Dion.

At length Dion got poffeffion of the city, Heraclides fubmitted to him, and was received into favour ; but as his feditious and turbulent behaviour fill continued, Dion beDion at laft gave orders to put him to death. This ac. comes me. tion, however neceffary, to affected the mind of Dion, lancholy, that he became melancholy; and ever after imagined himfelf haunted by a frightful fpestre, refembling a woman of gigantic ftature, with the haggard looks and air of a fury. In a fhort time after he loft his life, through the bafe treachery of Calippus, or Gylippus, who pretended to be his intimate friend, and who immediately after cauled his wife and fifter to he carried to prifon.

Calippus having removed Dion, foon made himfelf mafter of Syracufe, where he committed all manner of cruelties; but was driven out, and forced to fly to Rhegium, where he was murdered with the fame dagger which had killed Dion. In 350 B . C. Dionyfius again made himfelf malter of Syracufe ; and being exafperated by his pan misfortunes, tyranuized worfe than ever. The Dionyfins Syracufans firf had recourfe to Icetas tyrant of Lconti- reftored. ni ; but as the Carthaginians took this opportunity to in-

\section*{S Y R [ 18 I ] S Y R}
vade them with a powerful fleet and army, they were obliged to apply to the Corinthians. By them Timoleon, a celebrated commander, was fent to the affiftance of the Syraculans, whom he found in a very diftrefled fituation; Icetas being mafler of the city, the Carthaginians of the harbour, and Dionyfus of the citadel. As all parties were equally the enemies of Dionyfius, he

20
jurrenders o Timocon, and secps a chool at Gorinth. found it impofible to hold out, and therefore furrendered himfelf to Timoleon, by whon he was fent to Corinth; where at laft he was reduced to the ncceffity of teaching a fchool for his fupport.

After the expulfion of the tyrant, Timoleon withdrew to Catana, leaving only 400 Corinthians, under the command of an experienced officer named Lcon, to guard the citadel. Thefe were immediately befieged by Icetas and the Carthaginians, but Timoleon found means to relieve them in fpite of all oppofition; and having difperfed emiffaries through the army of Mago the Carthaginian general, exhorting the mercenary Greeks to forfake him, he was fo much intimidated, that in fpite of all the remonflrances Icetas could make, he fet fail for Africa, leaving his colleague to carry on the war in the beft manner he could.

The day after the departure of Mago, Timoleon affaulted the city fo brifkly, that the troops of Icetas were driven from the walls, and the Corinthians became mafters of the place. Timoleon, by found of trumpet, invited the inhabitants to come and affift in demolifhing the citadel and other cafter, which he called the nefs of tyrants; after which he caufed edifices to be erected in the place where the citadel had flood, for the adminifration of juftice. He found the city in a moft miferable fituation: for many having perifhed in the wars and feditions, and others having fled to avoid the oppreffion of tyrants, Syracufe, once fo wealthy and populous, was now become almoft a defert; infonuch that the horfes were fed on the grafs which grew on the market-place. Timoleon fupplicd the city with inhabitants from Corinth and other cities of Greece, at the fame time that great multitudes from Italy and the other parts of Sicily reforted thither. Timoleon diftributed the lands among them gratis; but fold the houfes, and with the money arifing from the fale eftablifhed a fund for the fapport of the poor. Having thus reflored Syracufe, he in like manner delivered all the Greek cities of Sicily from the tyrants who had taken poffeffion of them, all of whom he put to death. After this he refigned his authority, and led a retired life, honoured in the higheft degree by the Syracufans, and by all the cities in Sicily. After his death he was honoured as a god; the expence of his Dies, and is funeral was defrayed by the public; fports, with horfe. honoured as races and gymnaflic exercifes, were held annually on a gol. the day of his death; and it was decreed, that whenever the Syraculans were at war with the barbarians, they ftoould fend to Corinth for a general.

For 20 yeas the Syracufans enjoyed the fruits of Timoleon's victories; but new difturbances arifing, in a thort time another tyrant flarted up, who exceeded all that had gone before him in cruelty and other vices. This was the celebrated Agathocles, of whofe exploits againft the Carthaginians a full account is given under the article Carthage, \(\mathrm{N}^{\mathrm{o}} 33-53\). He was poifoned by one Mcenon in the year 289 B. C. after having reigned 28 years, and lived 95 .-A fucceffion of tyrants followed, till at laft the city, being held by two rivals,

Tocnion and Sofiftratus, who made war within the very Syracufe. walls, Pyrrhus king of Epirus was invited into Sicily, \(\underbrace{}_{26}\) in order to put an errd to thefe diftractions. He wil- pyrrhus lingly complied with the invitation; and was everywhere king of received with loud acclamations, as the deliverer not on- Epirus inly of Syracufc, but of all Sicily. \(\Lambda\) s he had a fine army vited into of 30,000 foot and 5000 horfe, with a fleet of 200 fail, Sicily. he drove the Carthaginians from place to place, till he left them only the two flrong pofts of Eryx and Lilybaum. The former of thefe be took by aflault, and was himfelf the firlt man who mounted the walls, after having killed a great number of A fricans with his own hand. The Mamertines likewife, who had conquered a confiderable part of the illand, were everywhere defeated and driven out, till at lalt they were hut up in the city of Meflana. The Carthaginians, alarmed at the rapidity of his conquefts, fent ambafladors with propofals of peace upon very advantageous terms; but Pyrrhus, puffed up with the expectation of reducing the whole ifland, refufed to bearken to any terms unlefs they would inftantly abandon it. So firm was he in the belief of this, that he caufed his fon to affume the title of king of Sicily; but in the mean time, having difpleafed the Sicilians by his arbitrary behaviour, they deferted from him in fuch numbers that he was glad to fet out for Italy, for which retreat the embaffies he received from the Samnites, Tarentines, and other Italians, furnifhed him with an honourable pretext. He embarked in the thips which he had brought with him from Italy; but was met at fea by the Carthaginians, who funk 70 of his veffels, and difperfed or took the reft; fo that he faved himfelf in Italy only with 12 veffels, the poor remains of a fleet of 200 fail. No Syracuic fooner were the Mamertines apprifed of his departure, haraflid bos than they difpatched a body of 18,000 men to harals him after his landing. Thefe, having paffed the fraits before him, pofted themfelves in the road which Pyrrhus mult take in marching by land to Tarentum; and concealing themfelves among woods and rocks, attacked him unexpectedly, and with great refolution. But Pyrrhus behaved on this occafion with his ufual bravery. The attack being made on his rear, he haftened thither, and made a dreadful flaughter of the enemy, till a wound on his head obliged him to retire.
After the departure of Pyrrbus, Hiero the fon of Hiero choHierocles, a defcendant of Gelon, the firt king of Sy- fen generat racufe, was chofen general of the forces, along with cufan foranother named Artemidorus. The two generals had ces. nothing more at heart than to put an end to the confufion and diforder which reigned in the city; for which reafon they entered it at the head of their forces. On this occafion Hiero difcovered extraordinary talents for government. By mere dint of infinuation and addrefs, without fhedding blood, or hurting a fingle citizen, he calmed the minds of the people; reconciled the factions; and fo gained the affections of all, that he was invefted with the whole civil as well as military power in the flate. Soon after this, he married the daughter of one of the firf citizens; and having diftinguifled himfelf by his exploits againft the Mamertines, was Is elected unanimoully eleeted king of Syracufe, in the year 265 king of asB. C.

Some time after Hiero's acceffion to the throne, he A. A. \(\mathrm{C}^{265}\) again defeated the Manertines, and reduced them to fach flraits, that they were obliged to call in the Ro-

\section*{G Y R [ 182 ] S Y R}

Syracufe. mans to their affiftance. The confequences of this have been fully related under the articles Rome ard Carthage. Hiero, who had allied himfelf with the Cartlaginians, being himfelf defeated by the Romans, and finding his allies unable to protect him againt the power of that republic, concluded an alliance with them; and continued faithful to them even in the time of the fecond Punic war, when they were in the greatef diftrefs. In his reign flourifhed the celebrated mathematician Archimedes, whole genius he employed in fortifying the city of Syracufe, by innumerable machines, in fuch a manner as rendered it abfolutely impregnable to every method of attack known at that time.

Hiero died about 21 I B. C. and was fucceeded by his grandfon Hieronymus: but he imprudently forfook the counfels of his grandfather, and entered into an alliance with the Carthaginians. Soon after this he was murdered, in confequence of his tyranny and cruelty, and the greateft diforders took place in the city ; which Hannibal, though then in Italy, found means to foment, in hopes of keeping the Syracufans in his intereft. This indeed he effected; but as his own affairs in Italy began to decline *, he could not prevent Marcellus from land. ing in Sicily with a formidable army, which the Sicilians could by no means reffe. Syracufe was foon inrefted; but the machines invented by Archimedes baffed all attempts to take it by affault. The immenfe preparations which the conful had made for taking the city by form, could not have failed to accomplifh his purpofe, had the place been otherwife defended than by the contrivance of Archimedes. The Roman fleet confifted of 60 quinqueremes, befides a far greater number of other hhips. The decks were covered with foldiers armed with darts, llings, and bows, to drive the befieged from the ramparts, which on one fide were wathed by the fea, and to facilitate the approach to the walls. But a machine of Marcellus's own invention, called a fambuca, was what he chiefly depended on. The conful's defign was to bring his fambuca to the fot of the walls of Acradina; but, while it was at a confiderable diftance (and it advanced very llow, being moved only by two ranks of rowers), Archimedes difcharged from one of his engines a vaft fone, weighing, according to Plutarch's account, 1250 pounds, then a fecond, and immediately after a third ; all which, falling upon the fambuca with a dreadful noife, broke its fupports, and gave the galleys upon which it Jlood fuch a violent fhock that they parted, and the machine which Marcellus had raifed upon them at a vaft trouble and expence was hattcred to pieces. At the fame time, feveral other machines, which were not vifible without the walls, and confequently did not leffen the confidence of the Romans in the aifault, played incefiantly upon their thips, and overwhelmed them with fhowers of flones, rafiers, and beams pointed with iron; infomuch that Marcellus, heing at a lofs what to do, retired with all poffible hafte, and fent orders to his land-forees to do the fame; for the attack on the land-fide was attended with no better fuccefs, the ranks being broken and thrown into the utmooft confufion by the flones and darts, whicl flew with fuch noife, force, and rapidity, that they firuck the Romans with terror, and dafhed all to pieces hefore them.

Marcellus, furprifed, though not difcouraged, at this artificial florm, which he did not expect, held a council of war, in which it was refolved, the next day before
funrie, to come up chofe under the wall, and kee? Syracufe. there. They were in hopes by this means to fecure therufelves againt the terrible florm of flomes and darts which fell on the fhips when at a diflance. But Archimedes had prepared engines which were adapted to all dillanees. When the Romans therefore had brought their fhips clofe under the wall, and thought themfelves well covered, they were unexpectedly overwhelmed with a new fhower of darts and flones, which fell perpendicularly on their heads, and obliged them to retire with great precipitation. But they were no fooner got at fome diftance, than a new hower of darts overtook them, which made a dreadful havoek of the men, while flones of an immenfe weight, difcharged from other machines, either difabled or broke in pieces moft of their galleys. This lofs they fuftained, without being able to revenge it in the leaft on the enemy. For Archimedes had placed moft of his engines behind the walls, and not only out of the reach, but even out of the fight, of the enemy; fo that the Romans were repulfed with a dreadful flaughter, without feeing the hand that occafioned it. What moft haraffed the Romans in the attack by fea, was a fort of crow with iron claws, faflened to a long chain, which was let down by a kind of lever. The weight of the iron made it fall with great violence, and drove it into the planks of the galleys. Then the befieged, by a great weight of lead at the other end of the lever, weighed it down, and confequently raifed up the iron of the crow in proportion, and with it the prow of the galley to which it was faftened, frinking the poop at the fame time into the water. After this the crow letting go its hold all of a fudden, the prow of the galley fell with fuch force into the fea, that the whole veffel was filled with water, and funk. At other times, the machines, dragging fhips to the fhore by hooks, difhed them to picces againfl the points of the rocks which projected under the walls. Other veffels were quite lifted up into the air, there whirled about with incredible rapidity, and then let fall into the fea, and funk, with all that were in them. How thefe ftupendous works were effected, few, if any, have hitherto been able to comprehend.

The troops under the command of Appius fuffered no lefs in this fecond attack than the fleet. In the whole fpace of ground which the army, when formed, took up, the laft files as well as the firft were overwhelmed with fhowers of darts and flints, againf which they could not poflibly defend themfelves. When they had with infinite trouble brought the mantelets and covered gallcries, under which they were to work the rams, near the foot of the wall, Archimedes difeharged fuch large beams and flones upou them as crefhed them to pieces. If any brave Roman ventured to draw too near the wall, iron hooks were immediately let down from above, which, taking hold of his clothes or fome part of his body, lifted him up in the air and dofled out his brains with the fall. Marcellus, though at a lofs what to do, could not however forbear exprefing limfelf with pleafantry: Shall we perfift, faid he to his workmen, in making war upon this Briareus, upon this giant with an hundred hands? But the foldiers were fo terrified, that if they faw upon the walls only a fmall cord, or the leaft piece of wood, they immediately turned their hacks and fled, crying out, that Archimedes was going to difcharge fome dreadful machine upon them.

Syracufe. \(\overbrace{3}\) the fiege urned inta blockade. 34 tecount of lie taking if syracule.

The confuls, finding themfelves thus defeaied in every attempt, tumed the fiege into a blockade, reduced molt of the other places in the ifland, and defeated the forces which were lent againft them; and at laft Marcellus made himfelf mafter of Syracufe itfelf. He took the opportunity of a feftival, when the foldiers and cilizens had drunk plentifully, to make a detachment feale the walls of 'Yyche, in that part of it which was nearell to Epipule, and which was ill guarded. He prefently after pofiefled himfelf of Epipolx; whereupon the inhabitants of Neapolis, as well as 'I'yche, fent deputies to him, and fubmitted. Marcellus granted life and liberty to all of free condition, but gave up thofe quarters of the city to be plundered. The foldiers had orders to Spare the lives of the citizens; but they were cruel in their avarice, Aew many of them, and among the reft the incomparable Archimedes. He was very intent on a demonll ration in geometry, and calmly drawing his lincs, when a loldier entered the room, and clapped a fword to his throat. "Hold! (Taid Archimedes) one moment, and my demonftration will be finifhed." But the foldier, equally regardlefs of his prayer and his demonftratien, killed him inftantly. 'There are diferent accounts of the manner of his death; but all agree that Marcelius regretted it extremely, and howed a fingulat favour to his relations for his fake.

The city of Syracufe continued fubjeet to the weftern empire till its declenfion, when the illand of Sicily, being ravaged by different barbarians, the capital alfo underwent various revolutions; till at laft, in the gh century, it was fo deffroyed by the Saracens, that very ferv traces of its ancient grandeur are now to be feen. "The ancient city of Syracufe was of a triangular form, and confilted of five parts or towns. The circuit, according to Strabo, amounted to 180 fladia, or 22 Engliill miles, and four furlongs. An account which Mr Swinburne once fufpected of exaggeration; but, after fpending two days in traciug the ruins, and making reafonable allowances for the encroachments of the fea, he was convinced of the exactnefs of Strabo's meafurement.

At prefent it is ftrongly fortified towards the land, and the ditches of the baftions form the communications between the two havens. It is very weak towards the fea, but the thelves render it hazardous to debark on that fide. The garrifon is one of the beft appointed in the king dom, but the heights of Acradina command the works.

About cighteen thoufand inhabitants are now conlained in it. The dwellings are far from being memorials of ancient Syracufan architecture or opulence. in any other fituation they might be thought tolerable; buit to obferters who retiect on the flyle of thofe buildings that probably once covered the fame ground, th:e prefent edifices muft have a mean appeatance. The ancient temple of Minerva is now turned into a cathedral. The walls of the cella are thrown down, mionIy as much left in pillars as is neceliary to fupport the roof; the intercolumniations of the perinyle are wailed up. This temple is built in the old Doric prouortions ufed in the reft of Sicily; its exterier dimenfions are 155 feet in length and 75 in breadth. There are allo fome remains of Diana's temple, but now fcarcely difcernible. Befides thefe, there are few ruins in the ifliand; and one is furprifed that any fhould exift in a place which had been fo often laid watte by enemies, and fo
often flakien by earthquakes. E. Long. \(25.2 \%\) N. Lat. 37.3.

SYRIA, a very ancient kingdom of Afia, lying between the Mediterranean on the weft, the Euphrates on the eafl, and Arabia Deferta, l'heenicia and Palciline, on the fouth.

In ancient times this country was called Aram, pro-Names, dibably from Aram the youngeft fon of Shem. At firl vifions, zic. it was parcelled out into leveral petty llates; all of of ancimas which feem afterwards to have been reduced ander fub. Syriiajeetion to the four principal ones, Zobah, Damafcus, Hamath, and Geftur. Afterwards the whole country was divided into two parts only, viz. Colefyria and Phoenicia ; though the Phoenicians, Idumeans, Jews, Gazites, and Azotites, or the whole enuntry of the Prilifines, was included. After the death of Alexander, Syria, in the great extent of the word, was divided, according to Sirabo, into Comagene, Seleucis of Syria, Cceielyria, Phenice on the fea coatt, and Judea in the midland. Ptolemy, however, fubdivides theie; and in the Proper Syria reckons only Eumagere, Pieria, Cyrrlititica or Cyrrheftica, Seleucis, Cafliotis or Cafiotis, Chalybunitis, Chalcidice or Chalcidene, Apamene, Laodicene, Phoenicia Mediterranea, Coelefyria and Palmyrene.

The binory of the ancient Syrians, till the time of their beiag carricd away by the \(\operatorname{kin}_{6}^{-s}\) of Affrria, is totally unknown, excepting a few paiticulars which may be gathered from Scriptere, and which it is needele's here to repeat. During the continuance of the Alfyrian, Babylonian, and Perfian monarchics, the hiftory of this country afords nothing remarkable; but after the death of Alexander, it gave name to a very confiderable empire, which makes a conficuous figure in ancient hiflory. At this time, however, it was not confined to Syria properly fo called, but comprehended alt thofe vaft proxinces of the Upper Afia which formed the Perfian empire ; being, in its full extent, bounded hy the Mediterranean upon orie fide, and the river Indus on the other. The firl king was Seleucus, one of Seleucis the gencrals of Alexander the Great ; who, aftcr the the firt death of that conqueror, being made governor of Babylon, was tempted, by the example of Alexander's other captains, 10 fer her diexinder pumenes, who had fin-the Greato cerely at heart the intereft of Alexander's family, folicited his afiiftance againft Antigonus, who had openly revolted; but Seleucus not only refufed this affiltance, but attempted to deftroy Eumenes himfelf with his whole army. Eumenes, however, found means to efcape the danger without the lofs of a man. On this Scleucus endeavoured to gain over his troops: but filding that impoffible, he made a truce with Eumeries, and granted him a fafe paffare through his province; but at the fame time fent an exprefs to Antigonus, defring him to fall upon him, before he was joined by the governors of Upper Afis. Antigonus did not fail to fullow his advice; lut having prevailed againft Eumenes through treachery, the next thought of bringing Seleucus himfelf under fubjeftion. On his return to Baby. مre: gat hy lon, therefore, after having been ferited with his whoie inde nus army by Seleucus, he denianded of him an srecunt of to tho the revenues of his province. Receiving an unfavourable Eojrt anfwer to this requifition, Antigome was fo much exafperated, that Seleucus, not thinking himfelf a matar for him at that time, thought proper to Ay into Egypt.

By the flight of Seleucus, Antigonus was left mafter of all his provinces; but his fon Demetrius being afterwards defeated by Ptolemy at Gaza, Seleucus began to think of recovering what he had loft. Having received from Ptolemy a very flender furce, he fet out towards

4
Decomes
malter of Babylon. An. 3 F 2.
B. C.

Defeats
Nicanor, and reduces Medıa and Sufiana. Pabylon, and proeured reinforcements as he proceeded. As he approached the city, thole who favoured Antigonus retired into the citadel, but were foon obliged to furrender; and in that fortrefs Seleucus found his children, friends, and domeflics, whom Antigonus had kept prifoners ever fince his flight into Egypt.

Seleucus having made himfelf malter of Babylon, in the year 312 B . C. began to prepare for encountering Antigonus, who he knew would foon attack him with all his force. Nicanor, governor of Media under Antigonus, firlt advanced againft him at the head of 10,000 foot and 7000 horfe; but Seleucus, with only 3000 foot and 400 horle, having drawn him into an ambull, cut off alinoft the whole of his army, and fuch of the foldiers as had efcaped the flaughter willingly enlifted under his banner.

The confequence of this victory was the fubmiffion of all Media and Sufiana ; but during his abfence from the capital, Demetrius advanced towards it, and made himfelf mafter of it.

On the return of Seleucus to Babylon, he eafly drove out the troops left by Demetrius, recovered the caftle which he had garrifoned, and fettled his authority on fuch a from foundation, that it could never afterwards be moved. Having then marched again into Media, he defeated and killed with his own hand Nicanor or Nicator, whom Antigonus had fent againft him; after which, having fettled the affairs of Media, he reduced all Perfia, Bactria, and Hyrcania, fubjecting to his new empire thefe and all the other provinces on this fide the Indus which had been conquered.

Seleucus being now mafter of all the countries which lie between the Euphrates and the Indus, took the title of king of Babylon and Media. But, not fatisfied with thele poffeffions, ample as they were, he croffed the Indus, in order to conquer thofe regions which had fubmitted to Alexander beyond that river. In this expedition, however, he was unfuccefsful; but returning weftward againft his old enemy Antigonus, he defeated and killed him at Ipfus, and reduced his fon Demetrius to a very dependent flate. Seleucus now betook himfelf to the building of a city, which he called Seleucia, and which flood on the place where the eity of Bagdad now ftands. Befides thefe, he built a great many others; 16 of which he called Antioch, from the name of his lurother Antiochus; nine Seleucia, from his own name; three Apamea, from Apama his firft wife; one Stratonicon, from his fecond wife Stratonice; and fix Laodicea, from his mother Laodice.

In \(28_{4}\) Seleucus entered into a war twith Iyfinachus, with whom he had hitherto lived in ftrict amity. Out of \(3^{6}\) general officers left by Alcxander the Great, they two lurvived, and both were upwards of 70 years old. Neverthelefs they were both filled with the ambition and animofity of young men. The two armics met at 6. a place called Curopedion in Phrygia, where an obllinate Bufeats and engagement took place. Victory was long doubtful: kills Lyfi- but at laft Lyfimachus was run through with a fpear, มเลไดแร and died on the frot ; on which his troops bet ot them.
of Seleucus all thofe provinces which had formerly been fubject to Lyfimachus, and from this victory he is gcnerally called Nicator, or the conqueror. His triumph, is himfels however, on this occafion, but was but Chort-lived; for, treacherfeven months after, as lie was marching towards Mace-ounly murdon to take poffeffion of that lingdom, he was treach.derd. esoufly mundered by Ptolemy Ceraunus, on whom he had conferred innumerable favours.

Seleucus was fucceeded by his fon Antiochus Soter, Antiochus who held the empire 19 years. He refigned to Anti- Soter. gonus Gonattis all pretenfions to the crown of Macedon; An. \({ }^{280}\). and having engaged in a war with Eumenes king of Pergamus, he was defeated by him, and obliged to yield up part of his dominions. He died in 261 B. C. and Antiochus was fucceeded by his fon Antiochus Theos; who ha- Theos. ving engaged in a war withs Ptolemy Philadelphus king An. \({ }^{261}\). of Egypt, the Parthians and Bactrians took that oppor- B. C. tunity to revolt, and could uever afterwards be reduced. In 246 B . C. he was poifoned by his wife Laodice, who raifed to the throne her own fon, named Selencus Callinicus. He was fucceeded by his eldeft fon Seleucus selew 10 Ceraunus, a weak prince, who was poifoncd by a con-Callinicus fpiracy of two of his officers, when he had reigned one An. \({ }^{2460}\) year; after which his brother Antiochus, furnamed the B. C. Great, afcended the throne in 225 B. C.

11
In the very beginning of his reign, two of his generals, Antiochus Alexander and Molo, rebelled againft him. The for- the Great mer had been appointed governor of Perfia, and the lat- An. \({ }^{225}\) ter of Media. Antiochus marched againit the rebels, whom he defeated in a pitched battle; on which their chiefs laid violent hands on themfelves. On his return Suppreffes he received the fubmiffion of the Atropatii, a barbarous one rebelpeople in Media ; and put to death his prime minifter lion, but is Hermias, whom he had found hatching treacherous de- by another figns againft him. During his lifetime, however, the traitor, by accufing Achæus of treafon, had obliged him \(t 0\) revolt in his own defence; fo that the king had ftill two important wars on his hands, viz. one with Piolemy king of Egypt, and the other againft Achrus. After fome deliberation, he refolved to march firt againft the king of Egypt ; and was at firf very fucceffful, reducing many cities in Colefyria and Paleftine, and defeating the Egyptians in a pitched battle; but in the year 217 B . C. being worted in the battle of Raphia, he was obliged to abaudon all his conquelts ; of which Ptolemy immediately took poffeffion, and Antiochus was obliged to cede them to him, that he might be at leifure to purfue the war againft Achæus.

Antiochus having made valt preparations for his expedition, foon reduced Achrus to fuch diftrefs, that he was obliged to thut himlelf up in the city of Sardis, which he defended for fome time with great bravery; till at laft, being betrayed by two Cretans, he was delivered up to the king, and by his order put to death. Antiochus then undertook an expedition againf the His fucces Parthians, whom he obliged to conclude a pcace on fes iuthe very advantageous terms. He then turned his arms againft the king of Bactria, whom he alfo compelled to agree to his terms. He then crofled Mount Coucafus, and entered India; where he renewed his alliance with the king of that country. From India he marched into Arachofia, Drangiana, and Carmania, eftablifhing order and difcipline in all thofe countrics: then paffing througlı Perfia, Babylonia, and Mefopotamia, lic ieturned to Antioch, after an abfence of feven y'ears. felves to fight. This sicory added to the poriefiions

4 Ieague Enters into his dominions. He defeated the Egyptian general, re-
a league
with Philip covered all Palcfine and Colefyria; after which he inf Macelon vaded all Palcitine and Cocletyria ; after which he intgaint the sing of Igypt. 111. 204. 3. C.

15
His conjuelts lhecked by he Ronans.

In the year 204 B. C. Antiochus entercd into a league with Philip of Macedon, on purpofe to deprive Ptolemy Epiphanes, the infant king of Egypt, of all vaded Afia Minor, in hopes of reducing it alfo, and rettoring the Syrian empire to the fame extent it had in the time of Seleucus Nicator. The free citics in Afia Alinor immediately had recourfe to the Romans, who Sent an embafly to Antiochus on the occafion; but as both parties put on thofe haughty and imperious airs to which they thought the greatsefs of their power gave them a right, no fatisfaction was given, but every thing tended to an open rupture. While matters were in this fituation, Hannibal the Great being obliged to leave his own country, fled to Antiochus: from whom he met with a gracious reception. As Hannibal had, while a child, fworn perpetual enmity againt the Romans, he ufed all his eloquence to perfuade Antiochus to make war with them; and as the many victories which he had gained over them left no room to doubt of his capacity, Antiochus doubted nothing of being able, by his affiltance, to conquer that haughty people. Several embaffies paffed between the two nations; but chiefly with a defign, on the part of Antiochus, to gain time. Hannibal endeavoured to draw his countrymen into the confederacy againt Rome, but without effect. Antiochus having ftrengthened himfelf by feveral alliances, at laft refolved to begin the war in earneft. The king imprudently became the aggreffor, by falling on a body of 500 Romans before war had been declared. He alfo made King Philip his enemy, by entertaining the regent of Athamania, who was a pretender to the crown of Macedon. To complete all, he himfelf fell in love, though above 50 years of age, with a beautiful young woman of Chalcis, whom he married; and became fo great a flave to this paffion, that he entirely neglected his affairs; the army gave themfelves up entirely to diffipation and debauchery, and every trace of military difcipline vanifhed.

In the year igi B. C. Antiochus was raifed from his lethargy by a declaration of war againft him at Rome, and fet out for Etolia. His army at this time amounted to no more than 10,000 foot and 500 horfe. He had been made to believe that he would receive a valt reinforcement in Ætolia : but when he came to make the experiment, he foon found his miftake ; all the troops he could raife there amounted to no more than 4000 men, With this fo foes, fo exceedingly inadequate to the purpofe, he was cbliged to oppofe the Roman army, who were advancing in conjunction with the Macedonians, and had already made furprifing progrefs. Antiochus feized the fraits of Thermopyle; but was driven from them by the Romans, the king limfelf being the firf that Hed. Almofl his whole army was deftroyed in the battle or in the purfuit, and Antiochus returned with difgrace into Afia.

Soon after his return, Antiochus equipped a fleet of 200 fail ; on which he immediately embarked for the Thracian Cherfonefus, now Crim Tartary. He fortified the cities of Lyfimachia, Seftus, and Abydos, with others in that neighbourhood, 10 prevent the Romans from crofling the Hellefpont. In the mean time Polyxenidas the Syrian admiral fent intelligence to the liing that the Roman fleet had appeared off Delos; upon

Vol. XX. Part I.
which he defired him to feck them out and engage them at all events. He did fo, and was defeated with the lofs of 40 Thips taken or funk in the engagement. This Hi, flect was foon after revenged by the deftruction of the lho-defeated by dian fleet by the artifice of Polysenidas; but in the end that of the the king's affairs went everywhere to wreck. Having Romars. laid fiege to the city of Pergamus, he was obliged to raife it with lofs; the Phrenician Hect commanded by Hannibal was defeated by the Rhodians; and foon afier \({ }^{2 t}\) the Syrian flect under Polyxenidas was utterly defeated woots with by the Jomans. Antiochus was fo much dilheartened defeats, and by thefe repeated defeats, that he appcared like one in- becomes fatuated. Inflead of forifying more itrongly thofe cities like one ins which lay on the frontiers of his kingdom, he entirely deferted them: and thus I yfimachia and Abydos, the two keys to Afia, fell into the hands of the lomans without the leaft refiftance.

The arrival of the Romans in Afia ftrucli Antiochus with fuch terror, that he inlantly fued for peace. The terms he offered were indecd very advantageous, but by no means agreeable to the expectations of the Romans. They therefore gave him this final anfuer: Sues fur 1. That fince he had drawn upon himfelf the war, hepeace, but thould defray the whole expence of it; 2. That he \({ }^{\text {is refured }}\) fhould reftore liberty in general to all the Greek cities in Afia; and, 3. That to prevent future holtilities, he mould relinquifh all Afia on this fide Mount Taurus. Thefe terms, however, fill appeared to him fo intolerable, that he refolved to continue the war ; and determined alfo to take the moft imprudent method of carrying it on, namely, by hazarding all on the event of a general engagement. The king encamped near Magnefia, and firongly fortified his camp. The Romans infulted him in his trenches, and propofed to attack his fortifications if he continued to decline an engagement. At laft the king, thinking it would be fhameful for him longer to refufe an engagement, being at the head of an army far more numerous than that of the enemy, in a friend's country, and in the midft of his allies, refolved at all events to accept the challenge, and accordingly prepared for a decifive battle.

On the day of the battle the weather proved very Battle of \({ }^{23}\) favourable to the Romans; for a thick fog rifing in the Magnefia: morning, the day was almoft turned into night, fo that the Syrian commanders could not have all the corps under their command in view, on account of their great extent, nor fend them proper orders in time; whereas the fog was not thick enough to prevent the Roman generals from feeing their feveral bodies at the greatent diftance, as they took up but little ground. Befides, the damp which was occafioned by the fog nlackened the frings of the enemy's bows, fo that the Afiatics who ufed them could thoot their darts and arrows but faintly. The whole dependence of Antiochus in the firt attack was on his armed chariots, which were to cut their way into the Roman army. But Eumenes, king of Pergamus, undertook to render them ufelefs, and even fatal, to the enemy. After this advantage, the Roman cavalry advanced, and fell on thofe whom the chariots had put in diforder. The Syrians being already intim'. The Syo dated, after a faint refittance gave way; and the Romans riuns demade a great flaughter of their men and horfes, both feated. being bome down with the weight of their heary armour. Eumenes charged the left-wing, in which Seleucus commanded, with fuch vigour, that he put it to flight;
and the fugitives flying to the phalan:x for protection, put that body likewife in diforder: which Domitius obferving, advanced againft it at the head of his legionaries, but could not break it till he ordered his men to attack the elephants, which the Syrians had placed in the fpaces between the comparies. The Romans had learned, in their wars with Pyrrhus and Har-nibal, not to fear thofe monflers which were once fo terrible to them. They attacked them, therefore, with great refolution ; and driving them againtt the plialanx, put that body into diforder, by means of thofe very animals which had heen pofted there for its defence.

Afier a long and bloody conteft, the Syrians were totally roused, and the Romans walking over heaps of dead hodies, marched wo to the Syrian camp, attacked, and plundered it. The riches they found in it are not to be defuribed; but the taking of it coft the Romans a now batule, which proved more fatal to the Syirans than that in the field; for the Romans having, in fpite of a moft defperate sefiftance, forced the intrenchments, gave no quarler, but putall to the fword without diffincti.m. There fell this day in the battle, in the purfuit, and in the plunder of the camp, 50,000 foot and 4000 horfe; 1500 were taken prifoners, and 15 elephants. In the confular a:my there were but 300 foot killed and 25 horfe. Eumencs had only 15 of his men killed; fo that this wictory, as we are told by the ancients, feemed a prodigy to all nations both of the eaft and wen.

Antiochus retired to Sardis with as many of his fores that had efcaped the flaughter as he could draw together. From Sardis he foon marched to rejoin his fon Seleucus, who had fled to Apamea. As for the conful, he took advantage of the ling's defcat and flight, making himfete mafter of all the neighbouing countries. Deputits haflened to him from all parts; the cities of Thyatira, Magnefia, Trallis, Magnefia in Caria, all Lydia, and Ephefus itfelf, though highly favoured by Antiochus, declared for the Romans. Po. lyxenidas, upon the news of the king's defeat, left the port of Ephefus, and failed to Patara, where he landed with a very fmall guard, and returned by land into Syria. The conful took the road to Sardis, which opened its gates to him.
Antiochus finding his affairs in a bad fituation both by fea and land, and not daring to appear befure the confular army in the field, fent Antipater his brother's fon, and Z.euxis, who had been goverror of Lydia and Thrygia, to fue for a peace. They were ordered to treat chirfly with the elder Scipio, of whofe clemency and good nature Antioches entertained a high opinion. Accurdingly, on their arrival at Sardic, where the conSul then was with his brother, they addrefied the latter, and were ty hin prefented to the conful. Their feeech was very fubmifive, and fuch as became a vanquifhed people.

Hereupon a courcil was fummoned, and afzer long detbates the ambaffidors were callod in' and S.ipio Africanus propofed terms that were very humiliating.

The ambaffiders of Antiochus had been ordered to refuse no terns; and therefore thefe were accepter, and the whule affair concluded. So that the Syrian ambarfadors now prepared to fet out for Fome, to get the conditions of peace propofed by Scipio ratified there. L.

Aurelius Cotta was fent with the ambafiadors to Rome, to acquaint the fenate with the particulars of the treaty. When they appeared before the confcript fathers, they froke wilh great fubmifion, and only defired them to ratify the articles which the Scipios had offered to their mafter. The fenate, after examining thein, ordered that a treaty of peace fhould be concluded with Antiochus, and the articles of it engraved on brafs, and fixed up in the Capitol. They only added one claufe, which was, That the Syrians thould change every year all their hollages, except the fon of King Antiochus, who fould continue at lome as long as the republic thought fit. The peace being thus ratified, and all Afia on this ficte Mount Taurus delivered into the hands of the Romans, the Greek cities were by them reftored to their libety, the provinces of Caria and Lydia given to the Rhodians, and all the reft that had belonged to Antiochus beflorved upon Eumenes.

Antiochus did toot long furvive his misfurtune at \({ }^{2}{ }^{27}\) death Magnefia. He died in 187, and with him fell the glory of An. \(157^{\circ}\) the Syrian empire. The Romans now gave laws to the B. C. kings of Syria, infomuch, that when Antiochus Epiphanes the grandfon of Antiochus the Great hefitated at obsying the commands of the fenate, one of the ambafiadors drew a circle rcund him with a rod on the floor, and told him that he flould not go out of that \(f_{\text {pot before he had told him what he was to do. The }}\) moft remarkable tranfactions of this prince are his wars Syria hewith the Jews, and perfecutions of them; of which a comes a full accomt is given under the article Jews. After a province. variety of ufurpers and tyrants, the kingdom of Syria fell under Tigranes king of Armenia in the year 83 B. C.; and upon his overthrow by the Romans, it beceme a province of the dominions of the republic. Fiom them it was taken by the Saracens in the reign of the caliph Omar, and is now a province of Turkey in Afa. See Acre.

Syria is in fome meafure only a clain of mountains, climate, varying in their levels, fituation, and appearances. The foll, zc. of part of the country, however, next the fea is in general the counlotr, and befides this there are feveral extenfive valleys. try. The clinate on the fea-coaft and in thefe valleys is very hot, but in the higher parts of the country it bears a good deal of refemblance to that of France. Syria is exceedingly fertile, and the varicty of its productions is very great. Bcfides wheat, rye, barley, beans, and the cotton plant, which is cultivated everywhere, Paleftine abounds in fefamum, from which oil is procured, and doura as good as that of Egypt. Maize thrives in the light foil of Ralbec, and even rice is cultivated with fuccefs on the borders of the marfly country of Havula. They have lately begun to plant fugarcanes in the gardens of Saide and of Bairout, and they find them equal to thofe of the Dcita. Indigo grows wihout culidivating on the banks of the Joodan, in the country of Bifan, and only requires care to make it of an excellent quality. The hill-fides of Latakia produce tobacco. Gaza pocmey's produces dates like Mecca, and formegranates like Al- Tracils, giers; Tripoli affords oranges equal to thofe of Malta ; vul. i. Bairout figs like thofe of Marfeilles, and banamas not inferior to thofe of St Doningo; Aleppo enjoys the exclufive advantage of producing pittachios; and Damafcus juftly loants of poftcfing all the fruits known in France. Its Rony foil fuits equally the apples of Normandy, the plums of Touraine, and the peacles of Paris.

Paris. Twenty forts of apricots are reckoned there, the flone of one of which contains a kemel highly valued through all 'lurkey. The cochincal plant, which grows on all that coalt, contains perbap's that precious infect in as high perfection as it is found in Mexico and St Domingo.

Tlue inhabitants may be divided into three principal clafles: the delcendants of the Grceks of the Lower Fmpire ; the Arabs, their conquerars; and the Turks, the prelent ruling power: and thefe again, the firt in10 three, the fecond into four, claffes; befides three wandering trihes of 'l'urkomans, Curds, and Bedouin Arabs. The ancient ixhabitants before the Greeks under Alcxander are entirely lof. The inhabitants are in general of a middling thature, and the eyes of the women almoft everywhere beautiful, and their thape correct and well proportioned. The general language is Arabic.

SYRING 1 , the Lilac, a genus of plants belonging to the clafs diandria, and in the natural fytem ranging under the \(44^{\text {th }}\) order, Sepiarice. See Borany Index.

STlilNGE, a well-known inftument, ferving to imbibe or fuck in a quantity of fluid, and to fquirt or expel the fame with viulence. The word is farmed from the Greek \(\sigma \sigma_{马} v_{5}\), or the Latin fyrinx "a pipe." - A fyringe is only a fingle pump, and the water afcends in it on the fame principle as in the common fuck-ing-pump. Sce Hydrodynamics.

SYRUP, in Pharmacy, a faturated folution of fugar, made in vegetable decoctions or infufions. See Materia Medica.

SYSIEM, in general, denotes an affemblage or
chain of principles and conclufions, or the whale of any doctrise, the feveral parts whereof are bound together, and follow or depend on each other; in which tenfe we fay a fystcm of phitofophy, fystem of divinity, dic. The word is tormed trom the Greek ovsques "compofition, compages."

Systum, in the animal economy, the safoular, the nervous, and the collular. Sce Ansmoms.

System, in \(14 u f i c\), an affemblage of the rules for harmony, deduced from fome common principle by which they are reunited; by which their conncction one with another is formed; from whence, as from their genuine fource, they natively flow; and to which, if we would account for them, we muft have recourf. Sce the arlicles Chromitic, Diatosic, Eninknonic, Hakmony, Litervil, and Music.

System, in Botany. See Botary.
System, in Astronomy. See Astronomy.
SYSTOLE, in Anatomy, the contraction of the heart, whereby the blood is drawn off its ventricles into the arteries; the oppofite fate to which is called the diafole, or dilatation of the heart. See ANstamy Index.

SYSCTLE, in Architecture, that manner of placing columns where the fpsce between the two fhafts conlifts of two diameters or tour modules.

SYZYGY, Syzygia, in Astronomy, a term equally ufed for the conjunction and oppofition of a planet with the fun. The word is formed from the Greck \(\sigma\) ? ? vyse, which properly fignifies conjunctio. On the phenomena and circumfances of the fyzygies a great part of the lunar theory depends. See Astronomy.

Tabatheer:

Iabařer. Though fome account was given of the tabafheer by the Arabian phyficians, no accurate linowledge of it was obtained till Dr Ruffel fav :ured the public with his obiérvations on \(i\).

The tabalticer is produced from the female bamboo, which is diflinguifhed from the male by a larger cavity. The bamboos containing it, make a rattling noife when Shalen. Dr Ruffel having examined a bamboo brought from Vellore, confinting of fix jointe, found no tabafheer in two of them: all the refl contained fome, but of various quality and quantity; the whole amounting to about 27 gra:ns. The beft was of a bluith white refembling frall fragments of fhells, harder alfo than the eft, but which might be eafily crumbled between the fingers into a gritty powder; and when applied to the tongue and palate, kad a light faline and teftaceous tafte; the weight not exceeding four grains. The colour of the relt was cineritious, rough on the furface, and more friable; having fome particles of a larger fize intermised, but light, fpongy, and fumewhat refembling pumice fitones; which appearance, our author fuppofes, led the Arabians to think that fire was concerned in the production. The two middle joints were of a pure white colour within, and lined with a thin film. In thefe the tabaheer was principally found. The other joints, particularly the two upper ones, were difcoloured within; and in fome parts of the cavity was found a blackifh fubftance in grains or in powder, adhering to the fides, the film being there obliterated. In two or three of the joints a fmall round hole was found at top and bottom, which feemed to have been perforated by fome infect.

Garzius informs us, that it is not found in all bamboos, or in all the branches indifcriminately, but only in thofe growing about Bifnagur, Batecala, and one part of the Malabar coaft. Dr Ruffel was informed by a letter from a medical gentleman attending the embafly to the Nizam, that though tabafheer bears a high price a.t Hydrabad, it is never brought thither from Bifnagur ; and that fome of what is fold in the markets comes from the pals of Atcour in Canoul; and fome from Emnabad, at the diftance of about 80 miles to the north-welt; but that the moft part comes from Mafulipatam. That fold in the markets is of two kinds; one the rate of a rupee per dram, but the other only half that price; the latter, however, is fuppofed to be factitions, and made up moflly of burnt teeth and bones. Dr Ruffel himfelf alfo, is perfuaded that the tabafheer met with in commerce is greatly adulterated. The above-mentioned gentleman likewife informed the doctor that tabafheer was produced in great quantities at Sylhat, where it is fold by the pound, from one rupee to one and an half; forming a confiderable article of trade from Bengal to Perfia and Arabia. There is, however, a third kind, mouch fuperior in quality, being whiter, purer, and alfo harder and heavier.

Dr Ruffel fuppofes that the tabanieer is the juice of the hamboo thickened and hardened. The following obfervations on its medical effects were taken from a Perfian work, intitled the "Tofut ul Monein of Mabommed Monein Flofeiny," by Mr Williams, a furgeon in the fervice of the Liaft India company. The tabaheer puts a flop to bilious vomitings and to the bloody Hux. It is allo of fervice in cafes of palpitation of the beart, in faintings, and for ftrengthening thofe members
of the body that are weakened by heat. It is ufeful al- Tabaneer fo for the piles, and for acute or burning fevers, and for pultules in the mouth (thrufh) ; and, given with oxymel, is of fervice againt reltleffnefs, melancholy, and bypochondrizcal affections. The habitual internal ufe of it is prejudicial to the virile fowers. It is alfo faid to be prejudicial to the lungs. Its correctives are the gum of the pine and honey. The dofe of it is to the weight of two d'herems, or feven mathás.

TABBY, in Commerce, a kind of rich filk which has undergone the operation of tabbying.

TABEYNG, the pafing a filk or ituff under a cal. lender, the rolls of which are made of iron or copper varioufly engraven, which bearing unequally on the fuff renders the furface thereof unequal, fo as to reflect the rays of light differently, making the reprefentation of waves thereon.

TABELLIO, in the Roman law, an officer or ferivener, much the fame with our notaries public, who are ofter called tabelliones.

TABERNACLE, among the Hebrews, a kind of building, in the form of a tent, fet up, by exprefs command of God, for the performance of religious worlhip, facrifices, \&c. during the journeying of the Ifraelites in the wildernefs: and, after their fettlement in the land of Canaan, made ufe of for the fame purpofe till the building of the temple of Jerufalera. It was divided into two parts; the one covered, and properly called the tabernacle; and the other open, called the court. The curtains which corered the tabernacle were made of linen, of feveral colours, embroidered. There were ten curtains, 28 cubits long and four in breadth. Five curtains faftened together made up two coverings, which covered up all the tabernacle. Over thefe there were two other coverings; the one of goat's hair, the other of fheep's fhins. The holy of holies was parted from the reft of the tabernacle by a curtain made faft to four pillars, fanding ten cubits from the end. The length of the whole tabernacle was 32 cubits, that is, about 50 feet; and the breadth 12 cubits or 19 feet. The court was a fpot of ground 1 co cubits long, and 50 in breadth, enclofed by 20 columns, each 20 cubits high and 10 in breadth, covered with filver, and flanding on copper bafes, five cubits diftant from one another; between which there were curtains drawn, and faftened with hooks. At the eaft end was an entrance, 20 cubits wide, covered with a curtain hanging loofe.

Feaf of Tabernacles, a folemn feftival of the Hebrews, obferved after harveft, on the 15 th day of the month Tifii, inflituted to commemorate the goodnefs of God, who protected the Irraelites in the wildernefs, and made them dwell in booths, when they came out of Egypt. On the firft day of the feaft, they began to erect booths of the boughs of trees, and in thefe they were obliged to continue feven days. The booths were placed in the open air, and were not to be covered with cloths, nor made too clofe by the thicknefs of the boughs; but fo loofe that the fun and the flars might be feen, and the rain defcend through them. For further particulars of the celebration of this feftival, fee Levit. ch. xxiii.

TABERNAE, in Ancient Geography. See Tres Tabcrnce.

TABERNÆMONTANA, in Botamy, a genus of plants belonging to the clafs of pentandria, and order of monogynia; and in the natural fyttem araanged undea

\section*{T A B \(\left[\begin{array}{lll}189\end{array}\right] \quad\) T A B}

Tawe the zoth order, Contorte. There are two horizontal follioles, and the feeds are immerfed in pulp. 'Ihere are cight fpecies, all of forcign growth.

TABI.E. a moveable piece of furniture, ufually made of wood or Aone, and fupported on pillars or the like, for the commodious reception of things placed thereons.
T.ible is allo ufed for the fare or entertainment ferved up.
'TAble, in Mafhematics, fyftems of numbers calculated to be ready at hand for the expediting atronomical, geometrical, and other operations.

Tisle-Book. See Writing.
TABLE-Mountain, a mountain of Africa, being the moll wefterly cape or promontory in that part of the world, and near the Cape of Good Hope. 'The bay which is formed thereby is called the Table-bay.

Laws of the Trectve TABLEs, were the frit fet of laws of the Rumans; thus called either becaure the fiomans then wrote with a tyle on thin wooden tablets covered with wax ; or rather, becaule they were engraved on tables or plates of copper, to be expoled in the molt noted part of the public forum. After the expulfion of the kings, as the Romans were then without any fixed or certain fyitem of law, at leaft had none ample enough to take in the various cafes that might fall between particular perfons, it was refolved to adopt the beft and wifelt laws of the Greeks. Une Hermodorus was firlt appointed to tranflate them, and the decemviri afterwards compiled and reduced them into ten tables. After a world of care and application, they were at length enacted and confirmed by the fenate and an affembly of the people, in the year of Rome 303. The following year they found fomething wanting therein, which they fupplied from the laws of the former kings of Rome, and from certain cuttoms which long ule had authorifed : all thefe being engraven on two other tables, made the law of the twelve tables, fo famous in the Roman jurifprudence, the fource and foundation of the civil or Roman law.

Tables of the Law, in Jewifh antiquity, two tables on which were written the decalogue, or ten commandments, given by God to Mofes on Mount Sinai.

TABOO, a word ufed by the South fea illanders, nearly of the fame import as prohibited or interdicted. It applies equally to perfons and things, and is alfo expreflive of any thing fasred, devoted, or eminent.

TABOR, a mountain of Galilee, about 12 miles from the city of Tiberias. It rifes in the form of a fugar loaf, in the mid!t of an extenfive plain, to the height of 30 fladia, according to Jofephus. The afcent is fo eafy, that one may afcend on horfeback. On the top there is a plain two miles in circumference.

The fituation of Mount Tabor is moft delightful. Rifing amid! the plains of Galilee, it exhibits to the enchanted eye a charming variety of profpects. On one fide there are lakes, rivers, and a part of the Mediterranean; and on the other a chain of little hills, with finall valleys, fluaded by natural groves, and enriched by the hands of the hufbandman with a great number of ufeful productions. Here you behold an immenfity of plains interfperfed with hamlets, fortrefles, and heaps of ruins; and there the eye delights to wander over the fields of Jezrael or Mageddon, named by the Arabs Ebn-Aamer, which fignifies "the field of the fons of Aamer." A little farther you diftinguifh
the mountains of Hermon, Gilboa, Samaria, and Arabia the Stony. In hort, you experience all thofe fenfations which are produced by a misture and rapid fucceffion of rural, gay, gloomy, and majeflic objects.

It was upon this enchanting mount that the apoftle Peter faid to Chrill, " 11 is good for us to be here: and let us make three tabernacles; one for thee, and one for Molec, and ane for Elias."

Flavian dofephus, goveruor of Galilee, caufed the fummit of this mountain, for the fpace of two miles and a lalf, to be furcounded with walls. The inhabitants of Tabor long braved the power of the Roman armies; but being deprived of water in confequence of the great heats. they were forced to furrender at difcretion to Placidus, the general of Vefpafian.

Several churches were built upon this mountain by St Helen, who founded here alfo fome monalleries. Of the two moll remarkable, one was dedicated to Mofes, and inhabited by Cenobites of the order of St Benedie, who followed the Latin rites: the other was dedicated to the prophet Elias by monks of the order of St Bafil, attached to the G;eek rites. The kings of Hangary erected here alfo a pretty fpacious convent for fome monks belonging to that nation, of the order of Si Paul the firit hermit. 'labor was alfo the feat of a bilhop, dependant on the patriarchate of Jerufalem.

When Godfrey of Bouillon feized on this mountain, he repaired the ancient churches, which were beginning to fall iato ruins. Under Baldwin I. in 1113 , the Saracen troops retook Tabor; and their fanguinary fury gained as many victories as there were prielts and Cenobites. This mountain again fell into the hands of the Chriftians; but the Catholic Itandard was not long difplayed on it. Saladin pulled it down the year following, and deftroyed all the churches. The Chriftians retook it once more in 1253 ; and their zeal made them rebuild all the facred places. At this time Rome being accultomed to give away empires, Pope Alexander IV. granted Tabor to the Templars, who fortified it again. At length, in the courfe of the year 1293 , the fultan of Egypt deftroyed and laid wafte the buildings of this mountain, which could never be repaired afterwards; fo that at prefent it is uninhabited.

TACAMAHACA, in Pharmacy, a gum refin, obtained from the Fagara cctandra and pupulus ballamifera; and having a fragrant fmell, a bitterifh naufeous tafte, and fuppofed to be fimulant and tonic in its effects.

TACCA, a genus of plants belonging to the clafs dodecandria. See Botany Index.

TACHYGRAPHY, from raxus, flort, and yoa申n'; I write, or the art of writing fhort-hand. See StenoGRAPHY.

T'ACITUS, Caius Cornelius, a celebrated Roman hiftorian, and one of the greatelt men of his time, appears to have been born about the year of Rome 809 or 810, and applied himfelf early to the labours of the bar, in which be gained very confiderable reputation. ATurtby \({ }^{\circ}\) Having married the danghter of Agricola, the road to Tranflatic:z public honours was laid open to him in the reign of of lacituss Vefpafian; but during the fanguinary and capricious tyranny of Domitian, he, as well as his friend Pliny, appears to have retired from the theatre of public affairs. The reign of Nerva reftored thefe luminaries of Roman literature to the metropolis, and we find Tacitus engaged, in A. U. C. \(85 c\), to pronounce the funeral

\section*{T A C.}

Tacituc. oration of the venerable Virginits Rufus, the collengue of the conperor in the confulthip, and afterwards lucceeding him as conful for the renainder of the year.

The time of his death is not mentioned by any ancient author, but it is probable that he died in the reign of Trajan.

His works which nill remain are, I. Five books of his Hillory. 2. His Annals. 3. A Treatife on the different Nations which in his time inhabited Germany: and, \&. The Life of Agricola his father in-law. These is alfo attributed to him a 'Treatife on Eloquence, which others have afcribed to Quintilian. The Treatie on the Manners of the Germans was publifhed in 851 .-In the year 853 , Pliny and Tacitus were appointed by the femate to plead the caufe of the oppreffed Africans agdinft Marius Prifcus, a corrupt proconful, who was convicted before the fathers; and the patriot orators were honoured with a declaration that they had executed their trutt to the entire fatisfaction of the houfe. The exact time when Tacitus publifhed his hiffory is uncertain, but it was in fome period of 'Trajan's reign, who died fuddenly, A. U. C. 870 , A. D. 117 - -Tla* hitory comprifes a period of 27 years, from the acceffion of Galba, 822, to the death of Domitian, \(8_{49}\). The hiftory being finithed, he did not think he had completed the tablature of ilavery; he went back to the time of Tiberius: and the fecond work, which, however, comes finf in the order of chronology, includes a period of 54 years, from the accelfion of Tiberius, 767 , to the death of Nero, 821 : this work is his "Annals."

It is remarkable, that princes and politicians have

Biozrajbi-
ral Diclion. ary. always held the works of Tacitus in the highefl efteem; which looks as if they either found their account in reading them, or were pleafed to find courts, and the people who live in them, fo exactly defcribed after the life as they are in his writings. Part of what is extant was found in Germany by a receiver of Pope Leo X. and publifled by Beroaldus at Rone in 1515 . Leo was fo much charmed with T'acitus, that he gave the receiver a reward of 500 crowns; and promifed not only indulgences, but money alfo and honour, to any one who thould find the other part; which it is faid was afterwards brought to him, Pope Paul III, as Muretus relatce, wore out his Tacitus by much reading it; and Cofmo de Medicis, who was the firf great duke of 'Jufeany, and furmed for governing, accounted the reading of liin his greatef pleafure. Murctus adds, that feveral princes, and privy.counfellors to princes, read him with great application, and regarded him as a Baillet Tie fort of orncle in politics. A certain author relates, that the Greek tongue, which the made "the diverfion of her leifure hours, was not reflrained by that from her ferious fuldies; fo the called among others 'Tacitus's Iliflory. fome pases of which the read conftantly every day." Lafly, Lord Bolingbroke, an authority furely of no mean rank, calls lim, " a kivourite aulhor," and gives him manifenly the preforence to all the Greek and Roman hiftorimus.

No author has ohtained a more fplendid reputation than T'acitus. He has been accounted, and with good reafon. the moft cultivated genius of antiquity; and we muf not feek for his parallel in modern timises. It is impoffible not to admire and recommend his intimate knowledge of the human heart, the fpirit of liberty
which he breaties, and the force and vivacity with which he perpetually esprefies himfelf: 'The reader of taft \(n\) is feruck: by the greasnefs of lis thoughts and the dignity of his narration; the philofopher by the comprehenfive pouces of his mind; and the politician by the fagacity with which he unfolds the frings of the muth fecret tranfactions. Civil liberty and the rights of mankind never met with a bolder or a more able aficrtor: ferritude, debafement, and tyranny, appear not in the writings of any other autior in jufter or more cdious colours. He has been cenfured as obffure ; and indeed nothing can be more certain than that he did not write for the common mafs of men. But to thofe who are judges of his compofitions, it is no matter of regret that his manner is his own, and peculiar. Never were defcription and fentiment fo wonderfully and fo beautifully blended; and never were the actions and characters of mear delineated with fo much frength and precifion. He has all the merits of other hifitorians, nithout their defects. He poffeffes the difi ctnefs of X:nophon without his uniformity; he is more eloquent than Livy, and is free from his fupertition; and he has more knowledge and judgment than Polybius, without his afectation of reafoning on every occafion. \(-\)

ward. Sce ivavigation, S.inling, and Naval Sactics, under Warr.
Tack, in Scots Laww. See L.aw, No clxvii.
TACKLE, among feamen, denotes all the 1 opes or cordnge of a thip ufed in managing the fuils, \&ce.

Tacksman. See Tenuri.
TAC IlCs, in the art of war, is the method of difpofisig furces to the beft advantage in order of battle, and of performing the feveral milicary motions and cvolutions. Sec Wak.
TADCASTER, a town in the weft riding of Yorkfhire, noted for the great plenty of linuttone dug up near it; and for being one of the firt places in wish a building was eteeted for Sunday fchonls. It is nine niles from York, and 188 from London.

TADMOR. See Palmyra.
TADPOLE, a young frog before it has difengaged itfelf from the membranes that envelope it in its firlt ftage of life. See Erpetology, p. 28 I .

TENLA, a genus of animals belonging to the clafs of vermes. S?e Helminthoiogy, \(\mathrm{N}^{-0} 29,30\).

TAFFETY, or Taffeta, in Commerce, a fine fmooth filken ltuff, remarkably glofly. There are taffeties of all colours, fome plain, and others friped with gold, filver, \&c. others chequered, others flowered, \&c. according to the fancy of the workmen.

TAGANROK, or Taganrog, a fea-port town fituated at the head of the'fea of Azof, and forming one of the principal ports of the Ruffian empire. It llands on a finall promontory, at the extremity of which is a fortrefs of confiderable ilrength, and capable of accommodating a numerous garrifon. The flreets are wide but unpaved, and from the lightnefs of the foil, arc either intolerably dufty, or ankle deep in mud. The houfes, which do not exceed a thoufand, are fmall, built chicfly of wood, plaiftered with mud, and roofed with bark. It is in north latitude \(46^{\circ}\).

Taganrok is remarkable only as a place of trade, but in this view is highly refpectable. When Mr Mi Gill vifited it in 1805 , he found there upwards of 200 veliels of various fizes, waiting for cargoes. From its advantegeous fituation, at the head of the fea of Azof, and near the mouths of the rivers Don and Volga, and from its being in the vicinity of a very fertite country, it has become the centre of commerce for many ftaple articies. Hither are brought, for exportation, valt quantities of grain, wool, hides, butter, tallow, bees-wax and boney from the fouthern provinces of Ruflia; iron, limber, pitch, and tar from Siberia; caviar to the amount of 50,000 puds annually from the Don and the Volga; hemp and flax from the neighbouring diftricts. Cordage and canvas are manufactured herc, and form a confideraible article of traffic. The trade is carried on chiefly by Ragufan and Greek fupercargoes, who remain only till their commodities are collected and fhipjed. For the belf accounts of this place, fee Pallas's Traiels in the Ruffan Empire, and M-Gill's Travels in Turkey, Ialy, and Ruffia.

TAGARA, a city of ancient India, the metropolis of a large diftrict called Ariacn, which comprehended the greateff part of the Subah of Aurungabad, and the fouthern part of Concan. Arrian fays, that it was fituated about ten days journey to the eaftward of Pultanah; which, according to the rate of travelling in that country with loaded carts, might be about 100 Britifh
miles. This fixes its fituation at Deoghir, a place of great antiquity, and famous through all lindia on account of the pagodas of Eloufa. It is now cailed Dou-lct-rilad.

TAGLeTES, Marygord, a genus of plants belonging to the clats fyngericlia; and in the naturdl lyitem ranging under the \(49^{\text {hi }}\) order, Compofilu. See Butany Index.
'IAGUS, the largen river of Spain; which, taking its rife on the contines of Arragon, runs fouth-welt through the provinces of Neiv Canile and Efremadura; and palfing by the cities of Aranjuez, Toledo, and Alcantara, and then crofling Porlugal, forms the harbour of Lifion, at which city it is about three miles over; and about eight or ten miles below this it falls into the Atlantic ocean.

TAHOEREWA, one of the Sandwich iflands, is fmall, deltitute of wood, the foil fandy and unfertule; is fituated in north latitude \(20^{\circ} 33^{\prime \prime}\), in eaft longitude \(203^{\circ}\) \(27^{\prime}\).

TAHOORA, one of the Sandwich inands in the South Sca. It is uninhabited, and lies in north latitude \(21^{\circ} 43^{\prime}\). and in eaft longitude \(199^{\circ} 36^{\prime}\). See S.IND-wich-Ifands.

TAJACU, or Peccary, in Zoology, a fpecies of hog. See Sus, Mammalia Index.

TAI-ouan, the Chinefe name of the ifland of Formofa. See Formosi. - Tai-ouan is alfo the name of the capital of the ifland.

TAIL, the train of a beaft, bird, or fifn; which in land animals, it is faid, ferves to drive away flies, \&c. and in birds and filhes to direct their courfe, and affift them in afcending or defcending in the air or water. But the tail in all animals is of great ufe in directing their motions.

Tale, or Fee-tail, in Law, is a conditional eftate or fee, oppofed to fee fimple. See Free.

A cenditional fee, at the common law, was a fee reftrained to fome particular heirs exclufive of others; as to the heirs of a man's body, by which only his lineal defcendants were admitted, in exclufion of collateral heirs; or to the heirs male of his body, in exclufion both of collaterals and lineal females alfo. It was called a conditiona! fee, by reafon of the condition expreffed or implied in the donation of it, that if the donee died without fuch particular heirs, the land hould revert to the donor. For this was a condition annexed by law to all grants whatfoever, that on failure of the heirs fpecified in the grant, the grant flould be at an end, and the land return to its ancient proprietor. Such conditional fees were ftrictly agreeable to the nature of feuds, when they firft ceafed to be mere eftates of life, and were not yet arrived to be abiolute eftates in feefimple.

With regard to the condition anncxed to thefe fecs by the common law, it was held, that fach a gife (to a man and the heirs of his body) was a gitt upon condition that it fhould revert to the domor if the dor.ee had no heirs of his body; but if he had, it fhould then remain to the donee. They therefore called it a fec.fornple on condition that he had iffue. New we mult ubferve, that when any condition is performed, it is thenceforth entisely gone; and the thing to which it was before annexed becomes abfolute and wholly uncenditional. So that as foon as the grantee had any intie born.

\section*{T A I [ 192 ] T A I}

Tal. his eftate was fuppofed to become ablolute by the performance of the condition; at leaf for thefe three purpoles: 1. To enable the tenant to alienate the land, and and thereby to bar not only his own iniue, but allo the donor, of his intereft in the reverfion. 2. To fubject him to forfeit it for treafon: which he could not do till iffue born longer than for his oun life, left thereby the the inheritance of the iffue and reverfion of the donor might have been defeated. 3. To empower him to charge the land with rents, commons, and certain other encumbrances, fo as to bind his iffue. And this was thought the more reafonable, becanfe, by the birth of iffue, the poffibility of the donor's reverfion was rendered more diftant and precarious: and his intereft feems to have been the only one which the law, as it then flood, was folicitous to protect, without much regard to the right of fuccefion intended to be vefted in the iffice. However, if the tenant did not in fact alienate the land, the courfe of defeent was not altered by this performance of the condition: for if the iffue had afterwards died, and then the tenant or original grantee had died, without making any alienation, the land, by the terms of the donation, could defcend to none but the heirs of his body; and therefore, in default of them, mult have reverted to the donor. For which reafon, in order to fubject the lands to the ordinary courfe of defcent, the donees of thefe conditional fee-fimples took care to alienate as foon as they had performed the condition by having iffue; and afterwards repurchafed the lands, which gave them a feeffimple abfolute, that would defcend to the heirs general, according to the courfe of the common law. And thus ftood the old law with regard to conditional fees: which things, fays Sir Edward Coke, though they feem ancient, are yet neceffary to be known, as well for the declaring how the common law food in fuch cafes, as for the fake of annuities, and fuch-like inhcritances, as are not within the ftatutes of entail, and therefore remain as the common law. The inconveniences which attended thefe limited and fettered inheritances were probably what induced the judges to give way to this fubtle fineffe (for fuch it undoubtedly was), in order to fhorten the duration of thefe conditional eftates. But, on the other hand, the nobility, who were willing to perpetuate their pofferfions in their own families, to put a flop to this practice, procured the ftatute of Weltminiter the fecond (commonly called the ftatute de donis conditionalibus) to be made; which paid a greater regard to the private will and intentions of the donor, than to the propriety of fuch intentions, or any public confiderations whatfoever. This fatute revived in fome fort the ancient feodal reftraints which were originally laid on alienations, by enacting, that from thenceforth the will of the donor be obferved; and that the tenements fo given (to a inan and the heirs of his body) fhould at all events go to the iflue, if there were any; or if none, fhould revert to the donor.

Upon the conftruction of this act of parliament, the judges determined that the donee had no longer a conditional fee-fimple, which became abfolute and at his own difpofal the inflant any iffue was born; but they divided the eftate into two parts, leaving in the donee a new kind of particular eftate, which they denominated a fee-tail; and vefting in the donor the ultimate feefimple of the land, expectant on the failure of iffue;
which expectant eftate is what we now call a reverfon: And hence it is that Littleton tells us, that tenant in fee-tail is by virtue of the Ratute of Weflminfer the fecond. The expreffion fectail, or frodum talliatum, was borrowed from the feudits (fee Crag. l. s.t. 10. § 24,25 .), among whom it fignified any mutilated or truncated inheritance, from which the heirs general were cut off; being derived from the barbarous varb taliare, to cut; from which the French sailler and the Italian taglinre are formed, (Spelm. Glf(f. \(53^{1 .)}\) ).

Having thus fhown the original of eftates tail, we now proceed to confider what things may or may not be en. tailed under the fatute de donis. Tenements is the only word ufed in the flatute : and this Sir Edward Coke expounds to comprchend all corporeal hereditaments whatfoever: and allo all incorporeal hereditaments which favour of the reality, that is, which iffue out of corporeal ones, or which concern or are amnexed to or may be exercifed within the fame; as rents, eftovers, commons, and the like. Alfo offices and dignities, which concern lands, or have relation to fixed and certain places, may be entailed. But mere perfonal chattels, which fayour not at all of the reality, cannot be entailed. Neither can an office, which merely relates to fuch perfonal chattels; nor an annuity, which charges only the perfon, and not the lands of the granter. But in thefe laft, if granted to a man and the heirs of his body, the grantee hath ftill a fee conditional at common law as before the ftatute, and by his alienation may bar the heir or reverfioner. An eftate to a man and his heirs for another's life cannot be entailed; for this is frictly no eflate of inheritance, and therefore not within the flatute de domis. Neither can a copyhold effate be entailed by virtue of the fatute; for that would tend to encroach upon and reftrain the will of the lord; but, by the fpecial cuftom of the manor, a copyhold may be limited to the heirs of the body; for here the cultom afcertains and interprets the lord's will.

As to the feveral fpecies of eftates-tail, and how they are refpectively created; they are either general or fpecial. Tail-general is where lands and tenements are given to one, and the heirs of his body begotten: which is called tail-general; becaufe, how often foever fuch donee in tail be married, his ifue in general, by all and every fuch marriage, is, in fucceffive order, capable of inheriting the eftate-tail per formam doni. Tenant in tail-fpecial is where the gift is reftrained to certain heirs of the donee's body, and does not go to all of them in general. And this may happen reveral ways. We Thall inflance in only one; as where lands and tenements are given to a man and the heirs of his body, on Mary his now wife to be begotten. Here no iffue can inherit but fuch fpecial iffue as is engendered between them two; not fuch as the huiband may have by another wife; and thercfore it is called fpecinl tail. And here we may obferve, that the words of inheritance (to him and his heirs) give him an eftate in fee; but they being heirs to be by him begotten, this makes it a fee tail; and the perfon heing allo limited, on whom fuch heirs flall be begotten (viz. Mary his prefent wife), this makes it a fec-tail Special.

Eftates in general and fpecial tail are farther diverfified by the diflinction of fexes in fuch entails; for both of them may either be in tail male or tail female. As

\section*{T A I}

Tail. if lands be given to a man, and his heirs-male of his body begotten, this is an eftate in tail male general ; but if to a man, and the heirs-female of his body on his prefent wife begotten, this is an eftate in tail female fipecial. And in cafe of an entail male, the heirs-female fisall never inherit, nor any derived from them; nor, \(i\) converfo, the heirs-male in cafe of a gift in tail female. Thus, if the donee in tail male hatha daugher, who dies leaving a fon, fuch grandfon in this cafc cannot inherit the effate-tail; for he cannot deduce his defcent wholly by heirs-male. And as the heir-male mult convey his defeent wholly by males, fo muf the heir-fenale whully by females. And therefore if a man hath two eftates-tail, the one in tail male and the other in tail female, and he hath iffue a daughter, which daughter hath iffue a fon; this grandfon can fucceed to neither of the eftates, for he cannot convey his defeent wholly either in the male or female line.

As the word heirs is neceffary to create a fee, fo, in farther imitation of the frictnefs of the feodal donation, the word body, or fome other words of procreation, are neceffiry to make it a fee-tail, and afcertain to what heirs in particular the fee is limited. If, therefore, either the words of inheritance or words of procreation be omitted, albeit the others are inferted in the grant, this will not make an eftate-tail. As if the grant be to a man and the iflue of his body, to a man and his feed, to a man and his children or offspring; all thefe ate only eftates for life, there wanting the words of irheritance, "his heirs." So, on the other hand, a gift to a man, and his heirs male or female, is an eftate in fee-fimple and not in fee-tail; for there are no words to afcertain the body out of which they fball iffue. Indecd, in latt wills and tefaments, wherein greater indulgence is al. lowed, an eftate-tail may be created by a devife to a man and his feed, or to a man and his heirs-male, or by other irregular modes of expreffion.

There is fill another fpecies of entailed eftates, norv indeed grown out of wfe, yet ftill capable of fubfiting in law; which are eftates in libero maritagio, or Fraxk. marriage. See that aticle.

The incidents to a tenancy in tail, under the fatute Weflminfter 2. are chiefly thefe: I. That a lenant in tail may commit wafte on the eflate-tail, by felling timber, pulling down houfes, or the like, without being impeached or called to account for the fame. 2. That the wife of the tenant in tail ftall have her dower, or thirds, of the effate-tail. 3 . That the hufband of a female tenant in tail may be tenant by the curtefy of the eftatetail. 4. That an effate-tail nay be barred, or deftroyed, by a fine, by a common recovery, or by lineal warranty defcending with affets to the heir. See Assets.

Thus much for the nature of eftates-tail : the eftablifnment of which family law (as it is properly fyled by Pigott) occafioned infinite difficulties and difputes. Children grew difobedie:at when they knew they c. uld not be fet afide : farmers were oulled of their leafes made by tenants in tail; for if fuch leafes had been valid, then, under colour of lons leafes, the iffue might have been virtually difinherited : creditors were defrauded of their debts; for, if a tenant in tail could have charged bis effate with their payment, he might alfo have defeaied his iftue, hy mortgaging it for as much as it was worth: innumerable latent entails were produced to deprive purchafers of the lands they had fairly brought; of fuits in Yol, XX. Part I.
conferquence of which, our ancient books are full: and treafons were encouraged, as eftates-tail were not liable to forfciture longer than for the tenant's life. So that they were juftly branded as the fource of new contentions and mifchiefs unknown to the common law; and almott univerfally confidered as the commun grievance of the realm. But as the nobility were always fond of this fiatute, becaufe it preferved their family-eflates from furfeiture, there was little hope of procuring a repeal by the legiflature; and therefore, by the comnivance of an arive and politic prince, a nuethod was devifed to evade it.

About 200 years intervencd betweed the making of the flatute de donis, and the applicatiun of common recoveries to this intent, in the 12 th year of Edward IV.; which were then openly declared by the judges to be a fufficient bar of an ellate-tail. Fur though the courts had, fo long before as the reign of Edward III. very frequently hinted their opinion that a bar might be ef. feated upon thefe principles, yet it was never carried into execution ; till Edward IV. obferving (in the difputes between the houfes of York and Lancaller) how little effect attainders for treafon had on families whofe eftates were protected by the fanduary of entails, gave his courtenance to this proceeding, and fufiered 'Talarum's cafe to be brought before the court : wherein, in confequence of the principles then hid down, it was in effect determined, that a cormmon recovery fuffered by tenant in tail Ahould be an effectual delltuction thereof. Thefe common recoveries are fictitious proceedings, intruduced by a kind of pia fraus, to elude the ftatute de donis, which was found to intolerably mifchievous, and which yet one branch of the legillature would not then confent to repeal ; and that thefe recoveries, however clandefinely begun, are now become by lung ufe and acquielicence a moft common aflurance of lands; and are looked upen as the legal mode of conveyance, by which a tenant in tail may diipofe of his lands and tenements: fo that nocourt will fuffer liten to be fliken or reflected on, and even acts of parliament have by a fide-wind countenanced and eftablifhed them.

This expedient having greatly abridged eftates tail with regard to their duration, others were foon invented to frip them of other privileges. The next that was attacked was their freedom from forfeitures for treafon. For, notwithlanding the large advances made by recoveries, in the compafs of about threefeore years, tuwards unfettering thefe inheritances, and thercby fubjecting the lands to furfeiture, the rapacious prince then reigning, finding them frequently refettled in a fimilar manner to fuit the convenience of fanilies, had addrefs enough to procure a fatute, whereby all eftates of inheritance (under which general words eftates-tail were covertly included) are declared to be furfeited to the king upon any convistion of high-treafon.

The next attack which they fuffered, in order of time, was by the fatute \(3^{2}\) Hen. VIII. c. 28 . whereby certain leafes made by tenants in tail, which do not tend to the prejudice of the iflue, were allowed to be geod in larr, and to bind the intue in tail. But they received a more violent blow in the fame fefion of parliament, by the confrakion put upon the fatute of fines, by the flatute 32 Hen . VIII. c. \({ }^{3} 6\). which declancs a fine duly levied by tenant in tail to be a complete bar to him and his hiers, and all other perfons chiming under fuch

\section*{T A L [ 194 ] T A 1}
entzit. This was evidently agreeable to the intention of Henry VII. whofe policy it was (before common recoveries had obtained their full ftrength and authority) to lay the road as open as poffible to the alienation of landed property, in order to weaken the overgrown power of his nobles. But as tacy, from the oppofite reafons, were not eafily brought to confent to fuch a provifion, it was thereforc couched, in his act, under covert and obfcure expreffions. And the judges, though willing to conftrue that flatute as favourably as poffible for the defeating of entailed eftates, yet hefitated at giving fines fo exienfive a power by mere implication, when the fatute de donis had exprefsly declared that they fhould not be a bar to effates-tail. But the fatute of Henry VIII. when the doctrine of alienation was better received, and the will of the prince more implicitly obeyed than before, avowed and eftablified that intention. Yet, in order to preferve the property of the crown from any danger of infringement, all eitates-tail created by the crown, and of which the crown has the reverfion, are excepted out of this flatute. And the fame was done with regard to common recoveries, by the ftatute 34 and 35 Hen. VIII. c. 20. which enacts, that no feigued recovery had againft tenants in tail, where the eftate was created by the crown, and the re. mainder or reverfion continues fill in the crown, fhall be of any force and effect. Which is allowing, indirectly and collaterally, their full force and efiect with refpect to ordinary eftates-tail, where the royal prerogative is not concerned.

Iafly, by a flatute of the fucceeding yeur, all eftatestail are rendered liable to be charged for payment of debts due to the king by record or fecial contract ; as fince, by the bankrupt-laws, they are alfo fubjected to be fold for the debts contracted by a bankrupt. And, by the confruction put on the fatute 43 Eliz. c. 4. an appointment by tenant in tail of the lands entailed to a charitable ufe is good without fine or secovery.

Eltates-tail being thus by degrees unfettered, are now reduced again to almof the fame flate, even before iffue born, as conditional fees were in at conmon law, after the condition was performed by the birth of iffue. lor, firlt, the tenant in tail is now emabled to alienate his lands and tenements by fine, by recovery, or by certain other means; and thereby to defeat the intereft as well of his own iffue, though unborn, as alfo of the reverfioner, except in the cale of the crown: fecondly, he is now liable to forfeit thens for high treafon: and, lafty, he may charge them with reafonable leafes, and alfo with fuch of his debts as are due to the crown on fpecialties, or have been contracted with his fellow-fubjects in a courle of extenfive commerce.

TAILZIE, in Scots Law, the fame with Tail. See Id F , No clxxs. 9.

TALAPOINS or Talopses, priefls of Siam. They enjoy great privileges, but are enjoined celibacy and auflerity of life, They live in monateries contiguous to the temples: and what is fingular, any one may enter into the priefthood, and after a certain age may yuit it to marry, and return to fociety. There are talapoinctics too, or nuns, who live in the fame convents, but are not adinitucd till they have paficd their fortieth year. The talapoins educate cliildren; and at every new and full moon explain the precepts of their reigion in their temples; and duaing the rainy feafon they
preach from fix in the morning till noon, and from one Talapoins in the afternoon till five in the evening. Thcy drefs in a very mean garb, go bareheaded and barefooted; and no perfon is admitted among them who is not well dikiled in the Baly language.

They believe that the univerfe is eternal ; but admit that certain parts of it, as this world, may be deftroyed and again regenerated. They believe in a univerfal pervading fpirit, and in the immortality and tranfmigration of the Soul; but they extend this laft doetrine, not only to all animals, but to vegetables and rocks. They have their good and evil genii, and particular deities, who prefide over forefts and rivers, and interfere in all fublunary affairs.

For the honour of human nature, we are happy to find fo puse a fyftem of morality prevail among thefe people : It not only forbids its followers to do ill, but enjoins the neceffity of doing good, and of fitfing every improper thought or criminal defire,

Thofe who wifh to perufe a more particular account of the talapoins, may cenfult Voynge de M. de la Loubere; and Sketches relating to the Hiftory, \&c. of the Hindoos.

TALC, a fpecies of mineral arranged under the magnefian earths. See Mineraiogy Index.

TALENT, figrifies both a weight and a coin very common amoug the ancients, but very different among different nations.

The common Attic talent of weight contains 60 Attic minæ, or 6000 Attic drachinx; and weighed, accurding to Dr Arbuthnot, 59 lbs . 11 oz . \(\mathrm{I}^{\frac{1}{7}} \mathrm{gr}\). Englifh troy weight. There was another Attic talent, by fome faid to confift of 80 , by others of 100 miliæ. The Egyptian talent was 80 mirre ; the Antiochian alfo 80 ; the Ptolemaic of Cleopatra \(86 \frac{2}{3}\); that of Alexardria 96 ; and the Infular talent 120 . In the valuation of money, the Grecian talent, according to Dr Arbuthnot, was equal to 60 min , or, reckoning the mina at 31. \(4^{\text {s. }} 7 \mathrm{~d}\). equal to 193 . I 5 s. The Syrian talent in this valuation confifted of 15 Attic minæ; the Ptolemaic of 20 ; the Anticchian of 60 ; the Euboic of 60 ; the Babylonic of 70 ; the Greater Attic of 80 ; the Tyrian of 80 ; the Eginean of 100 ; the Rhodian of 100; and the Egyptian of 80 minæ.

There is another talent nuch more ancient, which Dr Arbuthnot calls the Homeric talent of gold, which feems to lave weighed fix Attic drachms or three darics, a daric weighing very little more than a guinea. According to this talent, fome reck on the treafire of King David, particularly that mentioned I Chron. xxii. I 4 . which, according to the common reckoning, would amount in gold talcnts to the value of \(547,500,0001\), and the filver to above \(342,000,0001\). ; or, ieckoning according to the decuple proportion of gold to filver, the two fums would be equal. As David reigned in Judea after the fiege of Tioy, it is not improbable but Homer and he might ufe the fame mumeral talent of gold.

Among the Romans there were two hinds of talents, the little and the great talent: the little was the common talent; and whenever they fay finiply inlentum, they are to be underitcod of this. The little talcht was 60 mirae or homan pounds; the mina or pound efimated at ico drachnate or denarii : it was alfo efimated at 2,1 great fullerces, which :mounted to 60 pounds.

The grtant talent exscciod the lefs by onc-third part.

\section*{T A L [ 195 ] T A L}

Talent Budæus computes, that the little talent of filver was worth 751 . Aterling, and the greater 991. 6s. 8d. flerling. The greater of gold was worth 112 g l. Aterling.

TAMET, as a fipecies or money, among the Hebrcws, was fometimes ufed for a gold coin, the fame with the thekel of gold, called allo /later, and weighing only four drachms. The Ifebrews reckoned by thele talents as we do by pounds, Sce. Thus a million of gold, or million of talents of gold, anoong them, was a million of thekels or nummi ; the nummus of gold being the fame weight with the thekel, vie. four drachms.

But the Hebrew talent weight of filver, which they called cirar, was equivalent to that of 3000 thekels, or II 3 lb .10 oz .1 dwt. Io \({ }_{7}^{2}\) gr. Englilh Troy wight, according to Arbuthnot's computation.

TALIACOTIUS, Gaspak, chicf furgeon to the great duke of Tufiany, was born at Bononia in Italy in 1553. He wrote a Latin treatife intitled Chirurgia Noo a de Curtis Monbris, in which he teaches the art of engrafting nofes, ears, lips, Sec. giving reprefentations of the inftruments and proper bandages; many, however, are of opinion that he never put his art in practice. But his doctrine is not finģular; for Alexander Benedictus, a famous chirurgical writer, has defcribed a fimilar operation.
TALLIO (lex talionis), a fpecies of punifment in the Mofaic latv, whereby an evil is returned timilar to that committed againft us by another; hence that expreflion, "Eye for eye, tooth for tooth." This law was at firt inferted in the 12 tables amongh the Romans; but afterwards fet afide, and a power given to the pretor to fix upou a fum of movey for the damage done.

TALISMANS, magical figures cut or engraved with fuperfitious obfervations on the characterifms and configurations of the heavens, to which fome aftrologers have attributed wonderful virtucs, particularly that of calling down celeftial influences. The talifmans of \(\mathrm{Sa}_{3}\) mothrace, \(\mathfrak{i}\) famous of old, were pieces of iron forned into certain images, and fet in rings; the fe were cfteemed prefervatives againf all kinds of evils. There were likewife talifmans taken from vegetables, and others from minerals.

TALLAGE ( allagiusn), from the French tailic, is metaphorically ufed for a part or thare of a man's fubfance carved out of the whole, paid by way of tribute, toll, or tax.

TALLLOW, in Commerce, the fat of certain animals molted and clarified. It is procured from molt animals, but chiefly from bullocks, fheep, hogs, and bears. Some kinds of tallow are ufed as unguents in medicine, fume for making foap and dreffing leather, and fome for making candles. See Fat, Cuemistry Inder.

Tallow Trec. See Croton, Botany Inder.
TALLY, is a ftick cut in two parts, on each whereof is marked, with notches or otherwife, what is due between debtor and creditor, as now uled by brewers, \& \& . And this was the ancicnt way of keeping all accounts, one part being leept by the creditor, the other by the debtor, \&c. Hence the tallier of the exchequer, whom we now call the teller. But there are two kinds of tallies mentioned in our flatutes to have been long ufed in the exchequer. The one is termed tallies of debt, which are in the nature of an acquittance for debts paid to the king, on the payment whereof thefe tallies are delivered
to the debtors, who carrying them to the clerk of the pipc-othice, have there an acquiltance in parchment for their full difcharge. The other are tallies of reward or allowance, being made to therifts of counties as a recomperice for fuch matters as they have perforinced to their charge, or fuch moncy as is call upon them in their accounts of ccurfe, but not leviable, \&ec. In the exchequer there is a tally-court, where ettend the two deputychamberlains of the exchequer and the tally-cutter: and a tally is generally the king's asyuittance for money paid or lent, and has witten on it words proper to exprects on what occafion the money is recrived.

TALLL K-MIan, a perfon that fells or lets groods, clothes, \&c. to be paid by fo much a-weck.

TALMU!), a collection of lewifh traditions. There are two works which bear this name, the 'Ialmud of Jerufalem, and the Talmud of Babylon. Wach of thefe is compoled of two parts; the Mifhna, which is the text, and is common to both, and the Gemara or commentary. See Mishina and Gemara.
The Milluna, which compreisends all the laws, inflitutions, and rules of life which, befide the ancient Hebreir foripture, the lews thought themfilves bound to obferve, was compofed, according to the unanimous teflimony of the Jews, about the clofe of the fecond century. It was the work of Rabbi Jehuda (or Juda) Hakkadolh, who was the ornament of the โchool at Tiberias, and is faid to have occupied him forty years. The commentaries and additions which fucceeding Rabbis made were collected by liabbi Jochanan Ben Eliezer, fome fay in the 5 th, others fay in the 6th, and others in the 7 th century, under the name of Gemara, that is, complection; becaufe it completed the Talmud. A fimilar addition was made to the Mifina by the Rabylonifh doctors in the beginning of the 6th century according to Enfeld, and in the 7 th according to others.
The Millna is divided into fix parts, of which every one which is intitled order is formed of treatifes, cvery treatife is divided into chapters, and every chapter into millinas or aphorifins. In the firl part is difcuffed whatever relates to feeds, fruits, and trees: in the fecond feafts: in the third women, their dutice, their diforders, marriages, divorces, contrats, and nuptials: in the fourth are treated the damages or loffes fultained by beafts or men, of things found, depofits, ufuries, rents, farms, partnerthips in commerce, inheritance, fales and purchafes, oaths, witneffes, atrefts, idolatry; and here are named thofe by whom the oral law was received and preferved: in the fifth part are noticed what regards facrifices and holy things: and the fieth treats on purifications, veffels, furniture, clothes, houies, leprofy, baths, and numerous other articles. All this forms the Mifhna.

As the learned reader may with to obtain fome notion of rabbinical compofition and judgement, we fhall gratify his curiofity fufficiently by the following fpecimen: "Adam's bodiy was made of the carth of Babylon, his liead of the land of Irrael, his other mernbers of other parts of the world. R. Meir thought he was compact of the earth gathered out of the whole earth ; as it is written, thine eyes did fee my fubfance. Now it is elfewhere written, the cijes of the Lord are ouer a!l the earth. R. Aha expressly marks the twelve hours in which his various parts were formed. His flature was from one end ot the world to the other ; and it was for his tranfgreffion that the Creator, laying his hand in anger on him, lef-

\section*{T A M \(\quad[1: 6] \quad\) T A M}

Tanden foned him; for before (hys h. Lleazar), "with his hand If . \&e reached the firmanent.' R. Jehuda thinks his fin R.e reached the firmanent. R. Jehuda thinks his in his forefikin."

The Talmud of Babylon is mol valued by the Jews; and this is the book which they mean to exprefs when they talk of the Talmud in general. An abjifgement of it was made by Mamonides in the \(12: h\) century, in which he rejected fome of its greateft ablurditics. The Gemara is tiluffed with dreams and chimeras, with many ionorant and impertinent queftions, and the nyle very coarle. The Mifhna is witten in a fyle comparatively pure, and may be very ufeful in explaining pafiages of tl:e New 'Ceftanaent where the phraleolory is fimilar. This is indeed the only ufe to which Chritians can apFly it; but this renders it valuable. Inghtfoot had ju. diciounly availed himfelf of fuck information as he conld derive flom it. Some of the popes, with a harbarous zeal, and a timidity of fisit for the fuccefs of the Chriftian religion, which the belief of is divinity can never excuife. ordered great numbers of the ' Talmud to be bunced. Gregory IX. burned abont 22 cart-loads, and Pat IV, ordered 12,000 copies of the Talmud to be deflroyed.

The laf edition of the Talmud of Babylon, rinted at Amferdam, is in 12 vols folio. The Talmud of Jesufatem is in cre large folio.

TALPA, the RIOLE; a genus of quadrupeds belenging to the order of for \(\pi\). See Miammalia Index.

1ATIANDAU. Sce Myrmecophaga, Mabmaina Indix.

TAMARINDUS, the Tamarmd-tree; a genus of plants; according to Limnxus belorging to the clats of triandria; but Wuodvilie, Schreber, and other botanifts, have arranged it under the clafs of monodeli.hia. See Botany Index.

Thmarix, the Tamarise, a genus of plants belonging to the clafs pentandria; and in the natural F ftem ranging under the \(13^{\text {th }}\) ordcr, Succulinte. Sce Botaxy Index.

TAMBOUR, in Architecture, a term applied to the Corinthian and Compofite capitals, as bearing fume refemblance to a drum, which the French call tambour. Some chnofe to call it the zofe, and others campana or the bell.

Tambour is alfo ufed for a little box of timber work, covered with a ceiling, withinfe the porch of certain churches; both to prevent the view of perfons paffing ty, and to keep off the wind, \&e. by means of ioldingdoors, \&c.

Tambour. alfo denotes a round courfe of flone, feveral whercof form the fhaft of a column, not fo high as a diameter.

Tanbour, in the arts, is a fecies of embraidery. The tambour is an inftrument of a lipherical lorm, upon which if Aretched, by means of a liling and buckle, or other fuitable appendage, a piece of linen or thin filken fluff; which is wrought with a ncedle of a particular form, and by means of filken or gold and filver theads, into leaves, fowers, or other fropurcs.

TAMBOURIN, is the name of a dance performed on the Fronch Aage. The air is live!y, and the movemenis are quick.

The fame name is applied to a mufical inf rument, formed of a hoop, over which is ftefched a piece of parchment or velium, while belis and hollow hemifpheses of brafs
are loofely hung in holes cut in the hoor. The tambourin Tamerlane is ufed only as an accompaniment to other inftruments.
'PAMERLANE, or Tiaur Brk, a celebrated prince and conqueror. At the agre of 25 he attained the highen dignities, with lurprifing courage, and an ambition allonilhing to all the world. Elideavouring to perfect the great talents which he had received from mature, he fent nine years in difierent countries; where his gieat fenfe and elevated genius appeared in councils and affemblies, while his intrepidity and valour, whether in perfonal combats or pitched battles, drew upon him the admiration of all mankind. He made himfeli matler of the three empires of Jagatay Khân, Tuha Khân, and Ifûî̀k.û K :â:1 ; fo that his power, riches, and magnificence, were immenle. There remain vaf monuments of his grandeur in the cities, towns, caftles, and walls, which he built: in the rivers and canals which he dug, as well as the bridges, gardens, palaces, hofpitals, mofques, and monafterite, which he erected in divers parts of Alia in fo great a number, that a king might be accounted sery powerful and magnificent, who fhould bave employed 36 years only in building the great edifices which 'Timur', caured to be founded.

Tinût, according to the hiflorian Arabflâh, was in his peifon very corpulent and tall. He had a large forehead and big head. His countenance was agreeable, and his complexion fair. He wore a large beard, was very Atrong, and well limbed; had broad houldera, thick fingers, and long legs. His confitution was amazing!y vigorous; but he was maimed in one hand and lame of the right fide. His eyes appeared full of fire; his voice was loud and piercing; he feared nothing; and when far advanced in ycats, lis underflanding was found and petfect, his body vigorous and robuft, his mind conftant and unthaken like a rock.

He did not like raillcry, and could not bear a lie. There was no joking or fooling before him; for he loved the naked truth, even although it was to his own difadvantage. He neither grieved if he mifcarried in any attempt, nor appeared overjoved on any great fuccefs. The device of his feal was, "I am fimcese and plain." He had a clear and folid underftanding, was furprifingly happy in his conjectures; vigilant, active, and unnlaken in his relclutions. He tock great delight in reading hiflory, and was well verfed in the ftate of countries, provinces, and cilies. He was penetrating, fubtle, clofe, and difembling ; just by inclination, liberal from difpofition; hut ambition had in a great mealure extinguilhed his humanisty; war had familiarized him to blood; and his religious zeal had infpired him with the moft cruel, implacable, and pernicious fanaticilm.

He died on the ift of April 1405 , in the 7rf year of his age and 36 h of his reign. When he found death approaching, he fent for his principal officers, declared hic grandion his lreir, and made them fivear to execute his will. Having recommended brotherly love and concord to the pinces his children, he ordered one of the doctors to read the Koran at his bed's head, and often repeat the unity of God. At night he feveral times made profeffion of his belief, "That these is no ather God than God," and then expired. See Moguls, \(\mathrm{N}^{n}\) 15 , \&zc.
'IMTAM, a tlat drum ufed by the IIindoos, refombling a tabor, but it is larger, and founds louder.
'TAMUS, Bıack Briony, a genus of plants belong-

\section*{T A N}
ing to the clafs dioccia; and in the natural fyitem rank. ing under the isth order, Sarmentaccu. Sce Botany Indis.

TAN, the bark of the oak after it has been ground and ufed by the tanner. The fimalleft fort is generally made up in litule fquare cakes called turf, and fold for firing. The contler fort is fumetimes dried in the fun, and ufed by bakers for heating their ovens, \&ec. but its chief ufe is for making hut-beds to raite pine-apples and other plants.-Williain III. introduced the ufe of it from Holland, for the purpofe of raifing orange trees; after which it was difcontinued for many years: but abo:t 1719, when ananas were firt brought into England, it came into general ufe, and has ever fince been in great ellimation with gardeners for all the purpofes of forcing, \&\&c. on account of its flrong and lafing fermentation. Ithe fraller the tan the quicker it heats; but the larger fort acquires heat mo:e gradually and retains it longer: the Rkilful gardener thercfore ufes the one or the other, or a misture of both, according to the time and purpote for rhich it is wanted. It is fome time after the tan comes uat of the tanner's pit before it begins to heat, and therefuee it is not fit for immediate ufe; hat having fain a week or tro, it enters into a fate of fernentation, and ifyut into hot-beds properly prepa:ed, will retain a molerate heat for three or fuur months. When it becomes ufilefs for the hot-houfe, it is fuid by Miller and others to be in excellent manure for fome kinds of land.

The word ton is fome imes, though improperly, ufed for the bark itfelf, which is the chief ingredient in the tanning of leather. Osk bark, on account of its great aftringency and summy-relinous propertiec, is preferred to all other fubfances for the parpofe of tanning, as it not only preferves the laather from rotting, but alin, by condenfing the pores, renders it impervious to water. See Tancing.

For an account of tan or tann:n, confidered as a chemical principle, fee Chemistry, \(N^{\circ} 2504\).

TANACETUM, Tassy, a genus of plants belonging to the clafs fyngenefia; and in the natural fyntem ranging under the 49 th order, Compofitue. See Botany Intex.

TANFECIUM, a genus of plants belonging to the didynamia clafs; and in the natural method ranking under the \(25^{\text {this }}\) order, Putaminere See Botasy Index.

TANAGRA, 'lanager, a genus of birds belonging to the order of pafferes. See ()knithology Index.

TANAIS, or Don. See Don.
TANGENT of on Arcir, is a right line frawn perpendicularly from the end of a diameter, paffing to nie extremity of the arch, and terminated by a right line drawn from the centre through the other ead of that atch, and called the fecant. See Geometry.

TANGIER, a port-town of Africa, in the empire of Morocco and kingdom of Fez, fituated at the eatrance of the fraits of Gibraltar, in W. Long. 5.50. N. Lat. 38. 49. In 1662 , this place belonged to the Portugutefe, and was given to King Charles II. upon his marriage with the Infanta of Portugal ; but, he growing weary of the charge of keeping it, caufed it to be blown \(u_{r}\) and deftroyed in 1684; ever fince which time it has been only a poor filling town. Anciently it was called Tingir, and gave name to the frovince of Mauritania Tingitana.

\section*{197 T A N}

TANK, in the language of Indoftan, a place inclofed for receivi ig and setaining rain water. During the periodical rains the tanks are filled, and thus in the dry feafon furnith water for the rice fields and cattle. Some of them are of great extent, meafuring 350 o: 400 feet on the fide; they are of a quadrangular form, and lined with granite, defeending in regular tteps fom the margin to the bottom.

TANNER, one who drefles hides by tam:iny them. See Thnming.

Tasner, Dr Thomas, an Enchlifl preizie and ceiebrated aatiquarian, born in 3674 . He was admnitted of Queen's college Uxford, where a fimilarity of tafte for antiquities produced a clofe friendhip, between him and Edmund Gibfoa afterwards billop of London. In:697, he was chofen fellow of his college; and having already publithed fome fpecimens of his antiquarizu refearches; foon after became kiown to Dr Misore bifhop of Norwich, who made him chancellor of his diocele. In 1722, he was made archdeacon of Norwich, and in 1731 bihhop of St Afaph. He died at Oxford in 1735; and after his death was publithed an eliborate work, in which he is faid to have been employed for 40 years, under this litlc, Bibliotheca Britanica Hibermica, five cle Scriptorihus qui in Anglia, Scotin, at Hibcrnia, ad fiec:ati XVII. initinn forucrint, \& © \(c\).

TANNING, the ant of converting hides and fkins into leather. This art has heen practived for many centuries in Britain; but fome improvements have betri made on it, efperially in France, fuggetled by the difcoveries of modern chemiltry. Thele improvements we Mall briefly notice after having defribed the neethod letely pratiled in the neighbourhood of London, where the beft Britihh leather is manufactured. The general principles on which the improrements are founded, will naturally come to be contidered, after defribing the proceffes themfelves.
The leather tanned in Enfland is generaily divided Difierent by the manstacturers into three kinds, butes or laikr, kirds of hider, and pins. Buts, are made from the fouteft ar. \({ }^{\text {denther. }}\) heaviell o.s hides, and are ufed chiefly for the foles of flout fhoes and boots. Hides, or crop-hider, are made from cow hides, or the lighter ox hider, and are employed for ordinary foles. The term fkins is applicd to all the other kinds of leather, compreliending that made from the fhins of calves, feals, doge, kids. \&cc.

Butts ate tanned as follows. Atter the borns are arethod on taken off, the hides are laid frooth in heaps for two days turing. in fummer, and five or fix in winter; they are then hung butt:on poles in a clofe room, called a frucke-houle, in which is kept a fmouldering fire of wet tan ; this occafions a fmall degree of putrefaction, by which means the hair more eafily comes off, by fpreading the bide on a fort of wroden horle or beam, and feraning it with a crooked knife. The hair being taken off, the hide is thrown into a pool of water, 10 cleanfe it from the dirt, \&e. which being done, it is again fpread on the wooder beam, and the greafe, loofe thefh, extraneous Gith, \&ic. carefully taken off : the hides are then put into a pit of frong liquor, called ooze, prepared in pits kept for the purpofe, by infufing ground oak- bak' in water, which is termed colouring. The hides are then removed into another pit, called a fonming, which cosiff of water Arongly impregnated with vitriolic or fulphuric acid, na a vegetable acid prepated from rya or batley. This out of the fouring, and ipread frooth in a pit ufually filled with water, called a binder, with a quantity of ground bark ftrowed between each. Altor lying a month or fix weeks, they are taken up, and the decayed bark and l:quor being drawn out of the fit, it is again filled with ftrong ooze, when they are put in as before, with bark between each hide. They now lie two or three months, at the expiration of which the fame operation is repeated; they then remain four or five monthe, when they again undergo the lame procefs, and after being three months in the laft pit, are completely tanned, unlefs the hides are fo remarkably fout as to require an additional pit or layer. The whole procefs requires from if to i8 monthe, and fometimes two years, according to the fubftance of the hide, and difcretion of the tanner. When taken out of the pit to be dried, they are hung on poles; and after being comprefled by a ftcel pin, and beaten out imooth by wooden beelles, the operation is completed.

Hides are thus managed. ifter the horns are taken off, and the hide is walhed, they are put into a pit of water, faturated with lime, and having mixed with it a quantity of the fame fubflance, where they remain a few days, when they are taken out, and the hair fcraped ori on a wooden beam, as before defcribed; they are then wathel in a pit or pool of water, and the loofe flelh, \&zc. being taken off, they are removed into a pit of weak ooze, where they are taken up and put down two or three times a day, for the firft week; every fecond or third day they are thifted into a pit of freft ooze, fomewhat ftronger than the former, till at the end of a month or fix weeks they are put into a ftrong coze, in which they are handled once or twice a week with frelh bark for two or three months. They are then removed into another pit, called a layer, in which they are laid fmooth, with bark ground very fine, ftrew\(\epsilon d\) above each hide. After remaining here two or three inonths, they are generally taken up, when the coze is withirawn, and the hides put in again with frefh ooze and frell bark, where, after lying two or three months more, they are completely tanned; except a very few fout hides which may require an extra layer. They are then taken out, and hing on poles, and being fmoothed by a Aeel pin, are, when dry, ready for falc.
well as horfe lides, are managed nearly in the fame Tanning. manner as Akins , and are ufed for coach work, l:arneds \(\underbrace{\text { Ting }}\) wo K, Sec.

The principal objections to this old method of tan-objections ning are, that it is extremely tedious, and very expen- to the old five. Tarious mosns lave been fuggefted for introdu- methods. cing a cheaper and more expeditious method of tanning. Among the earlien of thefe we may notice that of Dr Macbride. This method confifts chiefly in the ufe of Dr Macfulphuric inftead of acetous acid, for raifing or diftend- bride's iming the pores of the leather, and in fubfituting lime water, or a folution of lime, for what has been called the milk of lime, or a confiderable quantity of line diffufed in water. According to a report made to the commitee of commerce of the Dublin fociety, it appeared that Dr Macbride's method produced a faving of more than 20 per cent. to the manufacturer, while the hides were completely tanned in a much fhorter time. It does not appear, howcver, that this metbod ever came into general ufe.

The experiments of M. Seguin, made in the end of the 18 th century, on the nature of the tanning principle, led him to fuggeft a method of tanning which is certainly much more expeditious than the old method. It has been adopted in England by Mr William Defmond, and by his directions bas been practifed with confiderable fuccefs, by fome of the principal tanners in Warwickthire, Stafordfhire, and fome of the neighbouring counties. The following directions, cummunicated by Mr Defmond to the editor of the Philofophical Magazine, will fufficiently explain this new procefs.

Provide five veffels, called digefiers, of any conveni- Mr Defent materials and dimenfions, with an aperture at the mond's me. bottom of each. Let them be placed near each other, thod. and elevated on fillages or otherwife; fo that a fmall veffel may be placed under them. Fill the digefters with tan, viz. the bark of certain trees, fuch as of oak, cut fmall, or ground to a coarfe powder. Pour water on the \(\tan\) in the firft digefter, where it may ftand fome time, or be immediately drawn off. This liquor is to be poured on the tan in the fecond digefter; from that to the third, and fo on, until it comes through the tan in the laft digefter. The liquor is then highly coloured, and marks from \(6^{\circ}\) to \(8^{\circ}\) on the bydrometer for falts. This liquor is to be ufed for taming the thickett hides, and may be called the tanning livizium. If you take a finall quantity of it in a glafs, and pour on it ? few drops of a folution of animal glue, the clear liquor becomes turbid, and a whitifl fubftance falls to the botton. The precipitate thus obtained, is a fure indication that the liquor contains the tanning principle; for this reafon, that glue being of the fame nature with the fkins or hides of which it is made, whatever fubfance unites itfelf indiffolubly with the former, will do fo likewife with the latter.

This folution is made by diffolving a little common glue in water over a moderate fire ; by means of it, not only oak bark, but alfo the bark of feveral other trees, as well as different fhrubs, and plants, all which may be called ton, are found to contain the tanning principle; and by employing the folution as before, it will be al. ways eafy to afcertain whether any given fubitance contains this principle.

In the courfe of thefe lixiviations it may be obferved, 1. That the liquor rumbing from the firf digefter, at

\section*{T A N [ 109\(]\) T A N} length lofes its colour. If in this flate a little of it be put into a glafs, and the former experiment be repeated, the liquor no longer becomes turbid, but remains clear, which thews that it contains no more of the tanning principle; but if a few drops of a folution of fulphate of iron be poured into the fame glals, the liquor becomes thick and black, which is not to be poured on the tan in the fecond digefler, but afterwards ufed for taking off the hair or wool. It is known by the name of gallic lixivium, as it appears to contain the fame principles with galls.

The liquid fulphate of iron is obtained by difolving a fmall quantity of iron in diluted fulphuric acid, or by diffolving green copperas in water. 'This folution ferves to afcertain fuch fubftances as contain the gallic principle. Lime water will alfo produce this effect.

When the liquor ceafes to grow black by the mixture of the fulphate of iron, it will be in vain to pour any more water on the tan in the firf digefter. 'This tan being thus exhaufted, muft be removed, and new tan put in its place.

The liquor, after running through all the digefters, at laft grows weak. All the liquor that marks from \(6^{\circ}\) to \(8^{\circ}\) on the hydrometer, muft be added to the flock of tanning lixivium. What proceeds afterwards from the laft digefter is to be poured on the new tan in the firf. Then the freh water is to be conveyed on the tan in the fecond digefter, and the liquor of the frit fet afide, while it marks \(6^{\circ}\) or \(8^{\circ}\) on the hydrometer, and added to the tanning lixiviun, which mult always be carefully feparated from the gallic. In this manner, the tan in all the digefters may be senewed, and the lixiviations continued.

The number of thefe lixiviations, as well as the mode of making them, may be varied at pleafure; the effential point is to repeat them fo as to give the liquor a fufficient degree of concentration, which may be determined by the hydrometer, and proportioned to the quicknefs required in the operation, and the thicknefs of the hides and fk ins to be tanned; all which experience will foon teach. As all kinds of tan are not equally good, it will fometimes happen that fix or mere filtrations will be neceffary to obtain a lixivium of \(6^{\circ}\) or \(8^{\circ}\), in which cafe the number of digefters muft be increafed, and the fame method purfued as above; and when a weaker lixivium is wanted, three or four filtrations will be fufficient.

The perfon disecting thefe lixiviations fhould be provided with the folution of glue and fulphate of iron, already defcribed, in order to afcertain the qualities of the different lisivia, as well as with a hydrometer properly graduated, to determine their degree of concentration or fpecific gravity.

In tanning cow and or hides with this lixivium, they fhould firt be wafted in running water, well cleaned, and Hefled in the ufual way. For removing the hair, the hides are to be fleeped for two or thrce days in a vat flled with the gallic lixivium, and a mixture of fulphuric acid, marking \(66^{\circ}\) on the hydrometer for acids, and in the proportion of one to a thoufand, or one pint to 125 gallons. During this fteeping, the hair is feparated from the hides in fuch a manner, that it may be eafily known when they are to be taken out of the vat, that is, when the hair is quite loofe. It is to be fcraped of with a round knife on the horfe or beam.

When raifing is neceffary, the hides are immerfed for Tamang. 10 or 12 hours in a vat filled with water, and 3 sor of its volume of mineral acid, of the fame quality with the former, and the operation of raifmg is finimed. The hides are repeatedly waftied, and the round haife is uled, after which tliey are prepared for tatining.

The relt of the procefs confifts in tanning, properly fo called; for which purpofe, the lides ate to be lleeped fome hours in a weak lisiviam of only \(1^{\circ}\) or \(2^{\circ}\); to obtain which, that is to be taken which runs from the fccond digefter, or fome already ufed for tanning. 'Thcy are nest put into a ftronger lixivium, where in a few days they will be biought to the fame degree of fatura. tion with the liquor in which they are immerfad. The ftrength of the liquor being then much diminithed, it muft be renewed; and when the hides are completely faturated, or fully tanned, which is known by cutting off a bit of the edge, remove the leather, and let it dry flowly in a fhady place.

For calfikins, goat Rkins, Scc. thefe are firf Refhed with the knife, and worked in running water like the athers. They are then lteeped in lime water, in which there fhould be more lime than the water can diffolve at once. What is not diffolved will fubfide, but muft be mixed with the water, by flirring it feveral times aday. In two or tnrec days the flins are to be removed; when the hair is found quite loofe, it is fcraped off en the horfe. They are then wafled and prefied well, till the water ruming from them is perfectly clear, and the lime totally extracted. They are firf fleeped in a weal: lixivium, then tanned as above; but the tanning lixivium mutt not be nearly fo ftrong as that for hides.

Lime is ufed for the foft fiins inftead of a misture of gallic lixivium and fulphuric acid, becaufe the ncid always fwells the leather more or lefs, and becaufe the lime may be more eafily extracted from them, by wafl. ing and comprefling them, than from the thick hides, which, when limed, are harfh and apt to crack, if the lime be not whully extracted before they are tanned.

Among the different methods of immerfion whicla may be practifed in the courfe of thefe operations, the beft way leems to be that of fufpending the hides and Akins vertically in the lixivia, by means of tranfverfe rods or bars, and at fuch a diftance afusder as not to touch each other in any one point. If they are laid out the one over the other, they will require frequent dandlire. in order that all the parts may be equally faturated. and to prevent the folds or plaits that rould otherwite be formed in them. In fume cafes it will be found expedient to mix. freth tan from time to time with the lisivium, which will depend on the fate and quality of the hides and ikins to be tanned, as well as on the purpoles for which they are intended. All thefe confiderations muft be left to the judgement of the manufacturer ; but they do not change the principle on which this mode of tanning is founded.

Mr Defmond afferts, that befides the very great favings in point of time and labour, the leather tamed according to the above method being more completely faturated, will be found to weigh heavier, to wear better, or \(_{\text {Phits }}\) and to be lefs fufceptible of moifture, than the leather Alaz. tanned in the ufual way *.

In explaining the principles on which the fereral 7 parts of the tanming procefs depend, we muft firf re-Principles mank, that the princinal object of tarning is, to com- of tumin

\section*{T A N [ 200 ] T A N}

bine the gelatinous part of the hides with the tanning principle of aftringent vegetables as intimately as poffible, and thus produce that compound which we call leather, and which is infoluble in water. The chief past of the procefs therefore confilts in fteeping the hides it a folution of tannin till they are fufliciently impregnated with the tanning principle; and to this operation the others are fubfervient, only as they prepare the hides to be more eafily akted on by the tanning principle.

The infufions of oak bark, when chemically examined, are found to contain two principal fubftances, one precipitable by folution of gelatine made from glue or ifinglafs, and this gives a denfe black, with folution of common fulphate of iron; the other not precipitable by folution of gelatine, but precipitating the falts of iron of a brownill black, and the falts of tin of a fawn colour.

The former of thefe is the tanning principle, or the tannin of Seguin ; it is efiential to the converfion of ARin into leather. The latter is the colouring or extractive matter; it is capable of entering into union with fin, and it gives to it a brown colour; but it does not render it infoluble in boiling water.

It has been generally fuppofed that the infufion of oak bark contains a peculiar acid, called gallic acid; but fome late experiments render this opinion doubtful; and this principle, if it exifls in oak bark, is in intimate combination with the extractive or colouring matter.

In the common procefs of tanning, the fkin, which is chi:efly compofed of gelatine, flowly combines in its organized form with the tannin and extractive matter of the infufions of bark; the greater proportion of its increafe of weight, however, is owing to tannin, and from this fubftance the leather derives its characteriftic properties; but its colour, and the dcgree of its Rexibility, appear to be isffuenced hy the quantity of colouring matter that it contains. When Rin, in large quantity, is fuffered to exert its full action on a fmall portion of infufion of bark, containing tamin and cxtråive matter, the fluid is found colourle?s. It gives no precipitate to folution of gelatine, and produces very little effect on the falts of fron or cif tin. The taining principle of oak bark is more foruble in water than the extractive matter; and the relative proportion of tannin to extradive matter is much greater in firong infufions of oak bark than in weak ones; and when frong infufions are ured for taming, a larger proportion of tannin is combined with the matter of Rin .

The fate of the 胲访 with regard to its impregnation with tannin may be eafily alcertained by cutting it tranfverfely with a flarp knife, as the tanned part will appear of a nutmeg colour, while the unimpregnated part retains its whitenefs. Though the impregnation of the fkins with tannin be an effential part of the procefs, fomething more is required to give the leather its proper degree of ferength and pliability. The infufions of oak bark, efpecially the weaker infufions, contain, befides tamin, more or lefs of extractive matter, which is abforbed by the flsins during the taming procefs. Hence it appears, that a folution of tannin alone would not convert the \(\mathfrak{k}\) ins into leather ; and that as concentrated infufions of oak bark contain a lefs proportional quantity of extrac. tive matter, they are not fo well calculated for the purgofes of tanning as the waker infufions, This is an im-
portant conclufon, as it flews that the vulgar opinion of tanners refpecting the propricty of the old methods, and what they call foeding the leather, is founded on rational principles. In fact it appears that, though, in the quick method, recommended by Seguin and Defo mond, the leather may te more expeditioully, and perhaps more completely impregnated with tannin, it is dcficient in firength and pliability, from the want of its due proportion of extractive matter.

Having thus explained the priaciples on which the material part of the tanning procefs depends, we mult brictly notice the rationale of the preliminary operations.

Chaptal has thewn, that when \(\mathbb{k}\) in is immerfed in a tanning liquor, without having been previouly freed from its cuticle or fcarf-fkin, the impregnation of tannin takes place only on the fleth fide. This fluews the neceflity, eflecially in the thicker hides or butts, of removing the cuticle, before Aleeping the hides in the tanning liquor. The fmall degree of putrefaction to which the butts are fubjected, has this effeet, and the lleeping of the hides and fleins in lime water contributes to the fame end; for though lime does not feem to be capable of diffolving the cuticle, it renders it friable, fo that it is eafily remored by the inltruments employed for feraping off the bair. Not only the cuticle, but likewife the foft matter of the extremity of the hair is acted on by lime; and this cffect mult confiderably tend to facilitate the procefs of depilation. The fame fubftance mixing with the fat on the flefty file of the fins, forms a foapy compound, which, with other extraneous matter, is removed by the fubfequent wafhing".

It has been fuppoled that the acids in which the \(\mathbb{f k i n s}\) are ftceped, previous to their immerfion in tanning liquors, have the effect of opening their pores, and thus rendering them more eafly penetrable by the tanning princip!e and extractive matter. We believe that this opinion is erroneous, as we cannot fee how acids, the obvious effect of which feems to be that of contracting animal matter, can enlarge the pores of the \&ims. It is probable that they produce fome other advantageous effect not yet fufficiently underfood, in preparing the fkitis for being more perfealy acted on by the tanning liquors.

The principal effect of the grainer, or the pigeons dung employed in the thinner kins, feems to be that of promoting putrefaction, and rendesing the fkins lefs elaftic, though the alkali evolved during the fermentation of the dung, may affift in removing the fat on the flefl fide of the \(\mathrm{fkin}^{2}\).

As from the profent great demand, and confequent Subritutes fcarcity of oak timber, oak bark has become a very ex. for oak penfive article, it may be proper to enumerate a few of bark. the principal vegetable futhtances, efpecially thofe indigenous to Great Britain, that may be fubftituted for it. Of thefe the batk of the Scotch fir appears to be moft deferving of attention, and was fome years ago employ. ed by a gentleman in Ireland with great fuccefs. Scveral fuecies of willow afford a good fubtitute for oak bark, particularly the Leicefter willow, of which the entire bark produces a greater quantity of folid extract than the entire bark of oak. Next to thele may be mentioned the bark of the common elm, the root of tormentil (cormentilla vulgaris, Lin.) which has been long employed in the north of Scotland as an article of do-

\section*{T A O [ 201\(] \quad\) I A P}

Tinning meftic tanning. To thefe may be added the herb avens (geum urbanum, Lin.), feveral fpecies of cinquefoil, and of hiltort, common ladies mantle (alchemilla vulgaris), and the root of the common water-Hag (iris pfectdacorus, Lin.). Of plants not indigenous to Britain, but generally cultivated here, we may particularly notice the horfo-chcfnut, the batk of which is a frong aftringent, and might be employed, we think, with great advantage in tanning. Thic mof powerful tansing fublance, however, with which we are acquainted, is the juice or extract of the mimofa catechu, commonly called Japan earth, one pound of which will tan as much leather as feven or eight pounds of oak bark.

Our limits will not permit us to extend this article, by defribing the procefles for tanning employed in other countries. On the method purfued in Ruflia, our readers may confult Tooke's View of the Rulfian Entpire; and of the French method of tanning, an ample account has been given in a publication by De Lalande. Another on the fame fubject may foon be expected from Chaptal. The moll complete work on Britifi tanning, and on other proceffes to which leather is fubjected, with which we are acquainted, is a fmall volume entitled The Art of Tanning and Currying Leather, publifhed by the Dublin Society in 1780. Several ufeful papers on this fubject may alfo be found in Nicholfon's Philofophical Journal, and Tilloch's Philofophical Magazine.

For an account of other proceffes connected with the leather manufacture, fee Leather and Currying.

TANTALIUM, a new metal which has been detected in two minerals. See Mineralogy, p. 250.

TANTALUS, in fabulous hiftory, king of Phrygia and Paphlagonia, was the for of Jupiter and the nymph Plota. He one day entertained the gods at his table; when, to prove their divinity, he ferved up his fon Pe lops cut in pieces. All the deities, except Ceres, perceived his cruelty and impiety, and would not touch his provifions. That goddefs, whofe thoughts were folely employed about her daughter Proferpine, inadvertently ate a part of his left fhoulder. Pelops, however, was reftored to life; and an ivory floulder given him in the room of that which had been eaten; while Tantalus was thrown into Tartarus, where he was punithed with perpetual hunger and thirt. He was chained in a lake; the water of which reached up to his chin, but retired when he attempted to drink. The branch of a tree loaded with fruit hung down even to his lips, but on his attempting to pluck the fruit the branch fprung upwards.

Tantalus, a genus of birds belonging to the order of gralla. See Ornithology Index.

Tantalus's Cup. See Science, Amufements of, \(\mathrm{N}^{0} 33\).

TANZy, or Tangy. See Tanacetum, Botany Indrx.

TAORMINA, a town in Sicily, which is fituated on a bigh rock, and is 88 miles fouth of Meffina. Of its origin little is known. A colony from the ifle of Naxos fettled at the foot of Etna, at no great diflance from the fhore, and at about a league or a league and a half from the prefent fituation of Taormina. Dionyfins the Tyrant attacked this colony, and either took or fet fire to their city. The inhabitants retired to the rocks of Mount Taurus; among which they found a tract of Tol. XX. Part I.
ground fufficiently level and fecure, and of fufficient ex. Tantmina tent. Here, therefore, they built a city; which, after the mountain, they named Tauromenium. It was at length raifed to a very dourifhing llate by trade, and became celebrated as a feat of the arts, the remains of which flow that the fine arts mull have been once fuccefffully cultivated at Tauromenium.

Among other remains are fill to be feen a fpacious theatre, a tomb, and a large natural grotto, which appears to have been anciently adorned within with artificial ornaments. After the inhabitants of Taormina embraced Chriftianity, they ftill continued to vifit this grotto with devout veneration. Inftead of the Pagan divinities to whom it had before been facred, they fubflituted a faint, the venerable St Leonard. But St I.eonard did not long draw crowds to this groto; and the Chriftians have either defaced its Pagan decorations, of fuffered them to fall into decay by the injuries of time. It is now black and fmoky; and it is with difficulty that any remains of the Greek paintings with which it was once ornamented can be dillinguifhed.

TAPE-worm. See Tenla, Helminthology Index.

TAPER, Tapering, is underflood of a piece of timber, or the like, when thick at one end, and gradually diminifling to the other; as is the cafe in pyramids, cones, \&c.

To meafure TAPER-Timber, \&c. See SLIDINc Rule.

TAPER-Bored, is applied to a piece of ordnance when it is wider at the mouth than towards the breech.

TAper, alfo denotes a kind of tall wax candle, placed in a candleffick, and burnt at funeral proceffions, and in other church folemnities.

Tapers are made of different fizes; in fome places, as Italy, \&c. they are cylindrical; but in moft other countries, as England, Fiance, \&c. they are conical or taper; whence poffibly the name; unlefs we rather choofe to derive taper, in the adjective fenfe from the fubflantive taper, in the Saxon tapen or tapon, cereus, "wax-candle." Both kinds are pierced at bottom for a pin in the candleftick to enter.-There are two ways of making tapers, the firf with the ladle, the fecond by hand; for which, fee Caidie.

Pafchal TAPER, among the Romanifs, is a large taper, whereon the deacon applies five bits of frankincenfe, in holes made for the purpofe in form of a crufs; and which be lights with new fire in the ceremony of Eafler Saturday.

The Pontifical makes Pope Zofimus the author of this ufage ; but Baronius will have it more ancient, and quates a hymn of Prudentius to prove it. That pope be fuppofes to have only eftabliftied the ufe thereof in parifh-churches, whicl, till then, had been reftrained to greater churches.
F. Papebroch explains the original of the pafchal taper more diftinctly, in his Comatus Chronico-Hifloricus, \&c. It feems, though the council of Nice regulated the day whereon Eafter was to be celebrated, it laid it on the patriarch of Alexandria to make a yearly canon thereof, and to fend it to the pope. As all the other moveable feafts were to be regulated by that of Ealler, a catalague of them was made evcry year; and this was written on a taper, cercus, which was blefled in the church with much folemnity.

C c
Tris

\section*{T A P [ 202 ] T A P}

Taper, Ta eftry.

This taper, according to the abbot Chaftelain, was not a wax-candle made to be burnt; it had no wick, nor was it any thing more than a kind of column of wax, made on purpofe to write the lit of moveable feats on ; and which would fuftice to bold that lift for the fpace of a year.

For among the ancients, when any thing was to be written to latt for ever, they engraved it on marble or fteel; when it was to laft a long while, they wrote it on Egyptian paper ; and when it was only to lafl a fhort time, they contented themfelves to write it on wax. In prosels of tine they came to white the moveable feats on preri, but they flill faftened it to the pafchal taper. Such is the original of the benediction of the pafchal taper.

TAPESIRY, a kind of cloth made of wool and fiik, adorned with figures of different animals, \&c. and formerly ufed for lining the walls of rooms, churches, \&c.

The art of weaving tapeftry is fuppofed to have been borrowed from the Saracens; accordingly the workmen employed in this manufacture in France were formerly called Sarazins or Sarazinois. Guicciardini afcrites the invention of tapeftry hangings to the inhabitants of the Nctherlands; but he has not mentioned at what time the difcovery was made. This art was brought into England by William Sheldon, near the end of Henry VIII.'s reign. In I619 a manufacture was eftablifhed at Mortlake in Surry by Sir Francis Crane, who received 20001. from King James to encourage the defign. The firlt manufacture of tapelty at Paris was fet up under Heary IV. in 1606 or 1607 , by feveral artilts whom that monarch invited from Flanders. Under Louis XIV. the manufacture of the Gobelins was inftituted, which has introduced very beautiful cloths, remarkable for ftrength, for eiegance of defign, and a happy choice of colours. The fineft paintings are copied, and eminent painters have been employed in making defigns for the work.

Tapellry-work is diflinguifhed by the workmen into two kinds, viz. that of bigh and that of low warp; though the difference is rather in the manner of working than in the work itfelf; which is in effect the fame in both: only the looms, and confequently the warps, are differently firuated; thofe of the low warp being placed flat and parallel to the horizon, and thofe of the high warp erected perpendicularly. The Englifh anciently excelled all the world in the tapeftry of the high warp; and they fill retain their former reputation, though with fome little change: their low warfs are Aill admired; but as for the high ones, they are quite laid :fide by the French. The French, before the revolution, had three confiderable tapellry manufactures befides that of the Gobelim: the firt at Aulunfon in Auvcrgnc, the fecond at Felletin in the Upper Marche, and the third at Beauvais. They were all equally eftablifled for the high and the low wasp; but they had all laid alide the high warp excepting the Gobelins. There were admirable low warps likewife in Fianders, gencrally cxcceding tho \(\mathrm{r}_{\mathrm{e}}\) of lirance; the chief and alinolt only Flemifh manufuctures we:e at Brufiels, Antwerp, Oudenard, Lifle, Tommay, Bruyec, and Valenciennes; but of the fate of thefe manufatures now we are ignorant.

The ufual widths of tapefiry are from two clls to Tapeftry. three ells Paris meaf.re.

T'ie Manufacture ef Tapeflry of the High WarpThe loons on which it is wrought is placed perpendicularly: it confits of four primcipal pieces; two long planks or cheeks of wood, and two thick rollers or beams. The plarks are let upright, and the beams acrofs them, one at the top and the other at the botom, or about a foot diftance from the giound. They have each their trumnions, by which they are fulpended on the planks, and are turned with bars. In each roller is a groove, from one end to the other, capable of cuntaining a long round piece of wood, fallened therein with houks. The ufe of it is to tie the ends of the warp to. The warp, which is a kind of worled, or twifted woollen thread, is wound on the upper roller; and the work, as fatt as wove, is wound on the lower. Withinfide the planks, whicb are leven or eight teet high, fourteen or fifieen inches broad, and three or four thick, are holes pierced from top to botlom, in which are put thick pieces of iron, with hooks at one end ferving to fuflain the coat-ltave: thefe pieces of iron have alfo holes pierced, by putting a pin in which the flave is drawn nearer or fet farther off; and thus the coats or threads are ftretched or loofened at pleafure. The coat-ftave is about three inches diameter, and runs all the length of the loom ; on this are fixed the coats or threads, which make the threads of the warp crols each other. It has mush the lame effect here as the fyring-ftave and treddies have in the common looms. The coats are little threads faftened to each thread of the warp with a kind of fliding knot, which forms a fort of mah or ring. They ferve to kcep the warp open for the paflage of broaches wound with filks, woollens, or other matters ufed in the piece of tapeftiy. In the laft place, there are a number of little lticks of diffee ent lengths, but all about an inch in diameter, which the workman keeps by him in bafkets, to ferve to make the threads of the warp crofs each other, by paffing them acrefs; and, that the theads thus croffed may retain their proper \(f\) tuation, a packthread is run among the threads above the fick.

The loom being thus furmed, and mounted with its warp, the firft thing the workman does is to draw on the threads of this warp the principal lines and Atrokes of the defign to be reprefented on the picce of tapeftry ; which is done by applying cartoons made from the painting he intends to copy to the fide that is to be the wrong fide of the piece, and then, with a black lead pencil, following and tracing out the contours thereof on the thread of the right fide; fo that the ftrokes appear equally both before and behind.

As for the original defign the work is to be finimed by, it is l:ung up behind the workmen, and wound on a long ftaff, from which a picce is unrolled from time to time as the work proceed.

Befides the loom, \& \& . here defribed, there are three other principal inftruments required for working the filk or the wool of the woof within the threads of the warp; thefe are a broach, a reed, and an iron needle. Tlie broach is made of a hard wood, feven or eight inches long, and two-thirds of an inch thick, ending in a point with a little handle. This ferres as a thuttle; the filks, woollens, gold, or filver, to be ufd in the work
rapertry. work being wound on it. The recal or comb is alfo of wood, eight or nine inches long, and an inch thick on the back, whence it grows lefs and lefs to the extremity of the tecth, which are more or lefs apart, according to the greater or lefs degree of fincnels uf the intended work. Laifly, the needle is made in form of the common needle, only bigger and longer. Its ufe is to prefs clufe the wool and filks when there is any line or colour that does not fit well.

All things being prepared for the work, and the workman ready to begin, he places himfelf on the wrong fide of the piece, with his back towards the defign: fo that he works as it were blindfold, feeing nothing of what he does, and being obliged to quit his polt, and go to the other fide of the loom whenever he would view and examine the piece, to correct it with his prefing-needle. To put filk, \&sc. in the warp, he firt turns and looks at the defign; then, taking a broach full of the propes colour, he places it among the threads of the warp, which he brings crofs each other with his fingers, by means of the coats or threads faftened to the flaff; this he repeats every time he is to change his colour. Having placed the filk or wool, he beats it with his reed or comb; and when he has thus wrought in feveral rows over cach other, he goes to fee the effects they have, in order to reform the contours with his ncedle, if there be occafion. As the work advances, it is rolled upon the lower beam, and they unroil as much warp from the upper beam as fuffices them to continue the the piece : the like they do of the defign behind them. When the pieces are wide, feveral workmen may be employed at once.

We have but two things to add : the firft is, that the high warp tapeftry goes on much more flowly than the low warp, and takes up almof turice the time and trouble. The fecond is, that all the difference that the cye can perceive between the two kinds, confifts in this, that in the low warp there is a red fillet, about one-twelfth of an inch broad, running on each fide from top to bottom, which is wanting in the tigh warp.

Manufacure of Tapiftry of the Low Warp.-The loom or frame, whereon the low warp is wrought, is much like that of the weavers; the principal parts thereof are two ftrong picces of wood forming the fides of the loom, and bearing a beam or roller at each end : they are fuitained at botion with other ftrong pieces of wood in manner of treftes; and, to keep them the firmer, they are likewife faftened to the floor with a kind of buttrelles, which prevent any flaking, though there are fometimes four or tive workmen leaning on the fore-beam at once.

The rollers have each thcir trunnions, by which they are fufained: they are turned by large iron pins three feet long. Along each beam runs a grove, wherein is placed the wich, a piece of wood of about two inches diameter, and almoof of the length of the roller : this piece fills the groove entirely, and is fatened therein, from fpace to fpace, by wonden pins. To the two wiches are faftened the two extremitics of the warp, which is wound on the father roller, and the work, as it advances, on the nearer.

Acrofs the two fides, almof in the middle of the loom, pafies a wooden bar, which fuffains little pieces of wood, not unlike the heam of a baiance: to thefe pieces are faftened ftings, which bear certain fpring flavcs, where-
with the workmatr, by means of two treddles under the TapeAry loom whereon he fets his fect, gives a motion to the coats, and makes the threads of the warp rife and fall
altermately. Each loom has more or fewer of thefe fring-flaves, and each flaff more or fewer coats, as the tapeftry confits of more or fewer threads.

The defign or painting the tapefly-man is to follow is placed underncath the warp; where it is futained from face to fpace with frings, by means of which the defign is brought nearer the warp.
' T he loom being mounted, there are two in?ruments ufed in working it, viz. the reed and the tlute. The tlute dots the office of the weaver's fhuttle; it is made of an hard polithed wood, three or four lines thick at the ends, and fomewhat more in the midelle, and three or four inches long. On it are wound the filks or other matters to be ufed as the woof of the tapelliy. The comb or reed is of wood or ivory; it has ufually teeth on both fides; it is about an inch thick in the middle, but diminilhes each way to the extremity of the teeth: it ferves to beat the threads of the woof clufe to each other, as faft as the workman has paffed and placed them with his flute among the threads of the warp.

The workman is feated on a bench before the loom, with his breall againf the beam, only a cufnion or pillow between them; and, in this pofture, feparating, with his fingers, the threads of the warp, that he may fee the defign underneath, and taking a hute, mounted with a proper colour, he paffes it among the thieads, after ha:ving raifed or lowered them, by means of the treddles moving the fpring-itaves and coats.

Lallly, To prefs and clofe the threads of the filk or yam, \&c. thus placed, he frikes each courfe (i. e. what the flute leaves in its pafing and coming back again) with the reed.

TAPIOCA, a fpecies of flarch, which the Brazileans make from the roots of the caffada plant. See Jatropha, Botaky Inden:

TAPIR, a quadruped of the order of belluæ, refembling the hippopotamus. See Mammalia Index.

TAPPING, in general, the act of pietcing a hole in a vefiel, and applying a tube or canula in the aperture, for the commodious drawing off the liquor contained therein.

Tafping, in Surgery. Sce Paracentesis, Surgery Index.

TAPROBANA, the ancient name of the ifland o§ Ceylon. See Ceylon, and Geocraphy. \({ }^{\circ} 28\).

TAR, a thick, black, unctuous fublance, obtained chiefly from old pines and fir-trees by burning them with a clofe fmothering heat. It is prepared in great quantities in Norwav, Stveden, Germany, Ruffia, and North America, and in other countries where the pine and fir abound.

Becler, the celebrated chemint, firft propofed to make tar from pit-coal. Manufactures for this puipore have been eflablihed many years ago in the bilhopric of Liege, and in feveral parts of England. In the year 1781 , the earl of Dundonald obtained a patent for extracting tas from pit-eoal by a new procels of diftillation. Great hopes were entertained of the value of this difeovery, but we have not heard that it has anfwered expectation.

Tar, which is well known for its economical ufes, is properly an empyicumatic nil of turpentinc, and has been

\section*{TAR [ 204\(] \quad\) T A R}

Tararto much uled as a medicine both iuternally and externally. Tar-water, or water impregnated with the more foluble parts of tar, was formerly a very popular remedy.

IARANTO, the ancient 'larentum, a fea-port town of Italy, in the kingdom of Naples, and in the Terra de Otranto. It is a Arong and populous place, with an archbithop's fee, and the itle of a principality. It is feated on a peninfula, and is defended by a itrong caftle; but the harbour is choaked up. E. Long. 17. 29. N. Lat. 40. 35 .

TARANTULA, a fpecies of aranea, fo called from Taranto, the place, where it is faid to abound. See Aranea, Entomology Indez.

TARASCON, an ancient and populous town of France, in the department of the Mouths of the Rhone, and late province of Provence, with a well-built caftle, feated on the river Rhone, oppofite Beaucaire, with which it communicates by a bridge of boats. Its commerce confifts in oil, brandy, farch, and fluffs that are much worn, one fort being of coarfe filk, and the other of the fame material and wool. It is 10 miles north of Arles, and 375 fouth by eaft of Paris. E. Long. 4.45 . N. Lat. 43. 46.

TARAZONA, a Itrong town of Spain, in the kingdom of Arragon, and on the frontiers of OId Caltile, with a bifhop's fee. It is feated partly on a rock, and partly in a fertile plain, on the river Chiles. It was taken from the Moors in 1110. W. Long. I. 26. N. Lat. 42.10.

TARCHONANTHUS, Flea-bane, a genus of plants belonging to the clafs fyngenefia; and in the natural fytem ranging under the 49 th order, Compofite. Sec Botany Index.

TARE, is an allowance for the outfide package that contains fuch goods as cannot be unpacked without detriment ; or for the papers, threads, bands, \&c. that in. clofe or bind any goods imported loofe; or though imported in calks; chefls, \&c. yet cannot be unpacked and weighed neat.

Tare, or Vetch. See Vicia, Botany Index.
TARGET, a kind of flueld or weapon of defence inade ufe of by the ancients.

TARGIONIA, a genus of plants belonging to the clafs of cryptogamia, and natural order of Alga. See Botaky Inder.

TARGUM, a name given to the Chaldee paraphrafes of the books of the Old Teflament. They are called paraplrafes or exprfitions, becnufe they are rather comments and explications than literal tranflations of the text. They are written in the Chaldee tongue, which became familiar to the Jews after the time of their captivity in Pahylon, and was more known to them than the Hebrew itfelf. So that when the Hebrew text was read in the fynagogue, or in the temple, they generally added to it an explication in the Chaldee tongue for the fervice of the people, who had but a very imperfect knowledge of the Hebrew tongue. It is probable, that even from the time of Ezra this cuftom began, fonce this learned fcribe, reading the law to the people in the temple, explained it, with the other priefs that were with him, to make it underftood by the people (Nehem. viii. 7-9.).
But though the cuftom of making thefe forts of expofitions in the Chaldee language be very ancient among Whe Hebrews, yet have they no written paraphrafes or
targums before the era of Onkelos and Jonathan, who Targum. lived about the time of our Saviour. Ionathan is placed about 30 years before Chrif, under the reign of Herod the Great. Onkelos is fomething more modern. The Targum of Onkelos is the molt of all efteemed, and and copies are to be found in which it is inferted verfe for verle with the Hebrew. It is fo ftort and fo fimple, that it cannot be fufpected of being corrupted. 'Ihis paraphraft wrote only upon the books of Mofes; and his ftyle approaches nearly to the purity of the Chaldee, as it is found in Daniel and Ezra. This targum is quoted in the Mifna, but was not known either to Eufebius, St Jerome, or Origen.

The Targum of Jonathan fon of Uziel is upon the greater and leffer prophets. He is much more diffule than Onkelos, and efpecially upon the leffer prophets, where he takes great liberties, and runs on in allegorics. His flyle is pure enough, and approaches pretty near to the Chaldee of Onkelos. It is thought that the Jewift doctors who lived above 702 years after him made fome additions to him.

The Targum of Jofeph the Blind is upon the Hagiographa. This author is much more modern, and lefs efteemed than thofe we have now mentioned. He has written upon the Pfalms, Job, the Proverbs, the Canticles, Ecclefiaftes, Ruth, and Efther. His fyle is a very corlupt Chaldee, with a great mixture of words from foreign languages.

The Targum of Jerufalem is only upon the Pentateuch; nor is that entire or perfect. There are whole verfes wanting, others tranfpofed, others mutilated; which has made many of opinion that this only is a fragment of fome ancient paraphrafe that is now loft. There is no targum upon Daniel, or upon the books of Ezra and Nehemiah.
Thefe targums are of great ufe for the better underflanding not only of the Old Teflament, on which they are written, but alfo of the New. As to the Old Teflament, they ferve to vindicate the genuinenefs of the prefent Hebrew text, by proving it to be the fame that was in ufe when thefe targums were made, contrary to the opinion of thofe who think the Jews corrupted it after our Saviour's time. They help to explain many words and phrafes in the Hebrew original, and they band down to us many of the aricient cuftoms of the Jews. And fome of them, with the phrafeologies, idioms, and peculiar forms of fpeech, which we find in them, do in many inftances help as much for the better illuftration and better underftanding of the New Teftament as of the Old ; the Jerufalem Chaldee dialeet, in which they are written, being the vulgar language of the Jews in our Saviour's time. They alfo very much ferve the Chriftian caufe againft the Jews, by interpreting many of the prophecies of the Meffiah in the Old Tellament in the fame manner as the Chriftians do. Many inftances are produced to this purpofe by Dr Prideaux in his Connect. of the Hijp. of the Old and New Teflament, vol. iv. p. 777, \&c.
Thefe targums are publifhed in the fecond edition of the great Hebrew Bible fet forth at Bafil by Buxtorf the father, anno 1610; for he has rectified the Chaldee text, and reformed the vowel pointings in it; the targums having at firft been written without vowel poists, which were afterwards added very erroneoufly by fome Jews.

TARIF, a table containing the names of different forts of merchandife, with the duties to be paid as lettled among trading nations.

TARPA, Spumus Mecius, a Latin critic in the time of Julius Cexfar and Augutus. He had his tribunal in the temple of Apollo, where, with four affifants, he paffed fentence con the works of the pocts. Cicero and Horace make honourable mention of this critic.
TARPAULIN, a piece of canvas, well tarred over, to keep of the rain from any place. The term is alfo often applied in a burlefque fenfe to a perfon that has been all his life bred to the fea.

TARPEIAN, in Roman antiquity, an appellation given to a fteep rock in Rome; whence, by the law of the twelve tables, thofe guilty of certain crimes were precipitated. It took its name from Tarpeia, a veftal virgin, who was killed by the Sabines, as related under the article Rome, \(\mathrm{N}^{0} 24\).

TARQUIN the Efder, king of Rome, fucceeded Ancus Martius 615 B. C. See Rome, \(\mathrm{N}^{\circ} 35-40\).

Tarouin the Proud, a tyrant and ufurper. Sce Rome, \({ }^{\circ}\) 49-51, \& с.
tarragon, or Dragon-wort. See Rotany Index.

TARROCK, a fecies of lorus. See Ornithology Index.

TARSHISH, a town frequently mentioned by ancient authors, the fituation of which it is difficult to afcertain. See Ophir.

TARTAN, in fea language, a fmall coalling veffel navigated in the Mediterranean, with only one maft and a bowfprit, the principal fail, which is very large, being extended by a lateen-yard. When tatans put up a fquare fail, it is called a fail of fortune.

TARTAR, a hard folid fubftance which feparates from wine after complete fermentation, and adheres to the top and fides of the tafks. It is an impure tartrate of potafh with the acid in excefs. See Cuemistry, \({ }^{\circ} 999\).

TARTARIC acid. See Chemistry, p. 529.
TARTARY, a name given by geographers and hiftorians to a confiderable extent of territory in Afia, lying between Ruffia and China, and including a great variety of nations, now chiefly dependent on thefe two empires. The whole country is ufually divided into Weflern Tartary, and Eafern or Clinefe Tartary, of which the former includes Weftern Turkiftan, Kharifm, and Great Bucharia; while the latter comprehends the country of the Monguls and the Mandfours, now both fubjeet to Ruffia, and Little Bucharia. The geography of feveral parts of this extenfive tract has already been confidered under the articles Bucharia, Cimina, and Russia, and we flall here confine ourfelves to that which is now commonly known by the name of Independent Tartary, by which we underfand that extent of country now poffeffed by the Kirghifes, and the Ufbeck Tartars, including the Kharifm, and Great and Little Bucharia.

Independent Tartary thus defined, extends from the

The country of the Kirghifes is feparated from Si- Tartary. beria by the great fleppe or defert of Iflim, an extenfive plain interfected by a river of the fame name, and abounding with lakes of falt and bitter waters. Even the foil of this fleppe is in many places impreguated with falt and nitre, though in feveral fpots the foil is by no means unfruitful. There are no towns, as the inhabitants dwell wholly in tents.

The Kirghifes have been long divided into three principal hordes, called the great, middle, and leffer. Of thefe, the two latter are now regarded as fubjects of the Ruffian empire, though they feem by no means to be dependent on that power. The great horde, defended by mountains on the fouth and eatt, are properly independent. This laft hoide is fuppofed to contain about 60,000 fanilies, while the lefer and middle hordes are faid to comprehend each about half that number. The whole population is computed at about 500,000 .

The Kirghifes have gradually moved from the eaft towards the weft. Their manners are defcuibed at confiderable length by Pallas. Their tents are of a fort of felt ; their drink kumifs, made of acidulated mares milk. The great horde is confidered as the fource of the other two. Being fettled near the mountains of Alak, or Ala Tau, this horde has been called the Alatanian Kirghifes. They lead a wandering life, from the borders of the Upper Sirr, near Taflikund, to the fteppe of Iffim. Each horde has its particular khan; but the middle horde, when Pallas vifited this country, was contented with a prince, who feemed to acknowledge the khan of the leffer horde; and in 1777, this khan was called Nur Hali, an equitable prince. Their features are Tartaric, with flat nofe and fmall eyes, but not oblique like thofe of the Monguls and Chinefe. They have horfes, camels, cattle, theep, and goats. Some individuals of the middle horde, it is faid, had 10,000 horfes, 300 camels, 4000 cattle, 20,000 fleeep, and upwards of 2000 goats; while in the leffer horde were proprietors of 5000 horfes, and a proportional number of the other animals. Their dromedaries furnifl a confiderable quantity of woolly hair, fold to the Ruffians and Bucharians, being annually clipped like that of fheep. Their chief food is mutton; and the lamb is fo exquifite, that it is fent from Orenburg to St Peteriburg for the tables of the palace. The lamb ikins are the moft celebrated next to thofe of Bucharia; but the wool of the fheep is coarle, and ufed only for domeftic purpofes, for felts and thick cloths. The fleppes fupply them with objects of the chace, wolves, foxes, marmots, antelopes, \&\&c. In the fouthern and eaftern mountains are found wild fhcep, the ox of Tibet, which feems to delight in fnowy alps; with chacals, tigers, and wild affes.
is the Kirghifians regard each other as brethren, they are obliged to employ flaves who are captives taken in their incurfions.. Their defs confifts of clofe vefts, large trowfers and pointed boots. The ladies adonn their heads with the necks of herons, difpofed like horns. They appear to be Mahometans, but have a more relaxed creed:
The Kirghifians carry on fome trade with Ruffia. The chief trafic is at Orenburg, and wholly by exchange ; but the middle horde procced to Omfk. About I 50,000 fheep are annually brought to Orenburg, with. horfes, cattle, lamb ikins, camels wool, and fometimes.

\section*{TA \(\mathrm{H}\left[\begin{array}{ll}206\end{array}\right]\) T A \(\mathrm{I}_{\mathrm{L}}\)}

Tartary, flaves. In return they take manufactured articles, cliefly clothes and furniture. From Bucharia, Khiva, and Tafhkund, they receive arms and coats-of-mail, which Ruflia refures, in return for camels and cattle. They are extremely fond of the Kalmuk women, who long retain their charms; and often marry them if they will adopt the Mahometan religion. They have an annual feftival in honour of the dead. About the beginning of the \(17^{\text {th }}\) century this people, who were formerly Shamanians, became childien of circumcifion, by the exertions of the priefts of Turkiftan.

The country of the Unek Tartars includes Kharim and part of Great Bucharia. The former of thefe extends from the river Gihon to the Cafpian fea, and is bounded on the north and eaft by valt deferts. Its length is about 400 Britifh miles, and its breadth rather lefs than 350. The chief town is Khiva, befides which there are five walled cities or towns, within half a day's journcy of each other. The khan is ablolute, and independent of any but the hioh prieft, or lama, by whom he is costrolled. The Kievinki Tartars differ litule from the Kirghifes, but furpals even them in treachery. Their manners are nearly the fame, except that the Kirghifes live in tents, while the others inhabit cities and villages. Their only trade is with Bokhara and Pcrfia; whither they carry cattle, furs, and hides, which they procuse fiom the Kirghifes and Turkoman Tartare. The place itfelf produces little more than cottnn, lamb furs, of a bad quaiity, and fome raw filk; part of which they manufacture. The town of Khiva flands on a rifing ground, with three gates, and a ftrong thick wall of earth much higher than the houles, with turrets at fmall diffances, and a broad deep ditch full of water. It occupies a large fpace, and commands a pleafant profpect, but the houres are built with mud, having flat roofs covered with earth. It is 17 days journey from the Cafpian fea, and 33 from Orenburg, allowing 40 verfts to the day"s journey.

The people of Khiva bring to Orenburg large quanlities of raw cotton; but the coafts of the Cafpian are held by fome remains of Tukkomans in the north, and by U'beks in the fouth. A confiderable trade is carried on with Mangulhlak. As the merchants of Khiva brought goid and gems to Afrakan, probably from the two Buchariac, it was fuggeted to Peter the Great that thefe products were found in Kharifm, in confequence of which be attempted a fettlement. But the Ruffins, to the number of 3050 , were cut of by the Uflocks.

Great Pucharia, by far the moft important part of Ind pendent Tartary, extends for about 700 Britilh mile in lengtla from north to fouth, by a medial breadth of about \(3 \leqslant 3\). leeing bourded on the nerth by the monatains of Argun, and divided from tharifin and Corezan by the river Amt, and extenfive defertc. while on the fouth and caft it las for its boundaries the mountaiis of \(G\)-ur and of Beber.

The chicf city of Great Bucharia is Samarcand, on the fouthern bank of the river Sugd. 'The other phaces of finte are Boknari on the fame niver, Balk on the river Dehafh, Zunf, and Kotlan.

The face of the country prefents a great varifty, abourdine with rivers, hills, and mountaits, but heing in gencral deficient in wood. Near the rivers the fnil is very frodutive, the grafs fometimes exicceding the
height of a man; and in fome parts much indully is Tarary. Aown in the cultivation of rice and other grain.

The rivers are, the Amus and Sirr. Befides the fea of Aral, already defcribed under that head, there are feveral confiderable takes, particularly that of Palkati, Tangis, or Balcaft, being ibuut \(1_{4} 0\) miles long by 70 broad.
" 112 all the regions of the carth, (fays Sir William Oufeley) there is not a more fourifling or a more delightful country than this, cfpecially the diftrict of Bokhara. If a perfon ftand on the Kohendis (or ancient cafle) of Bokhara, and catt his eyes around, he fhath not fee anv thing but beautiful and luxuriant verdure on every fide of the country; fo that he would imagine the green of the earth and the azure of the heavens were united; and as there are green fields in every quarter, fo there are villas interfperfed among the green fields. The Sogd, for eight days journey, is all delightful country, affording fine profpects, and full of gardens, and orchards, and villages, corn fields, and villas, running flreams, refervois, and fountains, both on the right hand and on the left. You pais from corn fields into rich meadows and pafture lands; and the Araits of Sogd are the finef in the world."

The religion of the Uibeks and Bucharians is the Reigion of Mahometan of the Sumi fect, and the government of the Tartars. the khans is defpotic. There are no accounts to be met with of the flate of the population, but it is believed that on any emergency they could mufter an army of 100,000 . The revenue of thele fertile provinces is not certainly known, though that of Corafan is faid to amount to half a million ferling annually, and it is probable that the revenue of Great Bucharia is at leaft equal to that of Corafan.
:
Befides the caravans to Perfia, Hindoftan, and China, Tratc. fome trade is carried on with the Ruflizns; the Bucharian merchants not only furnifhing their own products, but others from the eaflern countries to which they trade.

The manners and cuftoms of the Ufocks are fimilar Manners to thofe of the other Tartars; but they are fuppofed to be the mof fpirited and induftrious of thefe barbarians. Though many refide in tents in the fummer, yet in winter they inlabiut the towns and villages. They are accuftomed to make fudden inroads iito the Perfian provilices. The native Bucharians are comparatively fair, and correfpond in form and features with thofe of Little Bucharia. The Bucharians never bear arms. The Uzheks, on the contrary, are no ftrangers to the ufe of the mufket, and it is faid that even their women are not averfe to warfare. The langunge is Turkih, but that of the Bucharians has never been invefligated, though it be probably a dialcet of the Perfan. Their literature would furniih an ample theme, Samarcard having been a celehrated fchool of oriental fcience, cultivated even by monarchs, as Ulug Beg and others.
"Such are the generofity and liberality of the inhabitants, that no one (fays Sir William Oufeley) turns afide from the rites of hofpitality; fo that a perfon contemplating them in this light, would imagine that all the families of the land were turt one houfe. When a traveller arrives there, evcry perfon endeavours to attract him to himfelf, that he may have opportunities of performing kind onfices for the flranger; and the beft proof of their hofinitable and generous difpofition is that

\section*{T A S [ 207 ] T A S}
every peafant, though poffefing but a bare fufficiency, allois a portion of his cottage for the reception of a guelt. On the arrival of a tranger they contend one with another for the pleafure of taking him to their home, and entetaining him. Thus, in ads of hofpitality, they excerd their incomes. 1 happened once to be in S.ggd, and were 1 fiw a certain palace, or great building, the dorirs of which were faftened back with nails againht the walls. I afked the reafon of this, and they informed me that it was a hurdred years and more fince thofe doors had been fhut, all that time they had continued open day and night; Atrangers might arrive there at the moft unfeafonable hours, or in any numbers, for the matler of the houfe had provided every thing neceffary both for the men and for their healls; and he appeared with a delightel and joyful countenance when the guells tarried a while."

For a more particular account of the manners and cuftoms of the Tartars, fee the articles Rukhamia and Kalauks; Pallas's Trauds in the Southern Provinces of the Rufian Empire, and Tooke's View of the Rujian Empire. An account of the Bafchkirs, alfo a tribe of waydering Tartars, and of the Tartars of the Kimea, has been given under Russia.

We cannot here enter on the hifory of Tartary. The mof interefting parts of it will be found under the articles Cirnas and Mogut, and we may refer thofe who wifh for a more detailed account to the 4 th volume of the Modern Univerfal Hiflory, and to the Afatic Refearches.

\section*{Krim Tartary. See Crinea.}

TARTRA'ES, in Chemifry, are faline bodies, compoled of an alkaline, earthy, or metallic bafe, and tartaric acid.

TASSEL, a pendant ornament at the comers of a cufthon, \&c. In building, taffels denote thofe pieces of board that lie under the ends of the mantlet trees.

TASSO, Torguato, a celebrated Italian poet, was born at Sorrento in the kingdom of Naples, in 544. He was the fon of Bernaroo Taffo, and of Portia de Roffi, a lady of an illuftrious family of Naples.

At three years of age Tafio was committed by his father to the care of Angeluzza, a man of great learning, who at this tender age, it is faid, began to teach him granmar ; at four he was fent to the Jefuits col. lege, and at feven was well acquainted with Latin and Greek. At the age of \(\mathbf{1} 2\) he went from Rome to Mantua, where his father had entered into the fervice of the duke Guglielno Gonzaga; he had then completed his knowledge of the Latin and Greek languages; he was well acquainted with rhetoric and poetry, and mafter of Ariftotle's Ethics. He was foon after fent to the univerfity of Padua; and at 18 , publifhed his Rinaldo, a poem on the plan of Homer's Odyffey. This extended his fame through all Italy; but his father went to Padua, to remonftrate againft his apparent purpcfe of giving limfelf us 10 philofophy and poetry, and made ule of many harth expreffions, which Tafo heard with great patience. "Of what ufe is that philofophy on which you value yourlelf fo much?" "It has enabled me (replied Taffo) to endure the harninefs of your reproofs."

He foon after went to Bologna, by the inviation of the city and college ; but in a hort time he returned to Padua at the urgent defre of Scipio Gonzaga, who had
been elected prince of the academy cftablificd in that city under the name of the Fihherei. In this recreat lie formed the defign of his Jerufatern Delitered, invented the fible, difpoied the paxs, and decornaned to derlicate it to the houle of lite; and being prefled to refide at Ferrara, lie gave his confent. The dulie of Ferrana grive him an apartment ir his palace, where lie lived in peace and afluence, and prolicuied his wotk, which he determined to dedicate to the duke, and which was publified book by book, as he fritilied them.

At the age of 30 he finilhed his Serufalom, and the whole was reprinted and pablithed together, the fuccess of which was aftoniding. It was tranflatcdinto Latin, French, Spanifh, and even the oriental languages, almolt as foon as it appeared. Soon after the publication of his Jerufalem he lott his father, who had been appointed governor of Oftia on the Po by the duke of Miatua; and a pretended friend to Taffe, belonging to Ferrara, to whom he had incautionlly cummitted fome tranfactions of a very delicate nature concerning his patron the duke, had the perfdy to betray him. 'This coming to the ears of the duke, he fhut up ' C affo in prifon, from which, however, he found means to efcape, after a year's confinement, and retired to Tuzin, being then about 34 years of age, and was recommended to the duke of Savoy, who thowed him many marks of efteem and regard. Fearing, however, that he might be delivered up to the duke of Mantua, he fecretly relired to Rome, and went directly to his friend Mauritio Cataneo, by whom he was received with great kindnefs, and his prefence made the whole city-rejoice. Here he endeavoured to make his peace with the duke, and was fortunate enough to fucceed.

After this he lived at Mantua about a year, in great favour with the prince; but growing weary of a fate of dependence, he refolved to go to Naples, ard eadeavour to recover his mother's jointure, which had been feized by her relations; but as this law fuit had no appearance of being foon determined, he went from Naples to Rome, where he continued about a year, in high favour with Pope Sextus Quintus, and then went to Florence, at the cameit defire of Ferdinando, grand duke of Tufcany, who had been cardinal at Rome when Taffo firft refided there.

Having fpent another year at Florence, he returned to Naples, where he corrected his Jerufalem Delivered.

Cardinal Cynthio, who was a great patron of learning and genius, and knew Tafio when he firt refided at Rome, prevailed with him once more to leave his retreat at Naples and live with him in that city, where he continued till he was 50 , and then returned to Naples to profecute his law fuit, from which place, however, he was foon recalled; and beira introduced to the pope, lis holinefs faid, "that his merit would confer as much linnour on the laurel he was about to receive, as the laurel had formerly confersed on others."

It happened that while they waited for fair weather, for the purpole of celebrating the folemnity of Taffe's coronation with laurel, that great poct took his laft illnefs, and died on the 15 th day of his ficknefs, aged 51. His poems have acquired him an immortal reputation, the chief of which are, 1. Jerufalem Delivered. 2. Jerulalem Conquered. 3. Rinaldo. 4. The Seven Days of the Creation. 5. Whe Tragedy of Torinond.

\section*{T A S [ 208 ] T A S}

Tafte. 6. Aminta, \&c. All his works were printed together at Florence in \(17^{24}\), in 6 vols. folno, with the pieces for and againft his Jesufalem Delivered.
'TAS'IE, a certain fenfation excired in the mind by certain bodies, which are called fapid, applied to the tongue and palate, and moiftened with faliva. This is the criginal and proper meaniug of the word talle (fee Metaphysics, \(N^{\circ} 46\).); but as the qualities of bodies which produce thefe fenfations are unl nown, they have got the names of the fenfations themfelves, by fubtituting the caufe for the effect. Talles have been divided into fimple and compound, and philofophers have endeavoured to afcertain the number of each feccies. Attempts have likewife been made to determine from their taftes the effects of different fubftances on the human body, taken into the ftomach as food or phyfic ; but by ftating the refults of fuch inquiries, we thould be more likely to miflead than to communicate ufeful informa. tion.

Taste is likewife ufed in a figurative fenfe, to denote that faculty by which we perceive whatever is beautiful or fublime in the works of nature or of art. This faculty relifhes fome things, is difgufled with others, and to many is indifferent. It has alro been called an internal fenfe, and by one philofopher, a reflex fenfe, while others have confidered it as the joint exertion of perception and judgement in fome cafes, and as a play of the imagination in others.

To decide among thefe different opinions, it will be neceflary to afcertain, if we can, what are the objects of this faculty. Scarlet, blue, green, and yellow, are all beautiful colours, and a cube and a fphere are beautiful Egures; but it does not appear to us, that a man could be faid to have either a good or a bad tafte for relifhing the perception of a fcarlet more than that of a yellow colour, or a fpherical more than a cubical figure.

With refpect to the objects of the external fenfe, we are fo conftituted by nature as to relifh thofe kinds of food which are molt wholefome, and fuch a tafte is juftly faid to be found and uncorrupted. It is in the higheff perfection too at firft, for it depends not on culture of any kind, and is incapable of improvement. The reverfe is the cafe with refpee to internal tafte. Every voice, it is true, unites in applauding elegance, fimplicity, fpirit in writing, and in blaming affectation, or a falfe brilliancy; but when critics come to particulars, this feeming unanimity vanifhes. Perhaps no man ever beheld the rifing or fetting fun without feeling emotions of pleafure; yet it is certain that the emotions of the clown are not the fame, at leaft in degree, with thofe of the philofopher. Any beautiful objcet prefented to the eye, gives a pleafing fenfation to the mind; and it appears to us that the clown feels nothing more than a mere fenfation from the view of the rifing fun, fimilar to what he would feel from a blazing heath. In poetry and painting the vulgar are always delighted with the melody of the verfe, and the brilliancy of the colours, and think of nothing elfe as beauties.

If this be fo, the pleafures which the vulgar derive from what are called objects of talte, are mere gratifications of the fenfes; but vcry different is the pleafure which the man of cultivated tafte derives from the beauties of nature or of art. The mere fenfation of the clown is followed by a train of ideas which hurries him
beyond the object before him to its beneficent effects and its Almighty Creator.

The nature of any perlon's tafte, therefore, is generally determined from the character of his imagination and the foundnefs of his judgement. The timple perception of the object we find is infufficient to excite thefe emotions, unlefs it is accompanied with this operation of mind. Thus, when we feel the beauty or fublimity of natural fcenery, we are confcious of a vaniety of images in our minds, very different from thofe which the objects themfelves can prefent to the eye.

If the mind is in fuch a flate as to prevent this freedom of imagination, the emotion is not perceived. In fo far as the beauties of nature or art affect the external fenfes, their effect is the fame on every man who is in poffeffion of thefe fenfes. But to a man in pais or in grief, the fame fcene will not produce any feeling of admiration, which at other times would have produced it in perfection.

There are many objects of talle which produce not their full effect on the imagination, but through the medium of the judgement. The beauty of the Farmefe Hercules is one kind of beauty; that of the gladiators in the palace of Chighi, another; and that of the Apollo Belvidere a third. Each of thefe figures is acknowledged to be perfect in its kind; but according to Sir Jofhua Reynolds, the highell perfection of the human figure is not to be found but in that form which might be taken from them all, and which would partake of the activity of the gladiator, of the delicacy of the A. pollo, and of the mufcular ftrength of the Hercules. In this view the perfection, of thefe flatues confifts in fomething which being perceived by the eye, is referred by the underftanding to what we know of the characters of Hercules, Apollo, and the gladiator, and which we fuppofe it was the intention of the fatuaries to exprefs. There are befides, objects of which tafte is fometimes faid to judge, though they have little or no effect whatever on the imagination. A book of abftract fcience, written in a ? prolix and intricate ftile, may be faid to be in a bad tafte; and had Swift, in his clear and fimple file, written an EJIay on the Humans Underflanding, his work, fuppofing him mafter of the fubject, would undoubtedly have difplayed more tafte than Locke's, in which the ternos are fometines vague, and the period often encumbered. This is the cafe of Berkeley, who is admitted by all to have been a writer of good tafte, though neither the Principles of Human Knowledge, the Dialogues on Matter, nor the Minute Philofopher, is capable of affording pleafure, either to the fenfes or the imagination. His beauty confifts merely in the perfpicuity of his file, of which the underftanding alone is the judgc. The metaphyfical uritings of Dr Reid poffefs in an eminent degree the fame beauty ; and no man of true tafte can read them without admiring the elegant fimplicity of the compofition as much as the firength of the reafoning, and feeling from the whole a pleafure which the poetical fyyle of Shaftelbury cannot communicate.

If this be a juft account of the plcafures of talte, that faculty cannot be properly confidered as a mere internal fenfe, fince to its enjoyments a well-ftored fancy is nereflary in fome cafes, and the reafoning power in all: and the poet and the painter who wiffed to excel in

\section*{T A S [202] T A S}

Tafte. their refpective profeffions, muf not content themfelves, the one with filling the ear of the reader with mellifluous lounds, and the other with dazzling or deceiving the eye of the fpeetator by the brillimey of his colours, but both muff frive for fane by captivating the imagination; whilt the archited, who afpires to a iimilar celebrity, mult make the purnofe of his ornaments obvious to every jerfon capable of judging. the land. feapes of Chude Lorrain, the mufic of Handel, and poetry of Milton, excite fecble emotions in out minds, when our attention is confines to the qualities they prefent to our fenfes, or when it is to fuch qualities of their compofition that we turn our regard. It is then only we feel the fublimity or beauty of their productions, when our imaginations are kindled by their power, when we lofe ourfelves amid the number of images that pafs before our minds, and when we waken at laft from this play of fancy as from the charm of a tomantic dream.
* Difcourfe It is well obferved by Sir Joflua Reynolds* that delivercilat tafte is fometimes praifed in fuch terms by orators and the Royal poets, who call it infpiration, and a gift from heaven, Acratemy, that though a itudent by fuch praife may have his atDec. 14. 1770. tention rouled, and a defire excited of obtaining this
gift, he is more likely to be deterred than encouraged in the purfuit of his object. "He examines his own mind, and perceives there nothing of that diviue infpiration with which he is told fo many others have been favoured. He never travelled to heaven to gather reew ideas; and he finds himfelf poffeffed of no other qualifications than what mere common obfervation and a plain underflanding are able to confer. Thus he becomes gloomy amidn the fplendour of figurative declamation, and thinks it hopelefs to purfue an object which he fuppofes out of the reach of human indullry. But on this, as on many other occafions, we ought to diftinguifh how much is to be given to enthuiafm, and how much to common fenfe; taking care not to lofe in terms of vague admiration that folidity and truth of principle upon which alone we can reafon." Whoever poffeffes the ordinary powers of perception, fenfibility of heart, good fenfe, and an imagination capable of being roufed by the friking objects of nature and of art, may, without infpiration, become, by mere experience, a man of fine tafte in the objects of which he afpires to te a critical judge.

This being the cale, we may eafily account for the variety of taftes which prevail among men, not only as individuals but as nations. We have already mentioned the difference in one initance between the European tafte and the African refpecting female beauty; and we may now affirm, as we hope to prove our affirma. tion, that the one talte is equally correct with the other. The charms of fomale beauty cxift not in the mere external form and colour confidered by themfelves (for then the inanimate flatue of the Vonus de Medicis would give more delight to the European beholder than the fineft woman that ever lived) ; but we aflociate external beauty with fweetnefs of difpofition, and with all the train of endearments which take place in the union of the fexes; and it is this affociation which delights the man of tafte, as giving refinement to an appetite which itfelf is grofs and fenfual. A fimilar afio. ciation mult be formed in the breaf of the African who has any tafte; and as he never knew feminine foft-

VoL. XX. Part I.
nefs, or any of the endearing qualities of the \(\{\mathrm{C} x\), but as Tafre united with thick lips, a llat nofe, a black \(\mathfrak{k}\) in, and woolly hair-a fable beauly of that defeription mult evcite in his breatl the fame cmotions that are excited in the breaft of an European by the fair woman with Grecian features.

But is there not an ideal or perfect beauty of the human form? "There 'zertainly is, as of every other ratural object; but it cannot be the fame in Europe as in Africa, unlefs to a Being who is acruainicd with all the peculiarities of form, national and individual, that are to be found among the inhabitants of the whole earth. It has been fuppofed, and we think completely proved, by one of the beft writers that we have on the philofophy of tafte *, that the fublimity or beauty of forms*igr Ali* ariles altogether from the affociations we connect with fon. them, or the qualities of which they are expreflive to us. The qualities expreffed by tha male and female forms are very different; and we would by no means think the woman beautiful who thould have the form of the Farnefe Hercules, or admire the thafes of the hero who fhould be formed like the Venus de Medicis; becaufe the proportions of fuch a woman would indicate flrength and intrepidity, where we with to find only gentlenefs and delicacy; and the delicate form of the hero would inclicate foftnefs and effeminacy, where the oppofite qualities only can be efteemed. As we afiuciate with the female form many defrable qualities, every woman is elleemed more or lefs beautiful as her figure and features indicate a greater or fmaller number of thefe qualities; and the fame is the cafe with refpeet to the qualities which adorn the male character, and the form and features by which they are exprefted. Upon comparing a number of human beings with one another, we find, that with refpect to every feature and limh, there is one central form to which nature always tends, though hie be continually deviating from it on the right hand and on the left : (See Nose). This form thercfore is confidered as the moft perfect form of the fpecies, and moft exprelive of the qualities for which that fpecies is valued; but in \(\Lambda\) frica, the central form, with refpect to the proportions of the buman body and the features of the human face, is very different from what it is in Europe; and therefore the ideal or perfect beauty of the human form and features cannot be the fame in both countries. No doubt, if a man could examine the limbs and features of every individual of the human race, he would difcover one central form belonging to the whole, and be led to efteem it the ftandard of beauty; but as this is obvioutly impolfible, the common idea or central form belonging to each great clafs of mankind muft be efteemed the ftanderd of beauty in that clafs, as indicating moll completely the qualities for which individuals are efteemed. Thus there is a common form in childhood and a common form in age; each of which is the more perfect as it is the more remote from peculiarities: but though age and childhood have fomething in common, we hould not decm the child beautiful who was formed exactly like the mof handfome man, nor the man handfome who was formed exactly like the mot beautiful chilh. This doctrine is well illuftrated by Sir Joflua Reynolds, who has applied it to every object efteemed beautiful in nature; and proved, that the fuperiority of Claude Lorrain over the landfape painters of the Dutch and

Tafie. Flem:th fchools, arife chiefly from his having generalized his conceptions, and formed his piatures by compounding together the various draughts which he had previoully made from various beautiful fcenes and profipects. "On the whole (fays he), it feems to me that there is but one prefiding principle which regulates and gives ftability to every art. The works, whether of poets, painters, moralifts, or hifomens, which are built uron general nature, live for ever; while thofe which depend for their exiftence on particular cuftons and habits, a particular view of nature, or the fluctuation of fathion, can only be coeval with that which firt raifed them from obfcurity. All the irdividual objects which are exhibited to our view by nature, upon clofe examination, will be found to have their blemilhes and defects. The molt beautiful forms have fomething about them like weaknefs, minutenefs, or imperfection. But it is not every eye that perceives thefe bleminhes: It mult be an eye long ufed to the contemplation and comparifon of thele forms; which alone can difcern what any fet of objects of the fame kind has in common, and what each wants in particular."

From thefe reafonings the fame great artif concludes, that the man who is ambitious of the character of pof. feffing a correct iafte, ought to acquire a "habit of comparing and digefting his notions. He ought not to be wholly unacquainted with that part of plilofophy which gives him an infight into human nature, and relates to the manncrs, characters, paffions, and affections. He ought to know fomething concerning mind, as well as a great deal concerning the body, and the varions external works of nature and of art; for it is only the power of dittinguilhing right from wrong that is properly denominated taffe.
"G Genius ard tafie, in the common acceptation, appear to be very nearly related; the difference lies only in this, that gevius has fuperadded to it a habit or power of execution. Or we may fay, that tafte, when this power is added, changes its name, and is called genius. They both, in thie popular opinicn, pretend to an entire extmption from the reffraint of rules. It is fuppofed that their powers are intuitive; that under the name of senius great works are produced, ard under the name of tafie an exact judgement is given, without our knowing why, and without being under the leaft obligation to reafon, precept, or experience.
"One can fcaice flate thefe opinions withcut expofing their abfurdity; yet they are confantly in the mouths of men, and particularly of illiterate and affected comnoilleurs. The natural appetite, or tafte of the human mird, is for trulh; vilhether that truth refults from the real agreument or equality of original ideas among themiflvec, from the agreement of the reprefentation of any orject with the thing reprefented, or from the correfponkence of the feveral parts of any arrangement with each other. It is the very fame tafle which relifics a demonflration in geometry, that is pleafed with the refemblance of a picture to an original, and touched with the harmony of mufic.
"Put lecfides real, there is alfo apparemt trubl, or rpin on, or prejudice. With regrard to real truth, when it is known, the tafte which confurms to it is and munt be iniform. With regard to the fecond fort of truth, whels may be called truth upon fuferance, or truth by courcciy, it is net f.xed but varibile. However, whilit
thefe opinions and prejudices on which it is founded continue, they operate as truth; and the art, whofe office it is to pleafe the mind as well as inftruct it, muft direct itfelf according to opinion, or it will not athain its end. In proportion as thele prejudices are known to be generally diffufed or long received, the tafte which conforms to them approaches nearer to certainty, and to a fort of refemblance to real icience, even where opinions are found to be no better than prejudices. And fince they deferve, on account of their duration and extent, to be confidered as really true, they become capable of no fmall degree of thability and determination by their permanent and uniform nature.
"Of the judgement which we make on the works of art, and the preference that we give to one clafs of art over another, if a reafon be demanded, the quetion is perhaps evaded by anlwering, I judge from my talle; but it does not follow that a better anfwer cannot be given, though for common gazers this may be lufficient. Every man is not obliged to inveltigate the caufes of his approbation or diflike. The arts would lie open for ever to caprice and calualty, if thofe who are to judge of their excellencies had no fettled principles by which they are to regulate their decifions, and the metit or defect of performances were to be determined by unguided fancy. And indeed we may venture to affert, that whatever fpeculative knowledge is neceffary to the ar. tift, is equally and indifpenfably neceffary to the critic and the comoifteur.
"The firft idea that occurs in the confideration of what is fixed in art or in tafte, is that prefiding principle which we have already mentioned, the general idea of nature. The beginning, the middle, and the end of every thing that is valuable in tafte, is comprifed in the know-ledge of what is truly nature; for whatever ideas are not conformable to thofe of nature or univerfal opinion, mult be confidered as more or lefs capricious; the idea of nature comprehending not only the forms which nature produces, but alio the nature and internal fabric and organization, as I may call it, of the human mind and imagination. General ideas, beauty, or nature, are but different ways of expreffing the fame thing, whether we apply thefe terms to fatues, poetry, or picture. Deformity is not nature, but an accidental deviation from her accuftomed practice. This general idea therefore ought to be called nature: and nothing elfe, correctly fpeaking, has a right to that name. Hence it plainly appears, that as a work is conducted under the influence of general ideas, or partial, it is principally to be confidered as the effect of a good or a bad tafte."

Upon the whole, we may conclude that the seal fubflance, as it may be callcd, of what goes under the name of infle, is fixed and eftablifted in the nature of things; that there are certain and regular caufes by which the imagination and paftions of men are affected; and that the knowledge of the le caufes is acquired by a laborious and diligcnt inveRigation of nature, and by the fame flow progrefs as wiffom or knowledge of twey kind, however inftantaneous its operations may appear when thus acquired. A man of real tatte is always a man of judgement in other refpects ; and thofe inventions which eithor diflain or lhrink from reafon, are generally more like the dreams of a diflempered brain than the exalted enthufrafm of a found and ture genius. In the nidit of the highell fighlits of fancy or imagination, reafon ought

\section*{T A V [ 2 Ir\(] \quad\) T A W}
the beauties of any one of the fine arts by an imaginary innate fenfe or feeling, will make as ridiculous an appearance as the connoiffeur mentioned by Dr Moore, who praifed as a work of the divine Kaphacl the wretched claubing by a Swifs copyif. The reader who wifhes for further influction in the philofophy of tafte, may confult Gerard's Elfay on 'Tafte, with the differtations of Voltaire, d'Alembert, and Montefquicu; Dr Blair's Lectures on the Belles Lectres; Dr Reid's Effays on the Intellectual Powers of Man; Alifon's Effays on the Nature and Principles of 'Tafte; and Sir Iofhua Reynold's Difcourfes deliivered in the lioyal Academy.

TA'TE, Nanum, an Englif poct, born in Ireland about the niddle of the reign of Charles II. where he received his education. He rras made poet-laurcat to King William upon the death of Shadwell, and held that place until the reign of George I, whofe firt birth day ode he lived to write, and executed it with unufual fpirit. He died in the Mint in 1716 . He was the author of nine dramatic performances, a great number of poens, and a verfion of the Pfalms in conjunction with Dr Brady.

TATIAN, a writer of the primitive clurch in the fecond century. He was born in Affyria, and trained up in the heathen religion and learning. Coming over to Chriflianity, he became the difciple of Jultin Martyr, whom he attended to Romc. While Juftin lived, he continued fteadily orthodox: but after. Iuftin's death he made a fchifn, and became the author of a new fect, condemming marriage, enjoining abftinence from wine and animal food, and fuffering only water to be ufed in the holy mylteries; whence his followers were called Encratite and Hydroparaflatic. None of his works are aow extant but his piece againf the Gentiles; or, as it is ufually entitled, his Oration to the Grecks.

TATIUS, Acmlles, a native of Alexandria, was the author of a book on the fphere, which Father Pctau tranflated into Latin. There is alfo attributed to him a Greek romance on the loves of Leucippe and Clitophon, of which Salmafius has given a beautiful edition in Greek and Latin, with notes. Suidas fays, that this Achilles Tatins was a Pagan, but that he afterwards embraced the Chriftian religion, and became a bifhop. Piotius mentions him in his Bibliotheca.

TATONNEUR. See Lemer, Mammalia Index.

TATTOOING, or Tattowing, an operation in ufe among the iflanders in the South fea for marking their bodies with figures of various kinds which they cmafider as ornamental. It is performed by puneturing the fkint, and rubbing a black colour into the wounds. The inftrument ufed fomewhat refembles a comb, the tecth of which are repeated!y ftruck into the fkin by means of a fmall mallet. It is very painful; but the children are forced by their relations to fubmit to it.

TATTOU, a beat of a drum at night to advertife the foldiers to retreat, or repair to their quarters in the garrifon, or to their tents in a camp.

TAVERNIEl, John Baptist, a French traveller, was born in 1605 . In the courfe of 40 yeats he travelled fix times to Tukey, Perfia, and the Eat Indies, and vifited all the countries in Europe, travelling mofly
on foot. His travels have becn frequently reprinted in fix volumes 12 mo . He died on his fevemh journcy to the eaft, at Mofcow, in 1686.

TAVIRA, or TAVILA, a confiderable town of Portugal, and capital of the province of Algarve, with a handelfome caftie, and one of the bef harbours in the kingdom, defended by a fort. It is feated in a fertile country, at the mouth of the river Gilaon, betweca Cape Vincent and the ftrait of Ciibraltar, 100 miles welt by noth of Cadiz. W. Long. 7•46. N. Lat. \(3 \%\) 18.

TAVISTOCK, a town of Devonhire in England, fituated on the river Tavey or 'Iave. W'. Long. \&. 12 . N. Lat. 50. 37. It fends two members to parliament, and gives the title of marquis to the noble fansily of Ruffel duke of Bedford.

TAUNTON, a large, elegant, and well built town of Somerfethire, 146 miles from London. It confills principally of four itreets paved and lighted: the mar-ket-place is fpacious, and has a handfome market-houfe, with a town hall over it, which was finilhed in 1773. It has an extenfive woolien manufactory; and in 1780 a filk manufactory was introduced. Its caftle, the ruins of which remain, was in 1645 defended for the parl!a. ment by Colonel Blake againit an ermy of 10,000 men under Lord Goring, but was difinantled by Charles II. In 1685 the duke of Monmouth made this place his head-quarters. Its church, which is large and beautiful, is a fine fpecimen of the florid Gothic flyle of architecture. The tower, which is lofty, is of excellent workinanhip, crowned at the top with four flaiely pinnacles, 32 feet high. The whole perhaps is not equalled in the kingdom. Taunton is pleafantly feated on the river Tone, which is navigable to Bridgewater; is reckoned the helt town in the county; and fends two members to parliament. W. Long. 3.17 . N. Lat. 50. 59.

TAURIS, or Tebris, a town of Perfia, and capital of Aderbeitzan. It was formerly the capital of Perfia, and is now the mof confiderable next to Ifpahan; for it contains 15,000 houfes, befides many feparate fhops, and about 200,000 inhabitants. It is about five miles in circumference, and carries on a prodigious tradé in cotton, cloth, filks, gold and filver bracades, fine turbans, and thagreen leather. There are 300 caravanferas, and 250 mofques. Some travellers fuppofe it to be the aucient Ecbatana; but of this there is no certainiy. It is feated in a delightful plain, furrounded with mountains, from whence a ftream iffues, which runs through the city. E. Long. 47.50 . N. Lat. \(3^{8 .}\) 18.

TAURUS, a great chain of mountains in Afia, which begin at the eafterr part of Little Carimania, and extend very far into India. In diferent places they have different names.

Taurus, in Afronomy, one of the \(I_{2}\) figns of the zodiac.

TAUTOLOGY, a needlefs repeating of the fame thing in different words.
TAWING, the art of Areffing thins in white, fo as to be f: for dive:s manufatures, [articularly gloves, \&

All fkins may be tawed; but thofe chicfly ufed for this purpofe are lamb, hieen, kid, and goat fkins.

The method of tawing is this: Having cleated the D d 2

,

Taminc.

Akins of woul or hair by moans of lime, they are inid in a large vatt of wood or tone, fet on the ground', full of water, in which quit lime hass been ilaked; wherein they are allowed to lic a month or fix weeks, according as the weather is more or befs boo., or as the Rins are required to te mote we tels foft and pliant.

White they are in the ratt, the water and lime are claanged twice, and the flins are taker out and put in again every day: and when they are taken out for the lafi time, they are laid all might to foak in a running water, to get cut the greatef part of the lime ; and in the morning are laid to gether by fixes one upon another, upon a wooden leg, and are ficraped floutly orie after ano. ther, to get the fieth off from the flefiny fide, with a cutting two-handled inftrument called a knifc; and then they cut of the legs (if they are not cut off before) and other finperlluous parts about the extremes. Then they are laid in a vatt or pit with a little water, where they are fulled with wooden peftles for the fpace of a quartier of an hour; and then the vatt is fllcd ip with water, and they are rinfed in it.

In the noxt place, they are thrown on a clean pavement to drain, and afterwards caft into a frefly pit of water, out of which liey rinfe then well, and are laid again on the wooden leg, fix at a time, with the hair fide outermoft: after which they rub a kind of whetftone vely brikly, to foften and fit them to reieive four or five more preparations, given them on the leg both on the flefh fide and the hair-îde, with the knife, after the manner above mentioned.

After this they are put into a pit of water and wheaten bran, and fiirred about in it with woodenquoles, till the bran is perceived to fick to them, and then they are left : as they rife of themfelves to the top of the water by a kind of fermentation, they are plunged down again to the buttom; and at the fame time fire is fet to the liquor, which burns as eafily as if it were brandy, but goes out the moment the 民ins are all covered.

They rejeat this opcration as often as the thins rife aocve the water; and when they have done rifing they tike them out, lay them on the wooden leg, the llemy fide outwards, and pals the knife over them to ferape off the bran.

Having thus cleared them of the bron, they lay the flins in a large haflet, and load them with huge flones to promote their draining : and when they have daained fufficiently, they give them their feeding; which is performed atter the manner following:

For 100 of karge theep flins, ard for fmaller in proportion, they take eight pounds of alum and three of fea falt, and mett the whole with water i:n a vefiel over the fire, pouring the folution out, while yet lukervarm, into a kind of trough, in which is twenty pounds of the fineft wheat-flower, with the yolks of eight dozen of eggs; of all which is formed a kind of pafte, a little thicker than children's pap: which, when done, is put into another veffel, to be ufed in the following manner.

They pour a quantily of hot water into the trough in which the pafte was prepared, mixing two fnoonfuls of the pafte with it ; to do which they ufe a wooden fpoon, which contains juft as much as is required for a dozen of Rkins: and when the whole is well diluted, two dozen of the fkins are plenged intoit; but they take care that the
water be tol :co hot, which would fpoil the pafte and Tawing, burn the finins.

After incy have lain fome time in the trougls they tale them out, one after another, with the hand, and ftretch them out; this they do twice ; and after they have given them all their patle, they put them into tubs, and there full them afrell with wooden pefles.

They then put them into a vatt, where they are fuffered to lie for five or lix days, or more; then they take them out in fair weather, and hang them to dry on cords or racks: and the quicker they are dried the better; for if they be too long a drying, the falt and alum within them are apt to make them rife in a grain, which is an chiential fault in this kind of detfing.

When the flins ale dry, they are made up into bunales, and juft dipt in fair water, and taken out and drained: they are then thrown into an enpty tub; and after having lain fome time are taken out and trampled under foot.

They then draw them over a flat iron inftrument, the top of which is round like a battledore, and the buttom fixed into a woocen bluck, to flretch and open them; and having been opened, they are hung in the air upon cords to dry; and being dry, they are opened a fecond time, by pafing them again over the fame inftrument.

In the laft place, they are laid on a table, pulled out, and laid fmooth, and are then fit for fale.

TAXATION. Befides thofe expences which are neceflary to the exiftence, or conducive to the comfort and enjoyment of private individuals, there are others of whicla the benefit is directly applicable to the whole fociety. Thefe benefits indeed are chielly of a negative kind, but they are not therefore the lefo cfiential. They confill in the prefervation of perfon and property from that violence both internal and extctnal, to which the irregular paffions of human nature continually expofe them. The regular adminifiation of juftice, and defence againft foreign enemies, are fo eliential to the well-being of a people, that they can with no propriety hefitate, when neceflary, to part even with a large por tion of their income in order to provide for the proper accompliffiment of thefe objects. A certain pomp and magnificence too, in thofe who are to take the lead in thefe departmerts, have been deemed both ornamental to the fociety, and rieceflary for fecuring refpect and obedience fiom the body of the people. If, befides thefe grand and indifeenfable advantages of foreign and internal fecurity, public tunds can be applied to any other purpofes, evidently tending to promote the national well-being, yet beyond the reach of private exertions,to canals, high roads, or public inilitutions of any defcription, - there can be no doubl furely as to the propriety of fuch an application.

It is evident, therefore, that the money which is neceflary for the above purpofes, forms a perfectly neceffary and proper part of national expenditure. The government of the country, indeed may, as elfewhere obferved (Political Economy), conomica!ly fpcaking, be confidered as part of its fixed capital, effential to the advantageous employnemt of the rell. Without the \(f_{e}-\) curity which the labourer thence derives, of reaping the fruits of his induftry, he would have little motive to aclion; every thing would be the prey of the fliongef,

\section*{T A X [}

Taxation and all imprulfe to activity ceafing, univerfal poverty would enfuc. At the farne time we may obferve with regard to this as to other fised capitals, that the expence is expedient only lo far as it is neceflaty, and that if the fame functions can be perforned at a tinaller coll, a decided gair arifes to the public. It Lecomes therefore an important object to inquire, in what manner the offices of government may be adequatcly porformed, with the leatt burden on the people.

We have furmerly, under the head of Politicar. Ecoromy, lifighty illuftrated fome leading priaciples refpecting public revenuc. But as the fut ject is important, we thall confider it here in fomewhat greater detail.

Taxes may be arranged in the following manner. 1. Aleffed taves, or thofe which the fubject is required to pay directly into the hands of the fovereign or commonwealth. Under this title are comprehended all the taxes which bear the above name; all income or capitation taxes, and every fyecies of hand taxes. Thefe tuxes are almolt always intended to fall upoin incone. 2. Taxes upon commodities, which are paid, in the fint inflance, not by the conlumer, but by the producer, or importer. 'Thefe tases fill upon confumption ; he man who does not ufe the artizlec, pays no tax. 'Iliey operate thus partly as fources of revenue, and parlly as fumptuary laws. 3. Stamp duties, or duties upon thofe deeds which regulate the transficence of p:operty. Thefe dutics fall chicicly upon capital.
r. Affefled Taxer.-Alfeffed taxes, according to the abore definition, feem to be the moll fimple and direct mode of raifing a tevenue. The money comes at once from the pockets of the people into thofe of the fovereigu. Nu tas is fo certain of yielding a reventue. The money is demanded, and muft be paid. Where properly arranged alfo, they may probably be made to fall more equally than any o:her, upon the different clafles, according to their alitity. In abfolute governments, thercfore, and in goverments little ikilled in the fience of finance, thefe taxes are cominonly preferred, as thole which can be levied with the leall trouble. They have likewife this merit that they coft litule in the collection, and coafequently nearly their whole amount is brought into the treafury.
\(\Lambda\) fiefed taxes, however, are liable to many otjections. None are fo heavily feli. In other cafes the tax is concealed under the price of the commodity with which it confounds itfelf; but here the money is paid ditectly without any thing in return. It mult generally too be paid in a confiderable fum at once, a circumfance which mult often be productive of ferious inconvenience, while the fane fum, broken down into finall purtions, might have been paid without difficulty. For thefe reafons, much greater difcontent is exciled by thefe tases than by taser upon commodities. A double revenue perhaps, may, in the latter way, be raifed with lefs murmuring. In popular governments, therefore, and in thofe where finance has been reduced to a fyftem, the object has generally been to avoid direft affefiment as mucin as pofible. In this country, the greater part, by far, of the tevenue had been raifed by taxes upon conmodities, till, within thefe laft twenty years, the prefiure of public wants made it neceflary to have recourfe to every mode of raifing money which promifed to be offictual, and thus the afiefled tases have heen taifed to a very great amomat. The moft important of thefc

\section*{213 ] T A X}
taxes may be included under land tax, capitation iawes, Taxation: licufe tax, and income tax.

Laned Tan:- 't here is no elafs of men who may with more propricty be burthencd with an extraordinary innpofition, than the proprictors of land. 'lhey enjoy commonly a liberal income, without care or tiouble of their umn. Their property, being of permanent value, is much prefcrable to any fource of income which expires with its polfeflor. From being local and immoveable, it is peculiarly dependent on the protecting influence of government, and may therefore be reafonably called upon to contribute fomething more than the common thare to its fepport. In almolt all countrics, therefore, the landholders, befides being liable to the fame burdens with the reft of the focicty, are fubject to a peculiar tax, called land tax.

In India and other great oriental empires, the prir cipal revenue of the fovereign is derived from land. It arifcs, honever, not properly in the way of tax, but of reat. The fovereign, in thofe abfolute governments, is judged to be the fole proprietor of all the land in hio dominions, which are let out by him or lis deputy, to the farmers. This is alfo the principal fource of the revenue which we derive from our Eaft Indian poffcifions. It is otherwife, however, in all the European countries. There, almof all the land is private pro. perty, and the contribution which government draw. fium it is therefore a tax.

The adherents of the econonical fy term have propo. fed to fubftitute a land tax in the room of every other. They maintain that all taxes muft finally fall upon the produce of land, fince it alone affords that furplus reve. nue, out of which public contributions can be drawn. Were this doatrine true, much trouble and expence would doubtlefs be faved, exchanging the prefent complicated and laboricus fyitem of taxation, for one fo fimio ple and cafy. But we have already endeavoured to fhow, under the head of Political Economy, tiat the principles of this fect have no folid foundation; that manufactures and commerce are fources of wealth, as well as agriculture, though in a fomewhat infeniur degrec. It will follow, therefore, that they are equally liable to be affected by taxation. It is in vain to urge that the merchant muft lave his profit, and the labourer his hire, and that otherwife they will not employ their capital and labour. Were a tax to be impofed upon any one branch of induftry, leaving the relt untouched, there is no doubt, that wages and profit in that branch mult rife, till the merchant or labourer is placed on a level with the refl of the community, otherwife he will transfer his capital and indullry to fome other branch. But where the impofition falls indifcriminately upon the different employments of labour and fluck, there is no fuch refuge; the labourer and merchant muft fuffer a diminution of income; nor is there any f rocefs by which he can throw this diminution upon the landlord.
Other perfons of a much lefs informed character, are ofien heard urging, that we have only to lay the impofition upon the landlords; and that they will not be long of indemnifying themfelves by raifing the rent of their lands. Such arguments sill make little impreffion upon thofe who have at all attended to the true principlcs of political economy. The value of lands, as of every other article, is determined by the demand and

Taxation. \(\xrightarrow{+}\) the fupply. A tax upon the rent of land would have no tendency, either to increale the one, or to diminith the other, confequently no tendency to raife the value of land. Indecd, were we to fuppole, according to this hypothefis, that propricturs have an unlimited power of railing their lands, whenever they are fo inclined, it is quite contrary to cominon fenfe to fuppofe that they fhould not exert that power, without waiting for the fimulus of a tax.

For thefe reafons, land cannot, with any propriety, be made the fole fubject of taxation; but it is very fair, as above obferved, that it thould pay fomewhat more than other fources of revenue. A difficulty, however, arifes from the variations to which its value is fubject, fometimes on the decreafing, but more commonly on the increafing fide. The rate which, at one time, is equitable, becomes quite otherwife at another. An attempt, on the part of government, to keep up a continual furvey of all the lands in the kingdom, would be attended with very heasy expence, and would, after all, be probably fruitlefs. Befides, fuch a meafure would operate as a difcouragement to the improvement of land, when fo large a hare would go out of the hands of the improver. Thefe objections have weighed fo ftrongly with the legiflature of this country, that they have not raifed this tax, fince its firt impofition in the reign of King William. It was then meant to be at the rate of four hillings in the pound, though in fact, it was by no means fo much. It was allo very unequally diftributed, even at the beginning; a ferious evil, which however. it might have req̧uired very great trouble to avoid. Since that time, a great and general rife has taken place in the value of land, which has made this tax much higher ftill, than when it was originally impofed. It has alfo rendered it, however, ftill more unequal. Although almolt all the land in Great Britain has improved; yet this improvement has taken place in sery different proportions, according as each diftrict differed in natural advantages, and in the induftry of the inhabitants. The land tax accordingly is, at the prefent moment, mof exceedingly unequal; but as it fortunately happens, that there is fcarcely a diffrict in Great Britain which has not improved more or lefs, the general moderation of the tax has rendered its in equality lefs grierous.

A nethod has been propoled of obviating this difadvantage, by keeping a regifter, in which the landlord and terant thall be jointly obliged to enter the rent which the land bears, a now entry being made at every variation. A valuation may be made of the lands which the proprietor keeps in his own poffeflion. Something of this kind, it is faid, adtully takes place in the Vene. tian territory. The difcouragement to improvement indeed lill remains, hut even this might be obviated by an equitable, and even liberal allowance being made, for any fums which the landlord may fatisfagorily prove to have been expended in this way. The chief objection to the plan feems to be the danger of collufina letween the farmer and landlord, who would have a mutual inrerelt in reprefenting the rent as lefs than it really wac. The agreement indeed might, by law, be made oblicatory on the farmer only to the extent of the furm regillered; hut it may be doubtful, whether even this regulation would always be an adequate fecu.
rity againt fraud. The valuations would necefiarily Taxation. depend a good deal upon the difcretion of the revenue olficer; which, in an arbitrary government at lealt, might become a ferious objection. The additional expence of luch a plan would be confiderable; but, provided it could be made to anfwer the purpofe, this ought not to deter from its adoption.

Frederick of Prutfia impofed a higher tax upon lands held by a noble, than upon thofe held by a bafe tenure. Hie conceived that the privileges and flattering advantages of nobility were fuch as to compenfate for this additional charge. We are rather difpofed to confider this proceeding as fevere. A nobleman, with the fame income, is poorer than a commoner, becaufe he has a greater rank to fupport; and in the prefent flate of Europe, a great proportion of the nobility are extremely poor. This extreme, however, is much better than that of France before the revolution, of the Auftrian ftates, and of moft of the old governments of Europe. There the nobility, poffeffing the chief influence in the adminiftration, had obtained for themfelves liberal exemptions, and thrown the principal weight of this, as of other taxes, upon the inferior orders. In Sardinia, and in fome provinces of France, lands held by a noble tenure paid nothing whatever.

Some taxes upon land are proportioned, not to its rent, but to its produce. This is the cafe in the Afratic countries. In Clina, a tenth, and in India, a ffth of the whole produce of the land, are claimed by govern. ment. In England and Ireland, the chureh is fupported by a tax of this kind, which is called tithe.

Thefe taxes are liable to two very great objections. They are, in the firft place, unequal. It is rent only that can be the proper fubject of taxation ; that part of the produce which is neceflary to pay the expence of cultivation, ought to remain untouched. But this expence is far greater in poor than in rich lands. In the former, perhaps, the produce may be little more than fufficient to pay the expences incurred; while in rich lands, not only the neceffity of labour is lefs, but the produce greater. If, by well emplosed capital, and coftly cultivation, the farmer fucceeds in extracting tolerable crops from an ungrateful foil, it is both cruel and unjult that he mould be obiiged to pay as much as if he had no fuch obflacle to ftruggle with.

But if this tax be objectionable on the ground of equity, it it is fill more fo, on that of expediency. The firf excitement to labour and improvements of every kind, muft undoubtedly be the profpect of enjoying their fruits. Where the rate of taxation is fixed, this profpect remains unimpaircd; for whatever addition the proprietor or farmer can, hy fuch means, make to the produce of his land, is all his own. But the cafe is very differen:, when it muft be fo deeply thared in by perfons who have done nothing to forward this increafe of produce. A fovereign prince indeed may derive, from fuch an arrangement, fome motive to encourage agriculture, and improve the means of communication, fo as to raife the value of iis produce. But this advantage, which will fearcely ever counterbalance the attendant evils, difappears altogether, when this impofition is to be paid for the fupport of an ecclefiafical body. Thefe, being only life-renters, and feldom poffeffed of much capial, camot be expceled to co-operate

\section*{T A X [ 215 ] T A X}

Taxation. in any meafure for the improvement of the lands. The \(\underbrace{}_{\text {jarrings too, which are likely to take place between }}\) the paltor and his flock, form a moral argument againit this mode of fupport.

It muff not be concealed, however, that a permanent commutation of tithes would be a meafure little favourable to the interetts of the clergy. . It feems both juit to themfelves, and advantageous to the public, that when the country is in a flate of improvement, this body thould not be left behind; it fhould be able to keep pace with the other members of the fociety. This it can never do, if it has merely a certain fised fum allotted for its maintenance, without the pofibility of augmentation. This evil has, in fact, been ferioufly felt in the church of Scotland, the income of whofe members, notwithitanding all that has been done for their relief, is ftill very inferior to what it was thirty or forty years ago. A fource of income, which rifes or falls with the value of land, feems the moft effectual mode of maintaining this proportion between the income of the clergy, and of the relt of the fociety; we need not, therefore wonder, that the clergy flould be fo tenacious of it.

To reconcile thefe contrarietiec, would certainly be attended with difficulty; yet it does not feem to be abfolutely impofible. The firft object would be, to transfer the tax from the produce to the rent. This might be done by forming a correct eflimate, on an average of a few years, of the value of the tithe; and then affigning a claim to fuch a proportion of the rent, as would be equal to that value. This would remove all difcouragements to the exertion of the cultivator. Thofe which prefs againft the exertions of the landlord would indeed remain in full force, though without any increafe. In moft cafes, thefe exertions would be of very fmall importance, when compared with thofe of the former. But, befides, a fcheme might probably be contrived fimilar to that above fuggefled, by which the landlord might receive an adequate allowance for any improvements he might make.
The ground-rent of houfes forms part of the rent of land. In remote country fituations, it is often no more than the fame land would yield, if employed for the purpofes of agriculture. But in the vicinity, and till more in the heart of a great town, competition, and the value attached by convenience or faftion to fome particular fituations, raife this rent to a very extravagant height.
Ground rent feems to be a till more proper fubject of taxation than that of common land. It arifes commonly from circumfances entirely independent of any care or attention on the part of the proprietor. Yet ground rents have never been confidered as a feparate fubject of taxation. This has probably been from the difficulty of diftinguifhing them from the building rent. In every tax upon houfes, however, part mult fall upon the ground rent, provided that be able to bear it. Bv diminifhing the demand for houfes, it will diminifh alfo the derand for ground to build them on.

Capitation or Poll Taxes, -afiord one of the eafielt and moft obvious modes of taxation. To lay an affeffment upon every individual without exception, feems the molt effectual mode of preventing all trouble, and leaving no room for evalion. in moft of the abfolute governments, where the fovereign does not claim the
fole property of the lands, as in Turkey and Ruffia, poll Taxation. taxes are impoled in lieu of land tax.
The rudef form of this impofition is, when it is laid equally upon every ipdividual. An equality of this kind is the molt grievous inequality. To make the pooreft fubjeet pay as much as the richen, is palpably unjuif. The only cafe, where fuch a tax can be proper, is where it falls upon flaves. In this cafe, it is paid, not by the flave, but by the malter. The rumber of ilaves forms the moft accurate teft of the value of his property; and accordingly, in Ruffia, an ellate is defcribed, not by the number of acres, but by the number of flaves which it contains. This tax has alfo the good property of encouraging manumifion. In all other cafes, fiuch a tax can only be rendered tolerable by its extreme moderation.
Nations were not long of percciving the prepofterous nature of this arrangement, and of feeking to fubfititute fome more equitable one in its place. Fortune was evidently the molk correct flandard to procted upon; but a clofe inquifition into private concerns was conceived to be burdenlome and opprelinve. If each individual were to report his own fortune, could the report be truffed to ? If, on the other hand, the affeffment were to be regulated by the officers of government, according to what they fuppofed to be his wealth, a door was opened to vexatious and arbitrary proceedings. In order to avoid thefe oppofite dangers, it has been common to regulate the contribution according to the rank of the contributor, which it is fuppofed will bear at leaf a certain proportion to his fortune. This was the cafe with the different poll taxes impofed in this country during the reign of King William. It was the cafe alfo in France with regard to that past of the taille which fell upon the nobility. It is extremely unequal; for many men of rank have no fortune correfponding; and where it io happens, their rank impoverifies them, by the experce which is requifite for its fupport. Ye!, as rank affords a certain approximation to fortune, it is certainly better to fix it according to that flandard, than to leave it to the arbitrary appointment of the officers of government. Inequality is a lefs evil than uncertainty.

In that part of the taille which fell upon the inferior orders, the latter mode was adopted. This tax was the fubject perhaps of more grievous difcontent, than any other which yiflded an equal revenue. It cannot be fuppofed that the intendant thould not be often liwayed by motives of favouritifm, private interef, or private refentment; and the very uncertainty to \(w\) hich the people were expofed, formed a fevere hardhip. They were tempted to conceal their wealth, and even to employ inadequate infruments of trade or agriculture, in order to deceive the watchful eye of the intendant.
Houfe Tax.-In order to avoid the defcets incident to the above modes of affeffinent, rent of houfes has been fixed upon as affording the beft criterion of the amount of a man's income. It certainly affords a tolerable criterion of his expenditure; and though this may often differ confiderably from his means, yet as it is rather the object of government to difcourage profufe expenditure, there may be no harm in fuch an inequality.

The mon equitable mode of taxing houfes, would evidently be in the proportion of their rent. In this country, accordingle, fait of the land tax is made to fall upon the sent of houfes. This branch of the land

\section*{T A X [ 216 ] T A X}

Taxation. tax is fubject to the fame inequalitics, both original and acquired, as the other branches. The affefment, not upon each houfe, but upon each diftrict, continues invariably the fame. In general, it is till higher than upon land. The value of houles, however, has not rifen to invariably as that of land; hence, in fome diftricts where the population has decreafed, the tax falls with confiderable weight. Since that time another tax has been impofed upon houfes which is in proportion to the rent, and varies with it. The heavielt tax upon houfes, horrever, is now that which is regulated by the number of windows.

At the time of the original irapofition of the houle tax, it leems to have been confidered difficult or impolfible to afcertain and follow the fluctuations of the rent. Some obvious and undeniable circumftance, connected with the very form and conftruction of the houfe, was therefore felected. The molt ancient is the number of hearths. Hearth money is a very ancient duty, and feems to have exitted even before the Conquelt. Under Charles II. a tax of two millings on all hearths was granted to the crown for ever. This tax was grievous to the people, on account of the domiciliary vifits to which it neceflarily fubjects them. It had befides the worlt kind of inequality, preffing harder on the poor than the rich. A man of 201. a-year may have two hearths; a man of 200l. not above four or five. A man of 1000 . will fearcely have ten. Hearth money, therefore, was abolified at the Revolution. In its ftead was afterwards fubftituted the window tax, which could be afcertained without entering the houfe of the contributor. It was foon found, however, to be liable to the fame inequality as hearth money. In confideration of this, the rate was greatly increafed with the increafe of the number of windows, and houfes having lefs than fix were entirely exempted. If, however, as would rather appear, the rent can be afcertained in a fatisfactory manner, it would feem better to lay the whole of the houfe tax upon it directly, rather than by any circuitous and doubtful mode.

There are two parts of houfe rent ; the ground rent, or that which is given for the ufe of the ground on which the boufe ftands; and the building rent, which is paid to the builder, as a remuneration for his trouble and expence. The ground rent, as above obferved, mult pay a flare of the tax; but the building rent cannot be affected by it. The builder muft have his profit, otherwife he would turn his capital and induftry in another direction. 'This rule, however, is fomewhat modifed by the very durable nature of the fubject. When the tax is firf impoled, it is very probable that the fupply of houfes may continue for fome time nearly adequate to the demand; in which cafe the proprietor muft lower his price in order to get his houfes let. As the old houfes decay, however, new ones are wanted, which will not be built without an adequate remuneration; and thus the general law will again operate.

Income Tax. - The object of all the different affeffed taxes is to make the fubject contribute an equitable proportion of his income to the expences of the flate. But thole which we have above enumerated, though they may procure an approximation to this point, can never attain it with perfect precifion. If thercfore an income tax, eflablified on juft principles, could be collected without any farther gricvances, than the aluays una-
voidable payment of the contribution, it would ccrtainly laxation. be the mort equitable affefment or any, and might with propricty fuperfede all other taxes of this defeription. Serious, however, are the difficulties which attend it. The correctnefs of the eftimate muft always depend, in a great meafure, on the honour of the contributors; but all men are not honeft; and the cheating of the king, is, according to the popular code, fo venial an offence, that accurate returns cannot, in all cales, be expected. If, on the other hand, the collectors, as in the French taille, take upon themlelves to fa m this ellimate, a door is ofened to arbitrary and oppreflive exactions. The impofibility allo of efcaping the tax by any fpecies of privation makes its weight more fenfibly felt, than in thofe which are in any degree voluntary. For all thefe reafons, an income tax has hitherto been among the laft refources to which a nation has had recourfe in its extremeft neceflity.

Molt of the capitation taxes, as formerly obferved, partook more or lets of the neture of the income tax. The fubfidies, fo frequent in our early finance, were, like the taille, compoled, partly according to rank, and partly according to fortune. Among the nobility, alienation of eftates was yet rare, and the difproportion between raik and wailth, much greater than in fublequent times. The eftimate of income feems to have been made by the collectors. Such impofitions, however, were ill brooked by a free and turbulent peop!e; the fublidics become more and more unproductive; and at laft were entirely given up. The firf was impoled under hichard II. in 1370 ; the laft under Charles II. in 1673.

In fome fmall repubiican ftates, a tax of this kind is levied, the amount of which is entirely regulated by the good faith of the contributor. At Hamburgh every citizen is faid to have placed in the public coffers a fum, which is declared upon oath to be one fourth per cent. of his whole property, which, reckoning intercft at five per cent. would be one twentieth of his income. It was not fuppofed that this mode of collection gave occafion to any fraud. The good faith of the people and their confidence in their government, fupplied the place of compulfory laws. The fecrecy was confidered neceffary by a mercantile ftate; but in fome of the fimall Swits republics, every citizen declared publicly upon oath the amount of his income, and was affeffed accordingly. Such unfofpected good faith could only exift in thefe fmall Atates, where patrionifm was ardent, and the confidence of the people in their government entire.

Since the difcontinuance of fubfidies, nothing of this kind had been attempted in Britain, till the year 579 , when the accumulating weight of public debt fuggefted to Mr Pitt the neceffity of raifing a large portion of the fupplies within the year. For this purpofe, there appeared a neceffity for having recourfe to an income tax; and fo ftrong a fenfe was entertained by the nation of the preffing nature of the exigency, that it was fubmitted to with lefs reluctance than might have been expected.

An attempt was at firt, made to connect this impofition with the former affeffed taxes. Thefe were to be tripled; but if any perfon was able to prove, that this charge amounted to morc than a tenth of his income, he was relieved from all which exceeded that proportion. At the fame time, a voluntary fubfeription was

\section*{T A X [ 217 ] 'T A X}

Tasation. opened ; but the produce, though honourable to na-\(\xrightarrow{-}\) tiomal patriotifm, afforded but a flender fupply to public wants. Thefe irregular and uncertain approximations towards an income tax were foon given up, and their place fupplied by the tax itfelf, in its own flape.

To obviate the inconveniences of difclofure or arbitrary affeffment, meatures have been adopted, as effectual probably as awy that could be devifed. The commilfioners of income tax are chofen by the freeholders of the county, or by the electors in a borough, in the fame manner as a member of parliament, excepting that a fmaller qualification is requifite. To the office of thefe commiffioners, public opinion attaches a certain dignity, which makes it be performed gratuitoufly, and by the moft diftinguifhed perfons in the dill rict. Thefe are, by oath, bound to fecrecy. The ftatements are given, in the firl inftance, by the contributor; but if the commiffioners are not fatisfied with his return, they can require from him fatisfactory explanations. According to the fources of income, the perfon is affeffed at the amount of one year, or at an average of three years. The refult of thefe regulations feems to have been fuch as to obviate, almoft entirely, the chief inconveniences attached to this mode of taxation. The fimple payment of the income tax indeed, is moft grievoufly complained of; but the acceffories of difclofure, or arbitrary affeffment, which were confidered as prefenting unfurmountable obflacles to this meafure, fcarcely feem to be complained of at all.

The moft important confideration in fuch a tax relates to the proportion in which it fhould be paid by the different members of the community. That the lowelt orders, who fubfilt by the labour of their hands, ought to be exempted, feems univerfally agreed. This would produce the fame effect as a tax upon the neceffaries of life, the effects of which we hhall difcufs hereafter. But independent of this clafs, an equal impofition upon the higher and middling claffes of the community would be extreme inequality. The larger the income, the lefs of it mult be fpent upon neceffaries or common conveniences, and the more upon objects of mere fhow and oftentation. Thefe laft can certainly admit more eafily of retrenchment; and as the opulent have a greater ftake in the country, it feems reafonable that they thould contribute fomewhat more in a feafon of public exigency. A gradation continually augmenting, fuch as takes place in moft of the other affeffed taxes, feems to be ftrongly called for in this. The full proportion of ten per cent. was, from the firf, impofed upon incomes of 2001. ayear, and though this was infinitcly too low, yet at a fublequent period (in 1806) it was brought down to 1501. This fum, according to the prefent rate of expence, is the very loweft at which any family in the middling rank can poffibly be fupported. The whole of this clafs, therefore, a clafs which has fo many claims to the favour of the legillature, is affeffed to the very fame amount as the higheft claffes. The firf conveniences of life are taxed at the fame rate as its moft fuperfuous lixuries. Certainly roool. a-year ought to be the firt income liable to the very heavy charge of 10 per cent. \(;\) and the deficiency hence ariling might be very fairly fupplied by an increafe, gradually augmenting, upon incomes above that amount. Fifteen per cent. perhapa, ought to be the utmoft that it ever rofe to ; but this charge miglt doubtlefs be more cafily fupported by an
Vol. XX. Part I.
income of ro,000l, a-ycar, than half of it by one of Taxation. 2001 . or 3001 .

Modifications ought alfo to take place, according to the fource from which the income is derived. That which arifes from capital is undoubtedly of greater value than mere profeffional income. It does not expire with its poffeffor ; it relieves him from the care and anxiety of laying up a provifion for his family, and allows him to fpend his whole income, when, to another perfon, it would be the moit culpable imprudence. Of all fpecies of capital, land feems to be the molt valuable and durable. It flands alfo mofl in need of the protection of the flate. It generally, too, comes to its poffefior by inheritance, and is not the fruit of his own induftry. With regard to money, although its value is ftill much fuperior to falaries or protefional profits, yet it feems rather to be the policy of government to favour its accumu. lation, which a very great addition of charge might difcourage. Money befides is a more moveable fipecies of property than land, or even than profeflional income. If heavily taxed, the proprietor might withdraw into another country, and his capital, with the induftry which it fupported, be thus loft to the community.

The prefent tax makes no diftinction between income which dies with its poffeffor, and income arifing form land or capital. Yet fuch a diftinction, if it appeared eligible, might eafily be made under the prefent fyilcm of collection, which demands a ftatement, not only of the amount of income, but of the fource from which it arifes. The propriety, however, of fuch a charge demands fome confideration. Land, it is true, is well able to bear a confiderable thare of the public burthens. But land, in this country, and in almoft every other, is the fubjeet of a peculiar tax, over and above what is paid by income arifing from other fources. If therefore it were allo to pay a greater proportion of the income tax, the preffure might become unjuflly fevere. The land tax in this country amounts to about two millions. Were we to fuppofe the thare of the income paid by land to amount to \(5,000,0001\). (a large allowance), land would then pay fourteen per cent. which feems as much as carr reafonably be exacted. No fuch burden, at leaft in any fenfible degree, falls upon fock; but for the reafons above fated, the propriety of taxing it heavily feems fome what equivocal.
According to the original bill, as propofed by Mr Pitt, very liberal exemptions were granted on account of children. To encourage marriage and the rearing of families, has been generally confidered by legiflators as an important object. From fome recent feculations, however, it has appeared doubtful whether it be defirable to remove the obftacles to marriage which arife from the difficulty of fubfiftence. Whether from thefe views, or from the mere winh of rendering the tax more productive, this exemption has been gradually circumfribed. The laft regulation made refpecting it feems to be of a very capricious nature. An allowance of four per cent. is given, but only for the number of children excceding two. This allowance befides is given, not out of the income tax itfelf, bat out of the affeffed taxes. It is difficult to conceive any motive for this lalt regulation; and, efpecially in the cafe of the middling claffes, it may fometimes render the exemption nugatory.
Olher Affefed Taxes, - A confiderable revenuc is raifed E e

\section*{T A X}

Tazation. in this country by taxes on men fervants, pleafure horfes, carriages, dogs, \&ec. Thele are all luxuries, the uffe of which is confined to the mof opulent clafifs; they form, therefore, extremely proper fubjects of taxation. The income tax indeed, modified as above flated, might perhaps come inttead of all fuch taxes; but while that tax favours the higher above the middling claffes, thefe in queltion tend to remedy that inequality. One affefiment, however, is of a different nature ; that upon labouring horfes. It is not likely, and certainly could never be intended, that this tax flould reltrain the ule of thefe indifpenfable inffruments of agriculturc. Neither can the duty fall upon the farmer, who, in all cafes, mulf have his profits. To fecure thic, he mulf pay the lefs rent, in proportion as he pays the more tax; and this duty will finally operate as a land tax. It does not feem, however, to have any advantages above a direet affeffiment of the fame nature. It will bear hard upon the farmer who is is the middle of his leafe at the time of its being impofed. If at all heavy, it may have tome tendency to limit the ufe of fuch horfes, and to encourage inferior fublitutes. The tax was firft laid at 2 s. and was juttified only by its extreme lightnefs. It was then gradually raifed to 145 .; but a propofal to raife it aill higher was thrown out by parliament, and has ncver been again revived.
2. Taxes upon Commodities. - The experience of the difcontent excited by direct affefiments, and of the difficulty of preportioning them equally, led to the impofition of taxes on confumable commodities. Thefe being laid in the firft inflance on the commodity at the time of its produsion or importation, are finally paid hy the confumer in the increafed price of his goods. No taxes are fo little felt, or excite fo little difcontent. The duly, mingling with the price of the goods, is confounded with it; and unlefs when the tax is firll impofed, and a fudden rife in confequence takes place, the great mafs of the people are even ignorant, how much of what they pay goes. to government, and hoow much conlitutes the mere price of the goods. 'The payment is alfo made in the moft convenient manner, and may be divided into the finalleft portions. The power of not paying by ceafing to confume the article taxed, groes a great way in fupprefiing murmurs. Thus, indeed, thorc whofe expence does not keep pacc with their fortanes, pay an unequal fhare of the common contribution. But as the law is generally difpofed to recommend cconomy, it will not perhaps confider this as a ferious objection.
For theief reafons, the motern fyhtem of finance, particularly in this country where it is fo much an obje et to avoid difcontent, las hhewn a decided favour to this mode of raifing a revenue. And perlaps, upon the whole, they are the beft of any; yet the evils with which they are attended are by no means inconfiderable.
1. Thefe taxes take more out of the pocket of the people, in proportion to what they put in that of the public, than any othier. This arifes from the extenfive and mi:ute fuperintendence wlich is neceffiry for their proper collection. For this purpofe, a number of office:s mull be kept, whofe falarics form a ferious deduction from the produce. In Smith's time, this expence amountcd to above \(5 \frac{1}{2}\) per cent. on the duties of excifc, and above 10 per cent. on thofe of cuffoms. The great

\section*{18 ] \\ T A X}
augmentation of revenue which has taken place fince Taxation. that time, has been produced more by an increafe of duty on articles formerly taxed, than by the introduction of new fubjeets of taxation. The expence' of collection, however, bears fill a larger propurtion to the amount collected, than either in the flamys or affefied taxes.

There is another way, in which the burden of thefe taxes is rendered heavier on the public. The merchant or producer advances the tax, often a confiderable time before he can difpofe of the article. He mult therefore have not only indemnification to the amount of the dury, but alfo profit on the advance which he has made. It is univerfally obferved, that when a new tax is impofed, the article rifes more than in proportion to it. The public commonly nurmur, and complain that the merchant has merely made the tax a pretence for this difproportionate increafe in the price of his article. The truth is, however, that the merchart has a reafonable claim to receive the fame profit on that part of his capital, which he has employed in advancing the tax, as upon that which he employed in the original purchafe of the commodity.
2. Though the collection of thefe taxes is lefs grievous to the great mafs of the people, yet it falls heavier on certain clafies. Thefe are the dealers in excifeable commodities. As evafion is much eafier here than in affched taxes, a more grinding fylem of fuperintendance becomes requifite. The tax-gatherer mult have continual accels to every part, not only of the workilhop, but even of the private houfe, of the dealer in them. No time, no place, can be exempt from his vifits. The power with which he is invelted may allo, if he be fo difpoled, give occafion to infolence at leat, if not to oppreflion. Now, as the dealers in thele commodities form a part, and even a pretty numerous part of the locicty, any hardh:ip falling upon them mult be a confiderabie evil. It is felt, befides, though not directly, by the rett of the fociety. It has already been obferved, under the head of Politicaf. Economy, that every difagreeabie circumblance attendant on any profeflion, neceffarily railes the rate of wages and profit in that profeffion. it cannot be fuppofed, that the dealers in thefe conmodities will fubmit to the hardihips we bave noticed, without claiming fome indemnification in the price of their goods. Thus the firft inconvenience will be augmented, and fill more will be taken from the people, without any addition to the revenue of the public.
3. Thefe taxes give birth to the trade of tmuggling, a trade at once injurious to the public, and ruinous to the individual. Unfortunately the lax fate of public morals, in regard to this point, offers a flrong temptation to grafp at the extraordinary profits which fmuggling affords; and from the fame caufe, the produce of fuch traflic, when fucce\{sful, is always fure of a ready fale. This trade, loowever, in the end, gencrally ruins not only the fortune, but alfo the morals of him by whom it is purfued. It trains to the practice of falfehood, perjury, and other vices, without which it cannot be carried on with any chance of fuccefs.
4. Such taxes always alter more or lefs, the natural, and confequently the nof advantageous diredion of national induftry. The tax upon wine inuft diminilh the confumption of that a:ticle, and conlequantly the in-
duftry

\section*{T A X}
duntry employed in producing it. Wine indeed is not a commudity of liritill production ; but it mult be purchafed with Britilh commodities, and if the merchant cannot irapurt it, neither can he afford a market for thefe Pritifh articles which were to be given in exchange for it. Dr Smith feems to imagine, that thefe taxes produce an abfolute defalcation in the amount of national produce; a fuppofition in which we are inclined to differ from him. Although there is a diminution in the demand for this particular article; yet as the furn levied is not uithdrawn from the national expenditure, but is merely transferred from one clafs of perfons to another, it muft thill fupport a demand, if not for the fame, at leaft for fome other fpecies of commoditics. Thus the public vill fuffer chietty fro:n the inconveniences attendant on the change. Other reflaints, however, fur which there is no fuch compenfation, are ne. ceflarily attendant on the collection of fuch duties. In order to render this efficacious, regulations mult ofien be made, as to the manner in which the trade is io be carried on; and it is always to be apprehended, that goveruments will be more attentive to the fecurity of the rcvenue, than to the eafe of the public. In arbitrary and unenlightemed governments, this propenfity becomes often fo powerful, as to throw the moft formidable obttacles in the way of that free circulation of commodities on which the profperity of trade, and of all induliry, eflentially depenos.

The commodities on which thefe duties are impofed, may be either the neceffaries or the luxuries of life. Between thefe two divifions the line is not eaflly drawn. Neceflaries, flrialy fpeaking, are confined to thofe things, without which life cannot be fupported or health preferved. Yet, though the philofopher may reafon thus, the fovereign cannot confme his people within fuch flict limits. In regard to food indeed, which is entirely a domeftic arrangement, this definition may hold; but in clothing and lodging, the arrangements of which are in the eye of the public, long cuftum may impole obligations of decency and propriety, which fall little fhort of abfolute neceflity. Every thing, in this refpect, muft be confidered as neceffary, which a common labouring perfon of the lowen clafs cannot want, without incurring the reproach, or exciting the commiferation, of others in the fame fiation.

Taxes upon the neceffaries of lite have the fame effect with taxes upon the wages of labour. Dr Smith, and moft other writers, feem to conceive that the imrnediate efleet of fuch taxes is to raife the wages of labour. But we do not fee that fuch can be the cafe. Nothing can raife the wages of labour, except an augmentation of the func's deflined for its fupport. But thefe funds, far from being raifed by fuch taxcs, are fomewhat diminifhed. The employers of the poor, being themfelves affected by them, will be lefs able to pay wages than before. It is quite a fallacy to urge, that the labourer, if he does not get fufficient wages, will refufe to work. This might be, if the tax affected only a certain clafs of Jabourers, and left the reft free. The labourer, if he could not, over and above the tax, obtain the regular ftandard rate, would withdraw to other employments. The confequence would be, a rife in the wages of the taxed labour, with a night fall in thofe of every other, proportioned to the additional number who would thus be thrown upon it. But where the tax falls equally upon
labour of every defcription, as taxes upon the neceffaries Taxation. of life muth do, there is no new ruarter to which the labourer can turn; there is nothing either to raife or to lower wages; the fupply of and demand for labur continue the fame. The efleet of the tax is merely to diminifh the fubfiftence of the labourer in proportion to its amount.

This, however, is merely the firlt effect ; for the diminithed fubfittence will foon begin to act upon the population, which furnilhes the fupply of labour. Were wages at the time fo low as to lurnih merely the necellaries of life according to the firt definition, that is, fuch neceffaries as it cculd not fubfint without, the inevitable confiquence leems to be, that part of the labouring poor muli perifl for want. Such a calamitous effect feetns actually to refult, in the crowded population of fome eaftern empires, when a deficient crop produces a farcity of fubfiltence. Happily, honever, the labouring pour are feldum fo wholly without refource. In general the wages are fufficient to allow them a portion of the other defcription of neceffarics, and even of luxuries, by retrenching which, they can, in the event of fuch a tax, preferve the:nflelves frum abfolute flarvation. In the end, however, the difcouragement to marriage, and difficulty of rearing children, will reduce the population. Ihis reduction, diminifing the fupply of la, bour, will increafe wages, till they cover the amount of the tax. The fame fum, divided among a fmaller number will make more to each.

High wages operate as a complete tax upon every fpecies of manufactured produce. The manufacturer mult charge upon the price of his goods the whele fum which he has paid to his workmen with a profit. In the market of the world, therefore, he munt, ceteris paribus, be underfold by the manufacturer who refides in a country where labour is cheaper. When thele high prices l:owever, are the refult of national profperity, when they improve the fubfitence of the labourer, and lay a foundation for increafed population, this difadvantage will weigh very light in the balance. But where they are the refult of diminithed population, and attend ed with no improvement in the condition of the labouring poor, they form one of the greatell evils with which a nation can be afflicted.

For thefe reafons, taxes upon the neceffaries of life, though certainly produclive, have always been found to be oppreflive and ruinous to the profperity of a flate. Luxuries, therefore, form the p:oper objects of taxation. As every one, if unable to purcliafe his ufual quantity, can either diminifh it or abfain altogether, the rife of the article has no tendency to induce fuch a degree of want, as to check population, and thus caufe a tife to the wages of labour. This power of abltinence may indecd lead to a certain inequality; but as this inequality is altogether voluntary, it can neither excite murmuring, nor be confidered as a ferious hardihip. The greateft irreguiarity is in the cafe of abfentees, by whom fuch taxes are evaded altogether.

It is not, however, we muft obferve, from the mere luxuries of fhew and oftentation that asy important or permanent revenue is to be drawn. Thefe are confned chicfly to perfons of large fortune, who are few in number, and are always fubject to the intfuence of fanion, fo that little dependence can be placed on their regula: confumption. The luxuries from which alone a great

Tuxation. revenue can be drawn are thofe which, among the higher and middling claffes, have come to be confidered almoft as necefiaries, and which are extenfively ufed by fuch as are in ealy circumfances, even among the lower orders. The only drink neceffary for fupporting the human conftitution in perfect health, feems to be pure water. Men, however, have an univerfal propenfity for fomething more, both to gratify their tafte, and to exhilarate their ipirits. Fermented and firituous liquors, tea, coffee, \&c. are had recourfe to with this view, and are habitually ufed in various forms and degrees, by almoft every inhabitant of this country. Such articles form therefore the grand bafis of this fyltem of taxation.

Of all fupernuities, tea feems to be one of the greateft. It afords neither nourifhment nor frength, and is generally confidered by phyficians as injurious to the human conflitution. Being imported befides from a remote country, the intercourfe with which was, by the mercantile fyftem, figmatized as injurious, it was confidered as every way a fair fubject of taxation. Very high duties were accordingly accumulated upon it, which, in 1783 amounted to nearly 30 per cent. on the value, befides an excife of 1 s . on every pound. It was found that fo high a duty opened a wide door 10 the fmuggling of a conmodity of fo fmall bulk, and which was then imported in large quantities by all the neighbouring countries. It was calculated, that though duty was paid on five or fix millions of pounds, the confumption of Great Britain amounted to more than double that quantity. A plan was therefore brought forward by Mr Pitt to fubftitute in its room an additional tax on windows. Smuggling was no doubt checked, and the people were, on the whole, gainers; yet the new tax, being affeffed, was more heavily felt by the public than its predeceffor, which was only a duty on confumption. Since that time, the exigency of the times has made it again neceffary to have recourfe to this article; and the tax upon tea has been raifed even higher than it was previous to the commutation tas. The diminution, however, of the Indian trade carried on by the other powers, joined to the fricter precautions againft fmuggling, has prevented its renewal to nearly the fame extent as formerly. Tobacco is a fill more complete fuperfluity than tea, yet its ufe is very extenfive. It has therefore been juftly confidered as one of the propereft of all fubjects of taxation, and duties lhave been laid upon it , amounting to five or fix times the original value of the article.

Wine is the wholefomen of all fermented liquors, and is even pretty extenfively ufed as a medicine. Thefe circumftances might feem to entitle it to fome favour, which, however, it has not experienced. Being entire. ly a foreign commodity, and being particularly cultivated by a nation long the object of our commercial jealoufy, it has incurred the decided hoflility of the mercantile fyltem. Duties have been impofed, confiderably exceeding the original value. A preference has alfo been flewn to the wines of Portugal and Spain, (though inferior in quality), which has rendered them the common drink of this country.

Spirits are an article extenfively confumed in this country, and on which a high duty may, with the greatelf propriety, be impofed, for the purpofes not only of revenue, but of noral regulation. They afford no nourilhment, and are in the highent degree liable to
abufe. They are affected by the general tax on malt; Taxation. but pay, befides, a confiderable one when manufactured. In order to obviate the fmuggling which was carried to a great extent in the making of fpirits, it has been found advifable to lay the duty on the ftill, in proportion to its contents. It is paid by the month; and the difiller, when he choofes at any time to intermit his operations for that period, may, by giving due notice to the officers of revenue, avoid being charged. When this plan was firlt adopted, the duty was comparatively very low. But Mr Pitt foon found himfelf completely deceived as to the productivenefs of this rate of duty. It was raifed therefore fucceffively to 1621 . its prefent rate. This fyftem lays the diftiller under a temptation to work very rapidly, which is fuppofed to be injurious to the quality of the fpirits. It obliges them alfo to work without intermiffion, which they did at firf without even the exception of Sunday, till that practice was prohibited by the legillature. It may be proper to notice, that this mode of impofition is confmed to Scotland, and that in England it is laid upon the wort or walh.

Fermented liquors from malt are much more ufeful. They are the molt nutritive perhaps of any fpecies of drink, and are on that account well fuited to thofe who are engaged in hard labour. Neither do they offer the fame temptations to excefs; yet their extenfive ufe, and the neceflity of raifing a revenue, have led the legillature to confider them as a Ataple fubjoct of taxation, and they are now charged with a duty of nearly 100 per cent. Dr Smith advifes the transference of the whole tax on beer to the malt tax. The latter appears to be lefs liable to fmuggling, and it obviates the prefent exemption enjoyed by private brewers, which is evidently unreafonable and unequal. The only objection feems to be, that, being impofed at an earlier peiiod of the manufacture, it obliges the manufacturer to lie longer out of his advance, and confequently to demand a greater profit; though this might perhaps be obviated by allowing him a longer credit. The additional taxes, however, impofed upon this article, have been all laid upon beer or porter. In general, it would appear that confiderable unnecefliary trouble is occafioned by taxing fucceflively different flages of a manufacture. By laying the whole either upon malt, or upon beer, a confiderable expence of collection might be faved, without any diminution of the produce.

There are many fpecies of food which cannot, flrictly fpeaking, be confidered as neceffaries of life, fince their place can be fupplied by fome lefs expenfive fubflitute. Butcher meat can be fupplied by eggs, butter, and other products of milk; wheaten bread by other bread of inferior grains. It may be obferved, however, that the impofition of a tax on the fuperior article would produce an increafed demand for the inferior ; and confequently raife its price. Accordingly, both butcher meat and wheaten bread are univerfally numbered among the neceffaries of life; nor do we recollect, in the Britifh fyflem of taxation, any infance of folid food liable to duty. 'This is not the cafe in other countries, particularly in Holland. Heavy taxes are there impofed upon both articles. All butcher meat pays a duty of more than 7 per cent. of its value. All cattle, befides, pay about \(5^{\text {s }}\). per annum. The tax upon ground corn is alfo very heavy and undiftinguifting. Wheat

\section*{T A X [ 221 ] T A X}
axation. pays 104 forins (nearly gl.) per laft. Nor are the inferior grains entirely exempted. Rye pays 42 florins (about 31. 105.); barley, beans, and oats, zbout 21. Smith is not difpofed to cenlure thefe heavy impofitions, as they may lave been rendered neceffary by the long wars in which this people were engaged for the fupport of their independence; and when proper fubjects of taxation are exhaufted, recourfe mult be had to improper ones. Upon examining the lift, howcver, of Dutch taxes, we do not find that the taxes upon articles of luxury are fo very high, as to have reduced the legiflators of that country to fuch an cxtremity. The excife upon the aam of wine, equal to 40 Englifh gallons, is only 14 florins, or about 11. 5s. Tobacco, fo fair an article of taxation, and fo much ufed in Holland, is taxed only by a flight licence, eflimated at little more than a halfpenny a pound. Beer and fpirits are taxed ftill more moderately than wine. Befides, even fuppofing all the articles of luxury to be exhaufted, we thould conceive it more advifable to have recourfe to alfelfments upon income to the neceffary extent, than to dutics upon articles of neceffity. Accordingly, in this country, a larger revenue in proportion to the population, is now raifed than ever was raifed in Holland, without having recourfe to thefe ruinous refources.

Clothes and furniture are, to a certain extent, as much neceflaries of life as food. The quantity of them, however, which comes under this defcription, is much lefs; by far the greater part of the expence which is laid out in this way being for the purpofe of convenience at mof, if not of mere fherv and oftentation. There feems therefore no reafon for Iparing any, beyond thofe plaineft articles which decency demands from the loweft of the people. This clafs of commodities, however, has met with peculiar indulgence, in confequence of the favour entertained by the mercantile fythem for manufactures of every kind. Woollens and hardwares, the two ftaples of England, have been completely exempted. The fame favour has been thewn to linen, the flaple of the fiffer kingdoms. Yet, provided a correfponding drawback were allowed on exportation, there does not appear any good reafon why the finer forts of all thefe fabrics fhould not be made a fubject of revenue. Printed linens and cottons, which have recently been fo abundantly produced both in England and Scotland, have been made to pay a confiderable tax.

But though the legilature of this country has been thus laudably attentive to avoid touching on the firft neceffaries of life, there are flill feveral particulars in which it has failed. One of the moft important of thefe is coal, an article of the firf utility, the univerfal fuel of this country, and the material of many of its moft important manufactures. It is the lefs able to bear any duty, becaufe from its local and bulky nature, the expence of tranfport is often very heavy. London is fupplied with coal from Newcafle, which is 300 miles diftant. If a bounty could in any cafe be advifable, it would be in fuch a cafe. The legiflature, however, has judged otherwife, and has impofed upon every ton of fea-borne coal, a duty of \(3^{\text {s. }} 6 \mathrm{~d}\). Coals carried by land or inland navigation are duty free. Through the exertion of Lord Melville, Scotland, to the north of St Abb's Head, has been freed from this duty; a circumfance which has materially contributed to her rapid profperity.

Salt, though it may not be requifite for the fupport Taxation: of life, has yet, by immemorial ufage among civilized nations, been conftituted a neceffary of life. Notwithflanding this, the fnall quantity ufed by each individual, and the minute portions in which it is purchafed, make a tax upon it be levied with lefs murmuring than moft other taxes. Governments, taking advantage of this circumflance, have almolt univerfally made it a fource of revenue.

In this country the tax on this article preffes with the greater leverity, as falt is effential to the fifhery, one of the molf important fources of national wealdi. It is true, the duty is drawn back, when falt is fo employed; but the facility of frauggling by means of this drawback, produces the neceffity of frict regulations, which cramp extremely this branch of induftry, efpecially when carried on in that fmall fcale which is peculiarly fuited to it.

Leather, foap, and candles, are alfo neceffaries of life taxed in this country. But though thefe articles are to a certain extent neceffary, by far the greatelt confumption of them is for purpofes of luxury. Although therefore thefe taxes do prefs upon the poor, their weight is not very fevere. It might feem eafy enough, at leaf in the firft and laft of them, to exempt thofe coanfer forms of the commodity, which are ufed by the lower claffes, and thus the deficiency of revenue might be compenfated by an increafe on the more expenfive forms.

Taxes may be impofed either upon exportation or importation. The duties of cuftoms were at firf levied on both indifcriminately; but as the mercantile fyftem gained ground, and an anxious defire prevailed to encourage exportation and check importation, in the hope of increafing the fecie in the country, all the new duties were laid upon the latter, while the former was more and more excmpted. Although this fyftem may not have taken its rife from the mott enlightened views, yet no reafonable exception can be taken to it. The taxes impofed by any government ought to fall upon the confumption of its own people, not upon that of others; and as this is a maxim of jultice, fo it is equally recommended by policy. Were a government to tax its own exported commodities, thefe commodities would alfo have to pay the taxes of the country into whicly they were imported. Loaded with this double burden, they could not advantageoully come into competition with fimilar articles, either the produce of that country, or imported from another which followed a more liberal policy. It is only thesefore upon goods imported or produced for home confumption, that thefe taxes can with propriety fall. From fimilar views, the materials of manufacture have been generally exempted from duty. We have already obferved, that, provided thefe manufactures be objects of luxury, there is no good reafon why they fhould not pay a tax. But there is an evident advantage in levying the duty after, rather than before, the manufacturing procefs. In the latter cafe, the merchant, being obliged to advance it fo early, mult have a profit on his advance, proportioned to the length of time which elapfes till the commodity is fit for fale; and this profit muft be paid by the confumer in the price of the goods.
Should we fuppofe indeed a nation to poffefs a monopoly of any particular commodity, fi:ch a nation raight

\section*{T A X 「 222 〕 T A X}

Tamation. impofe a tax on its export, withont danger of its merchants being fupplanted in the foreign market. Still this could not but be confidered as a fomewhat illiberal fytiem; and it would alfo bear hard upon the producer, who would fill probably have a double fyftem of duties to pay, firce it cannot be fuppofed that the fo:eign country fhould regard thele monopolized commoditics with peculiar favour.

With the view of following up the principles of the mercantile fyftem, importation duties have often been laid upon goods, fo heary as to amount to a prohibition. Such duties are not intended to produce any revenue, but to favour fome home manufacture, or to injure that of fome foreign nation, which is an object of commercial jealoufy. In the fame manner, bounties are given to forward the growth of fome branch of induffry, which is the ohject of peculiar favour. In both cafes, the reverue is facrificed, without any real advantage accruing to the public. The induftry and capital of the nation are thus turned from their natural direction into one which is lefs advantageous, and the public is injured inftead of being benefited.

It is an undoubted principle, that whether the tax be paid at the time of importation, or at manufacture, it ought to be paid only once. Some governments, profoundly ignorant of the true principles of politicat economy, have repeated the impoition at every fucceffive fale of the property. This is obvioully unequal. The value of property, and the frequency of its transference, are two things altogether diffinct. One fpecies of goods may thus come to pay ten or twelve times as much as another of the fame value. But great as is its inequality, its impolicy is fill more glaring. It forms the moft powerful check to that free interchange of commodities which is the very foul of all induftry. It tends to confine the confumption of every article to the place of its production, and thus to exclude all tirrfe benefits which arife from the extenfien of the market. Of this ruinous nature is the Spanifh alcavaia, which confifts in an impofition, originally of 10 , but now only of 6 per cent. on every fale without exception, whatever be the nature of the property, or however frequently repeated. The mere undillinguifhing nature of fuch a tax mult he a great evil; but it is rendered far more pernicious by the obfruction which it thus throws in the way of every fpecies of commercial intercourfe.

It may be effablifhed as a principle in regard to thefe taxes, that they ought to be as uniform as poffible, and not to vary in different parts of the country. Such variations neceffarily lead to reftraints on the free circulation of commodities. Each province hecomes as an independent kingdom, the frontier of which is guarded by cultomboufes and by chains of officers, through which whoever paffes muff fubmit not only to the payment of riutics, but to the inconvenience and delay of having his gands fearched. Such was the cole both in France and in Spain, where each province having formerly been feparate and independent. retained fill its difira fyftem of taxation. The tranfiporting of goods from one province to annther was like exporting them to a forcign country ; the fame barriers of cuftoniloufes, duties, and revenue officers, obfiruled their paffiagc. One of the circumflances which has moft contihuted to the proficrity of Great Britain is the uniformity of taxation throughout, and conlequently the entire frectom of
commerce frem one part of the ifland to the other. Taxation. This was the principal advantage which Scotland ocrived from the union; and it has been fuch as fully to compenfate for the increafed burdens to which that meafure fubjected her.

Duties upon confumption, innead of being levied upon the trader, may be levied upon the perfon confuming, who may be made to pay a certain fum as a licrnce to ufe the commodity. Such a mode of levy has fome of the advantages of antefled taxes, in regard to the facility and cheapnefs of collection. It is till alfo in fome degree fpontaneous; but it muft obvioufly be, in molt cafes, very untequal. Of two perfons, who fliould pay the fame fum for a licence to ufe wine, one might confume twenty times the quantity of the other, A licence has befides the difadvantage of being paid all at once. and of being more fenfibly felt than taxes which confound themfetves with the price of the commodity. In general, therefore, it is a much lefs eligible form. There are a few inftances, however; of very coflly and durable goods, fuch as coaches, plate, \&c. Where it is found to be the noof convenient. Wine and other liquors, when confumed in taverns, may, it is fuppofed, be fairly required to pay more than when confumed in private houlcs. An attempt, however, to proportion this addition to the quantity confumed, would be attended with unfurmountable difficulies. A licence is therefore required to be taken out by innkeepers who deal in thefe articles. This tax falls with equal weight upon the great and fmall dealers; but it may be rather confidered as defirable to check the multiplication of the laft.
3. Stamp. Duties.-Under the title of famp dulies, we would include all thofe which fall upon the deeds which regulate the transference of property.

The firlt of thele duties, of which we find any mention, are thofe upon tefitamentay donations. A law of Auguftus impofed the vïcfima hercritatum, or tiventieth penny, upon all inheritances. Ii was in Holland, however, which was prefied by the fevereft neceflity of raifing a revenue, and not very difcriminating in the mode of doing it, that the fyftem of Aamp duties fift eriginated, and was carried to a formidable cxtent. Such were the difficulties of that flat, that they are faid to have publicly propofed a reward to any one who fhould fuggeft a new fource of revenuc. This plan was propofed and approved. From Holland it was, in 1671. imported into this country, and has fince become one of the great fources of public income. In other countries, deeds regarding the transference of property are required to be entered in a public. regifter, and the tax lind on the regiffration. A confiderable revenue was thus raifed in France. Auction dutics upon the fale of property, both moveable and inmoveable, though fomewhat different in point of form, coincide exactly with thefe taxes in their effence and tendency.

Taxcs of this nature are attended with confiderable conveniencies to the contributors. From the nature o the trasfaction, there muft always be money in hand with which the tax can be paid; and the time of payment is thus the moft convenient of any. In many cafes, the fum to be paid at a time is fmall. It is only part of the fociety which is liable to them to any great cxtent, and thefe only occafinnally; they are not felt as intrenching on daily and habitual comforts; nor do

\section*{T A X \(\boldsymbol{X} 223] \quad \mathrm{T} \wedge X\)}

「axation. they excite that general murmur, which is alonc formi\(\xrightarrow{\sim}\) dable to government. It is not to be wondered at, therefore, if the latter ftrould avail themlelves of this paffive difpofition in the people for the extenfion of this fource of fupply. 'The truth is, however, that in all effential refpects, thefe taxes are among the molt improper of any.
1. They are unequal, inafmuch as the value of any property is altogether uncoanected with the frequency of its transference. This inequality would fubfift, even though the flamp duty were always in exact proportion to the value of the property. But this is, in general, far from being ftrictly the cafe. It may be nuticed, however, that in the recent additions made to the 1lamp duties in this country, the principle of equality has been more attended to.
2. The greater part of fuch taxes fall not upon the income, but upon the capital of the country; not upon that fund which may be properly and fafely expended, but upon that, the expenditure of which muft be ultimately ruinous. Ihis circumfance is peculiar to thele duties; for though others, when very fevere, may oblige the contributor to encroach on his capital, they alone fall directly and immediately upon that fund. An objection of this nature would alone be fufficient to dif. fuade their adoption.
3. Such taxes, when they fall upon moveable goods, have a direct tendency to check commerce, and through it every kind of induftry. They are then a complete alcavala, differing from that ruinous impolt only by being more moderate.

Thus we find, that the facility of collection, and the avoiding of difcontent, which have tempted modern governments to extend fo much this fource of revenue, are aliogether fallacions advantages, and bear no proportion to the ill confequences with which fuch taxes are neceffarily aitended. It would therefore be much better that the duties upon the transference of moveable goods Rould be laid upon their original production. They would thus pay only once, and no impodiment would be thrown in the way of their free circulation. Duties upon the fale of land and other immoveabie goods, ought to be converted into affeffed taxes, payable on their yearly ufe. In the prefent circumflances of this country indeed, it is perhaps too much to expeet that taves, which are paid without much murnuring, thould se taken off; but the confiderations now fated ought certainly to deter from any farther addition to them.

Legacies from any diftant relation are a fort of accidental and unexpected advantage, and it is therefore to be fuppofed, that the perfon receiving will have fecured a regular fource of fubfiftence independent of them. He will not therefore, it is likely, be difpofed to complain very grievoully, if this cxtrinfic fource of walth be fomewhat diminilhed by a duty to govermment. In this count:y. accordingly, fuch legacies are chargeable with a duty of 10 por cent. This tax feems one of the moft nnexceptionable of the kind, and only liable to the objection of falling upon capital. It is otherwife with money left by a father or other very near relation. The death of fuch perfons commonly diminithes, inflead of increafing, the wealth of the family; and the fum left. forms ofien the fole dependance of a great part of it. Accordingly, in Great Britain, the duty on legacies to
the nearel relations is very flight, and gradually in- Taxatuon creafes as the confanguinity becumes more remote.
ficceipt llamps, though they are formally paid ' \(y\) the feller, fall really upon the purchafer. The merchant, who mult have his profit, will calculate the expence which he is likely to be al in llamps, and will lay a correfponding augmentation on the price of his goods. Such taxes, unlels very heavy, will fall upon income only, not upon capital.

Bills of exchange, and policies of infurance, being necelfary inftruments of trade, feem as improper fubjects of taxation as can well be. 'The only thing tolerable in thele taxes, as impoled in this country, is their mode. ration.

Auction duties feem liable to every objection which can be dated againft taxes of this defeription. They are the nore levere, as they mult fall often upon unfortunate perfons who are reduced to the necenity of difpofing, in this manner, of their property.

Stamps upon law proceedings tend to increafe the expence of obtaining juftice, which is already complained of in general as 100 heary. They may indeed be fuppofed to be of fome ufe in checking a litigious fpirit; but this fecms already to be done pretty effectually by the other expences attendant on judicial proceed. ings.

Taxes upon indentures, or upon the entrance to any profeflion, produce a monopoly to the perfons cxercifing that profeffion. They thus tend at once to raife the price of their labour and of its fruits, and to diminift the neceffity of qualifying themfelves for its performance. 'Ithe chief weight of thele taxes falls upon the perfons exercifing the profeffion of the law. The public are apt to regard fuch perfons with a degree of hofility, which bas probably induced government to believe it might tax them without danger of exciting any general murmur. The truth is, however, that thefe taxes. fall not on the practitioncrs themfelves, but on thofe who complain of them, on the perfons engaged in litigation; fo that their effect is precifely the fame with that of taxes on law proceedings. It differs from them only as a licence differs from a duty upon commodities, and islefs eligible, as falling more umequally. The perfons who pay the fame fum at entrance, carry on their profellion with very different degrees of fuccefs.

Some impofitions, which aflume the form of ftamp duties, are in reality taxes upon commodities. Such are the game duty, the duty on cards, hats, plate, \&zc. But moff of thefe feem to be unexceptionable fubjects.

TAXUS, the YEw-TREE, a genus of plants belonging to the clafs diœcia, and in the natural fyllem ranging under the 5 ill order, Coniferce. See Botany In. rex:

NAY, in Latin Tavus, or Taus, the largelt river in Scotland, rifes in Braidalbane, on the frontiers of Lorn; and laving in the paffage of a few miles augmented its itream by the acceffion of feveral fmall rills, fpread, it felf into the lake called Lack Dochart; out of which having zun but a little fpace, it expands itfelf again. Leaving this fecond lake, it rolls fome miles with a confiderable body of water, and then diffifes it el \({ }^{6}\) in the fpacious Locls Tay; which, reclioning from the fources of the river, is 24 miles in length, though, itricity fuealing.

Speaking, the lake is but 13: almoft as foon as it iffues from hence, it receives the river Lyon, coming out of Loch Lyon, and running through Glen Lyon; which, having travelled in a manner parallel to it, from its fource, for a face of 25 miles, at length joins the 'Tay as it enters Athol, which it next traverfes, and, directing its courfe in a manner due eaft, receives almoft all the waters of that country. Berding then to the fouth, at the diftance of fix miles, it reaches Dunkeld; which, in the language of our anceltors, fignifics "the hill of hazels," was the very centre of the old Caledonia, and is at prefent efteemed the heart of the Highlands. The river is very broad here, infomuch that there is a ferryboat over it at each end of the town. Declining fill 10 the fouth-ealt, with a winding courfe, for above 12 miles, the Tay receives a large fupply of waters from the county of Angus; and then running fouth-wef for eight miles more, is joined in that face by feveral rivers, the moft confiderable of which is the Almond. Turning then to the fouth-eaft, at the diffance of about three miles, this copious river comes with a fwelling flteam to Perth.
The Tay, continuing ftill a fouth-eaft courfe, receives, a few miles below Perth, the river Erne ; which, iffuing from a loch of the fame name, traverfes the county of Strathern, and paffes by Abernethy, once the capital of the PiCtift kingdom. Swelled by the waters of this laft river, the Tay, running next directly eaft, enlarges itfelf till it becomes about three milcs broad; but contracts again before the town of Dundee; foon after which it opens into the German ocean. At the entrance of the frith, there are fands both on the north and on the fouth fide; the former fyled Goa, the latter Aberlay and Drumlan; and before thefe, in the very mouth of the frith, thofe which are called the Crofs Sands. At Buttonnef, which is the northern promontory, there are two light-houfes. The fpace between the north and the fouth fands may be near a mile, with about three fathoms water; but being within the frith, it grows deeper, and in the road of Dundee is full fix fathoms. 'The frith of Tay is not indeed fo large or fo commodious as that of Forth, but from Buttonnefs to Perth it is not lefs than 40 miles; and the whole may be, without any great impropriety, fyled a harbour, which has Fife on one fide, and the flhires of Perth and Angus on the other, both very fertile and pleafant countries.

TAYLor, Dr Jeremy, bifhop of Down and Connor in Ireland, was the fon of a barber at Cambridge, where he was educated. Upon entering into orders, he became divinity lecturer of St Paul's in London; and was, by the interefl of Archbihhop Laud, elected fellow of All.fouls college, Cambridge, in 1636 . Two years after he became one of the chaplains of the archbithop, who beflowed on him the refory of Uppingham in Rutlandlaire. In 16 \({ }_{4} 2\), he was chaplain to the king; and frequent preacher before him and the court at Oxford. He afterward attended in the king's army in the condition of a chaplain. Upon the declining of his majenty's caufe, he retired into Wales, where he was permitted to officiate as minifter, and to keep a cchool, in order to maintain himfelf and his children. In this retirement le wrote feveral of his works. Having fpent feveral years there, his family was wifted with ficknefs; and b.e loft three fons of great hopes within the face of
two or three months. This affliction touched him fo fenfibly, that it made him defirous to leave the country; and, going to London, he for a time officiated in a private congregation of loyalills to his great hazard. At length meeting with Edward lord Conway, that nobleman carried him over with him into Ireland, and fettled him at Portmore, where he wrote his Ductor Dubitantium. Upon the Relloration he returned to England. Soon after, he was advanced to the bihhopric of Down and Connor in Ireland ; and had the adminiftration of the fee of Dromore granted to him. He was likewife made privy-counfellor and vice-chancellor of the univerfity of Dublin; which place he held till his death. He died of a fever at Lifnegarvy in 1667 , and was interred in a chapel which he himfelf had built on the ruins of the old cathedral of Dromore.

Taylor, Dr Brook, was born at Edmonton, Auguf 18th 1685. He was the fon of John Taylor, Efq. of Bifrons-houle in Kent, by Olivia, daughter of Sir Nicholas Tempeft, of Durham, Baronet. His grandfather, Nathaniel Taylor, was one of, thofe puritans whom " Cromwell thought fit to elect by a letter, dated June 14th 563 , to reprefent the county of Bedford in parliament." The charafter of his father partook in no fmall degree of the aufterity that had been tranfmitted to him in the line of his anceftors, and by the fpirit of the times in which they lived; and to this caufe may be afcribed the difaffection which fometimes fubfifted between the father and even fuch a fon as is the fubject of this article. The old gentleman's morofe temper, however, yielded to the powers of mufic; and the moft eminent profeflors of the art in that period were hofpitably welcomed in his houfe. His fon Brook was induced, by his natural genius, and by the difofition of his father, which he wifhed by all the means in his power to conciliate, to diref his particular attention to mufic ; and he became in very early life a dillinguithed proficient in it.-"In a large family piece, he is reprefented at the age of 13 fitting in the centre of his brothers and fifters; the two elder of whom, Olivia and Mary, crown him with laurel, bearing the infignia of haimony."

To mufic he added another accompliftment, in which he equally excelled. "His drawings and paintings, of which fome are ffill preferved, require not thofe allowances for error or imperfection with which we fcan the performances of even the fupcrior dilettanti;-they will bear the teft of icrutiny and criticifm from artifts themfelves, and thofe of the firf genius and profeffional abilities." Though he was eminent in the culture and practice both of mufic and drawing in his early youth, his whole attention was not occupied by thefe fafcinating arts. His claffical education was conducted at home under a private tutor; and his proficiency in the ordina. ry branches of the languages and the mathematics was fo great, that he was deemed qualified for the univerfity at the early age of 15 .

In 1701 he was entered a fellow commoner of St John's College, Cambridge. At that period mathematics engaged more particularly the attention of the univerfity; and the examples of eminence in the learned world, derived from that branch of fcience, attraEtcd the notice and roufed the emulation of cvery youth pof. feffed of talents and of application. We may prefume, that Brook 'Taylor, from the very hour of his adniffion

\section*{T A Y}

Taylor. at college, adopted the courfe of fudy which a Machin, a Keil, and, above all, a Newton, had opencd to the mind of man, as leading to difcoveries of the celeftial fyitem.-That he applied early to thefe fudies, and without remifion, is to be inferred from the early notice and kind attention with which he was honoured by thofe eminent perfons, and from the extraordinary progrefs which he made in their favourite fcience."
In 1708 he wrote his treatife On the Centre of Ofcillation, which was not publifhed in the Philofophical Tranfactions till fome years afterwards. In 1709, he took his degree of Bachelor of Lawvs. In 1712 , he was chofen a Fellow of the Royal Suciety. During the interval between thefe two periods, he correfponded with Profeffor Keil on feveral of the moft abltrufe fubjects of mathematical difquifition. Sir William Young informs us, that he has in lis poffeffion a letter, dated in \(17 \mathbf{1 2}\), addreffed to Mr Machin, which contains at length a folution of Keplet's problem, and marking the ufe to be derived from that folution. In this year he prefented to the Royal Society three different papers: one \(\mathrm{O}_{\mathrm{n}}\) the Afcent of Water between two Glafs Planes; a fecond, On the Centre of Ofcillation; and a third, On the Motion of a fretched String. It appears from his correSpondence with Keil, that in \(1{ }^{1} 13\) he prefented a paper on his favourite fubject of Mufic ; bat this is not preferved in the Tranfactions.

His diftinguifhed proficiency in thofe branches of fcience, which engaged the particular attention of the Royal Society at this period, and which embroiled them in contefts with foreign academies, recommended him to the notice of its molt illuftrious members; and in \({ }^{1} 7^{1} 4\) he was elected to the office of fecretary. In this year he took at Cambridge his degree of Dotor of Laws: and at this time he tranfmited, in a letter to Sir Hans Sloane, An Account of fome curious Experiments relative to Magnetifm; which, however, was not delivered to the Society till many ycars afterward, when it was printed in the Tranfactions. His application to thofe fudies to which his genius inclined was indefatigable; for we find that in 575 he publifhed in Latin his Methodus Incrementorum; ; alfo a curious eflay preferved in the Philofophical Tranfactions, entitled An Account of an Experiment for the Difcovery of the Laws of Magnetic Attraction; likewife a treatife well known to mathematicians, and highly valued by the beft judges, On the Principles of Linear Perfective. In the fame year (fuch were his admirable talents, and fo capable were they of being directed to various fubjects), he conducted a controverfial correfpondence with the Count Raymond de Montmort, on the Tenets of Malebranche; which occafioned his being particularly noticed in the eulogium pronounced by the French academy on the deceafe of that eminent metaphyfician.

The new philofophy of Newton (as it was then cal. led) engaged the attention of mathematicians and philofophers both at home and abroad. At Paris it was in high eftimation; and the men of fcience in that city were defirous of obtaining a perfonal acquaintance with the learned fecretary of the Royal Society, whofe reputation was fo generally acknowledged, and who had particularly diftinguifhed himfelf in the Leibnitzian or German controverly, as we may denominate it, of that period. In confequence of many urgent invitations, he Vol. XX. Part I.

\section*{225 ] 'T A 'Y}
determined to vifit his friends at Paris in the year 1716. He was reccived with every poffible token of affection and refpect ; and had an opportunity of difplaying ma. ny traits of character, whicls mark the general fcholar and accomplifhed gentleman, as well as the profound mathematiciall. His company was courted by all "who had temper to enjoy, or talents to improve, the charms of focial intercourfc." Befides the mathematicians, to whom he had always free accefs, he was here introduced to Lord Bolingbroke, the Count de Caylus, and Bifhop Bofluet.
Early in 1757 he returned to London, and compofed three treatifes, which were prefented to the Royal Society, and publifhed in the 30 th volume of the 'Tranfactions. About this time his intenfe application had impaired his health to a confiderable degree; and he was under the neceffity of repairing, for relaxation and relief, to Aix-la-Chapelle. Having likewife a defire of directing his attention to fubjects of moral and religious fpeculation, he refigned his office of fecretary to the Royal Society in 1718.

After his return to England in 1719, he applied to fubjects of a very differeni kind from thofe that had employcd the thoughts and labours of his more early life. Among his papers of this date, Sir William Young has found detached parts of A Treatife on the Jewifh Sacrifices, and a differtation of confiderable length On the Lawfulnefs of eating Blood. He did not, however, wholly neglect his furmer futjects of fudy, but employed his leifure hours in combining fcience and att; with this view he revifed and improved his treatife on Linear Perfpective. Drawing continued to be his favourite amufement to his lateft hour ; and it is not improbable. that his valuable life was fhortened by the fedentary habits which this amufement, fucceeding his feverer fudies, occafioned. "He drew figures with extraordinary precifion and beauty of pencil. Landfcape was yet his favourite branch of defign. His original landfcapes are moflly painted in water colours, but with all the richnefs and ftrength of oils. They have a force of colour. a freedom of touch, a varied difpofition of planes of diftance, and a learned ufe of aerial as well as limear perfpective, which all profeffional men who have feen thefe paintings have admired.

The work of Dr Brook Taylor in linear perfpective was cenfured by Bernoulli, in a treatife publifhed in the Afts of Leipfic, as " abftrufe to all, and as unintelligible to artilts for whom it was more efpecially written." It mult be acknowledged that this excellent work, for fo it deferves to be called, was not level to the apprehenfions of practitioners in the art of drawing and defign ; but it was much efteemed by mathematicians. Three cditions of it have been publifhed ; and as it is now fcarce, a republication of it in its moft improved and perfect fate would be very acceptable. Mr Kirby, however, has made it more plain and popular, in his treatife entitled "Brook Taylor's Perfpective made eafy;" and this book, detailing and illuffrating the principles of the original work, has been the vade mecum of artitts. Dr Broak Taylor was incenfed by the invidious attacks of Bernoulli; and he publifhed An Apolngy agzint J. Bernoulli's Obje Etions, which may be feen in the soth vilume of the Philofophical Tranfactions. Bernoulli, with his ufual envy of Britifl mathematicians, had difputed our author's right to his own

\section*{T A Y [ 226 ] T E A}

Txylor. wotk. We have no reafon to doult Dr Taylor's claims to the undecided difcovery of the method which he defcribes, though he is not an origital inventor. This method was long before publifhed by Guido Ubaldi, in his Perfeetive, frinted at Pelaro in 1600 ; where it is delivered very clearly, and confirmed by molt elegant demenfrations; and where it is actually applied to the ait of delineating the feenes of a theatre.

Toward the end of the year 1720, Dr Brook Taylor accepted the invitation of Lord Bolinbroke to fpend fome time at La Source, a country-feat near Orleans, which he beld in right of his wife, the widow of the Marquis de Villette, nephew of Madame de Maintenor:. In the next year he returned to England, and publifhed the latt paper which appears with his name in the Philofophical Tranfactions, entitled, An Experiment made to afcertain the Proportion of Exparfion of Liquor in the Thernometer, with regard to the degree of Heat.

In 17ンI, Dr Brook Tayior married Mifs Bridges of Wailington in the county of Surry, a young lady of good family, but of fmall fortune; and this marriage occafioned a rupture with his father, whofe conlent he had never obtained. The death of this lady in 1725 , and that of an infant fon, whom the parents regarded as the prefage and pledge of reconciliation with the father, and who actually proved fuch, deeply aflected the fenfibility of Dr Taylor. However, during the tho fuccecding years he refided with his father at Bifrons, where " the mufical parties, fo agreeable to his tafte and early proficiency, and the affectionate attentions of a numerous family welcoming an aniable brother, fo long eftranged by paternal refentment, not only foothed his forrows, but ultimately engaged him to a fcene of country retirement, and domefticated and fixed his babits of life. He could no mare recur to the defultory refources and coid folace of fociety, which cafual vifits, flight acquaintance, and diftant friendifips, afford the mar-who hath none to make, and cheer a confant home."
Il1 1725 he formed a new connection; and with the full approbation of his father and family, married Sabetta, daughter of John Sawbridge, Eff. of Olantigh, in Kent. In 1729 , on the death of his father, he fucceeded to the family eftate of Bifrons. In the following year he loft his wife in childbed. The daughter whofe birth occafioned this melancholy event furvived, and became the mother of Sir William Young, to whom we owe thefe memoirs of his grandfather.

In the interval that elapfed between the years \(\mathbf{1 7 n ⿻}_{7}\) and \(: 7.30\), no production by Brook Taylor appears in the Philofophical Tranfactions; nor did he publifh in the courfe of that time any work. His biographer has found no traces of his learned labour, excepting a Treatife of Lngarithms, which was committed to his friend Lord Paifley (afterward Ahercorn), in order to be prepared for the prels; but which probably never was printed. His healths was now much impaired; relaxation became neceflary, and he was diverted by new connections from the habit of fevere fludy, which had diftinguifted the carly period of his life, and which bad contributed to contract the duration of it. Happy in the focial circle of domettic enjoyment, and devoting his attention to bufine fs or amufement as they occuried, his application and his literary cmulation feem to have de-
clined. He did not long furvive the lofs of his fecord wife ; and his remaining days were days of increafing imbecillity and forrow.
'" The cflay entitled Comtemplatio Philofophica, publithed by Sir William Young, 1793, appears to have been written about this time, and probably with a view to abfract lis mind frem painful recellcetions and regret. It was the effort of a flrong mind, and is a moft remarkable example of the clofe logic of the mathematician applied to metaphyfics. But the blow was too deep at heart for fudy to afford more than temporary relief. The very refource was hurtful, and intenfe ftudy but accelerated the decline of his bealth. His friends offered evcry comfort; in particular Lord Bolinbroke preffed his confolation, and fought to call his mir.d from regret of domeftic endearments to focial friendihip at Dauley.

The attention and lindnefs of his friends, however, could not ward off the approaches of diffolution. "Having furvived lis fecond wife little more than a year, Dr Brook Taylor died of a decline in the 46th year of his age, Decomber the 29th 1731, and was buried in the churcl-yard of St Am's, Soho. 1 am fpared (fays his defeendant) the neceflity of elofing this biographical fietch with a prolix detail of his charater: in the beft acceptation of duties relative to cach fituation of life in which he was engaged, his own writings, and the writings of thofe who beft knew him, prove him to have been the fimifhed Chrifian, gentleman, and fchoo lar."

Taflor-Eird. See Motacilla, Ornitholegy Index.

TEA, the dried leaves of the tea plant.-A commodity with which we are fo well acquainted, which affords a beverage fo generally ufed and fo generally agreeable, and which forms fo confiderable an article of commerce, muft excite curiofity to know fomething of its hiffory, and of the nature of the plant from which it is obtained.

The tea plant is a native of Japan, China, and Tonquin, and has not, as far as we can learn, been found growing fontaneoully in any other parts of the world. Limrous arranged it under the clafe of polyandria, and order of nonogynia, and Thunberg, one of the mont diftinguifhed pupits of that illuflrious botanift, who refided 16 montlis in Batavia and Japan, has claffed it in the fame manner as his mafer. Several of the Britill botanifts, on the other hand, refer it to the order of trigynia; deriving their authority from a plant in the duke of Northumberland's garden at Sion-houfe, which had three flyles.

Linneus fays that there are two fpecies of the tea plant ; the bolien, the corolla of which has fix petals; and the viridis or green tea, which has nine petals. Thunberg makes only one fpecies, the bohea, confifing of two varieties; the one with broad and the other with narrow leaves.

The tea plant, which is an evergreen, grows to the height of five or fix feet; Le Comple fays ten or twelve. The leaves, which are the only valuable part of it, are about an inch and a half long, narrew, indented, and tapering to a point, like thofe of the fweet hriar, and of a dark gieen colour. The root is like that of the peach tree, and its flowers refemble thofe of the white wild rofe. Thic flem frreads into many irregular branches,

\section*{T E A}

Tea. branchics. The wood is hard, of a whitifh green colour, and the bark is of a greenifl colour, with a bitter, naufeous, and aftringent tafte. The fruit is fmall, and contains feveral round blackill feeds, about the bignefs of a bean or large pea.

This plant delights in valleys, is frequent on the floping fides of mountains and the banks of rivers, where it erijoys a fouthern expofure. It flourithes in the northern latitudes of Pekin as well as round Canton, but attains the greatef perfection in the mild temperate regions of Naukin. It is faid only to be found between the 30 th a:ad \(+5^{\text {th }}\) degree of north latitude. In Japan it is planted round the borders of fields, withont regard to the foil; but as it is an important article of commerce with the Chinefe, whole fields are covered with it, it is by them cultivated with care. The Abbé Rochen fays, it grows equally well in a poor as in a rich foil ; but that there are certain places where it is of a better quality. The tea which grows in rocky ground is fuperior to that which grows in a light foil ; and the worft kind is that which is produced in a clay foil. It is propagated by feeds; from fix to twelve are put into a hole about five inches deep, at certain diffances from each other. The reafon why fo many feeds are fown in the fame hole is faid to be, that only a fifth part vegetate. Being thus fown, they grow without any other care. Some, however, manure the land, and remove the weeds; for the Chinefe are as fond of good tea, and take as much pains to procure it of an excellent quality, as the Europeans do to procure excellent wine.

The leaves are not fit for being plucked till the hrub be of three years growth. In feven years it rifes to a man's height ; but as it then bears but few leaves, it is cut down to the flem, and this produces a new crop of freih floots the following fummer. We are informed by Koempfer, that there are three fealons in which the leaves are collected in the illes of Japan, from which the tea derives different degrees of perfection.

The firt gathering commences at the end of Fe bruary or beginning of March. The leaves are then fmall, tender, and unfolded, and not above three or four days old: thefe are called ficki-tfian, or "tea in powder," becaufe it is pulverifed; it is allo called \(i \mathrm{~m}\) perial tea, being generally referved for the court and people of rank; and fometimes alfo it is named lloom tea. It is fold in China for 20d. or 2 s . per pound. The labourers employed in collecting it do not pull the leaves by handfuls, but pick them one by one, and take every precsution that they may not break them. However long and tedious this labour may appear, they gather from 4 to 10 or 15 pounds a-day.

The fecond crop is gathered about the end of Narch or beginning of April. At this feafon part of their leaves have attained their full growth, and the reft are not above half their fize. This difference does not, however, prevent them from being all gathered indif. criminately. They are afterwards picked and afforted into different parcels, according to their age and fize. The youngent, which are carefully feparated from the reft, are often fold for leaves of the firft crop, or for imperia! tea. Tea gathered at this feafon is called tootfiaa, or "Chinefe tea," becaufe the people of Japan infufe it, and drink it after the Chinefe manner.

The third crop is gathered in the end of May or in the month of June. The leares are then very numer-
ous and thick, and have acquired their full growth. This kind of tea, which is called benofiaa, is the coarfen of all, and is referved for the common people. Some of the Japanefe collect their tea ouly at two feafons of the year, which correfpond to the fecond and third already mentiuned; others confine themfelves to one general gathering of their crop, towards the month of June: huwever, they always form alterwatds different affortments of their lcaves.

The fineft and moft celebrated tea of Japan is that which grows near Ud-fi, a fmall village fituated clcfe to the fea, and not far diftant from Meaco. In the difrict of this village is a delightful mountain, having the fame name, the climate of which is faid to be extremely favourable to the culture of tca; it is therefore inclofed by a hedge, and furrounded with wide ditches, which prevent all accefs to it. The tea Mrubs that grow on this mountain are planted in regular order, and are divided by different avenues and alleys.

The care of this place is entrufted to people who are ordered to guard the leaves from duft, and to defenct. them from the inclemency of the wather. The la. bourers who are appointed to collect the tea abftain from every kind of grofs food for fome weeks before they begin, that their breath and perfipation may not in the leaft injure the leaves. They gather them with the inof fcrupulous nicety, and never touch them but with very fine gloves. When this choice tea has undergone the procefs neceflary for its preparation, it is efcorted by the fuperintendant of the mountain and a ftrong guard to the emperor's court, and referved for the wife of the imperial family.

As the tea fhrub grows often on the rugged banks of fteep mountains, accefs to which is dangerous, and fometimes impracticable, the Chinefe, in order to come at the leaves, are faid to ufe a fingular fratagem: Thefe fteep places are gencrally frequented by great numbers of monkeys, which being irritated and provoked, to revenge themfelves tear of the branches, and thower them down upon thofe who have infulted them. The Chinefe immediately collect there branches, and nrip them of their leaves.

When the tea leaves have been collected, they are expofed to the fteam of boiling water; after which they are put upon plates of copper, and held over the fire until they become dry and frivelled, and appear fuch as we have them in Europe. According to the tentmony of Kcempfer, lea is prepared in the fame manner in the ifles of Japan. "There are to befeen there (fays this traveller) public buildings erected for the purpofe of preparing the freft gathered tea. Every private perfon who has not fuitable convenitnces, or who is unacquainted with the operation, may carry his leaves thither as they dry. Thefe buildings contain a great number of fmall floves raifed about three feet high, each of which has a bro: plate of iron fixed over its mouth. The workmen are feated round a large table covered with mats, and are employed in rolling the tea leaves which are fpread out upon them. When the iron plates are heated to a certain degree by the fire, they cover then with a few pounds of frefh gathered leaves, which being green and full of fap, crackle as foon as they touch the plate. It is then the bufinefs of the workman to ftir them with his naked hands as quickly as poffible, until they become fo warm that he cannot

Tea. eafily endure the heat. He then takes off the leaves with a kind of thovel, and lays them upon mats. The people who are employed in mixing them, take a fmall quantity at a time, roll them in their hands always in the fame direction; while others keep continually firring them, in order that they may cool fooner, and preferve their fhrivelled figure the longer. This procefs is repeated two or three times, and even oftener, before the tea is depofited in the warehoufes. Thefe precautions are necellary to extract all the moifture from the leaves."

The people of Japan and China generally keep their tea a year before ufing it, becaufe, when quite frefn and newly gathered, it poffeffes a narcotic quality which hurts the brain. Imperial tea is generally preferved in porcelain vales, or in leaden or tin canifters covered with fine mats made of bamboo. Common tea is kept in narrow-mouthed earthen pots; and coarfe tea, the flavour of which is not fo eafily injured, is packed up in bafkets of Araw.

An infufion of tea is the common drink of the Chinefe; and indeed when we confider one circumftance in their fituation, we muft acknowledge that Providence has difplayed much goodnefs in feattering this plant with fo much profufion in the empire of China. The water is faid to be unwholefome and naufeous, and would therefore perhaps, without fome correcive, be unfit for the purpofes of life. The Chinefe pour boiling water over their tea, and leave it to infufe, as we do in Europe; but they drink it without any mixture, and even without fugar. The people of Japan reduce theirs to a fine powder, which they dilute with warm water until it has acquired the confiftence of thin foup. Their manner of lerving tea is as follows: They place before the company the tea equipage, and the box in which this powder is contained; they fill the cups with warm water, and taking from the box as much powder as the point of a knife can contain, throw it into eacls of the cups, and ftir it with a tooth-pick until the liquor begins to foam; it is then prefented to the company, who tip it while it is warm. According to F. du Halde, this method is not peculiar to the Japanefe; it is alfo ufed in fome of the provinces of China.

The firlt European writer who mentions tea is Giovanni Botero, an eminent Italian author, who publinhed a treatife about the year \(159^{\circ}\), Of the Caufes of the Magnificence and Greatnefs of Cities. He does not indeed mention its name, but defcribes it in fuch a manner that it is impofible to miftake it. "The Chinefe (fays he) have an herb out of which they prefs a delicate juice, which ferves them for drink inftead of wine: it alfo preferves their health, and frees them from all thole evils whish the immoderate ufe of wine produces
* Ander-
fon's Com-
merce, vol
ii. P. \(13^{8 .}\) among us *."
'Tea was introduced into Europe in the year 1610 by the Dutch Eaft India Compray. It is generally faid, that it was firf imported from Holland into England, in 1666 , by the lords Arlington and Otfory, who brought it into faftion among people of quality. But it was ufed in coffee-houfes before this period, as appears from an act of parliament made in 1660 , in which a duty of 8 d . was laid on every gallon of the infufion fold in thefe places. In 1666 it was fold in London for 60 . per pound, though, it did not cof more than 2 s .6 d . or 3 s .6 d , at Batavia. It continued at this
price till 1707 . In 1715 green tea began to be uled; and as great quantities were then imported, the price was leffened, and the practice of drinking tea defcended to the lower rankst. In 1720 the French began \({ }^{10}+\) Hanway's fend it \(t 0\) us by a clandeftine commerce. Since that fournal. period the demand has been increafing yearly, and it has become almof a neceffary of life in feveral parts of Europe, and among the loweft as well as the ligheft ranks.

The following table will give an idea of the quantity of tea imported annually into Great Britain and Ireland fince 1717 :
```

From 1717 to 1726
1732 to 1742
1,200,000
1766
1785 about
1794 from
6,000,000
16 to 20,000,000

```

Befides thefe immenfe quantities imported into Britain and Ireland, mucl has been brought to Europe by other nations. In 1766 the whole tea imported into Europe from China amounted to 17 millions of pounds; in 1785 it was computed to be about 19 millions of pounds \(\ddagger\).

Several refearches have been made in Europe to de- \(\ddagger\) Rall i. and termine whether the tea plant grows fpontaneoully; but Robertfon's thefe refeaches have been hitherto in vain. When India. Captain Cook vifited Teneriffe in his laft voyage, Mr Anderfon his furgeon was informed by a gentleman of acknowledged veracity, that a thrub is common near Santa Cruz which agrees exactly with the defcription given of the tea-plant by Linuæus. It is confidered as a weed, and large quantities are rooted out of the vineyards every year: But the Spaniards who inhabit the illand fometimes make ufe of it, and afcribe to it all the qualities of the tea imported from China.

Many attempts have been made to introduce this valuable plant into Europe; but from want of proper pre. cautions molt of thefe attempts have mifcarried. The feeds, being of an oily nature, are apt to grow rancid during a long vayage, unlefs proper care is taken to preferve them. There are two methods of preferving thefe feeds: The firf is, to inclofe them in wax after they have been dried in the fun; the fecond is, to leave them in their hufks, and thut them up clofely in a box made of tin: but neither of thefe methods has been attended with general fuccefs, whatever care has been taken to obtain frefh feeds, or to preferve them. The beft method would be, to fow freth feeds in fine light earth immediately on leaving Canton, and to cover them with wire to fecure them from rats and other animals that might attack them. The boxes ought not to be too much expofed to the air, nor to that kind of dew which rifes from the fea. The earth in the boxes muft neither be hard nor dry, and thould from time to time be gently watered with frefl or rain water; and when the fhoots begin to appear, they ought to be kept in a nlight moilture, and hheltered from the fun. The teaplants to be found in England have been procured by thefe means only; and though feveral of the young rifing thoots perified, the laft method propofed is probably that which may be followed with greatell fuccefs.

The finef tea-plant known in England was raifed in

\section*{T E A}

Kew gardens ; it was carried thither by Sir J. Ellis, who brought it from feed: but the firft that ever Hlourified in Europe was one belonging to the duke of Northumberland at Sion, from a drawing of which our engraving is taken. The plants which are cultivated in the gardens near London thrive well in the green-houfe during winter, and fome fland that feafon in the open air. Limneus, who obtained this fhrub in its growing flate, contrived to preferve it in the open air in the northern latitude of Sweden. France has allo procured Some plants. There can be no doubt but they would fucceed in many countries of Europe, if proper care were paid to their cultivation till they became inured to the climate. It will be a great advantage if we can rear that plant, which can never fuffer fo much from change of foil as from growing multy during the long voyage from China. Befides, the demand for tea is now become fo great, that the Chinefe find it neceffary, or at leaft profitable, to adulterate it. Bad tea is now become an univerfal complaint. The abbé Grofier tells us, that there is a kind of mofs which grows in the neighbourhood of the little city of Many-ing-hien, which is fold as a delicate feccies of tea. If his delicious commodity is adulterated in China, can we flatter ourfelves that none comes to us but what is pure and unmised? How would our fine ladies like to be told, that inftead of tea they drink nothing but the infufion of mofs from the rocks of Mang-ing-hien ( F ) ?

Of the chemical qualities and effects of tea on the conflitution, many various and oppofite opinions have been formed. About a century ago, Bontikoe, a Dutch phyfician, beftowed extravagant encomiums on the benefits of tea. With him it was good for every thing; and any quantity might be drunk, even to the amount of 200 difhes in a day. Whether Bontikoe in this cale acted as a phyfician, or, being a Dutchman, was eager to encourage the fale of an important article of his country's commerce, is not eafy to fay. On the other hand, the pernicious effects of tea upon the nervous fyltem have been ofter repeated, and very oppofite effects have been afcribed to it. Some affirm that green tea is mildly aftringent ; others fay it is relaxing: Some fay it is narcotic, and procures fleep; while others contend, that taken before bed-time it afuredly prevents it.

Dr Lettfom, who has written the Natural Hifory of the Tea Tree, made fcveral experiments to dctermine its chemical qualities. He found an infufion of it preferved becf frem; it is therefore antifieptic : and from its Itriking a purple colour with the falt (fulphate) of iron, he he juftly concludes that it is aftringent. He concludes alfo, that the effential qualities of tea refide in its fragrant and volatile parts.

We have heard much of the bad effects of tea, but we have neither felt nor obferved it. If it were fo pernicious as it has been reprefented by fome, its effects muft certainly be evident in China, where it is drunk by all ranks; yet fo far from being thought hurtful in that country, it is in high eltimation. The prefent emperor has compofed a kind of eloge on the virtues of tea. We are told by thofe who have written the hiftory of China, that inflammatory difeafe are lefs frequent there than in many other countries, which is afcribed folely to the liberal ufe of tea. It mult be obferved by all, that tea is an antidote againf intemperance, and that he who relifhes the one feldom runs into the other. Raynal fays, that tea has contributed more to the fobriety of this nation than the fevereft laws, the molt eloquent harangues of Chrifian orators, or the beft treatifes of morality. We have no doubt but it may be hurtful to fome conftitutions in particular circumflances; but we fufpect that the nervous diforders fo often attributed to tea, are rather owing to hereditary difeafes, to want of exercife, and to irregularity in food or heep, than to tea.
"Weak tea drunk too hot (fays Dr Leake) will enervate, and if very flrong, may prove equally pernicious by affecing the head or flomach. But when it is drunk in moderation, and not too warm, with a large addition of milk, I believe it will feldom prove hurfful, but, on the contrary, falutary. After fludy or fatigue it is a moft refrefhing and grateful repaft ; it quenches thirft, and cheers the fpirits, without heating the blood; and the pleafing fociety, in which we fo often partake of it is no inconfiderable addition to its value; for whatever affords rational pleafure to the mind, will always contribute to bodily health.

In this country teas are generally divided into three kinds of green, and five of bohea: The former are, I. Imperial or bloom tea, with a large loofe leaf, lighs
green.
(F) There is very good reafon to believe, that the adulteration of tea is not confined to China. It is practifed, and often with too much fuccefs, among ourfelves. Mr Twining, a confiderable tea dealer in London, publifhed a pamphlet fome years ago, in which he has expofed this infamous traffic. The information (he fays) was obtained from a gentleman who had made very accurate inquiries into this fubject.

The fmouch for mixing with black teas is made of the leaves of the ath. When gathered, they are firft dried in the fun, then baked: they are next put upon a floor, and trod upon until the leaves are fmall, then fifted and fteeped in copperas with hheep's dung; after which, being dried on a floor, they are fit for ufe. There is allo another mode : When the leaves are gathered, they are boiled in a copper with copperas and fleep's dung; when the liquor is Atrained off, they are baked and trod upon, until the leaves are frnall, after which they are fit for ufe. Tbe quantity manufactured at a fnall village, and within eight or ten miles thereof, cannot be afcertained, but is fuppofed to be about 20 tons in a year. One man acknowledges to have made 600 weight in every week for firs months together. The fine is fold at 47. 4s. per cwt. equal to 9 d . per lb . The coarfe is fold at 2l. 2s. per cwt. equal to \(4 \frac{d}{d}\). per lb . Elder buds are manufactured in fome places to reprefent fine teas.

For the honour of human nature, we hope fuch a traffic as this is not very common; but if it be, thofe concerned in it deferve exemplary punifhment. The only way (Mr Twining fays) to efcape thic adulterated tea, is never to purchafe from thofe who offer their teas to fale at lower prices than genuine teas can be afforded; but to purchafe them only from perfons of character.

\section*{TEA [230] TE}

Teas, green colour, and a faint delicate fell. 2. Hyson, fo Teachers. \(4 \rightarrow\) called from the name of the merchant who first imported it ; the leaves of which are clofely culled and fall, of
a green colour, verging to a blue: And, 3. Singlo tea, from the name of the place where it is cultivated. The boheas are, 1. Souchong, which imparts a yellow green colour by infufion. 2. Mambo, fo called from the place where it is made; a fragrant tea, with a volet finell; its infufion pale. 3. Congo, which has a larger leaf than the following, and its infufion fomewhat deeper, refembling common bohea in the colour of the leaf. 4. Pekoe tea; this is known by the appearance of fall white flowers mixed with it. 5. Coinmon boha, whole leaves are of one colour. There are other varieties, particularly a kind of green tea, done up in roundish balls, called gunpowder tea.

Tes-Tree of New Zealand, is a fpecies of myrtle, of which an infusion was drunk by Captain Cook's peaple in their voyages round the world. Its leaves were finely aromatic, altringent, and had a particular pleafant flavour at the frt infusion; but this went off at the next filling up of the tea-pot, and a great degree of bitterness was then extracted; for which reafon it was never fugfeed to be twice infuled. In a fine foil in thick forefts this tree grows to a confiderable five; fometimes 30 or 40 feet in height, and one foot in diameter. On a lilly and dry exposure it degenerates into a flub of five or fix s inches; but its ufual frize is about eight or ten feet high, and three inches in diameter. In that cafe its flem is irregular and unequal, dividing very foo into branches, which arife at acute angles, and only bear leaves and flowers at top. The flowers are white, and very ornamental to the whole plant.
Mr White, in his Journal of a Voyage to New South Wales, mentions a flirub which he calls a tea -tree, merell from its being unfed by the convicts as a fuccedaneum for tea; for he had not len the flower, nor did he know to what genus it belonged. It is a creeping kind of a vine, running to a great extent along the ground; the flak lender; the leaf not fo large as the common bay leaf; the tale fret, exactly like the liquorice root of the flops.

TEACHERS, perfons employed in conducting the education of the young.

We will venture to fay, that there is no claps of men to whom a nation is fo much indebted as to thole emplayed in infracting the young : For if it be education that forms the only dilinction between the civilized and the lavage, much certainly is due to thole who devote themselves to the office of instruction. It mut be the duty therefore of every ftc to take care that proper encouragement he given to thole who undertake this of fine. There ought to be fuch a falary as would render it an object of ambition to men of abilities and learning, or at leaf as would keep the teacher refpectable. In Scotland, the office of a fchoolmafter was formerly much more lucrative than at prefent, and moll of that class had received liberal education; and this is the rafor why the common people in Scotland have been famows even to a proverb, for their learning. But at perefont the falary of a country fchoolmalter, independent of fees for scholars, is not greater than a ploughman can earn, being feldom more than 81. Gs. Bd. the coniczuence of which is that this, which is in fact an honour-
able, becaufe an uffful frofeffion, is now firing into Teachers contempt. It is no longer an object to a man of learning; and we mut fool be fatistied with fchoolmafters that can read, write, and caff accounts, a little better than the lowell of the people, or who from forme natural deformity are unable to exercife a trade. And what in this cafe mut become of the minds of the common prople? They mun be totally uncultivated.

We have oblerved a great difference between the culltivation of the common people in one part of Scotland compared with another; and we have found, that wherever a fchoolmafter is looked upon as a mean profeffion there is fcarcely a duly qualified perfon to be found to undertake the office; and in thole places the common people are lamentably ignorant. In other places again, where the fchoolmafter is considered as one of the primcipal perfons in the parifh, there men of a liberal educaton, young divines, and preachers, do not think themSelves difgraced by exercifing this profeffion; and there the common people flow a degree of acutenefs, knowledge, and observation, and poffefs fuck polished manness, as raife then very high above thole of their own rank in other parts of the country.

Many and keen have been the debates about a reform of government of late years; but little attention has been paid to the formation of the minds of the common people, who conllitute the greater part of the nation; of courfe they are ready to join the flandard of every feditious demagogue who founds the alarm of oppreffin; and fhould they at length be routed, their cruelty and barbarity, like the common people of France, would be exactly in proportion to their ignorance and want of principle.

We are willing to hope, then, that the government and the moneyed men of the nation, who alone have propetty to lore and money to below, will at length find it to be their intereft to patronize [choolmafters.

TE. deus, the name of a celcbrated hymn, used in the Chrittian church, and fo called hecaufe it begins with the fe words, \(T_{e}\) Drum Inudamus, We praife thee, O God. It is fug in the Romish church with great

\section*{TE F [ 231 [ T E F}
pomp and fulemnity upon the gaining of a victory, or other happy event; and is believed to be the compofition of St Ambrose bilhop of Milan.

TEES, a rives which rifes on the confines of Cumberland, and runaing eaftward, divides the county of Durhanı from Yorkhire, and falls into the German fea below Stockton.

TEEIH, the bones placed in the jaws for chewing fuod, that it may be the more eafily digefted ia the flomuch. The anatomical llructure of the tceth has already been defcribed unden Anstomy. The difeafes to which they are liable, as well as the moft fucceffful remedies for removing them, are fully detailed under Medicine and Surgery.

Much attention has been paid to the beauty and prefervation of the teeth among molt nations. The Komans subhed and wafhed them with great care; and when they loft them, fupplied their place with artificial teeth made of ivury; and funsetimes, when loofe, bound them with gold. Ligatures of wite have been found to hurt the natural teeth with whiel the artificial are connceted: whacreas filke: twit cannot affect them to any confiderable degree for feveral years.

Guilleman gives us the compofition of a pafte for making arificial teeth, which fhall never grow yellow: the compofition is white was. granulated, and melted with a little gum elemi, adding powder of white maitich, coral, and pearl.

When feveral teeth are out in the fame place, it is beft to make a fet, or the number wanted, out of one piece, all adhering together, which may be faftened to the two next of the found or natural teeth. And even a whole fet of altificial teeth may be made for one or both jaws, fo well fitted to admit of the neceflaty motions, and fo conveniently retained in the proper fituation by means of fpringe, that they will anfwer every purpofe of natural teeth, and may be taken out, cleaned, and replaced, by the patient himfelf with great eafe.

The common trick of mountebanks and other fuch practitioners, is to ufe various wafles for teeth, the fudden effects of which, in cleaning and whitening the teeth, furprife and pieafe people; but the effects are very pernicious. All the ftrong acid firits will do this. As good a misture as any thing can bc, on this occafion, is the folluring: take plantane-water an ounce, honey of rofes two drams, muriatic acid ten drops; mix the whole together, and rub the teeth with a piece of linen rag dipped in this every day till they are whitened. The mouth ought to be well wafhed with cold water after the ufe of this or any other acid liquor; and indeed the beft of all teeth walhes is cold water, with or without a little falt ; the conftant ufe of this will keep them clean and white, and prevent them from aching.

After all the numerous cures which have been propofed for preventing the toothach, we will venture to recommend the keeping the teeth clean as the moll efficacious, and avoiding cvety kind of hot food, efpecially hot liquids, as tea, \&ic. They who are conflantly ufing powders generally deffroy their teeth allagether, as the valetudinaiim docs his health.

TEETHing in children. See Medicine.
TEFF, a kind of grain, fown all over Abyffinia, from which is made the bread commonly uled through out the country. We have no defcription of this plant but froan Mr Bruce, who fays that it is herbaceous; and
that from a number of weak leaves furrounding the root proceeds a falk of about 28 inches in length, not perfectly fraight, fmooth, but jointed or knotted at particular diftances. This ftalk is not much thicker than that of a carnation or julyflower. About eight inches from the top, a head is formed of a number of fmall branches, upon which it carries the fruit and flowers; the latter of which is fmall, of a crimfon colour, and fcareely perceptible by the naked eye but from the oppofition of that colour. The pillil is divided into two, leemingly attached to the germ of the fruit, and has at each end fmall capillaments forming a brufh. The ftamina are three in number; two on the lower fide of the piftil, and one on the upper. Thefe are each of them crowned with two oval figmata, at firft green, but after: crimfon. The fruit is formed in a capfula, confifling of two conical b:ollow leaves, which, when clofed, feems to compofe a finall conical pod, pointed at the top. The fruit or feed is oblong, and is not fo large as the bead of the fmalleft pin; yet it is very prolific, and produces thefe feeds in fuch quantity as to yicld a very abundant crop in the quantity of meal.

Our author, from the fimilarity of the namer, conjectures it to be the tipha mentioned, but not defcribed, by Pliny; but this corjecture, which he acknowledges to be unfupported, is of very little importance.

There are three kinds of meal made from teff, of which the beft (he fays) is as white as flour, exceedingly light, and eafily digefted ; the fecond is of a brawner colour; and the laft, which is the food of foldiers and fervants, is nearly black. This variety he imagines to arife entirely from the difference of foils in which the feeds are fown, and the different degrees of moilure to which the plant is expofed when growing. The manner of making the meal or flour into bread is by taking a broad earthen jar, and having made a lump of it with water, they put it into an earthen jar at fome diflance fiom the fire, where it remains till it begins to Ferment or turn four; they then bake it into cakes of a circular form, and about two feet in diameter: it is of a fpungy foft quality, and not a difagreeable fourith tafte. Two of thefe cakes a-day, and a coarfe cotton cloth once a-year, are the wages of a common fervant.

At their banquets of raw meat, the fleth being cut in fmall bits, is wrapt up in pieces of this bread, with a proportion of foffil falt and Cayenne pepper. Before the company fits down to eat, a number of thefe cakes of different qualities are placed one upon the other, in the fame manner as our plates, and the principal people fitting firf dow, eat the white teff; the fecond or coarfe: fort ferves the fecond rate people that fucceed them, and the third is for the fervants. Every man, when he is done, dries or wipes his fingers upon the bread which he is to leave for his fucceffor, for they have no towels; and this is one of the moft beafly cufoms among them.

Of this teff bread the natives make a liquor, by a pro. cefs which pur author defrribes in the following words: The bread, when well toafted, is broken into fmall pieces, which are put into a large jar, and have warm: water poured upon them. It is then fet by the fire, and frequently firred for feveral days, the mouth of the jarbeing clofe covered. After being allowed to fettie three or four days, it acquires a fourifh taf?e, and is what they call bouza, or the common beer of the country. The bouza in Atbara is made in the fame manner, only in-

\section*{T E G [ 232\(] \quad\) T E L}
fead of teff, cakes of barley meal are employed. Both a.e very bad liquors, but the worft is that made of barle\%.

TEFFLIS, or Tifflis, a town of Afia, in Georgia, one of the leven nations betweer the Black fea and the Cafpion. It is the capital of that country, the place of reisicnce of its fovereigu, and iv called by the inhabitancs Thilis-Cabor, " warm town," from the warm baths in its neighbourhood. Though its circumference does not exceed two Englifh miles, it comains 20,000 inhabitants, of which more than half are Armenians; the remainder are principally Georgians, with fome Tartars. According to Major Rennel, it has 25 Armenian and I; Greek churches, and three metfheds. But Mr Cose, ors the authority of Profeffor Guldenitaedt, flates the places of worfhip to be one Roman Catholic, 13 Greek, and feven Armenian ehurches. There are fome magnif.cent caravanferas, bazars, and palaces in the city, but no mofques; for the Georgians, though living under a Moliammedan government, have always rifen up in arms as often as any attempts have been made to erect fuch places of Mohanmedan worlhip. Many of the Romifh mifionaries live here in difguife under the denomination of phyficians, furgeons, and chemifts; and the great cures which they perform procure them much efteem, though they are fometimes expofed to the infults of the people when they attempt to make any profelytes to their church. All the houfes are of ftone, with flat roofs, which ferve, according to the cuitoms of the Eaft, as walks for the women. They are neatly built; the rooms are wainfcotted, and the floors fpread with carpets. The flreets feldom exceed feven feet in breadth; and fome are fo narrow as fcarcely to allow room for a man on horfeback : they are confequently very filthy.

Teflis is a place of confiderable trade, elpecially in furs, which are conveyed hence to Conftantinople by the way of Erzerum. As for the filks of this country, they are bought up on the foot by the Armenians, and conveyed to Smyrna and other ports of the Mediterranean ; but the greatelt part is firff fent to Erzerum to be manufactured, the Georgians being very ignorant and unfkilful in that refpect. From hence, likewife, great quantities of a root called boya is fent to Erzerum and Indontan for the ufe of the linen dyers. Here is likewife a foundery, at which are caft a few cannon, mortars, and balls, all of which are very inferior to thofe of the Turks. The gunpouder made here is very good. The Armenians have likewife eftablifhed in this town all the manufactures carried on by their countrymen in Perfia: the moft flourifing is that of printed linens. Teflis is feated on the river Kur, at the foot of a mountain ; and on the fouth fide of it flands a large cafle or fortrefs, built by the Turks in 1576, when they made themfelves matters of the city and country, under the command of the famous Muftapha Pacla. It is 125 miles weft of Terki. E. Long. 63. 3. N. Lat. 41.59.

TEGERHY, a principal town in Fezzan, in Africa, about 80 miles fouth-weft of the capital. It collects from its lands little other produce than dates and Indian corn. In this, as in every town in Fezzan, a market for butcher-meat, corn, fruit, and vegetahles, is regularly held. Mutton and goats flefh are fold by the quarter without weighing ; the ulual price is from 32 to 40 grains of gold-duft, or four or five hillings Englifi movey. 'the flefh of the camel, which is much more highly
valued, is commonly fold at a dearer rate, and is divid- Terument ed into fmaller lots. Agriculture and pafturage feem to be the princıpal occupations.
'IEGUMEN'I', any thing that furrounds or covers another.

TEINTS, and Semiternts, in Painting, denote the feveral colours ufed in a picture, conlidered as more or lefs ligh, bright, deep, thin, or weakened and diminifted, \&c. to give the proper relievo, foftnefs, or diftance, \&c. of the feveral objects.

TELEGRAPH (derived from \(\tau \gamma \lambda_{\varepsilon}\) and \(\gamma \operatorname{geq}^{\circ} \varphi \omega\) ), is the name very properly given to an inflrument, by means of which information may be almof inftantaneoully conveyed to a confiderable diftanee.

The telegraph, though it has been generally known and uled by the moderns only for a few years, is by no means a modern invention. There is reafon to believe that amongit the Greeks there was fome fort of telegraph in ufe. The burning of Troy was cestainly known in Greece very foon after it happened, and before any perfon had returned from thence. Now that was altogether fo tedious a piece of bufinefs, that conjecture never could have fupplied the place of information. A Greek play begins with a fcene, in which a watchman defcends from the top of a tower in Greece, and gives the information that Troy was takep. "I have been looking out thefe ten years (fays he) to fee when that would happen, and this night it is done." Of the antiquity of a mode of conveying intelligence quickly to a great diftance, this is certainly a pioof.

The Clinefe, when they fend couriers on the great canal, or when any great man travels there, make fignals by fire from one day's journey to another, to have every thing prepared; and moft of the barbarous nations ufed formerly to give the alarm of war by fires lighted on the hills or rifing grounds.

Polybius calls the different inftruments ufed by the ancients for communicating information tugoscat, pyrfie, becaufe the fignals were always made by means of fire. At firf they communicated information of events mertly by torches; but this method was of little ufe, becaufe it was necefiary before-hand to fix the meaning of every particular fignal. Now as events are exceedingly various, it was impollible to exprefs the greater number of them by any premeditated contrivance. It was ealy, for inftance, to exprefs by fignals that a fleet had arrived at fuch a place, becaufe this had been forefeen, and fignals accordingly had been agreed upon to denote it; but an unexpected revolt, a murder, and fuch accidents, as happen but too often, and require an immediate remedy, could not be communicated by fuch fignals; becaufe to forefee them was impolfible.

Ancas, a contemporary of Ariflotle, who wrote a Polybius, treatife on the duties of a general, endeavoured to cor-book x. rect thofe imperfections, but by no means fucceeded, chap. 40 . "Thofe (fays he) who would give fignals to one another upon affairs of importance, muft firf prepare two veffels of earth, exactly equal in breadth and depth; and they need be but four feet and a half deep, and a foot and a half wide. They then mutt take pieces of cork, proportioned to the mouth of thefe veffels, but not quite fo wide, that they may be let down with eafe to the bottom of thefe veffels. They next fix in the middle of

\author{

}

\section*{T E L [ 233 ] 'I' E 1,}

Telegraph. this cork a flick, which muft be of equal fize in both thefe veffels. 'Ihis fick muft be divided exaclly and diftinefly, by fpaces of three inches each, in order that fuch events as generally happen in war may be written on them. For example, on one of thefe faces the following words may be written: ' A body of horse are marcied into the country.' On another, 'A body of infantry, heavily armed, are arrived hither'. On a third, 'Infantry lightly armed. On a fourth, - Horse and foot.' On another, 'Shirs;' then ' Provisions;' and fo on till all the events which may prob. ably happen in the war that is carrying on are marked in thefe intervals.

This being done, each of the two veffels mult have a little tube or cock of equal bignefs, to let out the water in equal proportion. Then the two veffels mult be filled with water; the pieces of cork, with their ficks thruft through them, muft be laid upon them, and the cocks mult be opened. Now, it is plain, that as thefe veffels are equal, the corks will fink, and the ficks defcend lower in the veffels, in proportion as they empty themfelves. But to be more certain of this exactnefs, it will be proper to make the experiment firt, and to examine whether all things correfpond and agree together, by an uniform execution on both fides. When they are well affured of this, the two veffels muft be carried to the two places where the fignals are to be made and oblerved: water is poured in, and the corks and fticks are put in the veffels. When any of the events which are written on the ficks fhall happen, a torch or other light is raifed, which muft be beld aloft till fuch time as another is raifed by the party to whom it is directed. (This firf fignal is only to give notice that both parties are ready and attentive). Then the torch or other light muft be taken away, and the cocks fet open. When the interval, that is that part of the fick where the event of which notice is to be given or written, flall be Eallen to a level with the veffels, then the man who gives the fignal lifts up his torch; and on the other fide, the correfpondent fignal-maker immediately turns the cock of his veffel, and looks at what is writ on that part of the fick which touches the mouth of the veffel : on which occafion, if every thing has been executed exactly and equally on both fides, both will read the fame thing."

This method was defective, becaufe it could not convey any other intelligence except what was written on the fticks, and even that not particularly enough. With regard to all unforefeen events, it was quite ufelefs.

A new method was invented by Cleoxenus (others fay by Democlitus), and very much improved by Polybius, as he himfelf informs us. He defcribes this method as follows: Take the letters of the (Greek) alphabet, and divide them into five parts, each of which will confift of five letters, except the laft divifion, which will have only four. Let thefe be fixed on a board in five columns. The man who is to give the fignals is then to begin by holding up two torches, which he is to keep aloft till the other party has allo thown two. This is only to flow that both fides are ready. Thefe firft torches are then withdrawn. Both parties are provided with boards, on which the letters are dilpofed as formerly defcribed. The perfon who then gives the fignal is to hold up torches on the left to point out to the other party from what column he fhall take the letters as they

Vol. XX. Part I.
are pointed ont to him. If it is to be from the frift co. Preegraph. lumm, he holds up one torch; if from the fecond, two ; and fo on for the others. He is then to hold up torclies on the right, to denote the particular letter of the co. lumn that is to be taken. All this mut have been agreed on before-hand. The man who gives the fignals mult have an inftrument (diontgus), confilling of two tubes, and fo placed as that, by looking through one of them, he can fee only the right fide, and throught the other only the left, of him who is to anfuer. The board muft be fet up near this infrument; and the flation on the right and left mun be furiounded with a wall ( \(\pi \alpha \xi \alpha \pi \varepsilon \psi_{\xi} \sigma \chi^{\beta a r}\) ) ten feet broad, and about the height ob a man, that the torches raifed above it may give a clear and Atrong light, and that when taken down they may be completely concealed. Let us now fuppofe that this information is to be communicatcd.-A number of the auxiliaries, about a hundred, have gone over to the chemy. In the firt place, words muf be chofen that will convey the information in the feweft letters poffible; as, \(A\) hundred Cretans have deferted, Kgntes 'छxxीov a \(\varphi^{\prime}\) reau yplopeonyour. Having writen down this fentence, it is conveyed in this manner. The firll letter is a \(K\), which is in the fecond column; two torches are therefore to be raifed on the left hand to inform the perfon who receives the fignals to look into that particular column. Then five torches are to be held up on the right, to mark the letter \(k\), which is the laft in the column. Then four torches are to be held up on the left to point out the \(e_{\rho}\) \((r)\), which is in the fourth column, and two on the right to fhow that it is the fecond letter of that column. The other letters are pointed out in the fame manner. -Such was the pyrfia or telegraph recommended by Polybius.

But neither this nor any other method mentioned by the ancients feems ever to have been brought into general ufe; nor does it appear that the moderns had thought of fuch a machine as a telegraple till the year 1663 , when the Marquis of Worceftet, in his Century of Inventions, affirmed that he had difcovered " a method by which, at a window, as far as eye can difcover black from white, a man may hold difcourfe with his corre. fpondent, without noife made or notice taken; being according to occafion given, or mears afforded, ex re na\(t a\), and no need of provifion before hand; though much better if forefeen, and courfe taken by mutual confent of parties." This could be done only by means of a telegraph, which in the next fentence is declared to have been rendered fo perfect, that by means of it the correfpondence could be carried on " by night as well as by day, though as dark as pitch is black."

About 40 years afterwards M. Amontons propofed a new telegraph. His method was this: Let there be people placed in feveral ftations, at fuch a diftance from one another, that by the help of a telefcope a man in one flation may fee a fignal made in the next before him; he muft immediately make the fame fignal, that it may be feen by perfons in the fation next after him, who are to communicate it to thofe in the following flation, and fo on. Thefe fignals may be as letters of the alphabet, or as a cipher, underfood only by the two perfons who are in the difant places, and not by thofe who make the fignals. The perfon in the fecond ftation making the fignal to the perfon in the third the very moment he fees it in the firlt, the news may be carried to the greatent
diftance

\section*{T E L \\ T E I}

Telegraph. ditance in as little time as is necoflary to make the fignals in the firt ftation. The dilance of the fevernl fations, which mutt be as few as poffible, is meafured by the reach of a telefcope. Amontons tried this method in a fmall tract of land before feveral perfons of the highe:t rank at the court of France.

It was not, however, till the French revolution that the telcgraph was applied to uteful purpofes. Whether M Clappe, who is faid to have invented the telegraph firti uled by the French abcut the end of 1793, knew any thing of Amontons's invention or not, it is impoffinle to lay; but his telegraph was confructed on principies nearly fimilar. The manner of uirg this telegraph war as follows: At the firf ीation, which was on the roof of the palace of the Louvre at Paris, M. Chappe, the inventur, received in writing, from the committee of publir welfare, the words to be fent to Litle, near which the French army at that time was. An upright polt was erected on the Lourre, at the top of which were two trantverfe azms, moveable in all ditedions by a fingit piece of mechariim, and with inconccivable rapidity. Fie invented a number of fofilions for thefe arms, which fiood as figns for the letters of the alphabet; and thefe, for the greater celerity and fimplicity, he reduced in number as nuch as polfible. The grammarian will eafily conceive that fixteen figns may amply fupply all the letters of the alphabet, fince fume letters may be omitted not only without detriment but with advantage. Thefe figns, as they were arbitrary, could be changed every week; fo that the fign of \(B\) for one day might be the fign of \(M\) the next ; and it was only necefary that the perforis at the extremity fhould know the key. The intermediate operators were only inftucted generally in thefe fixteen fignals; which were fo ditinct, lo marked, fo different the one from the olher, that they were eafily remembered. The conftruction of the machine was fuch, that each fignal was uniformly given in precifely the fame manner at all times: It did not depend on the operator's manual fikill; and the pofition of the arm could never, for any one fignal, be a degree higher or a degree lower, its movement being regulated mechanically.
M. Chappe having received at the Louvre the fentence to be conveyed, gave a known fignal to the fecond flation, which was Mont Martre, to prepare. At each flation there was a watch tower, where telefcopes were fixed, and the perfon on watch gave the fignal of preparation which he had received, and this communicated fucceffively through all the line, which brought them all into a flate of readinefs. The perlon at Mont Martre then received, letter by letter, the fontence from the Lnuvre, which he repeated with his own machine ; and this was again repeated from the next height, with inconceivable rapidity, to the final fation at Liff.

The firft defcription of the telegraph was brought from Paris to Erankfort on the Maine by a former mem. ber of the parliament of Bourdeaux, who had feen that which was erected on the mountain of Belville. As given by Dr Hutton from fome of the Englint papers, it is as follows. \(\triangle \mathrm{A}\) is a beam or matt of wood place, upright on a rifing ground (fig. 1.), which is about 15 or 16 feet high. B13 is a beam or balance moving upon the centre AA. This balance-bcam may be placed vertically or horizontally, or any how inclined, by means of Atong cords, which are fixed to the whecl 1),
on the cage of which is a double groove to receive the Telegrapi. two cords. This balance is about 11 or 12 feet long, and nine inches broad, having at the end two pieces of wood CC, which likewife turn upon angles by means of fuur other cords that pafs through the axis of the main balance, otherwife the balance would derange the cords; the pieces \(C\) are each about three fect long, and may be placed either to the right or left, ftraight or !quare, with the balance-kean. By means of thefe three the combination or movement is very extenfive, remarkably fimple, and eafily performed. Below is a frall wooder gouge or hut, in which a perfon is employed to obferve the movements of the machinc. In the mountain neareft to this another perlon is to repeat thefe movements, and a third to write them down. The time taken up for each movement is 20 feconds; of which the motion alone is four feconds, the other 16 the machine is flationasy. 'I'wo working models of this inftrument were executed at Frankfort, and fent by Mr W. Playfair to the duke of York ; and hence the plan and alphabct of the machine came to England.

Various experiments were in confequence tried upon telegraphs in this country; and one was foon after fet up by government in a chain of ltations from the admirally.cffice to the fea coaft. It confifts of fix octagon boards, each of which is poifed upon an axis in a frame, in fuch a manner that it can be either placed vertically, fu as to appear with its full fize to the obferver at the neareft ftation, as in fig. \(z\). or it becomes invifible to him by being placed horizontally, as in fig. 3. fo that the Tig. 2. narrow edge alone is expofed, which narrow edge is from a diflance invifible. Fig. 2. is a reprefentation of this telegraph, with the parts all hint, and the machine ready to work. T, in the officer's cabin, is the telefcope pointed to the next fation. Fig. 3. is a reprefentatiun Fig. 3. of the machine not at work, and with the ports all open. The opening of the firlt port (fig. 2.) exprefles \(a\), the fecond \(b\), the third \(c\), the foutth \(d\), the hith \(c\), the fixth \(f\), \&ic.
Six boards make 36 changes, by the moft plain and fimple mode of working; and they will make many more if more were necefary ; but as the real fuperiority of the telegraph over all other modes of making fignals confits in its making letters, we do not think that more changes than the letters of the alphabet, and the ten arithmetical ciphers, are neceflary; but, on the contrary, that thofe who work the telegraphs fhould avoid communicating by words or figns agreed upon to exprefs fentences; for that is the fure method never to become export at fending unexpected intelligence accurately.
This telegraph is withnut doubt made up of the beft number of combinations polfible; five boards would he infufficient, and feven would be ufelefs. It has been objected to it, however, that ils form is too clumly to admit of its being raifed to any confiderable height above the building on which it flands; and that it cannot be made to change its direction, and confequently cannot be feen but from one particular point.

Several other telegraphs have been propofed to remedy thele defeets, and perliaps others to which the inftument is filil liaule. The dial plate of a clock would make an excellent telegraph, as it might exlibit 144 figns fo as to be rifible at a great dillance. A telegraph on this principle, with only fix divifions inftead of

\section*{TE L [ 235\(] \quad \mathrm{T}] \mathrm{T}\)}

Tciegrapit. twelve, would be fimple and cheap, and might be raifed \(\xrightarrow{\square}\) 23 or 30 feet ligh above the building without any dif ficulty: it might be fupported on one poit, and therefore turn round, and the contralt of colours would always be the fame.

A very ingenious improvement of the telegraph has been propofed in the Gentleman's Magozine. It conlifts of a femicircle, to be properly elevated, and fixed perpendicularly on a frong fland. The radius 12 feet; the femicircle coufequently fomewhat more than 36 . This to be divided into 24 parts. Fach of thefe will therefore comprite a face of 18 inches, and an arch of \(7^{\circ} 33^{\prime}\) on the circumference. Thefe 24 divifions to be occupied by as many circular apertures of fix inches diameter ; which will leave a clear face of fix inches on each fide between the apertures. Thete apertures, beginning from the left, to denote the letters of the alphabet, omitting K , J confonant, \(\mathrm{V}, \mathrm{X}\), and Q, as ufelefs for this purpofe. There are then \(2 I\) letters. The four other fipaces are referved for fignals. The inflrument to have an index moveable by a windlafs on the centre of the femicircle, and having two tops, according as it is to be ufed in the day or night; one, a circular top of lacquered iron or copper, of equal diameter with the apertures (and which confequently will ecliple any of them againf which it refts) ; the other, a pear or arrowfhaped top, black and highly polinhed, which, in flanding before any of the apertures in the day-time, will be difinctly vifible. In the night, the apertures to be reduced by a diaphragm fitting clofe to each, fo as to leave an aperture of not more than two inches diameter. The diaphragm to be of well-polifhed tin; the inner rim lacquered black half an inch. All the apertures to be illuminated, when the infrument is ufed in the nighttime, by fmall lamps; to which, if neceffary, according to circumftances, convex lenfes may be added, fitted into each diaplragm, by which the light may be powerfully concentrated and increafed. Over each aperture one of the five prifmatic colours leaf likely to be miftaken (the remaining two being lefs diftinguilhable, and not wanted, are beit omitted) to be painted; and, in their natural order, on a width of eighteen inches and a depth of four, red, orange, yellow, green, blue : or, flill to heighten the contraft, and render immediately fucceffive apertures more diftinguifhable, red, green, orange, blue, yellow. The whole inner circle beneath and between the apertures to be painted black.

When the inftrument is to be ufed, the index to be fet to the fignal apertures on the right. All the apertures to be covered or dark when it begins to be ufed, except that which is to give the fignal. A fignal gun to be fired to apprife the obferver. If the index is fet to the firft aperture, it will denote that words are to be expreffed; if to the fecond, that figures; if to the third, that the figures ceafe; and that the intelligence is carried on in words. When figures are to be expreffed, the alternate apertures from the left are taken in their order, to denote from I to 10 inclufively; the fecond from the right denotes 100 ; the fifth ro00. This order, and thefe intervals, are taken to prevent any confufion in fo
peculiarly impostant an article of the intelligence to be Telegraph. conveycd.

Perbaps, however, none of the telegraphs hitherto offered to the public excecds the following, either in fimplicity, cheapnefs, or facility in working, and it might perhaps, with a few trifing alditions, be made exceedingly ditlinct. It is thus defcribed in the Repertory of Arts and Manufacीures: For a nocturnal telegrajh, let Vol. r. there be four large patent reflefors, lying on the faine \(\mathrm{e}^{\mathrm{p} \cdot 3^{5} 2}\). plane, parallel to the horizon, placed on the top of an obfervatory. Lete each of thefe refectors be capable. Ly means of two winches, either of elevation or depreffion to a certain degrec. By elevating or deprefling one or two of the reflectors, eighteen very diffinet ariangements may be produced, as the following feheme will explain (A).

For the fake of example, the above arrangements are made to anfwer to the mofl neceffary letters of the alphabet; but alterations may be made at will, and a greater number of changes produced, without any addition to the reflectors. In the firf obfervatory there need only be a fet of \(\sqrt{2} \mathrm{ing} / \mathrm{l}\) reflectors; but in the others cach reflector thould be double, fo as to face both the preceding and fubfequent obfervatory; and each obfervatory thould be furnilhed with two telefcopes. The proper diameter of the reffectors, and their diflance from each other, will be afcertained by experience.
To convert this machine into a diurnal telegraph, nothing more is neceffary than to infert, in the place of the reflectors, gilt balls, or any other confpicuous bodies.

Were telegraphs brought to fo great a degree of perfection, that they could convey information ipeedily and ditlinctly; were they fo much fimplified, that they could be confructed and maintained at little expence-the advantages which would refult from their ufe are almoft inconceivable. Not to fpeak of the feeed with which information could be communicated and orders given in time of war, by means of which misfortunes might be prevented or inflantly repaired, difficulties removed, and difputes precluded, and by means of which the wbole kingdom could be prepared in an infant to oppofe an

Gg 2
invadin

\section*{T E L \\ 236 T T E L}
icieceapis. invading enemy ; it might be ured by conmercial men
fured profe, which is remarkably harmonious, gives the flyle nearly as much elevation as the French language is capable of fupporting even in legular verfe.

According to the fame eminent critic, "the belt exe. Tclefcope. cuted part of the work is the firt fix books, in which Telemachus recounts his adventures to Calypfo. The narration throughout them is lively and interefting. Afterwards, efpecially in the laft 12 books, it becomes more tedious and languid; and in the warlike adventures which are attempted, there is a great defect of vigour. The chief objection againft this work being claf. led with epic poems, arifes from the minute details of virtuous policy, into which the author in fome places enters ; and from the difcourfes and inftruetions of Mentor, which recur upon us too often, and too much in the ftrain of common-place morality. Though thele were well fuited to the main defign of the author, which was to form the mind of a young prince, yet they feem not congruous to the nature of epic poetry; the object of which is to improve us by means of actions, characters, and fentiments, rather than by delivering profeffed and formal infruction."

TELEPHIUM, True Orpine, a genus of plåts belonging to the clafs pentandria; and in the natural fyftem ranging under the \(54^{\text {th }}\) order, Mifcellanec. Sec Botany Index.

TELESCOPE, an optical inftrument for viewing diftant objects; fo named by compounding the Greek words \(\operatorname{tn\lambda n}\) far off, and oxotew I look at or contemplate. This name is commonly appropriated to the larger fizes of the inftrument, while the fmaller are called PERSPEC-tive-glasses, Sfy-glasses, opera-glasses. A particular kind, which is thought to be much brighter than the reft, is called a Night-GLass.

To what has been faid already with refpeet to the inventor of this moft noble and ufeful inftrument in the article Optics, we may add the two following claims.

Mr Leonhard Digges, a gentleman of the \(17^{\text {th }}\) cen. tury of great and various knowledge, pofitively afferts in his Stratioticos, and in another work, that lis father, a military gentleman, had an inffrument which he ufed in the field, by which he could bring diftant objects near, and could know a man at the diftance of three miles. He fays, that when his father was at home he had often looked through it, and could diftinguifh the waving of the trees on the oppofite fide of the Severn. Mr Digges refided in the neighbourhood of Briftol.

Francis Funtana, in his Celefial Obfervations, publifhed at Naples in 1646, fays, that he was affured by a Mr Hardy, advocate of the parliament of Paris, a perfon of great learning and undoubted integrity, that on the death of his father, there was found among his things an old tube, by which diftant objects were diftinctly feen; and that it was of a date long prior to the telefcope lately invented, and had been kept by him as a fecret.

It is not at all improbable, that curious people, handling fpectacle glaffes, of which there were by this tine great varieties, both convex and concave, and amufing themfelves with their magnifying power and the fingular effeets which thicy produced in the appearances of things, might fometimes chance fo to place them as to produce diflinet and enlarged vifion. We know perfcetly, from the table and fcheme which Sirturus has given us of the tools or difics in which the fpectacle-

\section*{T E L [ 237 T \(]\) E L}
elecope. makers fathioned their glaffes, that they had convex \(\sim\) lenfes formed to fpheres of 24 inches cliameter, and of II inferior fizes. He has given us a fcherne of a fet which be got leave to meafure, belonging to a fpectaclemaker of the name of Rogette at Corunna in Spain ; and he fays that this inan had tools of the fame fizes for concave glafles. It alfo appears, that it was a general practice (of which we do not know the precile purpule) to ule a convex and concave glafs together. If any perfon thould chance to put together a 24 -inch convex and a 12 -inch concave (wrought on both fides) at the diflance of fix inches, he would have diftinct vifion, and the object would appear of double fize. Concaves of fix inches were not uncommon, and one fuch combined with the convex of 24 , at the diflance of nine inches, would have difinat vifion, and objects would be quadrupled in diameter. When fuch a thing occurrcd, it was natural to keep it as a curiofity, although the rationale of its opcration was not in the leaft underftood. We doubt not but that this happened much oftener than in thefe two inftances. The chief wonder is, that it was not frequent, and taken notice of by fome writer. It is pretty plain that Galileo's firft telefcope was of this kind, made up of fuch fpectacle-glaffes as he could procure; for it magnified only three times in diameter; a thing eafily procured by fuch glaffes as be could find with every fpectacle-maker. And he could not but obferve, in his trials of their glaffes, that the deeper concaves and flatter convexes he employed, he produced the greater amplification; and then he would find himfelf obliged to provide a tool not ufed by the fectacle-makers, viz. either a much flatter tool for a convex furface, or a much fmaller fphere for a concave; and, notwithftanding bis telling us that it was by reflecting on the nature of refraction, and without any inftruction, we are perfuaded that he procecded in this very way. His next telefcope magnified but five times. Now the lighteft acquaintance with the obvious laws of refraction would have directed him at once to a very fmall and deep concave, which would been much eafier made, and have magnified more. But he groped his way with fuch fpectacle-glaffes as he could get, till he at laft made tools for very fiat object-glaffes and very deep eye-glaffes, and produced a telefcope which magnified about 25 times. Sirturus faw it, and took the meafures of it. He afterwards faw a fcheme of it which Galileo had fent to a German prince at Infpruck, who had it drawn (that is, the circles for the tools) on a table in his gallary. The object-glafs was a plano-convex, a portion of a fphere, of 24 inches diameter; the eye-glafs was a double concave of two inches diameter; the focal difrances were therefore 24 inches and one inch nearly. This muft have been a very lucky operation, for Sirlurus fays it was the beft telefcope he had feen : and we know that it requires the very beft work to produce this magnifying power with fuch fmall fpheres. 'rclefcopes continued to be made in this way for many years; and Galilco, though keenly engaged in the obfervation of Jupiter's fatellites, being candidate for the prize held out by the Dutch for the difcovery of the longitude, and therefore much interefted in the advantage which a convex eye-glafs would have given him, never made them of any other form. Kepler publifhed his Diop. trics in 1611 ; in which he tells us, all that he or others Lad difcovered of the law of refraction, viz. that in very
fmall obliquities of incidence, the angle of refraction Telefcope. was nearly one-third of the angle of incidence. This was indeed enough to have pointed out, with fufficient exactuefs, the conltruction of every optical inftrument that we are even now poffered of; for this propurtionality of the angles of incidence and refraction is affumed in the conftruclion of the optical figure for all of them; and the deviation from it is ftill confidered as the refinement of the art, and was not larought to any rule till 50 years after by Huyghens, and called by him Aberravion. Yet even the fagacious Kepler feems not to have feen the advantage of any other conftruction of the telefope; he juft leems to acknowledge the poflibility of it: and we are furprifed to fee writers giving him as the author of the alfronomical telefcope, or even as hinting at its conftruction. It is true, in the laft propolition he fhows how a telefcope may be made apparently with a convex cye-glafs: but this is only a frivolous fancy; for the eye-glafs is dirceted to be made convex externally, and a very deep concave on the infide; fo that it is, in fact, a menifcus with the concavi. ty prevalent. In the 86 th propofition, he indeed fhows that it is pofible fo to place a conver. glafs behind another convex glaf, that an eye finall fee ubjects dillinet, magnified, and inverted; and he fpeaks very fagacioufly on the fubject. After having faid that an eye placed bchind the point of union of the firt glafs will fee an object inverted, he fhows that a fmall part only will be feen; and then he flows that a convex glafs, duly proportioned and properly placed, will how more of it. But in flowing this, he fpeaks in a way which flows evidently that he had formed no dillinet notions of the manner in which this effect would be produced, only faying vaguely that the convergency of the fecond glafs would counteract the divergency beyond the focus of the firf. Had he conceived the matter with any tolerable diftinctnefs, after feeing the great advantage of taking in a field greater in almoft any proportion, he would have eagerly catched at the thought, and enlarged on the immenfe improvement. Had he but drawn one figure of the progrefs of the rays through two convex glaffes, the whole would have been open to his view.

This ftep, fo ealy and fo important, was referved for Father Scheiner, as has been already obferved in the article Oprics; and the conftruction of this author, together with that of Janfen, are the models on which all refracting telefcopes are now conftructed; and in all that relates to their magnifying power, brightnefs, and field of vilion, they may be conftructed on Kepler's principle, that the angles of refraction are in a certain given proportion to the angles of incidence.

But after Huyghens had applied lis elegant geometry to the difcovery of Snellius, viz. the propotionality, not of the angles, but of the fines, and had afcertained the aberrations from the foci of infinitely flender pencils, the reafons were clearly pointed out why there were fuch narrow limits affixed by nature to the performance of optical infruments, in confequence of the indifinctnefs of vifion which. refulted from conftructions where the magnifying power, the quantity of light, or the field of vifion, were extended beyond certain moderate bounds. The theory of aberrations, which that moft excellent geometer eftablifhed, has enabled us to diminifh this ilidifinctnels arifing from any of there caules; and this

\section*{T I I} diminution is the fole aim of all the different conftructions which have been contrived fince the days of Galileo and Scheiner.

THE defcription which has been already given of the various confructions of telefcopes in the article Oprics, is fufficient for inftructing the reader in the general principles of their couftruction, and with moderate attention will thow the manner in which the rays of light proceed, in order to enfure the different circumftances of amplification, brightnefs, and extent of field, and even diftinctnefs of vifion, in as far as this depends on the proper intervals between the glafles. But it is inlufficicnt for giving us a knowledge of the improvements which are aimed at in the different depatures from the original confluctions of Galileo and Scleeiner, the advantage of the double eye-glafs of Huyghens, and the quintuple eye-glafs of Dollond : ftill more is it infufficient for mowing us why the highelt degrees of amplification and mott extenfive field cannot be obtained by the mere proportion of the focal diftances of the glaffes, as Kepler had taught. In fhort, without the Huyghenian doctrine of aberrations, neither can the curious reader learn the limits of their performance, nor the artifl learn why one telelcupe is better than another, or in what manuer to proceed to make a telefcope differing in any particular from thofe which he fervilely copies.

Although all the improvements in the confruction of telefcopes fince the puilication of Huyghens's Dioptrics have been the productions of this inand, and althougg Dr Smith of Cambridge has given the moll elegant and perfpicuous account of this ficience that has yet appeared, we do not recollect a performance in the Englifh language (except the Optics of Emerfon) which will carry the reader beyond the mere fchooiboy elements of the fience, or enabie a perfon of mathematical akill to underftand or improve the conflruction of optical infruments. The laft work on this fubject of any extent (Dr Priefley's Hiftory of Vifion) is merely a parlour book for the amufement of half-taught dilettanti, but is totaliy deficient in the mathematical part, although it is here that the fcience of optics bas her chief claim to pre-eminence, and to the name of a disclplisa accuraTA. But this would have been ultra cropidam; and the author would in all probability have made as poor a figure here as he has done in his attempts to degrade his fecies in his Commentaries on the Tribratiunculue of Hartley; motions which neither the author nor his andplificator were able to underfand or explain. We trufl that our readers, jealous as we are of every thing that firks us in the fcale of nature's works, will pardon this tranfient ejaculation of fpleen, when our thoughts are called to a fiflem which, of alfolute and unavoidable ne. celfity, makes the Divise misd nothing but a quivering - that matter of which it is the AUTHOR and unering mrector. Sed miflum faciamus.

We think therefore that we flall do the pullic fome Service, by giving fuch an account of this lighter hranch of optical fcience as will at leaf tend to the complete underflanding of this noble influment, by which our conceptions of the extent of almighty power, and wifdom, and beneficence, are fo wondcrfully enlarged. In the profecution of this we hope that many geveral rules will emerge. by which artifis who are not mathematicians may be cnabled to confruct optical inftruachits with

\section*{38 ] \\ T E L}
intelligence, and avoid the many blunders and defects Triefope. which refult from mere fervile imitation.

The general aim in the confruction of a telefcope is, to form, by means of mirrors or lenfes, an image of the diftant object, as large, as bright, and as extenfive as is poffible, confilten!ly with diltinctnefo; and then to view the image with a magnilying glafs in any convenient manner. This gives us ai arrangement of our fubj \(\leqslant t\). We fhall firft how the principles of confruction of the objcet-glafs or mirror, fo as that it flall form an image of the dillant object with thele qualities; and then thow how to condruct the magnifying glafs or eye-piece, fo as to preferve them unimpaised.

This indiftinctrefs which we with to avoid arifes from two caules; the fpherical figures of the refracting and reflecting furfaces, and the different refrangibiiity of the differently coloured rays of light. The firt may be called the spherical and the fecond the chromatic indiftinct nefs; and the deviations from the foci, determined by an elementary theorem, given under Optics, may be called the spherical and the chromatic aberrations.

The limits of a Work like this will not permit us to give any more of the doetrinc of aberrations than is abfolutely neceffary for the condruction of achromatic telefcopes; and we mult refer the reader for a general view of the whole to Euler's Dioptrics, and other works of that kind. Dr Smith has given as much as was neceffary for the comparifort of the merits of different glaffes of fimilar coniftuction, and this in a very plain and elegant manner.

We hall begin with the aberration of colour, becaufe it is the moft fimple.

Let white or compounded light fall perpendicularly on the flat fide \(P Q\) (fie. 1.) of a plano-convex lens PVQ, whofe axis is CV and vertex V. The white ray \(p \mathrm{P}\) falling on the extremity of the lens is difpetled by refraction at the point \(P\) of the fphe:ical furface, and the red ray goes to the point \(r\) of the axis, and the violet ray to the point \(v\). In like manner the white ray \(q Q\) is difperfed by refraction at \(Q\), the red ray going to \(r\), and the violet to \(\%\). The red ray \(\operatorname{Pr}\) croffes the violet ray \(Q v\) in a point D , and \(Q r\) crofles \(\mathrm{P} v\) in a point E; and the whole light refracted and difperfed by the circumference whofe diameter is \(P Q\), paffes through the circular area, whofe diamctcr is DE. Suppofing that the lens is of fuch a form that it would collect red rays, refracted by its whole furface in the point \(r\), and violet in the point \(v\); then it is evident that the whole light which occupies the furface of the lens will pafs through this little circle, whofe diameter is DE. Therefore white light ifluing from a point fo diflant that the rays may be confidered as parallel, will not be collcked in another point or fucus, but will be difperfed over the furface of that littic circle; which is therefore called the circle of chromatic difperfion; and the radiant point will be reprefented by this circle. The neighbouring points are in like manner reprefented by circles; and thefe circles encroacling on and mixing with each other, muf occafion hazinets or confufion, and render the piture indillinet. This indiflinctnefs will be greater in the proportion of the number of circles which are in this manner mixed together. This will be in the proportion of the room that is for them; that is, in proportion to the area of the circle, or in the duplicate propor-

\section*{T E L}
- elefonge. tion of its diameter. Our firt bufnefs therefore is, to obtain meafures of this diameter, and to mark the connection between it and the aperture and fucal diltance of the lens.

Let \(i\) be to \(r\) as the fine of incidence in glafs to the fine of refraction of the rect rays; and let \(i\) be to \(v\) as the fine of incidence to the fine of refraction of the violet rays. Then we fay, that when the apetture \(P^{2} Q\) is moderate, \(v \rightarrow r: v+r-2 i=\mathrm{DE}: \mathrm{P} Q\), very nearly. For let DE, which is evidently perpendicular to \(\mathrm{V} r\), moet the parallel incident rays in K and L and the radii of the fplerical furface in G and H. It is plain that GPK is equal to the angle of incidence on the poiterior or fpherical furface of the lens; and GPr and GPa are the angles of the refraction of the red and the violet rays; and that GK, GD, and GE, are very nearly as the fines of thofe angles, becaufe the angles are fuppofed to be fintil. We may therefore infitute this proportion \(\mathrm{DE}: \mathrm{KD}=v-r: r-i\); then, hy doubling the confequents \(\mathrm{DE}: 2 \mathrm{KD}=\boldsymbol{\mathrm { K }}-r: 2 r-2 i\). Alfo DE : \(2 \mathrm{KD}+\mathrm{DE}=v-r: 2 r-2 i+v-r,=v-r: r+\) \(ข-2 i\). But \(2 \mathrm{KD}+\mathrm{DE}\) is equal to KL or PQ . Therefore we have DE: \(\mathrm{PQ}=\boldsymbol{v}-r: r+v-2 i\). श E. D.
Cor. 1. Sir Ifaac Newton, by moft accurate obfervation, found, that in common glafs the fines of refraction of the red and violet rays were 77 and 78 where the fine of incidence was 50 . Hence it follows, that \(q\) - \(r\) is to \(v+r-2 i\) as 1 to 55 ; and that the diameter of the fmallent circle of difiperion is \(\frac{x}{5}\) th part of that of the lens.
2. In like manner may be determined the circle of difiperfion that will comprehend the rays of any particulas colour or fet of coluurs. Thus ali the orange and yellow will pafs through a circle whofe diameter is \(\frac{\mathrm{T}}{5}{ }^{5}\) th of that of the lens.
3. In different furfaces, or plano-convex lenfes, the angles of aberration \(r \mathrm{P} v\) are as the breadth PQ directly, and as the focal diflance VF inverfely; becaufe any angle DPE is as its fubtenfe DE directly and radius DP inverfely. N. B. We call VF the focal diftance, becaufe at this diltance, or at the point \(F\), the light is moft of all conflipated. If we examine the focal diflance by holding the lens to the fun, we judge it to be where the light is drawn into the fmalleft fpot.

When we reflect that a lens of \(5 \frac{1}{2}\) inches in diameter has a circle of difperfion \(\frac{1}{r_{0}}\) th of an inch in diameter, we are furprifed that it produces any picture of an object that can be diftinguiked. We thould not expect greater diftinctnefs from fuch a lens than would be produced in a camera obfcura without a lens, by fimply admitting the light through a hole of roth of an inch in diameter. Tlis, we know, would be very hazy and confured. But when we remark the fuperior vivacity of the yellow and orange light in comparifon with the reft, we may helieve that the effect produced by the confufion of the other colours will be much lefs fentible. But a ftronger reafon is, that the light is much denfer in the middle of the circle of difperfion, and is exceedingly faint towards the margin. This, however, mult not be taken for granted; and we muft know diftinely the manner in which the light of different colours is difributed over the circle of chromatic difiperfion, before we pretend to pronounce on the immenfe differenco between the indifinctnefs arifing from colour and that
arifing from the fyherical figure. We think this the Telefope. more neceflary, becaufe the iluttrions difcoverer of the chromatic aberration has made a great nuttake in the compariton, becaute he did not contider the ditribution of the light in the circle of fiherical difperfion. It is therefore proper to invelligate the chromatic ditribution of the light with the lame care that we beflowed on the fpherical difperfion in Oprics, and we liall then fee that the fuperiority of the retlecting telefcope is incomparably lefs than Newton imagined it to be.

Therefure let EB (fig. 2.) reprefent a plano-convex Fig. 2. lens, of which C is the centre and \(\mathrm{C} r\) the axis. Let us fuppofe it to have no fpherical aberration, but to collect rays uccupying its whole furface to fingle points in the axis. Let a beam of white or compounded light fall perpendicularly on its plane furface. The rays will be forefracted by its curved furface, that the extieme red rays will be collected at \(r\), the extreme violent rays at \(z\), and thofe of intermediate refrangibility at intermediate points, \(o, y, g, b, p, v\), of the line \(r w\), which is nearly \(\frac{x}{\mathbb{y}}\) th of \(r \mathrm{C}\). The extreme red and violet rays will crofs each other at A and D ; and AD will be a fection or diameter of the circle of chromatic difperfion, and will be about \(\bar{j}^{\prime} \xi^{\text {th }}\) th of EB. We may fuppole \(w r\) to be bifected in \(b\), becaufe \(w b\) is to \(b r\) very nearly in the ratio of equality (for \(r b: r \mathrm{C}=\) \(b \mathrm{~A}: c \mathrm{E},=b \mathrm{~A}: c \mathrm{~B},=w b: w \mathrm{C})\). The line \(r w\) will be a kind of prifmatic fpectrum, red from \(r\) to \(o\), orange-coloured from 0 to \(y\), yellow from \(y\) to \(g\), green from \(g\) to \(l\), blue from \(b\) to \(p\), purple from \(p\) to \(v\), and vilet from \(v\) to \(w\).

The light in its compound fate mult be fuppofed uniformly denfe as it fallis upon the lens; and the fame muft be faid of the rays of any particular colour. Newton fuppoles alfo, that when a white ray, fuch as eE, is difperfed into its component coloured rays by refraction at \(E\), it is uniformly furead ovcr the angle DEA. This fuppofition is indeed gratuitous; but we have no argument to the contrary, and may therefore confider it as jurt. The confequence is, that each point \(w, v, p, b\), \&c. of the fpectruni is not only equally lominous, but allo illuminates uniformly its correfponding portion of AD : that is to fay, the coating (fo to term it) of any particular colour, fuch as purple, from the point \(p\), is uniformly denfe in every part of AD ) on which it falls. In like manner, the colouring of yellow, intercepted by a part of \(A D\) in its paffage to the point \(y\), is uniformly denie in all its parts. But the denfity of the different colours in AD is extremely different: for fince the radiation in \(w\) is equally denfe with that in \(p\), the denfity of the violet colouring, which radiates from \(w\), and is fpread over the whole of AD , muft be much lefs than the denfly of the purple colouring, which radiates from \(p\), and occupies only a part of AD round the circle \(b\). Thefe denflies muft be very nearly in the inverfe proportion of \(w l^{2}\) to \(p l^{2}\).

Hence we fee, that the central point \(b\) will be very intenfely illuminated by the blue radiating from \(p b\) and the green intercepted from \(b g\). It will be more faintly illuminated by the purple radiating from : \(p\), and the yellow intercepted from \(g y\); and filll more faintly by the violet from \(w v\), and the orange and red intercepted from \(y\) r. The whole colouring will be a white, tending a little to yellownels. The accurate proportion of

\section*{T E L}

Telefcope, thefe colourings may be computed from our knowledge of the pofition of the points \(o, y, g, \& c\). But this is of little moment. It is of more confequence to be able to determine the proportion of the total intenfity of the light in \(b\) to its intenfity in any other point I.

For this purpofe draw \(r \mathrm{IR}, \mathrm{I} w \mathrm{~W}\), meeting the lens in R and W. The point I receives none of the light which paffes through the fpace RW : for it is evident that \(b \mathrm{I}: \mathrm{CR}=b \mathrm{~A}: \mathrm{CE},=1: 55\), and that \(\mathrm{CR}=\) CW ; and therefore, fince all the light incident on EB paffes through AB , all the light incident on KW paffes through \(\mathrm{I} i\) ( \(b i\) being made \(=b \mathrm{I}\) ). Draw o \(\mathrm{IO}, y \mathrm{IY}\), \(g \mathrm{IG}, \mathrm{I} p \mathrm{P}, \mathrm{I} v \mathrm{~V}\). It is plain, that I receives red light from RO, orange from OY, yellow from YG, green from GE, a little blue from BP, purple from PV, and violet from VW. It therefore wants fome of the green and of the blue.

That we may judge of the intenfity of thefe colours at I, fuppofe the lens covered with paper pierced with a fmall hole at \(G\). The green light only will pafs through I; the other colours will pals between I and \(b\), or between I and A , according as they are more or lefs refrangible than the particular green at I. This particulat colour converges to \(g\), and therefore will illuminate a fmall foot round \(I\), where it will be as much denfer than it is at \(G\) as this fpot is fmaller than the hole at \(G\). The natural denfity at \(G\), therefore, will be to the increafed denfity at I , as \(g \mathrm{I}^{2}\) to \(g \mathrm{G}^{2}\), or as \(g b^{2}\) to \(g \mathrm{C}^{3}\), or as \(b \mathrm{I}^{\mathrm{z}}\) to \(\mathrm{CG}^{2}\). In like manner, the natural denfity of the purple coming to I through an equal hole at \(P\) will be to the increafed denfity at I as \(b \mathrm{I}^{2}\) to \(\mathrm{CP}^{2}\). And thus it appears, that the intenfity of the differently coloured illuminations of any point of the circle of difperfion, is inverfely proportional to the fquare of the diflance from the centre of the lens to the point of its furface through which the colouring light comes to this point of the circle of difperfion. This circumftance will gives us a very eafy, and, we think, an elegant folution of the queftion.

Bifect CE in F, and draw FL perpendicular to CE, making it equal to CF. Through the point I. defcribe the hyperbola KLN of the fecond order, that is, having the ordinates EK, FL, RN, \&c. inverfely proportional to the fquares of the ablciffe \(\mathrm{CE}, \mathrm{CF}, \mathrm{CR}, \& \mathrm{c}\).; fo that \(\mathrm{FL}: \mathrm{RN}=\frac{\mathrm{I}}{\mathrm{CF}^{2}}: \frac{\mathrm{I}}{\mathrm{C}^{2}}\), or \(=\mathrm{CR}^{2}: \mathrm{CF}^{2}, \& \mathrm{c}\). It is evident that thefe ordinates are proportional to the denfities of the feverally coloured lights which go from them to any points whatever of the circle of difperfion.

Now the total denfity of the light at I depends both on the denify of each particular colour and on the number of colours which fall on it. The ordinates of this byperbola determine the firft ; and the fpace ER meafures the number of colours which fall on I, becaufe it receives light from the whole of ER, and of is equal BW . Therefore, if ordinates be drawn from any point of ER, their fum will be as the whole light which goes to I ; that is, the total denfity of the light at I will be proportional to the area NREK. Now it is known that \(\mathrm{CE} \times \mathrm{EK}\) is equal to the infinitely extended area lying beyond EK ; and \(\mathrm{CR} \times \mathrm{RN}\) is equal to the infinitely extended area lying heyond RN. Therefore the ares NREK is equal to ClixRN-CE \(\times\) EK. But RN
and EK are refpectively equal to \(\frac{\mathrm{CF}^{3}}{\mathrm{CR}^{2}}\) and \(\frac{\mathrm{CF}^{3}}{\mathrm{CE}^{3}}\). There- \(\underbrace{\text { Teiefope, }}\) fore the denfity at \(I\) is proportional to \(\mathrm{CF}^{3} \times\left(\frac{\mathrm{Cli}}{\mathrm{CR}^{2}}-\right.\) \(\left.\frac{\mathrm{CE}}{\mathrm{CE}^{2}}\right)=\mathrm{CF}^{3} \times\left(-\frac{1}{-\mathrm{R}}-\frac{1}{\mathrm{CE}}\right),=\mathrm{CF}^{3} \times \frac{\mathrm{CE}-\mathrm{CR}}{\mathrm{CE} \times \mathrm{Cl}^{-1}}\), \(=\mathrm{CF}^{3} \times \frac{\mathrm{ER}}{\mathrm{CE} \times \mathrm{CR}^{3}}=\frac{\mathrm{CF}^{3}}{\mathrm{CE}} \times \frac{\mathrm{ER}}{\mathrm{CR}}\). But becaure CF is \(\frac{x}{2}\) of \(\mathrm{CE}, \frac{\mathrm{CF}^{3}}{\mathrm{CE}}\) is \(=\frac{\mathrm{CF}^{3}}{2 \mathrm{CF}},=\frac{\mathrm{CF}^{3}}{2}\), a conftant quan. tity. Therefore the denfity of the light at I is proportional to \(\frac{\mathrm{ER}}{\mathrm{CR}}\), or to \(\frac{\mathrm{AI}}{b I}\), becaufe the points \(R\) and I are fimilarly fituated in EC and Ab.
Farther, if the femiaperture CE of the lens be called \(I, \frac{C F^{2}}{2}\) is \(=\frac{7}{8}\), and the denfity at \(I\) is \(=\frac{A I}{8 b I}\).

Here it is proper to obferve, that fince the point \(k\) has the fame fituation in the diameter EB that the point I has in the diameter AD of the circle of difperfion, the circle defcribed on EB may be conceived as the magnified reprefentation of the circle of difperfion. The point F , for inftance, reprefents the point \(f\) in the circle of difperfion, which bifects the radius \(b \mathrm{~A}\); and \(f\) receives no light from any part of the lens which is nearer the centre than F, being illuminated only by the light which comes through EF and its oppofite BF'. The fame may be faid of every other point.

In like manner, the denfity of the light in \(f\), the middle between \(b\) and \(A\), is meafured by \(\frac{\mathrm{EF}}{\mathrm{CF}}\), which is \(=\frac{\mathrm{EF}}{\mathrm{EF}}\), or r . This makes the denfity at this point a proper ftandard of comparifon. The denfity there is to the denfity at I as I to \(\frac{\mathrm{AI}}{b \mathrm{I}}\), or as \(b \mathrm{I}\) to AI ; and this is the fimpleft mode of comparifon. The denfity half way from the centre of the circle of difperfion is to the denfity at any point I as \(b I\) to IA.
Laftly, through \(L\) defcribe the common reftangular hyperbola \(k \mathrm{~L} k\), meeting the ordinates of the former in \(k\), L, and \(n\) : and draw \(k h\) parallel to EC, cutting the ordinates in \(g, f, r, \& c\). Then \(\mathrm{CR}: \mathrm{CE}=\mathrm{E} k: \mathrm{R} n\), and \(\mathrm{CR}: \mathrm{CE}-\mathrm{CR}=\mathrm{E} k: \mathrm{R} n-\mathrm{E} k\), or \(\mathrm{CR}: \mathrm{RE}=\) \(\mathrm{E} k: r n\), and \(b \mathrm{I}: \mathrm{IA}=\mathrm{E} k: r n\). And thus we have a very fimple expreffion of the denfity in any point of the circle of difperfion. Let the point be anywhere, as at \(I\). Divide the lens in \(R\) as AD is divided in \(I\), and then \(r n\) is as the denfity in I.

Thefe two meafures were given by Newton; the firlt in his Treatife de Mundi Systemate, and the laft in his Optics; but both without demonftration.

If the hyperbola \(k \mathrm{~L} n\) be made to revolve round the axis CQ, it will generate a folid fpindle, which will meafure the whole quantity of light which paffes through different portions of the circle of difperfion. Thus the folid produced by the revolution of \(\mathrm{L} k f\) will mearure all the light which occupies the outer part of the circle of difperfion lving without the middie of the radius. This fpace is ths of the whole circle; but the quantity of liglit is but \(\frac{1}{4}\) th of the whole.

\section*{T E L}

Eelefcope.
A fill more fimple expreflion of the whole quantity of light pafling through different portions of the circle of chromatic difperfion may now be obtained as follows :
It has been demonfrated, that the denfity of the light at \(I\) is as \(\frac{\mathrm{AI}}{b I}\), or as \(\frac{\mathrm{ER}}{\mathrm{CR}}\). Suppofe the figure to turn round the axis. I or h defcribe circumferences of circles; and the whole light pafling through this circumference is as the circumference, or as the radius, and as the denfity jointly. It is therefore as \(\frac{\mathrm{ER}}{\mathrm{CR}} \times \mathrm{CR}\), that is, as ER. Draw any Atraight line \(\mathrm{E} m\), cutting RN in \(s\), and any other ordinate FL in \(x\) R . The whole light which illuminates the circumference defcribed by \(I\) is to the whole light which illuminates the centre \(b\) as ER to EC, or as Rs to C m . In like manner, the whole light which illu. minates the circumference defcribed by the point \(f\) in the circle of difperfion is to the whole light which illuminates the centre \(b\), as \(\mathrm{F} x\) to \(\mathrm{C} m\). The lines \(\mathrm{C} m\), \(\mathrm{RS}, \mathrm{F} x\), are therefore proportienal to the whole light which illuminates the correfponding circumferences in the circle of difperfion. Therefore, the whole light which falls on the circle whofe radius is \(b \mathrm{I}\), will be reprefented by the trapezium in CRS; and the whole light which falls on the ring defcribed by IA, will be reprefented by the triangle \(\mathrm{E} s \mathrm{R}\); and fo of any other portions.

By confidering the figure, we fee that the diftribution of the light is exceedingly unequal. Round the margin it has no fenfible denfity; while its denfity in the very centre is incomparably greater than in any other point, being expreffed by the afymptote of a hyperbola. Alfo the circle defcribed with the radius \(\frac{A b}{2}\) contains \(\frac{3}{4}\) ths of the whole light. No wonder then that the confufion caufed by the mixture of thefe circles of difperfion is lefs than one flould expect ; befides, it is evident that the mof lively or imprefive colours occupy the middle of the fpectrum, and are there much denfer than the ref. The margin is covered with an illumination of deep red and violet, neither of which colours are brilliant. The margin will be of a dark claret colour. The centre revives all the colours, but in a proportion of intenfity greatly different from that in the common prifmatic feectrum, becaufe the radiant points \(L, p, b, g, \& c\). by which it is illuminated, are at fuch different diflances from it. It will be white; but we apprehend not a pure white, being greatly overcharged with the middle colours.

Thefe confiderations fhow that the coloured fringes, which are obferved to border very luminous objects feen on a dark ground through optical inftruments, do not proceed from the objeet-glafs of a telefcope or microfcope, but from an improper confluation of the eyeglaffes. The chromatic difperfion would produce fringes of a different colour, when they produce any at all, and the colours would be differentiy difpofed. But this difperfion by the object.glafs can hardly produce any fringes: its effect is a general and almoft uniform mixture of circles all over the field, which produces an urfiform hazinefs, as if the object were viewed at an improper diftance, or out of its focus, as we vulgarly exprefs it.

Vol. XX. Part I.

\section*{24] T E L}

We may at prefent form a good guefs at the limit Telfforpo which this caule puts to the performance of a telc. fcope. A point of a very dillant object is reprefent. edl, in the picture formed hy the object-glafs, by a little circle, whofe diameter is at lealt \(\frac{1}{5}\) osth of the aperture of the object-glafs, making a very full allowance for the fuperior brilliancy and denfity of the central light. We look at this picture with a magnifying eye-glafs. This magnifies the piture of the point. it it amplify it to fuch a degree as to make it an onject individually diftinguilhable, the confulion is then fenfible. Now this can be computed. An object fubtending one minute of a degree is dillinguifhed by the dullett cye, even although it be a dark object on a bright ground. Let us therefore fuppofe a telefoope, the object-glafs of which is of fix feet focal diftance, and one inch aperture. The diameter of the circle of chromatic difperfion will be \(\frac{3^{\frac{3}{0}} \mathrm{o} \text { th }}{}\) of an iuch, which fubtends at the centre of the object-glafs an angle of about \(9 \frac{1}{3}\) feconds. This, when magnified fix times by an eye-glafs, would become a diflinguihable object; and a telefcope of this length would be indiftinct if it magnified more than fis times, if a point were thus fpread out into a fpot of uniform intenfity. But the foot is much lefs intenfe about its margin. It is found experimentally that a piece of engraving, having fine crols hatches, is not fenfibly indiftinet till brought fo far from the limits of perfectly diftinct vifion, that this indiftinctnefs amounts to \(6^{\prime \prime}\) or \(5^{\prime}\) in breadth.- Therefore fuch a telefcope will be fenfibly diftinct when it magnifies 36 times; and this is very agreeable to experience.

We come, in the fecond place, to the more arduous talk of afcertaining the error arifing from the fpherical figure of the furfaces employed in optical inftruments. -Suffice it to fay, before we begin, that although geometers have exhibited other forms of lenfes which are totally exempt from this error, they cannot be executed by the artift; and we are therefore reilncted to the employment of fpherical furfaces.

Of all the determinations whicl have been given of fpherical aberration, that by Dr Smith, in his Optics, which is an improvement of the fundamental theorem of that molt elegant geometer Huyghens, is the moft perfpicuous and palpable. Some others are more concife, and much better fitted for after ufe, and will therefore be employed by us in the profecution of this article. But they do not keep in view the optical facts, giving the mind a picture of the progrefs of the rays, which it can contemplate and difcover amidt many modifying circumftances. By ingenious fubflitutions of analytical fymbols, the invefigation is rendered expeditious, concife, and certain; but thefe are not immediate fymbols of things, but of operations of the mind ; objects fufficiently fubtile of themfelves, and having no need of fubfitutions to make us lofe fight of the real fubject ; and thus our occupation degenerates into a procelis almoft without ideas. We hall therefore fet out with Dr Smith's fundamental Theorem.

\section*{x. In Reflections.}

Let AVB (fig. 3.) be a concave fpherical mirror, of Fiz. 3. which C is the centre, V the vertex, CV :he axis, and F the focus of an infinitely flender pencil of parallel rays

II h paffing

\section*{T E L}

Telefiope pafing through the centre. Let the ray \(a \mathrm{~A}\), parallel to the axis, be reflected in AG, croffing the central ray \(C V\) in \(f\). Let \(A P\) be the fine of the femi-aperture \(A V, A D\) its tangent, and \(C D\) its fecant.

The aberration Ff from the principai focus of central rays is equal to \(\frac{3}{2}\) of the excers VD of the fecent abore the racius, or very near equal to \(\frac{7}{2}\) of VP , the verled fine of the femi-aperture.

For becaufe AD is perpendicular to CA , the points \(\mathrm{C}, \mathrm{A}, \mathrm{D}\), are in a circle, of which CD ) is the dianseter; and becaufe \(A f\) is equal to \(C f\), by realon of the equality of the angles \(f \mathrm{AC}, f \mathrm{CA}\), and \(\mathrm{C} A a, f\) is the centre of the circle triough \(\mathrm{C}, \mathrm{A}, \mathrm{D}\) and \(f \mathrm{D}\) is \(=\frac{1}{2} \mathrm{CD}\). But FC 1s \(=\frac{1}{2} \mathrm{CV}\). Therefore \(\mathrm{F} f\) is \(\frac{1}{2}\) of VD .

But becaule \(D V: V P=D C: V C\), and \(D C\) is sery litle greater than YC when the aperture \(A B\) is modeFate, DV is very little greater than VP , and \(\mathrm{F} f\) is vesy neariy equal to \(\frac{\pi}{2}\) of VP.

Cor. 1. The longitudinal aberration is \(=\frac{A V^{2}}{4 C V}\), for PV is wery nearly \(=\frac{A V^{2}}{2 L V}\).

Cor. 2. The lateral aberr tion \(F G\) is \(=\frac{A V^{3}}{2 C V^{2}}\). For \(\mathrm{FG}: \mathrm{F} f=\mathrm{AP}: \mathrm{P} f,=\mathrm{AV}: \frac{\mathrm{CV}}{\mathrm{E}} \mathrm{nearly}\), and therefore \(F G=\frac{A V{ }^{3}}{{ }_{4} C V} \times \frac{2}{C V}=\frac{A V^{3}}{2 C V^{2}}\).

\section*{2. In Refractions.}

Eig. 4 or 5. Let AVB (ng. 4 . or 5.) be a fpherical furface feparating two refracting fubtances, \(C\) the centre, \(V\) the rertex, AV the femi-aperture, AP its fine, PV its verfed fine, and \(F\) the focus of parallel rays infnitely near to the axis. Let the extreme ray a A , parallel to the axis, be refracted into AG , croffing CF in \(f\), which is therefore the focus of extreme parallel rays.

The rectangle of the fine of incidence, by the diffirence of the fines of incidence and refration, is to the Jquare of the fine of refradion, as the veifed fine of the fimi apernure is to the lorgitudinal aberration of the extrcme rays.

Call the fine of incidence \(i\), the fine of refraction \(r\), and their difference \(d\).

Join CA, and about the centre \(f\) defcribe the arch AD.

The angle ACV is equal to the angle of incidence, and \(C 4 f\) is the angle of refraction. Then, fince the fine of incidence is to the fine of refracion as VF to CF , or as \(\mathrm{A} f\) to \(\mathrm{C} f\), that is. as \(\mathrm{D} f\) to \(\mathrm{C} f\), we have
\[
\mathrm{CF}: \mathrm{FV}=\mathrm{Cf}: f \mathrm{D}
\]
by converfion \(\mathrm{CF}: \mathrm{CV}=\mathrm{Cf}: \mathrm{CD}\)
aliern. conver. \(\mathrm{CF}-\mathrm{C} f: \mathrm{CV}-\mathrm{CD}=\mathrm{CF}: \mathrm{CV}\)
or - \(\mathrm{F} f: \mathrm{V}^{\top} \mathrm{D}=\mathrm{CF}: \mathrm{CV},=r: d\).
Now \(\mathrm{PV}=\frac{\Lambda \mathrm{P}^{2}}{\mathrm{CP}+\mathrm{CV}^{2}}=\frac{\Lambda \mathrm{P}^{2}}{2 \mathrm{CV}}\) nearly, and \(\mathrm{PD}=\frac{\mathrm{APz}}{f \mathrm{P}+f \mathrm{~V}}\). \(=\frac{\Lambda \Gamma^{2}}{2 f V}\) nearly, \(=\frac{A \Gamma^{32}}{2 \Gamma V}\) nearly. Therefore \(P V: P D\) \(=\mathrm{FV}: \mathrm{CV}\), and \(\mathrm{I} \mathrm{V}: \mathrm{PV}=\mathrm{CF}: \mathrm{FV}\) ncarly. We had atove \(\quad \mathrm{F} f: \mathrm{VD}=r: d\); and now - VD: PV=CF: \(\mathrm{FV},=r: i\); therefore - \(\mathrm{F} f: \mathrm{PV}=r^{2}: d i^{\prime}{ }^{\prime}\)
and \(\mathrm{Ff}=\frac{r^{3}}{d_{i}} \times \mathrm{PV}\). \& E. D.

\section*{\(T \mathrm{I}\)}

The aberration will be diriereat according as the re- Telefope, fraftion is made towards or from the perpendicular: that is, according as \(r\) is lefs or greater than \(i\). They are in the ratio of \(\frac{r^{2}}{d i}\) to \(\frac{i^{2}}{d r}\), or of \(r^{3}\) to \(i^{3}\). The abetation therefore is always much diminifned when the refrection is made from a rare into a denfe medium. The proportion of the fines for air and glafs is nearly that of 3 to 2 . When the light is refracted into the glafs, the aberration is nearly \(\frac{4}{3}\) of PV; and when the light paffes out of glafs into air, it is about \(\frac{?}{8}\) of PV.

Cor. 1. \(\mathrm{F} f=\frac{r^{2}}{d_{2}} \times \frac{\cdot \mathrm{AP}^{2}}{2 C V}\) nearly, and it is alfo \(=\frac{r^{2}}{d^{2}}\) \(\times \frac{A P^{2}}{F V}\), becaufe \(P V=\frac{A P^{2}}{2 C V}\) nearly, and \(i: d=E V\) : CT.
\[
\begin{aligned}
& \text { Cor. 2. Becaufe } f \mathrm{P}: \mathrm{PA}=\mathrm{Ff}: \mathrm{FG} \\
& \text { or } \mathrm{FV}: \cdot \mathrm{AV}=\mathrm{Ff}: \mathrm{FG} \text { nearly, }
\end{aligned}
\]
we have \(\Gamma G\), the lateral aberration, \(=F f \times \frac{A V}{F V},=\) \(\frac{r^{3}}{d^{2}} \times \frac{A V^{3}}{2 \bar{\Gamma} \bar{T}^{2}}=\frac{r^{2}}{i^{2}} \times \frac{A V^{3}}{2 C V^{3}}\).

Cor. 3. Eecaufe the angle F. A \(f\) is proportional to \(\frac{F G}{F V}\) very nearly, we have the angular aberration FA \(f=\frac{r^{2}}{a^{2}}\) \(\times \frac{A V^{3}}{2 \mathrm{FV}^{3}}=\frac{r^{2}}{i^{2}} \times \frac{A V^{1}}{2 C V^{3}}\).

In general, the longitudinal aberrations from the focus of central parallel rays are as the fquaret of the apertures direstly, and as the focal dillances inverfely; and the lateral abertations are as the cubes of the apertures directly, and the fquares of the focal difances inverfely; and the angular aberrations are as the cubes of the aperture directly, and the cubes of the focal dillances inverfely.

The reader muft have obferred, that to fimplify the inveftigation, fome limall errors are admitted. PV and PD are not in the exact proportion that we aflumed them, nor is Dfequal to FV. But in the fmall apertures which fuffice for optical inftruments, thefe errors may be difregarded.

This fplecrical aberration produces an indifinctnefs of vifion, in the fame manner as the chromatic aberiation does, viz. hy fpreading out evesy mathematical point of the olject into a little fpot in its picture; which fpots, by mixing with each other, contufe the whole. We mult now determine the diameter of the circle of diffufion, as we did in the cale of chromatic difperfion.

Let a ray \(\beta\) of (fig. 6.) be refracted on the other fide of the axis, into a \(\mathrm{H} \varphi\), cutling \(A f G\) in H , and draw the perpendicula: EH. Call \(A V a, u V \mu, V f\) (or VF, or Vo, which in this comparilon may be taken as equal) \(=f, \mathrm{E} f=b\), and \(f \mathrm{E}=\phi x\).
\(A V^{2}: \propto V^{\prime 2}=\mathrm{F} f: \mathrm{F} \varphi\) (already demonftrated) and \(\mathrm{F} \varphi\) \(=\frac{a^{2}}{a^{2}} b\), and \(\mathrm{F} f-\mathrm{F} p,(\) or \(f \hat{p})=b-\frac{a^{2}}{a^{2}} b,=\frac{a^{2} b-\alpha^{2} b}{a^{2}}\),
\(=\frac{b}{a^{2}} \times a^{2}-a^{2},=\frac{b}{a^{2}} \times \overline{a+a} \times \overline{a-a}\). Alro Pf:PA

\section*{Plate}

Fig. 6.

\section*{T E L [ 243 ] T E L}
\(\underbrace{\text { Eifenpe. }}=f E:\) EH, or \(f: a=x: \frac{a x}{f},=\mathrm{EH}\). And \(\mathrm{P}_{\pi}: \mathrm{P}_{\mathrm{p}}\) \(=\mathrm{EII}: \mathrm{E}_{\hat{p}}\), o: \(u: f=\frac{n x}{f}: \frac{n x}{\alpha}\), E. \(\varphi\). Therefore \(f \phi=\frac{a v}{\alpha}+x,=\frac{\overline{a+\alpha} v}{\alpha},=\frac{x}{\alpha} \times \overline{a+u} \quad\) Therefore \(\frac{x}{\alpha}\) \(\times \overline{a+\alpha}=\frac{b}{a^{2}} \times \overline{a+\alpha} \times \overline{a-\alpha}\), and \(\frac{x}{c b}=\frac{b}{a^{2}} \times \overline{a-\alpha}\), and \(x=\frac{b}{a^{2}} \times a(a-\alpha)\). Therefore \(x\) is greateft when \(\alpha \times \overline{n-x}\) is greateff that is, when \(e=\frac{1}{2} n\). Therefore \(\mathbf{E H}\) is greateft when \({ }^{\prime} \pi\) is equal to the half of \(\mathrm{Al}^{\prime}\). When this is the cale, we have at the fame time \(\frac{b}{a^{3}} \times \infty\) \((a-\infty)=\frac{b}{a^{2}} \times \frac{5}{4} a^{2}\), and \(x=\frac{1}{4} b\), or EH \(=\frac{r}{4} \mathrm{FG}\). That is , the diameter of the circle of aberration through which the whole of the refracted light mutt pafs, is \(\frac{r}{4}\) of the diameter of the circle of aberration at the focus of parallel central rays. In the chromatic aberration it was \(\frac{3}{2}\); fo that in this refpect the fpherical aberration does not create fo great confufion as the chromatic.

We are now able to compare them, fince we have now the meafure of both the circles of aberration.

It has not been found poffible to give more than four inches of aperture to an object glafs of 100 feet focal diflance, fo as to preferve futicient diftinctnefs. If we compute the diameter of the circle EH correfponding to this aperture, we fhall find it not much to exceed \(\frac{1}{120,000}\) of an inch. If we reftriet the circle of chromatic difperfion to \(\frac{\dot{\delta}}{30}\) of the aperture, which is hardly the fifth part of the whole difperfion in it, it is \(\frac{1}{62 \frac{1}{6}}\) of an inch, and is about 1900 times greater than the other.

The circle of fplerical aberration of a plano-convex lens, with the plane fide next the diftant object, is equal to the circle of chromatic difperfion when the femi-aperture is about \(15^{\circ}\) : For we faw formerly that EH is \(\frac{7}{4}\) of FG , and that FG is \(=\frac{r^{3}}{i^{2}} \frac{A \mathrm{P}^{3}}{2 A C^{3}}\), and therefore \(\mathrm{EG}=\frac{r^{2}}{i^{2}} \times \frac{A P^{3}}{8 A C^{2}} . \quad\) This being made \(=\frac{A P}{55}\), gives us \(A P=\sqrt{\frac{8 i^{7} A C^{2}}{55 r^{2}}}\), which is nearly \(\frac{A C}{4}\), and corre. fronds to an aperture of \(30^{\circ}\) diameter, if \(r\) be to \(i\) as 3 tn 2.

Sir Ifaac Newton was therefore well entitled to fay, that it was quite needlefs to attempt figures which should have lefs aberration than fpherical ones, while the confufion produced by the chromatic difperfion remained uncorrected. Since the indiftinetnets is as the fqיares of the diameters of the circles of aberration, the difproportion is quite beyond our imagination, even when Newton has made fuch a liberal allowance to the chromatic difperfion. But it muft be acknowledged, that he has not attended to the diftribution of the light in the circle of foherical aberration, and has haftily fuppofed it to be like the diftribution of the coloured light, indefintely rare in the margin, and denfer in the centre.

We are indsbted to Father Bofcovicls for the elegant Teicferge. determination of this diftribution, which we have given in the article Oprics. From this it appears, that tlic light in the margin of the circle of Spherical aberration, inftead of being incomparably rarct than in the fpaces between it and the centre, is incomparably denfer. The indiftinctuefs therefore p:oduced by the interfection of thefe luminous circumferences is vallly great, and increafes the whole indiftinetnefs excredingly. By a grofs calculation which we made, it appears to be i:crealed at leaft 500 times. The proporional indifinctnefs therefore, inftead of being \(19: 0^{2}\) to 1 , is only \(\frac{1950^{2}}{500}\), or nearly 7220 to 1 ; a proportion fill fuficiently great to warrant Newton's preference of the reflecting telefcope of his invention. And we may now oblerve, that the refleeting telefoope bas even a great advantage over a refracting one of the fame focal difance, with refpect to its fpherical aberration: For we have feen (Cor. 2.) that the lateal abetration is \(\frac{r^{2}}{2^{2}} \frac{\mathrm{AV}}{} \mathrm{AVV}^{3}\). This for a plano-convex glafs is nearly \(\frac{9}{4} \frac{A V^{3}}{2 C V^{2}}\). And the diameter of the circle of aberration is one-fourth of this, or \(\frac{9}{16} \times \frac{\mathrm{AV}^{3}}{2 \mathrm{CV}^{2}}\). In like manner, the lateral aberration of a concave mirror is \(\frac{A V^{3}}{2 C V^{2}}\); and the diameter of the circle of difperfion is \(\frac{\mathrm{AV}^{3}}{8 \mathrm{CV}}\); and therefore if the furfaces were portions of the fame fphere, the diameter of the circle of aberration of tefra\&ted ray'a would be to that of the circle of aberration of reflected rays as \(\frac{10}{\circ}\) to \(\frac{7}{4}\), or as 9 to 4 . But when the refracting and reflecting furfaces, in the pofition here confidered, have the fame focal diflance, the radius of the refracting furface is four times that of the rellecting furface. The proportion of the diameters of the circles of fpherical aberration is that of \(9 \times 4^{2}\) to 4 , or of 144 to 4 , or 36 10 r . The difindtnefs therefore of the reflector is \(36 \times 36\), or 1296 times greater than that of a planoconvex lens (placed with the plane fide next the diftant object) of the fame breadth and focal diftance, and will therefore admit of a much greater magnifying power. This comparifon is indeed made in circumftances moft favourable to the retlector, becaufe this is the very worft pofition of a plano-convex lens. But we have not as yet learned the aberration in any other nofition. In another pcfition the refraction and confequent aberration of both farfaces are complicated.

Before we proceed to the confideratinn of this very difficult fubject, we may deduce from what has been already demonftrated feveral general rules and maxims in the condruftion of telefcoves, which will explain (to fuch readers as do not wifh to enter more deeply into the fubject, and juftify the proportion which long practice of the beft aroilts has fanstioned.

Indiftinetnefs proceeds from the commixture of the circlec of aberration on the retina of the eve: For any one fenfible point of the retina, being the centre of a circle of aberration, will at once he affected by the admixture of the rays of as many different pencils of light as there are fenfible poinis in the area of that circle, and will conrey to the mind a mised fentation of as many Hh2
vifible

\section*{T E L [ 244 ] T E L}

Telefcope. vifible points of the object. This number will be as the \(\xrightarrow{\square}\) area of the circle of aberrations, whatever be the fize of a fenfible point of the retina. Now in vifion with teleScopes, the diameter of the circle of aberration on the retina is as the apparent magnitude of the diameter of the correfponding circle in the focus of the eye-glafs; that is, as the angle fubtended by this diameter at the centre of the eye-glafs; that is, as the diameter itfelf directly, and as the focal diltance of the eye-glafs inverfely. And the area of that circle on the retina is as the area of the circle in the focus of the eye-glafs directly, and as the fquare of the focal diffance of the eyeglafs inverfely. And this is the meafure of the apparent indilinctnefs.

Cor. In all forts of telefcopes, and alfo in compound microfcopes, an object is feen equally ditinet when the focal diftances of the eye-glaffes are proportional to the diameters of the circles of aberration in the focus of the object-glafs.

Here we do not confider the triffing alteration which well confructed eye-glailes may add to the indiftinencfls of the firit image.

In refracting telefcopes, the apparent indintinctnefs is as the area of the object-glafs directly, and as the fquare of the focal diftance of the eye-glafs inverfely. For it has been fhown, that the area of the circle of difperfion is as the area of the object-glafs, and that the fpherical aberration is infignificant when compared with this.

Therefore, to make refiecting telefcopes equally difinct, the diameter of the object-glafs mult be proportional to the fecal difance of the eye-glafs.

But in rellecting telefcopes, the inditinetnefs is as the fixth power of the aperture of the object-glafs directly, and as the fouth power of the focal diftance of the ob-ject-glafs and fquare of the focal diftance of the eyeglafs inverfely. This is evident from the dimenfions of the circle of aberration, which was found proportional 10 \(\frac{\mathrm{AV}^{2}}{\mathrm{CV}}\).

Therefore, to have them equally diftinct, the cubes of the apertures mult he proportional to the fquares of the focal difance multiplicd by the focal diffance of the eyc-gla fs.

By thele rules, and a flandard telefcope of approved goodnefs, an artill can always proportion the parts of any infrument he wihes to comifruct. Mr Huyghens made one, of which the object-glafs had 30 fect focal diftance and three inches diameter. The eye-glafs had 3.3 inches focal diffance. And its performance was found fuperior to any which he had feen; nor did this appear owing to any chance gooduefs of the object-glafs, becaufe he found others equally good which were conitructed on fimilar proportions. This has therefore been udopted as a fandard.

It does not at firlt appear how there can he any difficulty in this matter, becaufe we can always diminifin the aderture of the object-glafs or fpeculum till the circle of aberration is as fmall as se pleafe. Hut by diminihing Whis aperture, we diminifh the light in the duplicate ratio of the apcrture. Whatever be the aperture, the brightnefs is diminified by the magnifying power, which fpreads the light over a greater furface in the bottom of the eye. The apparent brightnefs mult be as the fquare of the aporture of thic telelcore directly, and the fquare
of the anplification of the diameter of an object inverfe- Telefcope. ly. Objeets therefore will be feen equally bright if the apetures of the telefcopes be as the focal diftances of the object-glaffes directly, and the focal diffances of the lingle eye-glais (or eye-glafs equivalent to the eye-picce) inveriely. Therefore, to have telefcopes equally dittinct and equally bright, we mult combine thefe proportions with the former. It is needlefs to go farther into this fubject, becaufe the confruction of refracting telefcopes has been fo materially changed by the correction of the chromatic aberration, that there can handly be given any proportion between the object-glafs and eye-glafles. Every thing now depends on the degree in which we can correct the aberrations of the object glafs. We have been able fo far to diminifh the chromatic aberration, that we can give very great apertures without its becoming fenfible. But this is attended with fo great an increafe of the aberration of figure, that this laft becomes a fenfible quality. A lens which has \(30^{\circ}\) for its femi-aperture, has a circle of aberration equal to its chromatic aberration. Fortunately we can derive from the very method of contrary refractions, which we employ for removing the chromatic aberration, a correction of the other. We are indebted for this contrivance alfo to the illuitrious Newton.

We call this Newton's contrivance, becaufe he was the firft who propofed a conitruction of an object-glafs in which the aberration was corrected by the contrary aberrations of glafs and water.

Huyghens had indeed fuppofed, that our all-wife Creator had employed in the eyes of animals many refracions in place of one, in order to make the vifion more diftinct ; and the invidious detractors from Newton's fame have catched at this vague conjecture as an indication of his knowledge of the poffibility of dellroying the aberration of figure by contrary refractions. But this is vety ill-founded. Huyghens lias acquired fufficient reputation by his theory of aberrations. The fcope of his wriling in the paffage alluded to, is to fhow that, by dividing any intended refraction into parts, and producing a certain convergence to or divergence from the axis of an optical infrument by means of two or three lenfes inftead of one, we diminifh the aberrations four o: nine times. This conjecture about the eye was therefore in the natural train of his thoughts. But he did not thirk of deffroying the aberration altogether by oppofite refractions. Newton, in 1669 , rays, that opticians need not trouble themfelves about giving figures to their glaffes other than fpherical. If this figure were all the obfacle to the improvement of telefcopes, he could fhow them a conftruction of an object-glafs having fpherical furfaces where the aberration is dellroyed; and accordingly gives the confruction of one compofed of glais and water, in which this is done completely by means of contrary refractions.

The general principle is this: When the radiant point R (fig. 7.), or focus of incident rays, and its conjugate focus \(F\) of refracted central rays, are on oppofite fides of the refracting furface or lens V , the conjugate foctis \(f\) of marginal rays is nearer to 16 than F is. But when the focus of incident rays \(R^{\prime}\) lies on the fame fide with its conjugate focus \(F^{\prime}\) for central rays, \(R^{\prime} f^{\prime}\) is grea'er than \(\mathrm{R}^{\prime} \mathrm{F}^{\prime}\).

Now fig. 8. reprefents the contrivance for deftroying the colonr produced at \(F\), the principal focus of the
\(\therefore\) Ciefore convex lens \(V\), of crown glals, by means of the contrary refraction of the concave lens \(\varepsilon\) of fint glafs. The incident parallel rays are made to converge to F by the firt lens. This convergence is diminithed, but not entirely dettroyed, by the concave lens \(v\), and the focus is formed in \(F . F\) and \(F^{\prime}\) therefore are conjugate foci of the concave lens. If F be the focus of V for central rays, the marginal rays will be collected at fome point \(f\) nearer to the lens. If \(F\) be now confidered as the focus of light incident on the centre of \(v\), and \(\mathrm{F}^{\prime}\) be the conjugate focus, the marginal ray \(p \mathrm{~F}\) would be refracted to lome point \(f^{\prime}\) lying beyond \(\mathrm{F}^{\prime \prime}\). Therefore the marginal ray \(p f\) may be refracted to \(F\), if the aberration of the concave be properly adjufted to that of the convex.

This brings us to the mof difficult part of our fubjeet, the compounded aberrations of different furfaces. Our limits will not give us room for treating this in the fame elementary and perfpicuous manner that we employed for a fingle furface. We muft try to do it in a compendious way, which will admit at once the different furfaces and the different refractive powers of different fubflances. This mult naturally render the procefs more complicated ; but we hope to treat the fubjeet in a way eafily comprehended by any perfon moderately acruainted with common algebra; and we truft that our attempt vill be favourably received by an indulgent public, as it is (as far as we know) the only differtation in our language on the conitruction of achromatic inftruments. We cannot but exprefs our furprife at this indifference about an invention which has done fo much honour to our country, and which now confitutes a very lucrative branch of its manufacture. Our artifts infinitely furpafs all the performances of foreigners in this branch, and fupply the markets of Europe without any competition; yet it is from the writings on the continent that they derive their fcientific inftruction, and particularly from the differtations of Clairaut, who has wonderfully fimplified the analyfis of optical propofitions. We fhall freely borrow from him, and from the writings of Abbé Bofcovich, who has confiderably improved the firt views of Clairaut. We recommend the originals to the curious reader. Clairaut's difiertations are to be found in the Memoirs of the Academy of Paris, 1756, \&c., thofe of Bofcovich in the Memoirs of the Academy of Bologna, and in his five volumes of Opufcula, publifhed at Baffano in 1785 . To thefe may bc added D'Alembert and Euler. The only thing in our language is the tranflation of a very imperfect work by Scharfer.

Fig. 9. Lerman 1. In the right-angled triangle MXS (fig. 9.). of which one fide MX is very finall in comparifon of either of the others ; the excefs of the hypothenufe MS, above the fide XS , is very nearly equal to \(\frac{\mathrm{MX}^{2}}{2 \mathrm{MS}}\) or to \(\frac{\mathrm{MX}^{2}}{2 \mathrm{X}} \mathrm{S}^{2}\). For if about the centre S , with the radius SN ; we defrribe the femicircle AMO , we have \(\mathrm{AX} \times \mathrm{XO}\) \(=\mathrm{MX}^{2}\). Now \(\mathrm{AX}=\mathrm{MS}-\mathrm{SX}\), and XO , is nearly equal to 2 MS or 2 XS ; on the other hand, MS is nearly equal to \(X S+\frac{M X^{2}}{2 X S}\); and in like manner \(M G\)
is nearly equal to
to \(\frac{M X^{2}}{2 X H}+X H\).
\(P_{\text {rof. }}\). Let the ray \(m \mathrm{M}\), incident on the forical furface AM, converge to \(G\); that is, let \(G\) be the fucus of incident rays. It is required to find the focus \(F\) of refracted rays?

Let \(m\) exprefs the ratio of the fine of incidence and refraction ; that is, let \(m\) be to 1 as the fine of incidence to the fine of refraction in the fubllance of the fphere.
Then - . MG: GS=fin. MSH : fin. SMG, and - \(m: 1=\) fin. SMG: fin. SMH; therefore \(m \times M G: G S=\operatorname{lin}\). MSH: fin. SMH. Now S, MSH : S, SMH =MH:HS. Therefore, finally, m MG: GS=MH: HS.
Now let MS, the radius of the refracting furface, be called \(a\). Let AG, the diflance of the focus of incident rays from the furface, be called \(r\). And let AH, the focal diftance of refracted rays, be called \%. Lafty, let the fine MX of the femi-aperture be called \(e\). Obferve, too, that \(a, r, x\), are to be confidered as pofitive quantities, when AS, AG, AH, lie from the furface in the direction in which the light is fuppofed to move. If therefore the refracting furface be concave, that is \(s_{y}\) having the centre on that fide from which the light comes; or if the incident rays are divergent, or the refracted rays are divergent; then \(a, r, x\), are negative quantities.

It is plain that HS=x-a; GS=r-a; allo AX \(=\frac{\frac{e}{}^{2}}{2 a}\) nearly. \(\mathrm{HX}=a-\frac{e^{2}}{2 a} . \mathrm{GX}=r-\frac{\epsilon^{2}}{2 a}\). Now add to HX and to GX their differences from MH and MG, which (by the Lemma) are \(\frac{e^{3}}{2 x}\) and \(\frac{e^{2}}{2 r}\). We get MH. \(=x-\frac{\epsilon^{2}}{2 a}+\frac{\epsilon^{2}}{2 n}\), and MG \(=r-\frac{\epsilon^{2}}{2 a}+\frac{\epsilon^{2}}{2 r}\). In order to thorten our notation, make \(k=\frac{1}{a}-\frac{1}{2}\). This will make \(\mathrm{MG}=r-\frac{k e^{2}}{2}\).

Now fubftitute thefe values in the final analogy at the top of this column, viz. MH: HS =m.MG:GS; it becomes \(x-\frac{e^{2}}{2 a}+\frac{e^{2}}{2 x}: \tilde{\infty}-a=m r-\frac{m k e^{3}}{2}: r-a\) (or \(a r k\) ), becaufe \(k=\frac{r-a}{a r}\), and \(a r k=r-a\). Now mul. tiply the extreme and mean terms of this analogy. It is evident that it mult give us an equation which will give us a value of \(x\) or AFI, the quantity fought.

But this equation is quadratic. We may avoid the folution by an approximation which is fufficiently accurate, by fubflituting for \(x\) in the fiaction \(\frac{t^{2}}{2 i x}\) (which is very fmall in all cafes of optical infruments), an approximate very eafily obtained, and very near the truth. This is the focal diftance of an infinitely fender pencil of rays converging to G . This we know by the common optical theorem to be \(\frac{a m r}{m-1} r \pm a\). Let this be called?

\section*{\(T \mathrm{E} \mathrm{L}\)}

Teiefcope. called \(\varphi\); if we fubftitute \(k\) in place of \(\frac{1}{a}-\frac{1}{r}\), this value of \(\phi\) becomes \(=\frac{a m}{m-a k}\).

This gives us, by the by, an eafily remembered \(c x\) preflion (and beautifully fimple) of the refracted focus of an infinitely flender pencil, correfponding to any diflance \(r\) of the radiant point. For fince \(\phi=\frac{a m}{m-a k}\), \(\frac{\mathrm{I}}{\varphi}\) muft be \(=\frac{m-a k}{a m t},=\frac{m}{a} m^{\prime},-\frac{a k}{a m}=\frac{1}{a}-\frac{k}{m}\). We may even exprefs it more fimply, by expanding \(k\), and it becomes \(\frac{1}{\phi}=\frac{1}{a}-\frac{1}{m a}-\frac{1}{m r}\).

Now put this value of \(\frac{1}{\phi}\) in place of the \(\frac{1}{x}\) in the analogy employed above. The firt term of the analogy becomes \(x-\frac{e^{2}}{2 a}+\frac{e^{2}}{2 a}-\frac{k c^{2}}{2 m}\), or \(x-\frac{k e^{2}}{2 m}\). The analogy now becomes \(x-\frac{k e^{2}}{2 m}: x a=m r-\frac{n k \epsilon^{2}}{2}:\) ark. Hence we obtain the linear equation \(n t x-\frac{n k e^{3} x}{2}\) \(-m r a+\frac{m k a e^{3}}{2}=a r k x-\frac{a r k e^{3}}{2 m}\); from which we finally deduce
\[
x=\frac{m r a-\frac{1}{2} m a k c^{2}-\frac{a r k^{3} e^{2}}{2 m} \frac{m r-n r}{2 m-\frac{r}{2} m k e^{2}}}{2}
\]

We may fimplify this greatly by attending to the elementary theorem in fluxions, that the fraction \(\frac{x+\dot{x}}{y+\dot{y}}\) differs from the fraction \(\frac{x}{y}\) by the quantity \(y+y\)
\(\frac{y x-x \dot{y}}{y^{2}}\); this being the fluxion of \(\frac{x}{y}\). Therefore \(\frac{x+\dot{x}}{y+y}\) \(=\frac{x}{y}+\frac{y \dot{x}-x \dot{y}}{y^{2}}\). Now the preceding formula is nearly in this fituation. It may be written thus;
\[
2 n r a\left(-\frac{1}{2} m a k e^{2}-\frac{a r k^{2} t^{2}}{2 m}\right)
\]
\(m r-a r k-m k e^{2} \quad\), when the laft terms of the numerator and denominator are very fmall in comparifon with the finf, und may be confidered as the \(\dot{x}\) and \(\dot{y}\), while \(m r a\) is the \(x\), and \(m r-a r k\) is the \(y\). Treating it in this way, it may be fated thus:
\[
x=\frac{m r}{m r-\frac{a}{a r b}}+
\]
\((m r a) \frac{r}{=} m c^{2}-(m r-a r k)\left(\frac{t}{s} m k a \epsilon^{2}+\frac{a r k^{2} c^{2}}{2 m}\right)\)
\[
\text { or } x=\frac{m r a}{r(m-a k)}+
\]
\(\frac{(m r a) m b-(m r-a r k)\left(m k a+\frac{a r k^{2}}{m}\right)}{r^{2}(m-a k)^{2}} \times \frac{r}{2} \epsilon^{2}\).
The firf term \(\frac{m r a}{r(m-a k)}\), or \(\frac{m a}{m-a k}\), is evidently \(=\) Q, the focal diflance of an infinitely flender poucil.

Therefore the aberration is expeeffed by the fecond term, Teleforpe. which we mult endeavour to fimplify.

It we now perform the multiplication indicated by -\((m-a r k) \times\left(m b a-\frac{a r k^{2}}{m}\right)\), it is plain that \(-m r\) \(\times m k a\) deftroys the firf term mraxmk of the numerator of our fmall fraction, and there remains of this numerator ( \(n a^{2} r k^{3}-a r^{2} k^{2}+\frac{a^{2} r^{2} k}{n k}\) ) \(: c^{2}\), which is equal to \(m^{2} a^{2}\left(\frac{r^{2}}{m 2}-\frac{r^{2} b^{2}}{m^{2} a}+\frac{r^{2} k^{2}}{m^{3}}\right) \frac{1}{2} c^{2}\).
The denominator was \(r^{2}(m-a k)^{3}\), and the fraction now becomes \(\frac{m^{2} a^{2}}{\left(m-a^{2}\right)^{2}}\left(\frac{k^{2}}{m r}-\frac{k^{2}}{m^{2} a}+\frac{k^{3}}{m^{3}}\right) \frac{r}{2} e^{2}\), which is evidently \(=\phi^{2}\left(\frac{k^{2}}{m r}-\frac{k^{3}}{m^{2} a}+\frac{k^{3}}{m^{3}}\right) \frac{c^{2}}{2}\). Now recol. lect that \(k^{2}=\frac{1}{a}-\frac{1}{r}\). Therefore \(\frac{k^{3}}{m^{2}}=\frac{k^{2}}{m^{2}}\left(\frac{1}{a}-\frac{1}{r}\right)=\) \(\frac{k^{3}}{m^{2} a}-\frac{k^{2}}{m^{2} r}\). Therefore, inflead of \(-\frac{k^{2}}{m^{2} a^{2}}\), write \(\frac{-k^{1}}{m^{2}}\) - \(\frac{k^{2}}{m r}\), and we get the fraction \(\phi^{3}\left(\frac{k^{3}}{m^{3}}-\frac{k^{3}}{m^{2}}-\frac{k^{2}}{m_{2}^{2} r}+\right.\) \(\left.\frac{k^{3}}{m r}\right)_{2}^{e^{2}}=\phi^{2}\left(\frac{k^{3}}{m}-\frac{m k^{3}}{m^{3}}-\frac{m k^{3}}{m^{3} r}+\frac{m^{2} k^{2}}{m^{3} r}\right) \frac{c^{2}}{2}\), which is equal to \(\varphi^{3} \frac{1-m}{m^{3}}\left(k^{3}-\frac{m k^{2}}{r}\right) \frac{e^{2}}{2}\), and finally to \(-\varphi^{2} \frac{2 m-\mathrm{I}}{m^{3}}\) \(\left(k^{3}-\frac{m k^{2}}{r}\right) \frac{\epsilon^{3}}{2}\).
Therefore the focal diftance of refracted rays is \(x=0\) \(-\phi^{2} \frac{m_{2}-1}{m^{3}}\left(k^{3}-\frac{m k^{2}}{r}\right) \frac{c^{2}}{2}\).

This confifts of two parts. The firt \(\phi\) is the focal diftance of an infinitely flender pencil of central rays, and the other \(-\varphi^{2} \frac{m-1}{m^{3}}\left(k^{3}-\frac{m k^{2}}{r}\right) \frac{c^{2}}{2}\) is the aberration arifing from the fpherical figure of the refracting furface.

Oar formula has thus at laft put on a very fimple form, and is vally preferable to Dr Smith's for practice.

This aberration is evidently proportional to the fquare of the femi-aperture, and to the fquare of the diffance \(\varphi\) : but in order to obrain this fimplicity, feveral quantities were neglected. The affumption of the equality of AX to \(\frac{c^{3}}{2 a}\) is the firft fource of error. A much more accurate value of it would have been \(\frac{a n c^{2}}{4 a^{3}+c^{2}}\), for it is really \(=\frac{e^{s}}{2 n-A X}\). If for AX we fubftitute its ap. proximated value \(\frac{e^{2}}{2 a}\), we flould have \(\mathrm{AX}=\frac{e^{2}}{2 a-\frac{t^{2}}{2 a}}\), \(=\frac{2 a c^{2}}{4 a^{2}-a^{20}}\). To bave ufed this valuc would not have much complicated the calculus; but it did not occur to us till we had finiliced the inveltigation, and it would have required the whole to be changed. The operation in page 246 . col. I. par. 3. is anotlicr fource of error. But thefe crrors are very inconfiderable when the apcr-

\section*{T E L}
from \(\mathrm{N} x\) ). Alfo let a be the thicknefs of the lens. Telcrope Thern oblierse, that the focal difance of the rays refracled by the firf furface, (neglecting the thicknefs of the lens and the aberration of the firlt furface). is the diftance of the radiant point for the fecond refruction, or is the focal dillance of rays incident on the fecond furface. In place of \(r\) therefore we mult take \(\phi\); and as we made \(k=\frac{T}{a}-\frac{1}{r}\), in order to abbreviate the calculus, let us now make \(l=\frac{1}{b}-\frac{1}{6}\); and make \(\frac{1}{f}=\frac{1}{b}\) \(-m l\), as we made \(\frac{1}{\theta}=\frac{1}{a}-\frac{k}{m}\). Lafily, in place of \(\theta\) \(=\frac{m-1}{m^{1}}\left(k^{3}-\frac{m k^{2}}{r}\right) \frac{t^{2}}{2}\), make \(\theta^{\prime}=\left(\frac{1}{m}-1\right) m^{3}\) \(\left(l^{3}-\frac{l^{2}}{m \phi}\right) \frac{c^{2}}{2},=-\frac{m-1}{m}\left(m^{3} l^{3}-\frac{m^{2} l^{2}}{\varphi}\right) \frac{\sigma^{2}}{2}\).

Thus we have got an expreflion fimilar to the other; and the focal diftance 131 , after two refractions, becomes \(\mathrm{Bl}=f-f^{2} \theta^{\prime}\).

But this is on the fuppofition that BH is equal to \(\phi\), whereas it is really \(\varphi-\varphi^{2} \theta-\alpha\). This muft occafion a change in the value juft now obtained of BI. The fource of the change is twofuld. Ift, Becaule in the value \(\frac{1}{b}-\frac{1}{\phi}\), we mull put \(\frac{1}{6}-\frac{1}{\varphi-\varphi^{2} \theta-\alpha}\), and becaufe we muft do the fame in the fraction \(\frac{\frac{m^{2} /^{2}}{\varphi}}{\varphi}\). In the fecond place, when the value of BH is diminifhed by the quantity \(\varphi^{2} \theta+\alpha\), BI will fuffer a change in the proportion determined by the 2d Lemma. The firlt difference may fafely be neglected, becaufe the value of \(\theta\) is very finall, by reafon of the coefficient \(\frac{e^{2}}{2}\) being ve. ry fmall, and alfo becaufe the variation bears a very fmall ratio to the quantity itfelf, when the true value of \(\varphi\) differs but little from that of the quantity for which it is employed. The chief change in BI is that which is determined by the Lemma. Therefore take from BI the variation of B1I, multiplied by \(\frac{m \mathrm{BI}^{2}}{\mathrm{BH}^{2}}\), which is very nearly \(=\frac{m f^{2}}{\varphi^{2}}:\) The product of this multiplication is \(m f^{2} \theta+\frac{m f^{2} \alpha}{q^{2}}\). This being taken from \(f\); lcaves us. for the value of BI \(f-\frac{f^{2} m \alpha}{\varphi^{2}}-f^{2}\left(m \theta+\theta^{\prime}\right)\).

In this value \(f\) is the focal ditance of an infinitely flender pencil of rays twice refracted by a lens having no thicknefs, \(a \frac{m f^{2}}{\phi}\) is the fluortening occafioned by the thicknefs, and \(f^{3}\left(m \theta+\theta^{\prime}\right)\) is the effeet of the two aberrations arifing from the aperture.

It will be convenient, for feveral collateral purpofes, to exterminate from thefe formule the quentities \(k, l\) and \(\varphi\). For this purpofe make \(\frac{1}{n}=\frac{1}{a}-\frac{1}{b}\). We have already \(k=\frac{1}{a}-\frac{1}{r}\); and \(\frac{1}{\varphi}=\frac{1}{a}-\frac{1}{m a}+\frac{1}{m r}\); and \(l=-\) \(\frac{\mathrm{T}}{\frac{1}{b}}-\frac{1}{\varphi},=\frac{1}{b}-\frac{1}{a}+\frac{1}{m a}-\frac{1}{m r}\). Now for \(\frac{1}{b}-\frac{1}{a}\) write \(-\frac{1}{n}\),

\section*{T E I} \(\underbrace{\text { Telcicope. }}\) and we get \(l=\frac{1}{m a}-\frac{1}{m r}-\frac{1}{m}\). Therefore \(\frac{1}{f}=\frac{1}{6}-\) \(n 1\) (by conftruction, pare 347. Prop. II.) becomes \(=\) \(\frac{1}{b}-\frac{1}{a}+\frac{1}{r}+\frac{m}{n},=\frac{m}{n}+\frac{1}{r}-\frac{1}{n},-\frac{m-1}{n}+\frac{1}{r}\).

This laft value of \(\frac{1}{f}\) (the reciprocal of the focus of a flender pencil twice refracted), viz. \(\frac{m-1}{n}+\frac{1}{r}\), is the fimplett that can be imagined, and makes \(n\) as a fubftitute for \(\frac{1}{a}-\frac{1}{b}\); a mort ufeful fymbol, as we thall frequently find in the fequel. It alfo gives a very fimple exprefion of the focal diftance of parallel rays, which we may call the principal focal diftance of the lens, and diftinguifh it in future by the fymbol \(p\); for the expreffion \(\frac{1}{f}=\frac{m-1}{n}+\frac{1}{r}\), becomes \(\frac{1}{p}=\frac{m-1}{n}\) when the incident light is parallel. And this gives us another very fimple and ufeful meafure of \(f\); for \(\frac{1}{f}\) becomes \(=\frac{1}{p}\) \(+\frac{1}{r}\). Thefe equatiens \(\frac{1}{f}=\frac{m-1}{n}+\frac{1}{r}, \frac{1}{p}=\frac{m-1}{n}\), and \(\frac{1}{f}=\frac{1}{p}+\frac{1}{r}\), deferve therefore to be made very familiar to the mind.

We may alfo take notice of another property of \(n\). It is half the radius of an ifofeles lens, which is equivalent to the lens whofe radii are \(a\) and \(b\) : for fuppofe the lens to be ifofeeles, that is \(a=b\); then \(n=\frac{1}{a} \frac{1}{a}\). Now the fecond \(a\) is negative if the firft be pofitive, or pofitive if the firft be negative. Therefore \(\frac{1}{a}-\frac{1}{b}=\) \(\frac{1+b}{a^{2}}=\frac{a+a}{a^{2}}=\frac{2}{a}\), and \(\frac{1}{n}=\frac{2}{a}\), and \(n=\frac{a}{2}\). Now the focal diftance of this lens is \(\frac{n-1}{n}\), and \(f o\) is that of the other, and they are equivalent.
But, to proceed with our invefigation, recollect that we had \(\theta=\frac{m-1}{m^{3}}\left(k^{3}-\frac{m^{2} k^{2}}{r}\right) \frac{e^{a^{8}}}{2}\). Therefore \(m=\) \(\frac{m-1}{m}\left(\frac{k^{1}}{m}-\frac{k^{2}}{r}\right) \frac{e^{2}}{2} . \quad\) And \(\theta^{\prime}\) was \(=\frac{m-1}{m}\left(-m^{3} / 3\right.\) \(\left.+\frac{m l^{2}}{\varphi}\right) \frac{t^{2}}{2}\). Therefore \(m \theta+\theta\), the aberration (neglecting the thicknefs of the lens is \(f^{2} \frac{m-1}{m}\left(\frac{k 1}{m}-\frac{k^{2}}{r}\right.\) \(\left.-m^{3} l^{3}+\frac{m l^{2}}{\phi}\right) \frac{c^{2}}{2}\).

If we now write for \(k, l\), and \(\phi\), their values as determined above, performing all the neceffary multiplications, and arrange the terms in fuch a manner as to collect in one fum the coefficients of \(a, n\), and \(r\), we fhall find 4 terms for the value of \(m \theta\), and 10 for the value of ' \(e\) ': The 4 are deftroyed by as many with contrary figns in the value of \(\psi\). and there remain 6 terms to exprefs the value of \(n t+t^{\prime}\), which we flall exprefs by one fymbol 9 ; and the equation ftands thus:
\(q=\frac{n-1}{m}(\frac{m^{3}}{n^{3}}-\frac{2 m^{2}+m}{a n^{n}}+\frac{m+2}{a^{2} n}+\frac{3 m^{2}+m}{r n^{2}}-\underbrace{\text { Telecsope: }}\) \(\left.\frac{4 m+4}{a r n}+\frac{3 m+2}{r^{2} n}\right) \frac{m^{3}}{2}\).

The focal diftance therefore of rays twice refracted, reckoned from the laft furface, or BI, corrected for aberration, and for the thicknefs of the lens, is \(f-f\) \(\frac{m \alpha}{\phi^{2}}-f^{2} q\), confilting of three parts, viz. \(f\), the focal diftance of central rays ; \(f^{2} \frac{m \alpha}{\phi^{3}}\), the correction for the thicknefs of the lens; and \(f^{2} q\), the aberration.

The formula at the top of this column appears rery complex, but is of very eafy management, requiring only the preparation of the fimple numbers which form the numerators of the fractions included in the parenthefis. When the incident rays are parallel, the terms vanilh which have \(r\) in the denominator, fo that only the three firft terms are ured.

We anight here point out the cafes which reduce the aberration expreffed in the formula laft referred to, to nothing; but as they can fearcely occur in the objectglafs of a telefcope, we omit it for the prefent, and proceed to the combination of two or more lenfes.

Lemima 3. If AG be changed by a fmall quantity \(\mathrm{G} g, \mathrm{BI}\) fuffers a change \(\mathrm{I} i\), and \(\mathrm{G} g: \perp i=\mathrm{AG}^{2}\) : \(\mathrm{Bl}^{2}\). For it is well known that the fmall angles GM \(g\) and IN \(i\) are equal; and therefore their fubtenfes \(\mathrm{G} k\), I \(n\) are proportional to MG, NI, or to AG, AI nearly, when the aperture is moderate. Therefore we have (nearly)
\[
\begin{aligned}
& \mathrm{G} k: \mathrm{I} n: \mathrm{AG}: \mathrm{BI} \\
& \mathrm{I} n: \mathrm{I} i=\mathrm{AM}: \mathrm{BI} \\
& \mathrm{G} g: \mathrm{G} k=\mathrm{AG}: \mathrm{AM}^{2} \\
& \text { Therefore } \mathrm{G} g: \mathrm{I} i=\mathrm{AG}^{2}: \mathrm{BI}^{2}
\end{aligned}
\]

Prop. III. To determine the focal diftance of rays refracted by two lenfes placed near to each other on a common axis.

Let AM, BN (fig. II.) be the furfaces of the firft lenfe, and CO, DP be the furfaces of the fecond, and let \(\beta\) be the thicknefs of the fecond lens, and \(\delta\) the interval hetween them. Let the radius of the anterior furface of the fecond lens be \(a^{\prime}\), and the radius of its pofterior furface be \(b^{\prime}\). Let \(m^{\prime}\) be to I as the fine of incidence to the fine of refraction in the fubtance of the fecond lens. Lafty, let \(p^{\prime}\) be the principal focal diflance of the fecond lens. Let the extreme or marginal ray meet the axis in L after paffing through both lenfes, fo that DL is the ultimate focal diftance, reckoned from the laft furface.
It is plain that DL may be deternined by means of \(a^{\prime}, b^{\prime}, m^{\prime}, p^{\prime}\), and CI, in the fame manner that BI was determined by means of \(a, b, m, p\), and AG.

The value of BI is \(f-m \alpha \frac{f^{2}}{\phi^{2}}-f^{2} q\). Take from this the interval \(\delta\), and we have \(C I=f-m \alpha \frac{f^{3}}{\phi^{2}}-\delta-\) \(f^{2} q\). Let the fmall part -in \(\frac{f^{2}}{\phi^{2}}-\delta-f^{2} q\) beneglected for the prefent, and let CI be fuppofed \(=f\). As we formed \(\varphi, f\), and \(q\), by means of \(a, b, m, n\), and
are vaftly more manageable than thofe cmployed by Tejefc ope Luler or D'Alembert. We have calculated trigonometrically the progrefs of the rays through onc of the glaffes, which will be given as an example, giving it a very extravagant aperture, that the crrors of the formulx might be very remarkable. We found the real aberration exceed the aberration affigned by the formula by no more than \(\frac{1}{5}\) th part, a difference which is quite infignificant. The procefs here given derives its limplicity from the frequent occurrence of harmonic proportions in all optical theorms. This enabled Mr Clairaut to employ the reciprocals of the radii and diftances with to much fimplicity and generality.

We confider it as another advantage of Mr Clairaut's method, that it gives, by the way, formulse for the more ordinary queltions in optics, which are of wonderful fimplicity, and moft eafily remembered. The chie? problems in the elementary confruction of optical infruments relate to the focal dillances of central rays. This determines the focal dilitances and arrangement of the glaffes. All the relt may be called the refinement of optics; teaching us how to avoid or correct the indiftinetnefs, the colours, and the diltortions, which are produced in the images formed by thefe fimple conftructions. We fhall mention a few of thefe formulæ which occur in our procefs, and tend greatly to abbreviate it when managed by an experienced analyf.

Let \(m\) be to 1 as the fine of incidence to the fine of refraction; let \(a\) and \(b\) be the radii of the anterior and pofterior furfaces of a lens; let \(r\) be the diftance of the radiant point, or the focus of incident central rays, and \(f\) the diftance of the conjugate focus; and let \(p\) be the principal focal diffance of the lens, or the focal diftance of parallel rays. Make \(\frac{1}{n}\) equal to \(\frac{1}{a}-\frac{1}{b}\); let the fame letters \(a^{\prime}, b^{\prime}, r^{\prime}, \& c\). exprefs the fame things for a fecond lens; and \(a^{\prime \prime}, b^{\prime \prime}, r^{\prime \prime}\), \&c. exprefs them for a third; and fo on. Then we have \(\frac{1}{f}=\frac{m-1}{n}+\frac{1}{r} ; \frac{1}{f}=\frac{m^{\prime}-1}{n^{\prime}}+\) \({ }^{\prime}{ }^{\prime} ; \frac{1}{f^{\prime \prime}}=\frac{n^{\prime \prime}-1}{n^{\prime \prime}}+\frac{1}{r^{\prime \prime}}, \& c\).

Therefore when the incident dight is parallel, and \(r\) infinite, we have \(\frac{1}{p}=\frac{n-1}{n} ; \frac{1}{p^{\prime}}=\frac{n^{\prime}-1}{n^{\prime}} ; \frac{1}{p^{\prime \prime}}=\) \(\frac{m^{\prime \prime}-1}{n^{\prime \prime}}\), \&c.
And when feveral lenfes are contiguous, fo that their intervals may be neglected, and therefore \(\frac{1}{f}\), belonging to the firft lens, becomes \(\frac{1}{r}\), belonging to the fecond, we have
r. \(\frac{\mathrm{I}}{r^{\prime}}=\frac{\mathrm{I}}{f}=\frac{m-1}{n}+\frac{\mathrm{I}}{r},=\frac{\mathrm{I}}{p}+\frac{\mathrm{I}}{r}\).
2. \({ }_{\gamma^{\prime \prime}}^{1}=\frac{1}{f^{\prime}},=\frac{m^{\prime}-1}{n^{\prime}}+\frac{m-1}{n}+\frac{1}{r},=\frac{1}{p^{\prime}}+\frac{\mathrm{x}}{p}+\frac{\mathrm{x}}{r}\)
\(3 \cdot \frac{1}{f^{\prime \prime}}=\frac{m^{\prime \prime}-1}{n^{\prime \prime}}+\frac{m^{\prime}-1}{n}+\frac{m-1}{n}+\frac{1}{r},=\frac{1}{p^{\prime \prime}}+\frac{1}{p^{\prime}}+\frac{1}{p}+\frac{5}{r}\).
Nothing can be more eafily remembered than thefe formulæ, how numerous fo ever the glaffes may be.

Having thus obtained the neceffary analylis and for-

\section*{TE [ 250 ] T E L}

Telefcope. mula, it now remains to apply them to the confruction of achromatic lenfes; in which it fortunately happens, that the employment of feveral furfaces, in order to produce the union of the differently refrangible rays, enables us at the lame time to employ them for corredting each other's fpherical aberration.

In the article Optics we gave a general notion of the principle on which we may proceed in our endeavours to unite the differently refrangible rays. A white or compounded ray is feparated by refraction into its component coloured rays, and they are diffufed over a fmall angular fpace. Thus it appears, that the glafs ufed by Sir Ifaac Newton in his experiments diffuled a white ray, which was incident on its pofterior furface in an angle of \(30^{\circ}\), in fuch a manner that the extreme red ray emerged into air, making an angle of \(50^{\circ} 21^{\frac{7}{3}}\) with the perpendicular; the extreme violent ray emerged in an angle of \(52^{\circ} 15^{3 \prime}\); and the ray which was in the confines of green and blue, emerged in an angle of \(50^{\circ}\) \(48 \frac{1^{\prime}}{3}\). If the fine of the angle \(30^{\circ}\) of incidence be called 0.5 , which it really is, the fine of the emergence of the red ray will be 077 ; that of the violet ray will be 0.78 ; and that of the intermediate ray will be \(0.77 \frac{1}{2}\), an cxact mean between the two extremes. This ray may therefore be ealled the mean refrangible ray, and the ratio of \(77 \frac{7}{2}\) to 50 , or of 1.55 to I , will very properly exprefs the mean refraction of this glafs; and we bave for this glafs \(m=1.55\). The fine of refraction, being meafured on a fcale, of which the fine of incidence occupies 100 parts, will be 154 for the red ray, 155 for the mean ray, and 156 for the violet ray. This number, or its ratio to unity, is commonly taken to reprefent the refractive power. of the glafs. There is fome impropriety in this, unlefs we confider ratios as meafured by their logarithms: for if \(m\) be 1 , the fubftance does not refract at all. The refrative power can be properly meafured only hy the refraction which it produces; that is, by the change which it makes in the direction of the light, or the angle contained between the incident and refracted rays. If two fubftances produce fuch deviations aluays in one proportion, we fhould then fay that their refractive powers are in that proportion. This is not true in any fubflances; but the fines of the angles, comained between the refracted ray and the perpendicular, are always in one proportion when the angle of incidence in both fubftances is the fame. This being a cognifatle function of the real refraction, has therefore been affumed as the only convenient meafure of the refractive powers. Although it is not flrictly juft, it anfwers extremely well in the moft ufual cafes in optical inffruments: the refrations are moderate; and the fines are very nearly as the angles contained between the rays and the perpendicular; and the real angles of refraction, or deflections of the rays, are alinof exacly proportional to \(m\) - \(\mathbf{I}\). The moft natural and obvious meafure of the refractive powers would therefore be \(m-1\). But this would emharrafs fome very frequent calculations; and we therefore find it beft, on the whole, to take \(m\) itfelf for the meafure of the refractive power.

The feparation of the red, violet, and intervening rays, has been called difperfion; and although this arifes merely from a difference of the refractive power in refpeet of the different rays, it is convenient to difinguifh this particular modification of the refractive power by a
mame, and we call it the Dispersive Power of the re. Telefcorc frasing fubflance.

It is fufceptible of degrees; for a piece of fint-glafs will refract the light, lo that when the fine of retraction of the red ray is 77 , the fine of the refraction of the violet ray is nearly \(78 \frac{\pi}{2}\); or if the fine of refraction of the red ray, meafured on a particular Icale, is 1.54 , the fine of refraction of the violet ray is \(\mathbf{1 . 5 7}\). The difperfion of this fubftance, being mcafured by the difference of the extreme fines of refraction, is greater than the dif. perfion of the other glafs, in the proportion of 3 to 2 .

But this alone is not a fufficient meafure of the abfolute difperfive power of a fubflance. Although the ratio of J .54 to 1.56 remains conflant, whatever the real mag. nitude of the refractions of common glafs may be, and though we therefore fay that its difperfive power is conftant, we know, that by inereafing the incidence and the refraction, the abfolute difpcrion is alfo increaled. Another fubflance fhows the fame properties, and in a particular cafe may produce the lame difperfion; yet it has not for this fole reafon the fame difperfive power. If indeed the incidence and the refraction of the mean ray be alfo the fame, the difperfive power cannot be faid to differ; but if the incidence and the refraction of the mean ray be lefs, the difperfive power muff be confidered as greater, though the actual difperfion be the fame; becaule if we increale the incidence till it becomes equal to that in the common glafs, the difperfion will now be increafed. The proper way of conceiving the difperfion therefore is, to confider it as a portion of the whole refraction; and if we find a fubftance making the fame difperfion with half the general refraction, we mulf fay that the difperfive quality is double; tecaufe by making the refraction equal, the difperfion will really be double.

If therefore we take \(\dot{m}\) as a fymbol of the feparation of the extreme rays from the middle ray, \(\frac{n}{n-1}\) is the natural meafure of the difperfive power. We hall exprefs this in the Leibnitzian notation, thus \(\frac{d m}{m-1}\), that we may avoid the indiftinctnefs which the Newtonian notation would occafion when \(m\) is changed for \(m^{\prime}\) or \(m^{\prime \prime}\).

It is not unufual for optical writers to take the whole feparation of the red and violent rays for the meafure of the difperfive power, and to compare this with the refracting power with refpect to one of the extreme rays. But it is furely better to confider the mean refraction as the meafure of the refracting power: and the deviation of either of the extremes from this mean is a proper enough meafure of the difperfion, being always half of it. It is attended with this convenien \(\mathbf{c}\), that being introduced into our computations as a quantity infinitely frall, and treated as fuch for the eafe of computation, while it is really a quantity of fenfible magnitude; the errors ariing from this fuppofition are diminifhed greatly, by taking one half of the deviation and comparing it with the mean refraction. This method has, however, this inconvenience, that it does not exhibit at once the refractive power in all fulffances refpecting any particular colour of light; for it is not the ray of any particular colour that fuffers the mean refraction. In common glafs it is the ray which is in the confines of the yellow and blue; in flint-glafs it is nearly the mid-

\section*{\(T \mathrm{~F}\)}
viefopec. dle Llue ray; and in other fublances it is a dificent
ray. Thefe circumflances appear plainly in the dificerent proportions of the colours of the prifmatic fpectrum exhibited by different fubftances. This will be confidered afterwards, being a great bar to the perfection of achromatic inftruments.
The way in which an achromatic lens is conflucted is, to make ufe of a contrary refraction of a fecond lens to deflroy the difperfion or fpherical aberration of the firft.
The firft purpofe will be anfwered if \(\frac{d m}{n}\) be equal to \(-\frac{d n^{\prime}}{n^{\prime}}\). For, in order that the different coloured rays may be collected into one point by two lenfes, it is only neceffary that \(\frac{1}{f^{\prime \prime}}\), the reciprocal of the focal diflance of rays refracted by both, may be the fame for the extreme and mean rays, that is, that \(\frac{m+d m-1}{n}+\) \(\frac{m^{\prime}+d m^{\prime}-1}{n^{\prime}}+\frac{1}{r}\) be of the fame value with \(\frac{m-1}{n}+\) \(\frac{m^{\prime}-1}{n^{\prime}}+\frac{1}{r}\), which mult happen if \(\frac{d m}{n}+\frac{d m^{\prime}}{n^{\prime}}\) be \(=0\), or \(\frac{d m}{n}=-\frac{d m^{\prime}}{n}\). This may be feen in another way, more comprehenfible by fuch as are not verfant in thele difcuffions. In order that the extreme colours which are feparated by the firft lens may be rendered parallel by the fecond; we have fhown already that \(n\) and \(n^{\prime}\) are proportional to the radii of the equivalent ifofceles lenfes, being the halves of thefe radii. They are therefore (in thefe fmall refractions) inverfely proportional to the angles formed by the furfaces at the edges of the lenfes. \(n^{\prime}\) may therefore be taken for the angle of the firft lens, and \(n\) for that of the fecond. Now the fmall refraction by a prifm, whofe angle (alfo fmall) is \(n^{\prime}\), is m—i \(\times n\). The difperfive power being now fubfituted for the refractive power, we have for this refraction of the prifm \(d n \times n^{\prime}\). This mutt be deftroyed by the oppofite refraction of the other prifm \(d n^{\prime} \times n\). Therefore \(d m \times n^{\prime}=d m^{\prime} \times n\), or \(\frac{d m}{n}=-\frac{d m^{\prime}}{n^{\prime}}\). In like manner, this effer will be produced by three lenfes if \(\frac{d m}{n}+\frac{d m}{n^{\prime}}\) \(+\frac{d m^{\prime \prime}}{n^{\prime \prime}}\) be \(=0, \& c\).

Laftly, the errors arifing from the fpherical figure, which we exprefied hy \(-\mathrm{R}^{2}\left(q+q^{\prime}\right)\) will be corrected if \(q+q^{\prime}\) be \(=0\). We are therefore to difcover the adjuftments of the quantities employed in the preceding formule, which will infure thefe conditions. It will render the proces more perfpicuous if we colled into one view the fignifications of our various fymbols, and the principal equations which we are to employ.
r. The ratios to unity of the fines of mean
incidence in the different media are - \(m, m^{\prime}, m^{\prime \prime}\).
2. The ratio of the differences of the fines

\section*{of the extremes}
\[
\text { 3. The ratio } \frac{m-1}{n-1}
\]
\(\frac{d m}{d n l^{2}},=u\).
\(=c\).
4. The radii of the furfaces \(a, b ; a^{\prime}, l^{\prime \prime} ; a^{\prime \prime}, l^{\prime \prime}\). Theffope.
5. The principal focal diftances, or the focal diftances of parallel central rays,

6 . The focal diftance of the compound lens \(p, p, p\).
7. The diflance of the radiant point, or of the focus of incident rays on cach lens \(r, r, r^{\prime} r^{\prime \prime}\).
8. The focal diffance of the rays refracted by each lens - - - \(f, f^{\prime}, f^{\prime \prime}\).
9. The focal diftance of rays refracted by the compound lens
10. 'The half breadth of the lens

Alfo the following fubfidiary values:
1. \(\frac{1}{n}=\frac{1}{a}-\frac{1}{b} ; \frac{1}{n^{\prime}}=\frac{1}{a^{\prime}}-\frac{1}{b} ; \frac{1}{n^{\prime \prime}}=\frac{1}{a^{\prime \prime}}-\frac{1}{b^{\prime \prime}}\).
2. \(q=\frac{n-1}{m}\left(\frac{m^{\prime 3}}{n^{3}}-\frac{2 m^{2}+m}{a n^{2}}+\frac{m+2}{a^{2} n}+\frac{3 m m^{2}+m}{r n^{2}}-\right.\) \(\left.\frac{4(m+1)}{a r n}+\frac{3 n+2}{r^{2} n}\right) \frac{\varepsilon^{2}}{2}\). And \(q^{\prime}\) and \(q^{\prime \prime}\) muft be formed in the fame manner from \(m^{\prime}, a^{\prime}, n^{\prime}, r^{\prime}\); and from \(m^{\prime \prime}, a^{\prime \prime}\), \(n^{\prime \prime}, r^{\prime \prime}\), as \(q\) is formed from \(m, a, n, r\).
3. Alfo, becaule in the cafe of an object-glats, \(r\) is infinitely great, the laft term \(\frac{1}{r}\) in all the values of \(\frac{1}{f}, \frac{1}{f}\), \(\frac{1}{f^{\prime \prime}}, \frac{1}{r^{\prime \prime}}, \frac{1}{r^{\prime \prime}}\), will vanilh, and we fhall alfo have \(\mathrm{F}=\mathrm{P}\).

Therefore in a double object-glafs \(\frac{\mathrm{Y}}{\mathrm{Y}}=\frac{n n^{\prime}-\mathrm{I}}{n^{\prime}}+\frac{m-\mathrm{I}}{n}\) \(=\frac{1}{\rho}+\frac{1}{p^{\prime}}\).
And in a triple object-glafs \(\frac{\mathrm{I}}{\mathrm{P}}=\frac{n^{\prime \prime}-\mathrm{I}}{n^{\prime \prime}}+\frac{m^{\prime}-\mathrm{I}}{n^{\prime}}+\) \(\frac{m-1}{n},=\frac{1}{p^{\prime \prime}}+\frac{1}{p^{\prime}}+\frac{1}{p}\).

Alfo, in a double object-glafs, the correstion of fphe. rical aberration requires \(q+q^{\prime}=v\).

And a triple object-glafs requires \(q+q^{\prime}+q^{\prime \prime}=v\). For the whole error is multiplied by \(\mathrm{F}^{3}\), and by \(\frac{1}{2} e^{2}\); and therefore the equation which corrects this error may be divided by \(F^{2} \frac{1}{2} e^{2}\).

This equation in the fourtenth line from the top of the column, giving the value of \(q, q^{\prime}, q^{\prime \prime}\), may be much fimplified as follows: In the firla place, they may be divided by \(m\), \(m^{\prime}\), or \(m^{n}\), by applying them properly to the terms withira the parenthefis, and expunging them from the denominator of the general factors \(\frac{m-1}{m}, \frac{m^{\prime}-1}{m^{\prime}}\), \(\frac{n^{\prime \prime}-1}{m^{\prime \prime}}\). This does not alter the values of \(q, q^{\prime}\), and \(q^{\prime \prime}\). In the fecond place the whole equations may be afterwards divided by \(m^{\prime}-1\). This will give the values of \(\frac{q}{m^{\prime}-1}, \frac{q^{\prime}}{n^{\prime}-I}\) and \(\frac{q^{\prime \prime}}{3 n^{\prime}-1}\), which will fill be equal to nothing if \(q+q^{\prime}+q^{\prime \prime}\) be equal to nothing.
This divifion reduces the general factor \(\frac{m^{\prime}-\mathrm{T}}{m^{\prime}}\) of \(g^{\prime}\) to \(\frac{1}{m^{2}}\). And in the equation for \(q\) we obtain, in place of the general factor \(\frac{m-1}{m}\), the factor \(\frac{m-1}{m^{\prime}-1}\), or \(c\). This will alfo be the factor of the value of \(q^{\prime \prime}\) when the third lens is of the fame fubfance with the firft, es is general-

Telefcope. ly the cafe. And, in the third place, fince the rays in-cident on the firlt lens are parallel, all the terms vanifh from the value of \(q\) in which \(\frac{1}{r}\) is found, and there re. main only the three firf, viz. \(\frac{m^{3}}{n^{3}}-\frac{2 m m^{2}+m}{a n^{2}}+\frac{m+2}{a^{2} n}\).

Performing thefe operations, we have
\[
\begin{aligned}
& \frac{q}{m^{\prime}-1}=c\left(\frac{m^{2}}{n^{3}}-\frac{2 m+1}{a n^{2}}+\frac{m+2}{m a^{2} n}\right) \frac{e^{2}}{2} \\
& \frac{q^{\prime}}{m^{\prime}-1}=\left(\frac{m^{\prime 2}}{n^{\prime 3}}-\frac{2 m^{\prime}+1}{a^{\prime} n^{\prime} 2}+\frac{m^{\prime}+2}{m^{\prime} a^{\prime 2} n^{\prime}}+\frac{3 m^{\prime}+1}{r^{\prime} n^{\prime 2}}-\frac{4\left(m^{\prime}+1\right)}{m^{\prime} a^{\prime} r^{\prime} n^{\prime}}\right. \\
& \left.\quad+\frac{3 m^{\prime}+2}{m^{\prime} r^{\prime 2} n^{\prime}}\right) \frac{e^{2}}{2} \\
& \frac{q^{\prime \prime}}{m^{\prime}-1}=c\left(\frac{m^{2}}{n^{\prime \prime 3}}-\frac{2 m+1}{a^{\prime \prime} n^{\prime \prime 2}}+\frac{m+2}{m^{\prime \prime} a^{\prime \prime 2} n^{\prime \prime}}+\frac{3 m+1}{r^{\prime \prime} n^{\prime \prime 2}}+\frac{4(n+1)}{n^{\prime \prime} a^{\prime \prime} r^{\prime} n^{\prime}}\right. \\
& \left.\quad+\frac{3 m+2}{m^{\prime \prime} r^{\prime \prime 2} n^{\prime \prime}}\right) \frac{\epsilon^{2}}{2}
\end{aligned}
\]

Let us now apply this invefligation to the conftruction of an objeck-glafs; and we fhall begin with a double lens.

\section*{Confiruction of a Double Achromatic Object-glafs.}

Here we have to determine four radii \(a, b, a^{\prime}\), and \(b^{\prime}\). Make \(n=1\). This greatly fimplifies the calculus, by exterminating it from all the denominators. This gives for the equation \(\frac{d m}{n}+\frac{d m n^{\prime}}{n^{\prime}}=0\), the equation \(d m+\frac{d m^{\prime}}{n^{\prime}}\) \(=0\), or \(d m=-\frac{d m^{\prime}}{n^{\prime}}\), and \(\frac{1}{n^{\prime}}=-\frac{d m}{d m m^{\prime}},=-u\). Alfo we have \(r^{\prime}\), the focal diffance of the light incident on the fecond lens, the fame with the principal focal diftance \(p\) of the firt lens, (neglecting the interval, if any). Now \(\frac{1}{p}=\frac{m-1}{n}\), which in the prefent cafe is \(=m-1\). Alfo \({ }_{A^{\prime}}^{1}\) is \(\left.=-u\right)_{n i}^{\prime}-1\), and \(\frac{1}{\mathrm{P}}=n-1-u\left(n^{\prime}-1\right)=u^{\prime}\).

Make thefe fubftitutions in the values of \(\frac{q}{m-1}\) and \(\frac{q^{\prime}}{n^{\prime}-1}\), and we obtain the following equation :
\[
c m^{3}-\frac{c(2 m+1)}{a}+\frac{c(m+2)}{m a^{2}}-u^{3} m^{\prime 3}-\frac{u^{2}\left(2 m^{\prime}+1\right)}{a^{\prime}}
\]
\[
-\frac{u\left(m^{\prime}+2\right)}{m^{\prime} a^{\prime 2}}+u^{2}\left(3 m^{\prime}+1\right)(m-1)+\frac{4 u\left(m^{\prime}+1\right)(m-1)}{n^{\prime} a^{\prime}}
\]
\[
-\frac{u\left(3 m^{\prime}+2\right)(m-1)^{2}}{m^{\prime}}=0
\]

Arrange thefe terms in order, according as they are \(f_{a}\) ators of \(\frac{1}{a^{2}}, \frac{1}{a}, \frac{1}{a^{\frac{1}{2}}}, \frac{1}{a^{\prime}}\), or independent quantities. It puts on this form :
\[
\begin{aligned}
& \frac{(m+2)}{m} \times \frac{1}{a^{2}}-c^{\prime}(2 m+1) \times \frac{1}{a}-\frac{u\left(m^{\prime}+2\right)}{m^{\prime}} \times \frac{1}{a^{\prime 2}}- \\
& \left(u^{2}\left(2 m^{\prime}+1\right)-\frac{4 u\left(m^{\prime}+1\right)(m-1)}{m^{\prime}}\right) \times \frac{1}{a^{\prime}}+c m^{2}+u^{3} \\
& \left(3 m^{\prime}+1\right)(m-1)-a^{3} m^{\prime 3}-\frac{u\left(3 m^{\prime}+2\right)(m-1)^{2}}{m^{\prime}}=0
\end{aligned}
\]

I et A be the coefficient of \(\frac{1}{a^{2}}, \mathrm{~B}\) that of \(\frac{1}{a}, \mathrm{C}\) that \(\underbrace{\text { Telefopec }}\) of \(\frac{1}{a^{\prime 2}}, D\) that of \(\frac{1}{a^{\prime}}\), and \(E\) the fum of the independent quantity; that is, let A be \(=\frac{c(m+2)}{m}, \mathrm{~B}=c(2 m+1)\), \(\mathrm{C}=\frac{u\left(m^{\prime}+2\right)}{m^{\prime}}, \mathrm{D}=u^{2}\left(2 m^{\prime}+2\right)-\frac{4 u\left(m^{\prime}+1\right)(m-1)}{m^{\prime}}\), and \(\mathrm{E}=c m^{2}+u^{2}\left(3 m^{\prime}+1\right)(n-1)-u^{3} m^{3}-\) \(\frac{u\left(3 m^{\prime}+2\right)(m-1)^{2}}{m^{\prime}}\).

Our final equation becomes
\[
\frac{\mathrm{A}}{a^{2}}-\frac{\mathrm{B}}{a}-\frac{\mathrm{C}}{a^{\prime 2}}-\frac{\mathrm{D}}{a^{\prime}}+\mathrm{E}=0
\]

The coefficients of this equation and the independent quancity are all known, from our knowledge of \(m\), \(m^{\prime} d m, d m^{\prime}\); and we are to find the values of \(a\) and \(a^{\prime}\), and from them and \(n=1\) to find the values of \(b\) and \(b^{\prime}\).

But it is evidently an indeterminate equation, becaufe there are two unknown quantities; fo that there may be an infinity of folutions. It muft be rendered determinate by means of fome other conditions to which it may be fubjected. Thefe conditions muft depend on fome other circumfances which may direct our choice.

One circumfance occurs to us which we think of very great confequence. In the paffage of light from one fubftance to another, there is always a confiderable portion refleted from the pofterior furface of the firf and from the anterior furface of the laft; and this reflection is more copious in proportion to the refraction. This lofs of light will therefore be diminifhed by mak. ing the internal furfaces of the lenfes to coincide; that is, by making \(b=a^{\prime}\). This will be attended with another advantage. If we put between the glaffes a fubflance of nearly the fame refrating power, we fhall not only completely prevent this lofs of light, but we thall greatly diminifh the errors which arife from an imperfect polifh of the furfaces. We have tried this, and find the effeet very furprifing. The lens being polifhed immediately after the figure has been given it, and while it was almolt impervious to light by reafon of its roughnefs, which was ftill fenfible to the naked eyc, performed as well as when finihed in the fineft manner.
N. B. This condition, by taking away one refraction, obliges us to increafe thofe which remain, and therefore increafes the fpherical aberrations. And fince our formulic do not fully remove thofe (by reafon of the fmall quantities neglected in the process), it is uncertain whether this condition be the mof eligible. We have, however, no diredt argument to the contrary.

Let us fee what determination this gives us.
In this cafe \(\frac{1}{a^{\prime}}=\frac{1}{b},=\frac{1}{a}-1\). For becaufe \(\frac{1}{n}=\frac{1}{a}\) \(-\frac{1}{b}\) and \(n=1\), we have \(1+\frac{1}{b}=\frac{1}{a}\), and \(\frac{1}{b}=\frac{1}{a}-\mathrm{r}\). Therefore \(\frac{1}{a^{\prime 2}}=\frac{1}{a^{2}}-\frac{2}{a}+1\). Therefore, in our final equation, put \(\frac{1}{a^{2}}-\frac{2}{a}+1\) in place of \(\frac{1}{a^{12}}\), and \(\frac{1}{a}-1\) in

\section*{TEEL[253] TE EL}
\(\underbrace{\text { elefrope. }}\) place of \(\frac{1}{a^{\prime}}\), and it becomes \(\frac{A-C}{a^{2}}-\frac{B+D-2 C}{a}\) \(+\mathrm{E}+\mathrm{D}-\mathrm{C}=0\).
Thus have we arrived at a common affected quadratic equation, where \(\frac{1}{a}\) is the unknown quantity. It has the common form \(p x^{2}+q x+r=0\), where \(p\) is \(=A-C\), \(q\) is equal to \(2 \mathrm{C}-\mathrm{B}-\mathrm{D}, r\) is equal to \(\mathrm{E}+\mathrm{D}-\mathrm{C}\), and \(x\) is equal to \(\frac{1}{a}\).

Divide the equation by \(p\), and we have \(x^{2}+\frac{q}{p} x+\frac{r}{p}\) =0. Makes \(=\frac{q}{p}\) and \(t=\frac{r}{p}\), and we have \(x^{2}+s x\) \(+t=0\). This gives us finally \(\frac{1}{a}\), or \(x=-\frac{x}{2} s \geq\) \(\sqrt{\frac{1}{4} s^{2}-1}\)

This value of \(\frac{1}{a}\) is taken from a fale of which the unit is half the radius of the ifofceles lens which is equivalent to the firft lens, or has the fame focal dittance with it. We muft then find (on the fame fcale) the value of \(b\), viz. \(\frac{1}{a}-1\), which is alfo the value of \(a^{\prime}\). Having obtained \(a^{\prime}\), we muft find \(b^{\prime}\) by means of the equation \(\frac{1}{n^{\prime}}=\frac{1}{a^{\prime}}-\frac{1}{b^{\prime}}\), and therefore \(\frac{1}{b}=\frac{1}{a^{\prime}}-\frac{1}{n^{\prime}}\), But \(\frac{1}{n^{\prime}}=u\). Therefore \(\frac{1}{b^{\prime}}=\frac{\mathrm{r}}{a^{\prime}}+u,=\frac{1}{a}+u-1\).

Thus is our object-glafs conftructed ; and we mult determine its focal diftance, or its reciprocal \(\frac{\mathrm{I}}{\mathrm{P}}\). This is \(=m-1-u\left(m^{\prime}-1\right)\).

All thefe radii and diftances are meafured on a fcale of which \(n\) is the unit. But it is more convenient to meafure every thing by the focal diftance of the compound object-glafs. This gives us the proportion which all the diffances bear to it. Therefore, calling P unity, in order to obtain \(\frac{1}{a}\) on this fcale, we have only to fate the analogy \(m-1-u\left(m^{\prime}-1\right): 1=\frac{1}{a}: \frac{1}{\mathrm{~A}}\), and A is the radius of our firll furface meafured on a fcale of which \(P\) is the unit.

If, in the formula which expreffes the final equation for \(\frac{1}{a}\), the value of: flould be pofitive, and greater than I \(s^{3}\), the equation has imaginary roots; and it is not poffible with the glafes employed, and the conditions affumed, to correct both the chromatic and fipherical aberrations.

If \(t\) is negative and equal to \(\frac{x}{4} s^{2}\), the radical part of the value is \(=0\), and \(\frac{1}{a}=-\frac{1}{2} s\). But if it be negative or poficive, but lefs than \(\frac{x}{4} s^{2}\), the equation has two real roots, which will give two confructions. That is to be preferred which gives the fmalleft curvature of the furfaces; becaufe, fince in our formule which determine the 〔pherical aberration fome quantitics are neglected, thefe quantities are always greater when a large.
arch (that is, an arch of many degrees) is employed. Telefrope No radius thould be admitted which is much lefs than \(\frac{2}{5}\) of the focal diftance.
All this procefs will be made plain and eafy by an example.

Very careful experiments have fhown, that in common crown-glafs the fine of incidence is to the fine of refraction as 1.526 is to 1 , and that in the generality of flint-gla \(f_{s}\) it is as 1.604 to 1 . Alfo that \(\frac{d m}{d m^{\prime}}=0.6054\) \(=u\). Therefore \(m-\mathrm{r}=0.526 ; m^{\prime}-\mathrm{r}=0.604\); \(\theta=\frac{m-1}{m^{\prime}-1^{\prime}}=0.87086\). By thefe numbers we can compute the coefficients of our final equation. We fhall find them as follows:
\[
\begin{aligned}
& \mathrm{A}=2.012 \\
& \mathrm{~B}=3.529 \\
& \mathrm{C}=1.360 \\
& \mathrm{D}=-0.526 \\
& \mathrm{E}=1.8659
\end{aligned}
\]

The general equation (p. 252.col. 2. lin. 8.), when fubjected to the affumed coincidence of the internal furfaces, is \(\frac{A-C}{a^{2}}-\frac{B+D-2 C}{a}+E+D-C=0\). \(A-C\) is \(=0.652 ; \mathrm{B}+\mathrm{D}-2 \mathrm{C}\) is \(=0.283\); and \(\mathrm{E}+\mathrm{D}-\mathrm{C}\) is \(=-0.020\); and the equation with numerical coefficients is \(\frac{0.652}{a^{2}}-\frac{0.283}{a}-0.020=0\), which correfponds to the equation \(p x^{2}+q x+r=0\). We muft now make \(s=\frac{q}{p},=\frac{0.283}{0.652},=0.434\), and \(t=\frac{r}{p},=\frac{0.02}{0.652},=0.0307\). This gives us the final quadratic equation \(\frac{1}{a^{2}}-\frac{0.434}{a}\) \(-0.0307=0\). To folve this, we have \(-\frac{1}{2} s=0.217\), and \(\frac{1}{4} s^{2}-0.047\). From this take \(t\), which is \(=-0.0307\) (that is, to \(0.047^{1}\) add 0.0307 ), and we obtain 0.0778 , the fquare root of which is \(=0.27^{89}\). Therefore, finally, \(\frac{1}{a}=0.2170 \pm 0.2789\), which is either 0.4959 or 一 0.0619 . It is plain that the firf mult be preferred, becaufe the fecond gives a negative radius, or makes the firf furface of the crown-glafs concave. Now as the convergence of the rays is to be produced by the crownglafs, the other furface mult become very convex, and occafion great errors in the computed aberration. We therefore retain 0.4959 for the value of \(\frac{1}{a}\), and \(a\) is \(=\frac{1}{0.4959},=2.0166\).

To obtain \(b\), ufe the equation \(\frac{1}{b}=\frac{1}{a}-1\), which gives \(\frac{1}{b}=-0.5041\), and therefore a convex furface. \(b\) is therefore \(=\frac{1}{0.504 \mathrm{I}}=1.9837\). \(a^{\prime}\) is the fame with \(b\), and \(\frac{1}{a^{\prime}}=-0.504 \mathrm{r}\).

To obtain \(b^{\prime}\), ufe the equation \(\frac{1}{b^{\prime}}=\frac{1}{a^{\prime}}+u\). Now \(u=\). 0.6054 , and \(\frac{1}{4!}=-0.504 \mathrm{I}\). The fum of thefe is 0.1013:-

\section*{T E L}

Telefcope. 0.1013 ; and fince it is pofitive, the furface is concave. \(b^{\prime}=\frac{1}{.1013}=9.872\).

Laftly, \(\frac{1}{\mathrm{P}}=n-\mathrm{I}-4\left(n^{\prime}-1\right)=0.1603\), and \(\mathrm{P}=\) \(\frac{1}{0.1603},=0.2383\).

Now to obtain all the meafures in terms of the focal diftance \(P\), we have only to divide the meafures already found by \(6.23^{8}\), and the quotients are the meafures wanted.
\[
\text { Therefore } \begin{aligned}
a & =\frac{2.0166}{6.2383}=0.32325 \\
b & =\frac{1.0837}{6.23^{8} 3}=-0.3^{17} 798 \\
a^{\prime} & =-.-0.31798 \\
b^{\prime} & =\frac{9.872}{6.2383}=1.5825 \\
\mathrm{P} & =1 .
\end{aligned}
\]

If it be intended that the focal diftance of the objcetglafs thall be any number \(n\) of inches or feet, we have only to multiply each of the above radii by \(n\), and we bave their lengths in inches or feet.

Thus we have completed the invefligation of the conItruction of a double object-glafs. Although this was intricate, the final refult is abundantly fimple for practice, efpecially with the affiftance of logarithms. The only troublefome thing is the preparation of the numerical coefficients \(\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}, \mathrm{E}\) of the final equation. Strict attention mult alfo be paid to the pofitive and negative figns of the quantities employed.

We might propofe other conditions. Thus it is natural to prefer for the firt or crown-glafs lens fuch a form as thall give it the fmalleft poftible aberration. This will require a fmall aberration of the flint-glafs to correct it. But a little reflection will convince us that this form will not be good. The focal diftance of the crown-glafs mult not exceed one third of that of the compound glafs; thefe two bcing nearly in the proportion of \(d m^{\prime}-d m\) to \(d m^{\prime}\). Therefore if this form be adopted, and \(a\) be made about \(\frac{1}{6}\) th of \(b\), it will not exceed \(\frac{1}{5}\) th of P . Therefore, although we may produce a molt accurate union of the central and marginal rays by oppofite aberrations, there will be a confiderable aberration of fome rays which are between the centre and the margin.

It is abfolutely impoffible to collect into one point the whole rays (though the very remoteft rays are united witls the central rays), except in a very particular cafe, which cannot obtain in an object-glafs; and the frall quantities which are negleded in the formula which we have given for the fpherical aberration, produce errors which do not fullow any proportion of the aperture which can be expreffed by an equation of a manageable furm. When the apertute is very large, it is better not to corre of the aberration for the uhole aperture, but for abrut rils of it. When the rays correfponding to this diftance are made to coincide with the central rays by mears of appefite aberrations, the rays which are beyond this difance will be united with fome of thofe which are nearer to the centre, and the whole diffufion will be confiderably diminithed. Dr Smith has illuftrated
this in a very perficucus manner in his theory of his TeleficonCatoptric Micrufcope.

But although we cannot adopt this form of an ob-ject-glafs, there may be other confiderations which may lead us to prefer fome particular form of the crownglafs, or of the fiint-glafs. We hall therefore adapt our general equation \(\frac{\Lambda}{a^{2}}-\frac{B}{a}-\frac{C}{a^{r_{2}}}-\frac{D}{a^{\prime}}+E=0\) to this condition.

Therefore let \(h\) exprefs this felected ratio of the two radii of the crown-glafs, making \(\frac{a}{b}=h\) (remembering al ways that \(a\) is pofitive and \(b\) negative in the cale of a double convex, and \(h\) is a negative number).

With this condition we have \(\frac{1}{b}=\frac{h}{a}\). But when we make \(n\) the unit of our formula of aberration, \(\frac{1}{b}=\frac{1}{a}-1\). Therefore \(1=\frac{1}{a}-\frac{h}{a}\), and \(\frac{1}{a}=\frac{1}{1-h}\). Now fubflitute this for \(\frac{1}{a}\) in the general equation, and charge all the figns (which fill preferves it \(=0\) ), and we obtain
\[
\frac{\mathrm{C}}{a^{\prime 2}}+\frac{\mathrm{D}}{a^{\prime}}-\mathrm{E}-\frac{\mathrm{A}}{(\mathrm{I}-h)^{3}}+\frac{\mathrm{B}}{1-h}=0 .
\]

By this equation we are to find \(\frac{1}{a}\), or the radius of the anterior furface of the flint-glafs. The equation is of this form \(p x^{2}+q x+r=0\), and we mult again make \(s=\frac{q}{p}\) and \(t=\frac{r}{p} . \quad\) Therefore \(s=\frac{D}{C}\), and \(t=\frac{1}{\mathrm{C}} \times\)
\[
\begin{gathered}
\left(\frac{\stackrel{P}{\mathrm{~B}}}{1-h}-\frac{\mathrm{A}}{(1-h)^{2}}-E\right) . \text { Then, finally, } \\
\frac{1}{a^{\prime}}=-\frac{\pi}{2} s \pm \sqrt{\frac{1}{4} s^{2}-i}
\end{gathered}
\]

It may be worth while to take a particular cafe of this condition. Suppofe the crown-glafs to be of equal convexities on both fides. This has fome advantages: We can tell with precifion whether the curvatures are precifely equal, by meafuring the focal diftance of rays reflected back from its pofterior furface. Thefe diftances will be precifely equal. Now it is of the utmoft im. portance in the conflruction of an object-glafs which is to correct the fpherical aberration, that the forms be precifely fuch as are required by our formulx.

In this cafe of a lens equally convex on both fides \(\frac{1}{a}\) is \(=-\frac{1}{b},=\frac{1}{2}\). Subftitute this value for \(\frac{1}{a}\) in the general equation \(\frac{A}{a^{2}}-\frac{B}{a}-\frac{C}{a^{\prime 2}}-\frac{D}{a^{\prime}}+E=0\), and then \(\frac{A}{a^{2}}=\frac{A}{4} ; \frac{B}{a}\) becomes \(\frac{B}{2}\). Now change all the figns, and we have \(\frac{\mathrm{C}}{a^{\prime 2}}+\frac{\mathrm{D}}{a^{\prime}}-\mathrm{E}-\frac{\mathrm{A}}{4}+\frac{\mathrm{B}}{2}=0\), by which we are to find \(a^{\prime}\). This in numbers is \(\frac{1.360}{a^{\prime 2}}-\)
> \(\frac{0.526}{a^{6}}\)

T E L
\(\underbrace{\text { decope. }} \frac{0.526}{a^{\prime}}-0.6044=0 . \quad\) Then \(s=\frac{-0.526}{1.360},=0.3867\), and \(t=\frac{-0.6044}{1.360}=-0.4444\). Then \(-\frac{1}{8} \mathrm{~s}=0.1233\); \(\frac{1}{4} S^{2}=0.0374\); and \(\sqrt{\frac{1}{4} \mathrm{~S}^{2}-1}= \pm 0.6941\); fo that \(\frac{1}{a^{\prime}}\) \(=0.1933 \pm 0.6941\). This gives two real roots, viz. 0.8874 , and -0.5008 . If we take the firt, we fiall have a convex anterior furface for the flint-glafs, and confequently a very deep concave for the pofterior furface. We therefure take the fecond or negative root -0.5008.

We find \(\frac{1}{b^{\prime}}\), as before, by the equation \(\frac{1}{b^{\prime}}=\frac{1}{a^{\prime}}+u,=\) 0.5046 , which will give a large value of \(b^{\prime}\).

We had \(\frac{1}{a}=\frac{1}{2}\)
and
\[
\frac{1}{6}=-\frac{1}{2}
\]
and \(\frac{1}{P}\) is the fame as in the former cafe, viz, 0.1603 .
Having all thefe reciprocals, we may find \(a, b, a^{f}, b^{\prime}\), and P ; and then dividing them by P , we obtain finally
\[
\begin{aligned}
& a=0.3206 \\
& b=-0.3206 \\
& a^{\prime}=-0.3201 \\
& b^{\prime}=1.533 \\
& \mathrm{P}=1 .
\end{aligned}
\]

By comparing this object-glafs with the former, we may remark, that diminifhing \(a\) a little increafes \(b\), and in this refpect improves the lens. It indeed has diminifhed \(b^{\prime}\), but this being already confiderable, no inconvenience attends this diminution. But we learn, at the fame time, that the advantage muft be very fmall; for we cannot diminith \(a\) much more, wihout making it as fmall as the fmalteft radius of the object-glafs. This proportion is therefore very near the maximum, or beft polfible; and we know that in fuch cafes, even confiderable changes in the radii will make but fmall changes in the refult: for thefe reafons we are difpofed to give a ftrong preference to the firft conftruction, on account of the other advantages which we fhowed to attend it.

As another example, we may take a cafe which is very nearly the general practice of the London artifts. The radius of curvature for the anterior furface of the convex crown-glafs is \(\frac{5}{6}\) ths of the radius of the pofterior furface, fo that \(h=\frac{5}{8}\). This being introduced into the determinate equation, gives
\[
\begin{array}{ll}
a=0.2938 & a^{\prime}=-0.3743 \\
b=-0.3526 & b=1.1474
\end{array}
\]

As another condition, we may fuppofe that the fecond or Alint-glafs is of a determined form.
This cafe is folved much in the fame manner as the former. Taking \(h\) to reprefent the ratio of \(a^{\prime}\) and \(l^{\prime}\), we have \(\frac{1}{a}=\frac{1}{1-l}\). This value being fubfituted in the general equation \(\frac{A}{a^{2}}-\frac{\mathrm{B}}{a}-\frac{\mathrm{C}}{a^{\prime} 2}-\frac{\mathrm{D}}{a}+E=0\), gives us \(\frac{A}{a^{2}}-\frac{B}{a}+E-\frac{C}{(1-k)^{2}}-\frac{D}{1-h}=0\). This gives for

\section*{T E L}
the final equation \(x^{2}+s x+t=0, s=\frac{\mathrm{B}}{\mathrm{A}}\), and \(t=\frac{1}{\mathrm{~A}} \underbrace{\text { Telefoper. }}\)
\(\times\left(\mathrm{E}-\frac{\mathrm{C}}{(1-h)^{2}}-\frac{\mathrm{D}}{1-h}\right)\) and \(\frac{\mathrm{r}}{a}=-\frac{1}{2} \frac{x}{2} s \pm\)
We ringht here take the patticular cafe of the flintglafs being equally concave on both fides. Then becaufe \(\frac{1}{n^{\prime}}=-u\), and in the cafe of equal concavities \(\frac{2}{a^{\prime}}=\frac{1}{n^{\prime}},=-u\), it is fufficient to put \(-\frac{1}{2} u\) for \(\frac{1}{a^{\prime}}\). This being done, the equation becomes \(\frac{\mathrm{A}}{a}-\frac{\mathrm{B}}{a} \frac{\mathrm{C} u^{2}}{4}+\) \(\frac{\mathrm{D} u}{2}+\mathrm{E}=0\). This gives \(s=\frac{\mathrm{B}}{\mathrm{A}}\), and \(t=\frac{1}{\mathrm{~A}} \times\) \(\left(\frac{4^{\mathrm{D}} u-2 \mathrm{C} u^{2}}{8}+\mathrm{E}\right)\).

We imagine that thefe cafes are fufficient for fhowing the management of the general equation; and the example of the numerical folution of the firlt cafe affords inflances of the only nicties which occur in the procefs, viz. the proper employment of the pofitive and negative quantities.
We have oftener than once obferved, that the formula is not perfectly accurate, and that in very large apertures errors will remain. It is proper therefore, when we have obtained the form of a compound object-glafs, to calculate trigonometrically the progrefs of the light through it; and if we find a confiderable aberration, either chromatic or fpherical, remaining, we muft make fuch changes in the curvatures as will correct them. We have done this for the firf example; and we find, that if the focal diffance of the compound object-glafs be 100 inches, these remains of the fpherical aberration nearly \({ }_{3}^{\frac{r}{0}}\) th of an inch, and the aberration of colour is over corrected above \(\frac{x}{9}\) th of an inch. The firft abcrration has been diminifhed about 6 times, and the other about 30 times. Both of the remaining errors will be diminilhed by increafing the radius of the inner furfaces. This will diminilh the aberration of the crown glafs, and will diminifh the difperfion of the flint more than that of the crown. Put indeed the remaining error is hardly worth our notice.

It is evident to any perfon converfant with optical difcuffions, that we fall improve the correction of the fpherical aberration by diminifhing the refractions. If we employ two lenfes for producing the convergency of the rays to a real focus, we fhall reduce the aberration to \(\frac{2}{4}\) th. Therefore a better achromatic glafs will be formed of three lenfes, two of which are convex and of crownglafs. The refraction being thus divided between them, the aberrations are leffened. There is no occafion to employ two concave lenfes of flint.glafs; there is even an advantage in ufing one. The aberration bcing confiderable, lefs of it will ferve for correcting the aberration of the crown-glafs, and therefore fuch a form may be felected as has little aberration. Some light is indeed lof by thefe two additional furfaces; but this is much more than compenfated by the greater apertures which we can venture to give when the curvature of the furface is fo much diminifhed. We proceed therefore to
The Comfruction of a Triple Achromatic Otject-glafs.
Ix is plain that there are more conditions to be 2 ?
fumed.

Telefope. fumed before we can render this a determinate problem, and tha: the inveltigation mult be more intricate. At the fame time, it muft give us a much greater variety of contructions, in conlequence of our having more conditions neceffary for giving the equation this determinate form. Our limits will not allow us to give a full account of all that may be done in this method. We mall therefore content ourfelves with giving one cafe, which will fufficiently point out the method of proceeding. We fhall then give the refults in fome other eligible cafes, as rules to artifts by which they may conftruct fuch glaffes.

Let the firf and fecond glaffes be of equal curvatures on both fides; the firf being a double convex of crown-glafs, and the fecond a double concave of tintglafs.

Still making \(n\) the unit of our calculus, we have in the firt place \(a=-b,=-a^{\prime},=b^{\prime}\). Therefore \(\frac{1}{a},-\frac{1}{b^{\prime}}=\) \(\left(\frac{1}{a}-\frac{1}{b}\right)\), or \(\frac{1}{n^{\prime}}=-\frac{1}{n}=-I\). Therefore the equation \(\frac{m}{n}+\frac{d m^{\prime}}{n^{\prime}}+\frac{d m^{\prime \prime}}{n^{\prime \prime}}=0\) becomes \(u-1+\frac{u}{n^{\prime \prime}}=0\), or \(\frac{1}{n}\) \(=\frac{1}{u}-1\). Let us call this value \(u^{\prime}\).

We have \(\frac{1}{p}=m-\mathrm{I} ; \frac{\mathrm{I}}{p^{\prime}}=-\left(m^{\prime}-\mathrm{I}\right) ; \frac{1}{p^{\prime \prime}}=u^{\prime}\) \((m-1) ; \frac{1}{\mathrm{P}}=\frac{\mathrm{I}}{p}+\frac{\mathrm{I}}{p^{\prime}}+\frac{\mathrm{I}}{p^{\prime \prime}}=m-m^{\prime}+u^{\prime}(n-\mathrm{I})\). And if we make \(n^{\prime}-m=C\), we thall have \(\frac{1}{P}=-C\), \(+u^{\prime}(m=1)\) Alfo \(\frac{1}{r^{\prime}}=m-1 ; \frac{1}{r^{\prime t}}=m-1-\) \(\left(n^{\prime}-1\right),=m-m^{\prime},=-\mathrm{C}^{\prime}\).

The equality of the two curvatures of each lens gives \(\frac{I}{a}=\frac{1}{2 n} . \quad\) Therefore \(\frac{1}{a}=-\frac{1}{b},=-\frac{1}{a^{\prime \prime}}=\frac{1}{b},=\frac{1}{2} ;\) and \(\frac{1}{b^{\prime \prime}}=\frac{1}{a^{\prime \prime}}-\frac{1}{n^{\prime \prime}},=\frac{1}{a^{\prime \prime}}-u^{\prime}\).

Subftituting thefe values in the equation (p. 252.col. 2. par. r.), we obtain the three formulx.
\[
\begin{aligned}
& \text { 1. } c m^{3}-\frac{\pi}{2} c(2 m+1)+\frac{c(m+2)}{4 m} \\
& \text { 3. }-m^{\prime} 2+\frac{2}{2}\left(2 m^{\prime}+1\right)-\frac{m^{\prime}+2}{4 m^{\prime}}+\left(3 m^{\prime}+1\right)(m-1) \\
& -\frac{2\left(m^{\prime}+1\right)(m-1)}{m^{\prime}}-\frac{\left(3 m^{\prime}+2\right)(m-1)^{\prime}}{m^{\prime}} \\
& \text { 3. } c u^{\prime} 3 m^{2}-\frac{c u^{\prime 2}(2 m+1)}{a^{\prime \prime}}+\frac{c u^{\prime}(m+2)}{m a^{\prime \prime}}-c c^{\prime} u^{\prime 3} \\
& (3 m+1)+4 c c^{\prime} \frac{u^{\prime}(m+1)}{m a^{\prime \prime}}+\frac{c c^{\prime 3} u^{\prime}(3 m+2)}{m}=0 .
\end{aligned}
\]

Now arrange thefe quantities according as they arc coefficients of \(\frac{1}{a^{1 / 2}}\) and of \(\frac{1}{a^{11}}\), or independent quantities. Let the coefficient of \(\frac{1}{a^{\prime 2}}\) be \(A\), that of \(\frac{1}{a^{11}}\) be \(B\), and the independent quantity be \(C\), we have
\(\mathrm{A}=\frac{c u^{\prime}(m+2)}{m} ; \mathrm{B}=c u^{\prime 2}(2 m+1)-\frac{4 c c^{\prime} u^{\prime}(m+1)}{m}\)
and \(\mathrm{C}=c m^{2}+\frac{c(m+2)}{4 n}+\frac{2}{2}\left(2 m^{\prime}+1\right)+\left(3 m^{\prime}+1\right)\)
\((m-1)+c u^{\prime 3} m^{3}+\frac{c c^{\prime 3} u^{\prime}(3 m+2)}{m}-\frac{1}{8} c(2 m+1)\) \(-m^{\prime 2}-\frac{n^{\prime}+2}{4 m}-\frac{2\left(m^{\prime}+1\right)(m-1)}{m^{\prime}}-\frac{\left(3 m^{\prime}+2\right)}{m^{\prime}} \frac{(m-1)^{2}}{m^{\prime}}\) \(-c c^{\prime} u^{\prime 2}\left(3^{m+1}\right)\).

Our equation now becomes \(\frac{\mathrm{A}}{a^{1 / 3}}-\frac{\mathrm{B}}{a^{\prime \prime}}+\mathrm{C}=0\).
This reduced to numbers, by computing the values of the coefficients, is \(\frac{1.312}{a^{1 / 2}}-\frac{1.207}{a^{\prime \prime}}-0.3257=0\).

This, divided by 1.312 , gives \(s=-0.92 ;\) and \(t=-\) \(0.2482 ;-\frac{2}{7} s=0.46 ; \frac{7}{4} s^{2}=0.2116\); and \(\sqrt{\frac{1}{4} s^{2}-8}\) \(= \pm 0.678 \mathrm{I}\).

And, finally, \(\frac{1}{a^{\prime \prime}}=0.46 \doteq 0.678 \mathrm{r}\).
This has two roots, viz. 0.2181 and - 1.1381. The laft would give a fmall radius, and is therefore rejected.

Now, proceeding with this value of \(\frac{1}{a^{\prime \prime}}\) and the \(\frac{1}{n^{\prime \prime}}\), we get the other radius \(b^{\prime \prime}\), and then, by means of \(u^{\prime}\), we get the other radius which is common to the four furfaces. Then, by \(\frac{\mathrm{l}}{\mathrm{P}}=\frac{1}{p^{\prime \prime}}-c^{\prime}\), we get the value of \(\mathbf{P}\).

The radii being all on the fcale of which \(u\) is the unit, they mult be divided by P to obtain their value on the fcale which has \(\mathbf{P}\) for its unit. This will give us

This is not a very good form, becaufe the laft furface has too great curvature.
- We thought it worth while to compute the curvatures for a cafe where the internal furfaces of the lenfes coincide, in order to obtain the advantages mentioned on a former occafion. The form is as follows:

The middle lens is a double concave of flint-glafs; the laft lens is of crown-glafs, and has equal curvatures on both fides. The following table contains the dimenfions of the glaffes for a variety of focal diftances. The firft column contains the focal diftances in inches; the fecond contains the radii of the firt furface in inches; the third contains the radii of the pofterior furface of the firft lens and anterior furface of the fecond; and the fourth column has the radii of the three remaining furfaces.
\begin{tabular}{cccc}
\(\mathbf{P}\) & \(a\) & \(b, a^{\prime}\) & \(b^{\prime}, a^{\prime \prime}, b^{\prime \prime}\) \\
12 & 9.25 & 6.17 & 12.75 \\
24 & 18.33 & 12.25 & 25.5 \\
36 & 27.33 & 18.25 & 38.17 \\
48 & \(36.4^{2}\) & 24.33 & 5092 \\
60 & \(45.4^{2}\) & 30.33 & 63.58 \\
72 & 54.5 & 36.42 & 76.33 \\
84 & 63.5 & 42.5 & 89. \\
96 & 72.6 & 48.5 & 101.75 \\
108 & 81.7 & 54.58 & 114.42 \\
120 & 90.7 & 60.58 & 127.17
\end{tabular}

We have had an opportunity of trying glaffes of this conftruction, and found them equal to any of the fame length, although exeruted by an artif by no means excellent in his profeffion as a glafs-grinder. 'This very circumfance

\section*{T E L} circumftance gave us the opportunity of feeing the good effects of interpofing a tranfparent fubftance between the glafles. We put fome clear turpentine varnifh between them, which completely prevented all reflection from the internal furfaces. Accordingly thefe telefcopes were furprifingly bright ; and although the roughnefs left by the frift grinding was very perceptible by the naked eye before the glaffes were put together, yet when joined in this manner it entirely difappeared, even when the glafles were viewed with a deep magnifier.

The aperture of an object-glafs of this confruction of 30 inches focal diftance was \(3 \frac{1}{3}\) th inches, which is confiderably more than any of Mr Dollond's that we have feen.

If we fhould think it of advantage to make all the three lenfes ifofceles, that is, equally curved on bath furfaces, the general equation will give the following radii :
\[
\begin{array}{lll}
a=+0.639 & a^{\prime}=-0.5285 & a^{\prime \prime}=+0.6413 \\
b=-0.639 & b^{\prime}=+0.5285 & b^{\prime \prime}=-0.6413
\end{array}
\]
'Ihis feems a good form, having large radii.
Should we choofe to have the two crown-glafs lenfes ifofceles and equal, we uuf make
\[
\begin{aligned}
& a=+0.6412 \quad a^{\prime}=-0.5227 \quad a^{\prime \prime}=+0.6+12 \\
& b=-0.6412 \quad b^{\prime}=+0.5367 \quad b^{\prime \prime}=-0.6412
\end{aligned}
\]

This form hardly differs from the laft.
Our readers will recollect that all thefe forms proceed on certain meafures of the refractive and difperfive powers of the fubftances employed, which are expreffed by \(m, m^{t}\), \(d m\), and \(d m^{\prime}\) : and we may be anfured that the formula are fufficiently exact, by the comparifon (which we have made in one of.the cales) of the refult of the formula and the trigonometrical calculation of the progrefs of the rays. The error was but \(\frac{1}{60}\) th of the whale, ten times lefs than another error, which unavoidably remains, and will be confidered prefently. Thefe meafures of refraction and difperfion were carefully taken; but there is great diverfity, particularly in the flintglafs. We are well informed that the manufacture of this article has confiderably changed of late years, and that it is in general lefs refractive and lefs difperfive than formerly. This mult evidently make a change in the forms of achromatic glafies. The proportion of the focal diltance of the crown-glaffes to that of the flint muft be increafed, and this will occafion a change in the curvatures, which thall correft the fpherical aberration. We examined with great care a parcel of flint-glafs which an artilt of this city got lately for the purpofe of making achromatic object-glaffes, and alfo fome very white crown glafs made in Leith; and we oblained the following meafures:
\[
\begin{aligned}
& m=1.529 \\
& m^{\prime}=1.57^{8}
\end{aligned} \quad \frac{d m}{d m^{\prime}}=\frac{142}{219}=0.6,841 .
\]

We computed fome forms for triple object glafes made of thefe glaffes, which we finall fubjoin as a fpecimen of the variations which this change of data will occafion.

If all the three lenfes are made ifofceles, we have
\[
\begin{array}{lll}
a=+0.796 & a^{\prime}=-0.774 & a^{\prime \prime}=+0.502 \\
b=-0.795 & b^{\prime}=+0.474 & b^{\prime \prime}=-0.502 \\
a=0.504 & a^{\prime}=-0.475 & a^{\prime \prime}=+0.793 \\

\text { Vol. XX. Part I. }
\end{array}
\]
lenfes may be made of the fame form and focal diftance, Telefope. and placed the fame way. I'his will give us
\[
\begin{array}{lll}
a=+0.705 & a^{\prime}=-0.475 & a^{\prime \prime}=+0.705 \\
b=-0.547 & b^{\prime}=+0.475 & b^{\prime \prime}=-0.547
\end{array}
\]
N. B. This conftruction allows a much better form, if the meafures of refraction and difpertion are the fame that we ufed formerly. For we ftall have
\[
\begin{array}{lll}
a=+0.628 & a^{\prime}=-0.579 & a^{\prime \prime}=+0.628 \\
b=-0.749 & b^{\prime}=+0.579 & b^{\prime \prime}=-0.749
\end{array}
\]

And this is pretty near the practice of the London opticians.

We may here oblerve, upon the whole, that an ama. teur has little chance of fucceeding in thefc altempts. The diverfity of glaffes, and the uncertainty of the workman's producing the very curvatures which he intends, is fo great, that the object-glafs turns out different from our expectation. The artilt who makes great numbers acquires a pretty certain guefs at the remain. ing error; and having many lenfes, intended to be of one form, but unavoidably differing a little from it, he tries feveral of them with the other two, and finding one better than the reft, he makes ule of it to complete the fet.

The great difficulty in the confluction is to find the exact proportion of the difperfive powers of the crown and flint-glafs. The crown is pretiy conftant; but there are hardly two pots of flint-glafs which have the fame difperfive power. Even if conftant, it is difficult to meafure it accurately; and an error in this greatly affects the inftrument, becaule the focal diftances of the lenfes muft be nearly as their difperfive powers. The nethod of examining this circumftance, which we found moft accurate, was as follows:

The fun's light, or that of a billiant lamp, paffed through a fmall hole in a board, and fell on another board pierced alfo with a fmall hole. Behind this was placed a fine prifm A (fig. Iq.), which formed a fpec- Fig. is trum ROV on a fcreen pierced with a fmall hole. Behind this was placed a prifm \(B\) of the fubftance under examination. The ray which was refracted by it fell on the wall at D , and the diffance of its illumination from that point to C , on which an untefracted ray would have fallen, was carcfully meafured. This thowed the refraction of that colour. Then, in order that we might be cestain that we always compared the refraction of the fame precife colour by the diffcrent prifms placed at \(B\), we marked the precife pofition of the prifm \(A\) when the ray of a particular colour fell on the prifm B. This was done by an index AG attached to \(A\), and turning with it, when we cauled the diffesent colours of the fpectrum formed by \(A\) to fall on B. Having examined one prifm \(B\) with refpect to all the colours in the fpectrum formed by A , we put another B in its place. Then bringing A to all its former pofitions fucceffively, by means of a graduated arch HGK, we were certain that when the index was at the fame divifion of the arch it was the very ray which had been made to pals through the firft prifin \(B\) in a former experiment. We did not folicitoully endeavour to find the very extreme red and violent rays; becaufe, although we did not learn the whole difperfions of the two prifins, we learned their proportions, which is the circumftance wanted in the confluction of achomatic glafles. It is in vain to attempt this by meafuring the fpestrums themfelves; for we cannot be certin of
felecting

\section*{\(T\) Ij \([238] \quad T \mathrm{E}\),}

IT. : ficecre. feiccting the very fame coluurs for the comparifon, be--anle they fucceed in an infenfible gradation.

The intelligent reader will readily obferve, that we have hitherto proceeded on the fupporition, that when, by means of contrary refractions, we have united the extreme red and violet rayc, we have alfo united all the others. But this is quite gratuitous. Sir Ifaac Ncwton would, howescr, have made the fane fuppofition; for he imagined that the different colours divided the fpectrum formed by all fubtances in the proportions of a mufical canon. This is a miffake. When a fpectrum is formed by a prifm of crown ghefs, and another of precifely the fame length is formed by the fide of it by a prifm of tint-glafs, the confne between the green and blue will be found precifely in the middle of the firit fpectrum, but in the fecond it will be confiderably nearer to the red extremity. In thort, different fubfances do not difecrfe the colours in the fame proportion.

The effect of this irrationality (fo to call it) of difperfion, will appear plainly, we hope, in the following manner: Let A (fig. 12.) reprefent a fpot of white folar light falling perpendicularly on a wall. Suppofe a prifm of common glafs placed behind the hole through which the light is admitted, with its refracting angle facing the left hand. It will refract the beam of light to the right, and will at the fame time difperfe this heterogeneous light into its component rays, carrying the extreme red ray from \(A\) to \(R\), the extreme orange from A to \(O\), the extreme yellow from A to Y, \&c. and will form the ufual prifmatic fpectrum ROYGBPVC. If the whole length RC be divided into 1020 parts, we Shall have (when the whole refraction AR is fmall) RO very nearly \(125, \mathrm{RY}=200, \mathrm{RG}=333, \mathrm{RB}=500\), \(\mathrm{RP}=667, \mathrm{RT}=779\), and \(\mathrm{RC}=1020\); this being the proportion obferved in the differences of the fines of refraction by Sir Ifaac Newton.

Perhaps a refracting medium may be found fuch, that a prifm made of it would refract the white light from \(A^{\prime}\), in the upper line of this figure, in fuch a manner that a fpectrum \(\mathrm{R}^{\prime} \mathrm{O}^{\prime} \mathrm{Y}^{\prime} \mathrm{G}^{\prime} \mathrm{E}^{\prime} \mathrm{P}^{\prime} \mathrm{V}^{\prime} \mathrm{C}^{\prime}\) flall be formed at the fame diftance from \(\mathrm{A}^{\prime}\), and of the fame length, but divided in a different proportion. TWe do not know that fuch a mediur has been found; but we know that a prifin of flint-glafs has its refractive and difperfive powers. fo conflituted, that if \(A^{\prime} H^{\prime}\) be taken about one third of \(A R\), a firot of white light, formed by rays falling perpendicularly at \(\mathrm{H}^{\prime}\), will be fo refrated and difperfed, that the extreme rad ray will be carricd from \(\mathrm{H}^{\prime}\) to \(\mathrm{R}^{\prime}\), and the extreme violet from \(\mathrm{H}^{\prime}\) to \(\mathrm{C}^{\prime}\), and the intermediate colours to intermediate points, forming a fputrurn refembling the other, but having the colours more comflipated towards \(\mathrm{R}^{\prime}\), and more dilated towards C ; fo that the ray which the common glafs carried to the middle point 13 of the fpectrum RC is now in a point \(\mathrm{B}^{\prime}\) of the fpectrum \(\mathrm{H}^{\prime} \mathrm{C}^{\prime}\), confiderably nearcr to \(\mathrm{K}^{\prime}\).

Dr Blair has found, on the othcr hand, that certain fuid, particularly fuch as contain the muriatic acid, when formed into a pri'm, will refract the light from \(\mathrm{H}^{\prime \prime}\) (in the lower line) fo as to form a fpectrum \(\mathrm{R}^{\prime \prime} \mathrm{C}^{\prime \prime}\) c \(\eta^{\prime}\) ial to RC , and as far removed from \(\Lambda^{\prime \prime}\) as RC is from A, but having the colours more dilated toward \(\mathrm{l}^{1 \prime \prime}\), and more conflipated toward C , than is obfeived in RC ; fo that the ray which was carritd by the rrifm of common
glafs to the middle point \(B\) is canied to a point \(E^{\prime \prime}\), con - Telerope. fiderably nearer to \(\mathrm{C}^{\prime \prime}\).

Lect us now fuppofe that, inflead of a white fpot at A, we have a pisimatic fpectrun \(A B\) (fig. 13.), and that the prifm of common glafs is applied as before, immediately behind the prim which forms the fpectrum Ab. We know that this will be refracted fidcwife, and will make a fpectrum ROI GBPC, inclined to the plane of refraction in an angle of \(45^{\circ}\); fo that drawing the perpendicular \(\mathrm{RC}^{\prime}\), we have \(\mathrm{IC}^{\prime}=\mathrm{C}^{\prime} \mathrm{C}\).

We alfo know that the prifn of tlint-glafs would refract the fpectium formed by the firft prifm on EHF, in fuch a mamer that the red ray will go to \(R\), the violet to \(C\), and the intermediate rays to points \(o, y, s, b, p, z\), fo fituated that \(\mathrm{O}^{\prime} o\) is \(=\mathrm{N}^{\prime} \mathrm{O}^{\prime}\) of the other figure; \(\mathrm{Y} y\) is \(=\Pi^{\prime} \mathrm{L}^{\prime \prime}\) of that figure, \(\mathrm{G}_{g}=\Pi^{\prime} \mathrm{G}^{\prime}, \& c^{\prime}\). Thele points muft therefore lie in a curve RoygbpvC, which is convex toward the axis \(\mathrm{R}^{\prime} \mathrm{C}^{\prime}\).

In like manner we may be affured that Dr Blair's fluid will form a fpectrum R \(o^{\prime} y^{\prime} s^{\prime} b^{\prime} p^{\prime} v^{\prime} \mathrm{C}\), concave toward \(R^{\prime} C\).

Let it be obferred by the way, that this is a very good method for difcovering whether a medium difperfes the light in the fame proportion with the prifm which is employed for forming the finf fpectrum \(A \mathrm{~B}\) or EF . It difjerles in the fame or in a different proportion, according as the oblique fpectrum is Atraight or crooked; and the exact proportion correlponding to each colour is had by meafuring the ordinates of the curves \(\mathrm{R} b \mathrm{C}\) or \(\mathrm{K} b^{\prime} \mathrm{C}\)

Having formod the oblique fpectrum RBC by a prifin of common glafs, we know that an equal prifm of the fame glafs, placed in a contraty pofition, will bring back all the rays from the fpectrum BIBC to the foectrum \(A B\), laying each colour on its former plice.

In like manner, having formed the oblinue fiectrum \(\mathrm{R} b \mathrm{C}\) by a prifin of Hint-glafs, we know that anotl.er prifm of fint-glafs, placed in the oppofite direction, will bing all the rays back to the fpectum EHF.

But having formed the oblique fpectrum RBC by a prifm of common glafs, if we place the fint-glafs prifm in the contrary pofition, it will bring the colour \(R\) back to E , and the colour C to F ; but it will not bring the colour B to H , but to a point \(h\), fuch that \(B h\) is equal to \(l \mathrm{H}\), and \(b \mathrm{l}\) to \(h \mathrm{II}\). In like manner, the other colours will not be brought back to the Itraight line LIIF, but to a curve \(E / / \mathrm{F}\), forming a crooked fpectrum.

In like manner, the fluids difcovered by Dr Bhar, when employed to bring back the oblique fpectrum RBC formed by common glafs, will bring its extremities back to E and F, and form the crooked fpectrum E \(h^{\prime}\) F lying beyond EHF.

This experiment evidently gives us another method for examining the proportionality of the difperfon of different fubitances.

Having, by common glafs, brought back the oblique fpectrum formed by common glafs to its natural place \(A B\), fuppofe the original fpectrum at \(A B\) to contract gradually (as Newton has made it do by means of a lens), it is plain that the oblique fpectrum will alfo contrach, and fo will the fecond fpeefrum at \(A B\); and it will at laft coalefee into a white fpot. 'Ihe effect will be equivalent to a gradual compreflion of the whole figure

\section*{T E L}
relefcope. figure, by which the parallel lines AR and BC gradual1y approach, and at laft unite.

In like manner, when the oblique fpectrum formed by flint glals is brought back to E1IF by a flint-glafs prifm, and the figure comprefled in the fane gradual manner, all the culours will coalefee into a white fpot.

But when dint-ghafs is employed to bring back the obligue fipectruin tormed by common glafs, it forms the crooked fpectrum E \(k \mathrm{~F}\). Now let the figure be compreffed. The curve \(\mathrm{E} / \mathrm{F}\) will be doubled down on the line \(H h\), and there will be formed a compound frectrun \(\mathrm{H} h\), quite unlike the common frectrum, being purple or claret coloured at H by the minture of the extreme ted and violet, and green edged with blue at \(h\) by the mixture of the green and blue. The fluid prifms would in like monner form a lipetrum of the fame kind on the other fide of H .

This is precifcly what is obferved in achromatic ob-ject-glaffes made of crown-glafs and fint: fur the refraction from A to R correfponds to the refraction of the conves crown-glafs; and the contrary refraction from R to E correfponds to the contrary refraction of the concave fint-glafs, which ftill leaves a part of the firt refraction, producing a convergence to the axis of the telefcope. It is found to give a purple or wine-coloured focus, and within this a green one, and between thefe an imperfect white. Dr Blair found, that when the eye-glafs was drawn out beyond its proper diftance, a Par was furrounded by a green fringe, by the green end of the fpectrum, which croffed each other within the focus; and when the eye-glafs was too near the ob-jeit-glafs, the flar had a wine-coloured fringe. The green rays were ultimately moft refracted. N. \(\tilde{B}\). We ihould expect the fringe to be of a blue colour rather than a green. But this is cafly explained: The extreme violet rays are very faint, fo as hardly to be lenfible ; therefore when a compound glafs is made as achromatic as polfible to our fenfes, in all probability (nay certainly) thefe almoft infenfible violet rays are left out, and perhaps the extreme colours which are united are the red and the middle violet rays. This makes the green to be the mean ray, and therefore the molt outfanding when the difperfions are not proportional.

Dr Blair very properly calls thefe fpectrums, \(\mathrm{H} h\) and H \(h^{\prime}\), fecondary Spectrums, and feems to think that he is the firf who has taken notice of them. But Mr Clairault was too accurate a mathematician, and too careful an obferver, not to be aware of a circumflance which was of primary confequence to the whole inquiry. He could not but obferve that the fuccefs refted on this very particular, and that the proportionality of difperfion was indifpenfably neceffary.

This fubject was therefore tonched on by Clairault; and fully difcuffed by Rofoovich, firt in his Differtations publithed at Vienna in \(\mathbf{1 7 5 9}\); then in the Comment. Boncnienfis; and, lafly, in his Opufcula, publinhed in 1785 . Dr Blair, in his ingenious Differtation on Achromatic Glaffes, read to the Royal Society of Edinburgh in 1793 , feems not to have known of the labours of the ewriters; fpeaks of it as a new difcovery ; and exhibits fome of the confequences of this principle in a fingular point of view, as fomething very paradoxical and inconfiftent with the ufunlly received notions on thefe fubjects. But they are by no means fo. We are, however, much indebted to his ingenious refearches, and his fucceffiul en-
deavours to find fome remedy for this imperfection of Telefope. achumatic glaffes. Some of his contrivances are cxceedingly ingenious; but had the Doctor confulted thele wuters, he would have faved himfelf a good deal of trouble.

Bufcovich flows how to unite the two extremes with the moof outfanding colour of the focondary fpectrum, by means of a third fubflance. When we have done this, the aberration occafioned by the fecondary fpectrums mult be prodigioufly diminifhed; fur it is evidenily equivalent to the mion of the points H and \(h\) of our figure. Whatever caufe produces this mult dimininh the curvature of the arches \(\mathbb{E} h\) and \(h \mathrm{~F}\) : but cven if thefe curvatures were not diminilhed, their greateft ordinates cannot exceed one-fourth of \(\mathrm{H} h\); and we may lay, without hefitation, that by uniting the mean or moft outhanding ray with the two extremes, the remaining difperfion will be as much lefs than the uncorrected colour of Dollond's achromatic glafs, as this is lefs then four times the difperfion of a common object-glafs. It muft therefore be altogether infenfible.

Bofcovich afferts, that it is not poffible to unite more than two colours by the oppolite riffaction of two fubfances, which do not difperfe the light in the fame proportions. Dr Blair makes light of this affertion, as lie finds it made in general terms in the vague and paltry extract made by Priefley from Bofcovich in his Ellay on the Hithoy of Optics ; but had he read this author in his own difirtations, he would have feen that he was perfectiy right. Dr Blair, however, has hit on a very ingenious and effectual method of producing this union of three colours. In the fame way as we curre e the difperfion of a concave lens of crown-glafs by the oppofite difperfion of a concave lens of tint-glaf, we may correct the fecondary difperfion of an achromatic convers lens by the oppofte fecondary difperfion of an achromatic concave lens. But the intelligent reader will oblerve, that this union does not contradict the affertion of Bofcovich, becaufe it is neceffarily produced by means of three refracting fubfances.

The moit efiential lervice which the public has received at the hands of Dr Blair is the difcovery of fuid mediums of a proper difperive poser. By compofing the lenfes of fuch fubfances, we are at once freed from the irregularities in the refraction and difperficn of Hintglafs, which the chemifts have not been able to free it from. In whatever way this glafs is made, it confifts of parts which differ both in refractive and difperfive power; and when taken up from the pot, thefe parts mix in threads, which may be diffeminated through the mals in any degree of finencfs. But they Alll retain their properties; and when a piece of flint-glafs has been formed into a lens, the eye, placed in its focus, fees the whole furface occupied by gliftening threads or broader veins running acrofs it. Gireat rewards have been offered for removing this defeet, but hitherto to no purpofe. We beg leave to propofe the following method: Let the gla?s be reduced to powder, and then melted with a great proportion of alkaline falt, fo as to make a liguor filicum. When precipitated from this by an acid, it muft be in a late of very uniform compofition. If again melted into glafs, we fhould hope that it would be free from this defect ; if not, the cafe feems to be defperate.

But by ufing a Huid medium, Dr Blair was freed from all this embarr:ment; and he acquired another

\section*{T E L [260] T E L}

Tileicope. immenfe advantage, that of adjufting at pleafure both the refractive and difperfive powers of his lenfes. In folid lenfes, we do not know whether we have taken the curvatures fuited to the refractions till our glafs is finimed; and if we have mitaken the proportions, all our labour is loft. But when fluids are uled, it is enough that we know nearly the refractions. Wre fuit our focal diftances to thefe, and then felect our curvatures, io as to remove the aberration of figure, preferving the focal diftances. Thus, by properly tempering the fluid mediums, we bring the lens to agree precifely with the theory, perfectly achromatic, and the aberration of figure as much corrected as is polfible.

Dr Blair examined the refractive and difperfive powers of a great variety of fubflances, and found great varieties in their actions on the different colours. This is indeed what every well informed naturalif would expect. There is no doubt now anong naturalifts about the mechanical conneclion of the phenomena of nature ; and all are agreed that the chemical actions of the particles of matter are perfectly like in kind to the action of gravitating bodies; that all thefe phenomena are the effects of forces like thofe which we call attractions and repelfions, and which we obferve in magnets and electrified bodies; that light is refracted by forces of the lame kind, but differing chiefly in the fmall extent of their fphere of activity. One who views things in this way will expect, that as the actions of the fame acid for the different alkalies are different in degree, and as the different acids have alfo different actions on the fame alkali, in like manner different fubitances differ in their general refractive powers, and alfo in the proportion of their action on the different colours. Nothing is more unlikely therefore than the proportional difperfion of the different colours by different fubftances; and it is furprifing that this inquiry has been folong delayed. It is loped that Dr Blair will oblige the public with an account of the experiments which he has made. 'Ihis will enable others to co-opcrate in the improvement of achromatic glafies. We cannot derive much knowledge from what he bas already publifhed, becaufe it was chiefly with the intention of giving a popular, though not an accurate, view of the fubject. The conftructions which are there mentioned are not thofe which he found moft effectual, but thofe which would be moft eafily underflood, or demonftrated by the fight theory which is contained in the differtation; befides, the manner of exprefling the difference of refrangibility, perhaps chofen for its paradoxical appearance, does not give us a clear notion of the characteriftic differences of the fubitances examined. Thofe rays which are ultimately mof deflected from their direction, are faid to have become the molt refrangible by the combination of different fubStances, although, in all the particular refractions by which this effect is produced, they are lefs refracted than the violet light. We can jult gather this much, that common ghafs difperfos the rays in fuch a manner, that the ray which is in the confine of the green and blue occupies the midjle of the prifmatic fpectrum ; but in glaftes, and many other fubilances, which are more difperlive, this ray is nearer to the ruddy extremity of the fpectrum. While therefore the itraight line \(\mathrm{RC}^{\prime}\)
Fig. 13. (fig. 13.) terminates the ordinates \(\mathrm{O} o^{\prime}, \mathrm{Y}^{\prime}, \mathrm{C}_{\mathrm{g}} \mathrm{g}^{\prime}\) \& c . which reptefent the difperfon of common glafs, the ordinates which exprefs the difpe: fions of the.c fubfances
are terminated by a curve paffing through \(R\) and \(C^{\prime}\), but Telefope. lying below the line \(\mathrm{RC}^{\prime}\). When theseluse para!lel heterogenous light is made to converge to the axis of a convex lens of common glafs, as happeas at F in fig. 6 . C, the light is difperfed, and the violet rays have a thorter focal ditance. If we now apply a concave lens of greater difperfive power, the red and violet rays are brought to one focus F ; but the green rays, not being fo much refracted away from F , are left behind at \(0_{\text {, }}\) and have now a fhorter focal diftance. But Dr Blair afterwards found that this was not the cafe with the muriatic acid, and fome folutions in it . He found that the ray which common glafs caufed to occupy the middie of the feectrum was much nearer to the blue extremity when refracted by thefe fluids. Therefore a concave lens formed of fuch fluids which united the red and violet rays in \(F^{\prime}\), refracted the green rays to \(f^{\prime}\).

Having oblerved this, it was an obvious conjecture, that a mixture of fome of thefe fluids might produce a medium, whole action on the intermediate rays fhould have the fame proportion that is obferved on common glafs; or that two of them might be found which formed fpectra fimilarly divided, and yet differing fufficiently in difperfive power to enable us to deftroy the difperfion by contrary refractions, without deftroying the whole refraction. Dr Blair accordingly found a mixture of folutions of ammoniacal and mercurial falts, and alfo fome other fubftances, which produced difperfions proportional to that of glafs, with relpect to the different colours.

And thus has the refult of this intricate and laborions invefigation correfponded to his utmolt wihes. He has produced achromatic telefcopes which feem as perfect as the thing will admit of; for he has been able to give then fuch apertures, that the incorrigiole aberration arifing from the fpherical furfaces becomes a fenfible quantity, and precludes father amplification by the eye-glaffes. We have examined one of his telefcopes: The focal diftance of the object-glafs did not excced ig inches, and the aperture was fully \(3^{\frac{5}{2}}\) inches. We viewed fome fingle and double ftars and fome common objeets with this telefcope; and found, that in magnifying power, brightnefs, and dillinetnefs, it was manifefly fuperior to one of Mr Dollond's of 42 inches focal length. It alfo gave us an opportunity of admiring the dexterity of the London artifts, who could work the glaffes with fuch accuracy. We had molt diftinct vifion of a ftar when ufing an erecting eye-piece, which made this telefcope magnify more than a hundred times; and we found the field of vifion as uniformly diftind as with Dollond's 42 inch telefcope magnifying 46 times. The intelligent reader mult admire the nice figuring and centering of the very deep eye-glafles which are neceflary for this amplification.

It is to be hoped that Dr Blair will extend his views to glafies of different compofitions, and thus give us ob-ject-glaftes which are folid; for thofe compofed of fluids have inconveniences which will hinder them from coming into general ufe, and will confine tham to the mufeums of philofophers. We imagine that antimonial glaftes bid fair to anfwer this purpofe, if they could be made free of colour, fo as to tranfmit cnough of light. We recommend this differtation to the careful perufal of our readers. Thofe who have not made themfelves much acquainted with the delicate and abitrufe theory of alcerations, will find it exhibited in fuch a popular,

\section*{T E L}

The imple afronomical telefcope is reprefented in Telefonpe. fig. 16. The heam of parallel rays, inclined to the Fig. 16 . axis, is made to converge to a point \(G\), where it forms an image of the loweft point of a very dittant object. Thele rays decuffating from G fall on the eye-glafs; the ray fiom the lowelt point \(B\) of the object glafs falls on the eye-glafs at \(b\); and the ray from \(A\) falls on \(a\); and the ray from the centre O falls on o. Thefe rays are rendered parallel, or nearly fo, by refraction through the cye.glafs, and take the direction \(b i^{\prime}\),o I , a \(i\). If the eye be placed fo that this pencil of parallel rays may enter it, they converge to a point of the retina, and give diftinet vifion of the loweft point of the object. It appears inverted, becaufe the rays by which we fee its loweft point come in the direction which in fimple vifion is connected with the upper point of an object. They come from above, and therefore are thought to procced from above. We fee the point as if fituated in the direction Io. In like manner the eye placed at I, fees the upper point of the ohject in the direction IP, and its middle in the direction IE. The proper place for the eye is I; if brought much nearer the glafs, or removed much farther from it, fome, or the whole, of this extreme pencil of rays will not enter the pupil. It is therefore of importance to determine this point. Becaufe the eye requircs parallel rays for diftinct vifion, it is plain that \(F\) muft be the principal focus of the eyeglafs. Therefore, by the common focal theorem, OF: \(\mathrm{OE}=\mathrm{OE}: \mathrm{OI}\), or \(\mathrm{OF}: \mathrm{FE}=\mathrm{OE}: E I\).

The magnifying power being meafured by the magnitude of the vifual angle, compared with the magnitude of the vifual angle with the naked eyc, we have \(\frac{0 I p}{o O p}\), or \(\frac{O I F}{O O F}\) for the meafure of the magnifying power. This is very nearly \(=\frac{\mathrm{OE}}{\mathrm{EI}}\), or \(\frac{\mathrm{OF}}{\mathrm{FI}}\).

As the line OE, joining the centres of the lenfes, and perpendicular to their farfaces, is called the axis of the telefcope, fo the ray OG is called the axis of the oblique pencil, being really the axis of the cone of light which has the object-glafs for its bafe. This ray is through its whole courle the axis of the oblique fencil; and when its courfe is determined, the amplification, the field of vifion, the apertures of the glaffes, are all determined. For this purpofe we have only to confider the centre of the object-glafs as a radical point, and trace the procels of a ray from this point through the other glaffes: this will be the axis of fome oblique pencil.

It is evident, therefore, that the field of vifion depends on the breadth of the eye-glafs. Should we increafe this, the extreme pencil will pals through I, becaufe \(O\) and \(I\) are fill the conjugate foci of the eye-
(A) While we thus repeatedly \{peak of the theory of fpherical aberration as coming from Mr Huvghens, we muft not omit giving a due flare of the honour of it to Dr Barrow and Mr James Gregory. The firlt of thefe authors, in his Optical Lectures delivered at Cambridge, has given every propofition which is employed by Huyghens, and has even profecuted the matter much further. In particular, his theory of oblique flender pencils is c : immenfe confequence to the perfection of telefcopes, by flowing the methods for making the image of an extended furface as Hat as poffible. Gregory, too, has given all the fundamental propofitions in his Optica Promota. But Huvghens, by taking the fubject together, and treating it in a fyftem, has greatly fimplified it: and his mamer of viewing the principal patts of it is incomparably more perficuous than the performances of Barrow and Gregory,

\section*{T E L}

Teieícope. \(\underbrace{\text { Ieleicope. }}\) gleifs. On the other hand, the angle refolved on for the extent or field of vifion gives the breadth of the eye-glafs.

We may here obferve, by the way, that for all optical inftruments there mull be two optical figures confidered. The firl flows the progrefs of a pencil of rays coming from one point of the object. The vatious focufes of this pencil thow the places of the different images, real or virtual. Such a figure is formed by the three rays \(\mathrm{AG} a i, \mathrm{OG}\) o \(\mathrm{I}, \mathrm{BG} b i\).

The fecond fhows the progrefs of the axes of the different pencils proceeding through the centre of the object-glafs. The focufes of this percil of axes thow the places where an image of the object. glafs is formed; and this pencil determines the field of vifion, the apertures of the lenfes, and the amplification or magnifying power. The three rays OG oI, OFEI, OHPI, form this figure.

See alfo fig. 24 . where the progrefs of both fets of pencils is more diverffified.

The perfection of a telefcope is to reprefent an object in its proper thape, diffinctly magnificd, with a great field of vifion, and fufficiently bright. But there are limits to all thefe qualities; and an increare of one of them, for the moft part, diminiihes the refl. The brightnefs depends on the aperture of the object-glafs, and will increafe in the fame proportion (becaufe \(i i^{\prime}\) will always be to \(A B\) in the proportion of \(E F\) to FO), till the diameter of the emergent pencil is equal to that of the pupil of the eye. Increafing the object-glafs any more, can fend no more light into the eye. But we cannot make the emergent pencil nearly fo large as this when the telefcope magnifies much; for the great aperture of the object-glafs produces an inditinct image at GF, and its indifinctnefs is magninied by the eyeglafs.

A great field of vifion is incompatible with the true Mlape of the object; for it is nat frictly true that all rays flowing from O are refracted to I . Thofe rays which go to the margin of the eye-glafs crofs the axis between E and I ; and therefore they crofs it at a greater angle than if they paffed through 1 . Now had they really paffed through 1 , the objeet would have been reprefented in its due proportions. Therefore fince the angles of the marginal parts are enlarged by the aberration of the cye-glafs, the marginal parts themfelves will appear enlarged, or the object appear diflorted. Thus a chels board viewed through a reading glafs appcars drawn out at the corners, and the flraight lines are all
Fig. 1s. changed into curves, as is reprefented in fig. 18.
The circumfance which moft peremptorily limits the extent of Gield is the neceffary diflinctnefs. If the vifion be indiflinet, it is ufelefs, and no other quality can compenfate this defect. The diftortion is very inconfiderable in much larger angles of vifion than we can admit, and is unvorthy of the attention paid to it by optical writers. They have been induced to take notice of it, hecaufe the means of correcting it in a confiderable degree are att:inable, and afford an opportunity of exhibiting their knowledge; whereas the indiftinctnefs which accompanies a large field is a fubject of moft difficult difcuffion, and has hitherto baffled all their efforts to exprefs by any intelligible or manageable formule.

\section*{T E \(\mathbf{L}\)}

\section*{Quaque tractata nitpfecre pofe Defperat relinģuti.}

This fubject muft, however be confidered. The image at GF of a very remote objea is not a plain furface perpendicular to the axis of the telefcope, but is nearly fpherical, having \(O\) for its centre. If a number of pencils of parallel rays crolling each other in I fall on the cyc-glafs, they will form a picture on the oppofite fide, in the focus F . But this picture will by no means be flat, nor nearly fo, but very concave towards E. Its exact form is of molt dificult invelligation. The elements of it a:e given by Dr Barrow; and we have given the chief of them in the article Optics, when confidering the foci of infinitely flender pencils of oblique rays. Thereforc it is impofible that the picture formed by the object-glafs can be feen diflindly in all its parts by the eye-glafs. Even if it were Hat, the points G and H (fig. 16.) are too far fiom the cyeglafs when the middle \(F\) is at the proper diftance for diftinet vifion. When, therefore, the telefcope is fo adjufted that we have dillinct vifion of the middle of the field, in order to fee the margin dillinctly we muft pufh in the cye-glafs: and having fo done, the middle of the field becomes indiftinet. When the field of vifion exceeds 12 or 15 degrees, it is not polible by any contivance to make it tolerably diftinct all over; and we mull turn the telefcope fucceffively to the different parts of the field that we may fee them agrecably.

The caufe of this inditinctnefs is, as we have already faid, the fhortnefs of the lateral foci of lateral and oblique pencils refracted by the eye-glafs. The oblique pencil \(b \mathrm{G} a\), by which an eye placed at I fees the point \(G\) of the image, is a cone of light, having a circular bale on the eye-glafs; of which circle \(a b\) is one of the diameters. There is a diameter perpendicular to thic, which, in this figure, is reprefented by the point 0. Fig. 17. reprefents the bafe of the cone as feen by an eye plazed in the axis of the telefcope, with the ob-ject-glafs as appearing behind it. The point \(b\) is formed by a ray which comes from the loweft poin \(B\) of the object-glafs, and the point \(a\) is illuminated by a ray from \(A\). The point \(c\) at the right hand of the circular bafe of this cone of light came from the point C on the left fide of the object-glafs; and the light comes to \(d\) from D. Now the laws of optice demonftrate, that the rays which cone through the points \(c\) and \(d\) are more convergent after refraction than the rays which come through \(a\) and \(b\). The analogice, thercfore, which afcertain the foci of rays lying in planes pafing througls the axis do not determine the foci of the others. Of this we may be fenfible by looking through a lens to a figure on which are drawn concentric circles crofied by radii. When the telefcope is fo adjulled that we fee diflinctly the extremity of one of the radii, we fhall not fee dillinctly the circumference which croffes the extremity with equal diftinêness, and vice verfa. This difference, however, hetween the foci of the rays which come throught \(a\) and \(b\), and thofe which come through \(c\) and \(d\), is not confiderable in the fields of vifion, which are otherwife adminible. But the fame difference of foci obtains alfo with refpect to the difperfon of light, and is more remarkable. Both d'Aicnibert and Euler lave attempted to introduce it into their for-

\section*{T E L [ 263 ] T E L}
defcope. mulx ; but they have made them ufelefs for any prac-tical purpole by their inextricable contplication.
'lis muf lerve as a general indication of the diffculties which occur in the conftruction of telefcopes, even although the object-glafs were prefect, forming an image without the fabllef confufion or diftortion.

There is yet anolher dificuley or imperfection. The rays of the pencil a \(G b\), when refracted through the eycorlafs, are allo feparated into their component coInurs. The edge of the lens muft evidently perform the office of a prilin, and the white ray \(G b\) will be fo difo perfed that if \(b i\) be the path of its red ray, the violet ray, which makes another part of it, wihl take fuch a courfe \(b n\) that the angle \(t^{t} b n\) will be nearly \(z^{\frac{1}{2}} \boldsymbol{t}\) th of \(\mathrm{G}^{\prime} b i^{\prime}\). The ray G a pafing through a part of the lens whofe furfaces are lefs inclined to each other, will be leis refracted, and will be lefs difperfed in the fame proportion very nearly. 'Therefore the two violet rays will be very nearly parallel when the two red rays are rendered parallel.
Hence it mult happen, that the objeat will appear bordered with coloured fringes. A black line feen near the margin on a white ground, will have a ruddy and orange border on the outfide and a blue botder within: and this confufion is altogether invependent on the ob-ject-riafs, and is fo mucli the greater as the vifual angle \(6 I E\) is greater.

Such are the dificulies: They would be unfurmountable ticre it not that fome of them are fo connelted that, to a certain extent, the diminution of one is accompanied by a diminution of the other. What are called the canflic curves are the geometrical loci of the foci of infinitely flender pencils. Confequently the point \(G\) is very nearly in the cauntic formed by a beam of light confiting of rays parallel to \(I o\), and uccupying the whole fyrface of the eye-gids, becaure the pencil of rays which are collected at \(G\) is vesy fmall. Any thing therefore that diminithes the mutual inclination of the adjoining rays, puts their concourfe farther off: Now this is precifely what we want: for the point \(G\) of the inage formed by the ntject-glal's is already beyond the focus of the oblique alender pencil of parallel mays \(i\) a and \(i^{\prime} b\); and therefore, if we could make this focus go a little farther from \(a\) and \(b\), we flall bring it nearer to \(G\), and obtain more diftinct vifon of this point of the object. Nuw let it be recoliected, that in moderate tefractions through prifms, two rays which are inclined to each other in a fmall angle are, after refraction, inclined to each other in the fame angle. Therefore, if we can diminifl the abertation of the ray \(a i\), or 0 I , or \(l n^{\prime}\), we diminith their mutual inclination; and confe. quently the mutual inclination of the rays \(G a, G o, G b\), and therefore lengthen the focus, and get more diftinet vifon of the point \(G\). Therefore se at once corref the diftortion and the indiftinctuefs: and this is the aim of \(\mathrm{M}^{\prime}\) Huyghens"s great principle of dividing the refractions.

The general method is as follows: Let o be the ob-ject-glafs (fig. 19.) and E the eye-glafs of a telefcope, and F their common fucus, and \(\bar{F} G\) the image formed by the object-glafs. The proportion of their focal diftances is fuppofed to be fuch as gives as great a magnifying power as the perfection of the ohject-glafs will admit. Let 31 be the axis of the emergent rencil. It
is known by the focal theorem that GE is parallel to Telefcope. Bl : therefore BGE. is the whole refraction or dellec. tion of the ray OHB from its former direction. Let it be propofed to diminilh tha aberrations by dividing this into two parts by means of two glaffes I) and \(\varepsilon\), fo as to make the ultimate angle of vifion \(b i c\) equal to BIF, and thus retain the fame magnifying power and vifible field. Lee it be propufed to divide it into the parts BGC and CGI:.

From G draw any line \(G D\) to the axis towards \(O\); and draw the perpendicular Dll, cutting OC in H; draw II \(c\) parallel to \(G C\), cutting GD in \(g\); draw \(\delta f\) perpendicular to the axis, and \(g e\) parallel to \(G E\); draw c b perpendicular to the axis; draw D i parallel to GC , and o \(d\) perpendicular to the axis.
'Ihen if there be placed at D a lens whofe focal dif tance is \(\mathrm{D} d\), and another at \(e\) whofe focal difance is \(c f\), the thing is done. Tlie ray OH will be tefracted into \(\mathrm{H} b\), and this into \(b i\) parallel to BI .

The demonftration of this conilruction is fo evident by means of the common focal theorem, that we need not repeat it, nor the reafons for its advantages. We have the fame magnifying power, and the fame field of vilion; we have lefs aberation, and therefure lefs diftortion and indiftisetnefs; ard this is brouglst about by a lens Hi ) of a linaller aperture and a grealer fucal diftance than IBE. Confequently, if we ate contented with the difinctnets of the matgin of the field with a lingle eye glais, we may gieatly increafe the field of vifion; for if we increale DIH to the fize of EB we Ahall have a greater field, and much greater dithetnefs in the margin ; bccaufe HD is of a longer focal diftance, and will bear a greater aperture, preferving the fame difinctuefs at the edge. On this account the glafs HD is commonly called the Firdiglafs.

It muft be oblerwed here, however, that although the diftortion of the object is lellened, there is a real dillortion produced in the image \(f g\). But this, when magnified by the glafs \(c\), is fmaller than the diftortion produced by the glafs E, of gieater aperture and fhorter focus, on the undiftorted image GF. But becaufe there is a difortion in the fecond image \(f g\), this confiruction cannot be uled for the telefcopes of aftronomical quadrants, and other graduated inftruments; becaufe then equal divifions of the micrometer would not correfpond to equal ingles.

But the famc conftruction will anfwer in this cafe, by taking the point \(D\) on that fide of \(F\) which is remote from O (fig. 20.). This is the form now employed in the telefcopes of all graduated inftruments.

The exact proportion in which the dillurtion and the indifinctners at the edges of the ficld are diminilled by this conftruction, depends on the propurtion in which the angle BGE is divided by GC; and is of pretty dif: ficult invelligation. But it never deviates far (never \(\frac{7}{5} t h\) in optical inftruments) from the proportion of the fquares of the angles. We may, without any fenfible erior, fuppofe it in this proportion. This gives us a practical rule of eafy recollection, and of mof extenfive ufe. When we would diminift an aborration. by dividing the whole refraction into two parts, we farll do it monf effectually by making them equal. In like manner, if we divide it inte three parts by nieans of two ads

Telefope. ditional glafles, we muft make each \(=\frac{r}{3} d\) of the whole; and fo on for a greater numbe:.

This ufeful problem, even when limited, as we have done, to equal refractions, is as yet indeterminate; that is, fufceptible of an infinity of lolutions: for the point D, where the field-glats is placed, was taken at pleafure: yet there mut be fituations more proper than others. The aberrations which produce diltortion, and thofe which produce indiflinetnefs, do not follow the fame proportions. To correct the indiftinctnefs, we thould not felect fuch pofitions of the lens HD as will give a fmall focal ditlance to \(b e\); that is, we fhould not remove it very far from \(F\). Huygens recommends the proportion of 3 to 1 for that of the focal diftances of the lens HD and \(e b\), and fays that the difance \(D e\) thould be \(=2 \mathrm{Fe}\). This will make \(e i=\frac{5}{2} e \mathrm{~F}\), and will divide the whole refraction into two equal parts, as any one will readily fee by conftrulting the common optical figure. Mr Short, the celebrated improver of reflecting telefcopes, generally emploved this proportion; and we fhall prefently fee that it is a very good one.

It has been already obferved that the great refractions which take place on the eye-gleffes occafion very confiderable difperfions, and difturb the vifion l'y fringing every thing with colours. To remedy this, achromatic eye-glaftes may be employed, confructed by the rules already delivered. This conftruction, however, is incomparably more intricate than that of object-glaffes: for the equations muft involve the diftance of the radiant point, and be more complicated : and this complication is immenfely increafed on account of the great obliquity of the pencils.

Mof fortunately the Huyghenian conftruction of an eyc-piece enables us to correĉ this difperfion to a great degree of exactnefs. A heterogenous ray is difperfed at H , and the red ray belonging to it falls on the lens \(b e\) at a greater diffance from the centre than the violet ray coming from H. It will therefore be lefs refracted (cateris paribus) by the lens \(b e\); and it is poffible that the difference may be fuch that the red and violet rays difperfed at H may be rendered parallel at \(b\), or even a little divergent, fo as to unite accurately with the red ray at the bottom of the eye. How this may be affected, by a proper felection of the places and figures of the lenfes, will appear by the following propofticn, which we imagine is new, and not inelegant.
Fig. 21.
Let the compound ray OP (fig. 21.) be difperfed by the lens PC; and let PV, PR be its violet and red rays, cutting the axis in \(G\) and \(g\). It is required to place another lens RD in their way, fo that the emergent rays It \(r\), V \(v\), ftiall be parallel.

Produce the incident ray OP to \(Z\). The anoles ZPR, \(Z \mathrm{PV}\), are given, (and RPV is nearly \(=\frac{7 P R}{27}\) ) and the interfections \(G\) and \(g\) with the axis. Let \(F\) be the focus of parallel red light coming through the lens RD in the oppofite direction. 'Then (by the common optical theorem), the perpendicular \(\mathrm{F}_{\rho}\) will cut PR in fuch a'point \(\rho\), that \(\rho\) F will be parallel to the emergent ray \(K r\), and to \(V \psi\). Therefore if \(\rho D\) cut PV in \(u\), and uf be drawn perpendicular to the axis, we fhall have (alfo by the common theorem) the point \(f\) for the fo-
cus of violet rays, and \(\mathrm{DF}: \mathrm{D} f=\mathrm{D}_{\varrho}: \mathrm{D} u=28\) : 27 nearly, or in a given ratio.

The problem is therefore reduced to this, "To draw from a point \(D\) in the line \(C G\) a line \(D_{\rho}\), which thall be cut by the lines PR and PV in the given ratio."

The following confruction natually offers itfelf: Make GMI: gMI in the given ratio, and draw MK parallel to Pg . Through any point D of CG draw the ftraight, line PDK, cutting MK in K. Join GK, and draw \(\mathrm{D}_{\rho}\) parallel to KG . This will folve the problem; and, drawing \(\rho F\) perpendicular to the axis, we fhall have \(F\) for the focus of the lens IID for parallel red rays.

The demonflration is evident : for MK being paralle! to \(\mathrm{P} g\), we have \(\mathrm{GM}: g \mathrm{M}=\mathrm{GK}: H K,=\rho \mathrm{D}: u \mathrm{D}\) \(=\mathrm{FD} f \mathrm{D}\), in the ratio required.

This problem admits of an infinity of folutions; becaufe the point \(D\) may be taken anywhere in the line CG. It may therefore be fubjected to fuch conditions as may produce other advantages.
1. It may be reftricied by the magnifying power, or by the divifion which we choofe to make of the whole refraction which produces this magnifying power. Thus, if we have refolved to diminigh the aberrations by making the two refractions equal, we have determined the angle \(\mathrm{R} r \mathrm{D}\). Therefore drâu GK , making the angle MGK equal to that which the emergent pencil mult make with the axis, in order to produce this magnifying power. Then draw MK parallel to Pg , meeting GK in K . Then draw PK , cutting the axis in \(\mathrm{D}_{\text {, and }} \mathrm{D}_{\rho}\) parallel to \(G K\), and \(\varsigma \mathrm{F}\) perpendicular to the axis. D is the place, and DF the focal diffance of the eye-glafs.
2. Particular circumftances may caufe us to fix on a particular place \(D\), and we only want the focal diftance. In this cafe the firft conftruction fuffices.
3. We may have determined on a certain focal diftance DF, and the place muft be determined. In this cale let
\[
\mathrm{GF}: \mathrm{F}_{\rho}=1: \tan \cdot \mathrm{G}
\]
\[
\mathrm{F}_{\rho}: f_{u} \equiv \mathrm{I}: m, \mathrm{~m} \text { being }=\frac{29}{8}
\]
\[
f_{u}: f_{g}=\tan g: 1
\]
then \(G F: f_{g}=\tan . g: m \tan . \mathrm{G}\)
then \(\mathrm{GF}-f g: \mathrm{GF}=\tan . g-m \tan . \mathrm{G}: \tan . g\)
or \(\mathrm{G} g+\mathrm{F} f: \mathrm{GF}=\tan . g-m \tan . \mathrm{G}: \tan . g\);
and \(\quad \mathrm{GF}=\mathrm{G} g+\mathrm{F} f \frac{\tan . g}{\tan . g-m \tan , \mathrm{G}}\), and is therefore given, and the place of F is determined; and fince FD is given by fuppofition, D is determined.
'The application of this problem to our purpofe is difficult, if we take it in the molt general terms; but the nature of the thing makes fuch linitations that it becomes very ealy. In the cafe of the difperfion of light, the angle GP'g is fo fmall that MK may be drawn parallel to PG without any fenfible error. If the ray OP. were parallel to CG , then G would be the focus of the lens PC, and the point MI would fall on C; becaule the focal diffance of red rays is to that of violet rays in the lame proportion for every lens, and therefore \(\mathrm{CG}: \mathrm{C}_{g}\) \(=D F^{*}\) : 1) \(f\). Now, in a telefcope which magnifies confiderably, the angle at the object-glats is very fmall, and CG hardly exceeds the focal diftance; and CG is to \(\mathrm{C} g\) very nearly in the fame proportion of 28 to 27 . We may therefore draw through C (fig. 22.) a line CK

\section*{T E L \\ \([265\) ] \\ T E L}
icleforpe. parallel to PG ; then draw \(\mathrm{GK}^{\prime}\) perpendicular to the \(\xrightarrow{\sim}\) axis of the lenfes, and join \(\mathrm{PK}^{\prime}\); draw \(\mathrm{K}^{\prime}\) BE patallel to CG, cutting PK in B; draw BHI parallel to GK, cutting \(\mathrm{GK}^{\prime}\) in H : Join HD and \(\mathrm{PK}^{\prime}\). It is evident that \(C G\) is bifected in \(F^{\prime}\), and that \(K^{\prime} 13=2 F^{\prime} D\) : alfo \(K^{\prime} H: H G=K^{\prime} B: B E,=C D: D G\). Therefore \(D H\) is parallel to \(\mathrm{CK}^{\prime}\), or to PG . But becnule \(\mathrm{P}^{\prime} \mathrm{F}^{\prime}=\mathrm{F}^{\prime} \mathrm{K}^{\prime}\), PD is \(=\mathrm{DB}\), and \(\mathrm{IH}=\mathrm{HB}\). Therefore \(\rho \mathrm{D}=\mathrm{HB}\), and \(\mathrm{FD}=\mathrm{K}^{\prime} \mathrm{B},=2 \mathrm{~F}^{\prime} \mathrm{D}\); and FD is bilected in \(\mathrm{F}^{\prime}\). Thercfore \(\mathrm{CD}=\frac{\mathrm{CG}+\mathrm{FD}}{2}\).

That is, in order that the eye-glafs RD may correct the difperfion of the field-glaf PC, the diffance between them mufl be equal to the half fum of their. fucal diffances very nearly. More exactly, the diflance between then mift he equal to the half fum of the focal difance of the eyfe-ghofs, and the diffance at which the field-glafs would form on image of the object-glnfs. For the point G is the focus 10 which a ray coming from the centse of the object-glafs is refracted by the field-glafs.

This is a very fimple folution of this important problem. Huyghens's eye-piece correfonds with it exactly. If indeed the difperfion at \(P\) is not entirely produced by the refraction, but perhaps combined with fome previous difperfion, the point M (fig. 21.) will not coincide with C, (fig. 22.), and we thall have GC to CaM, as the natural difierion at \(P\) to the difperfion which reaily obtains there. This may deftroy the equa-
\[
\text { tion } C D=\frac{C G+F D}{2} \text {. }
\]

Thus, in a manner rather unexpected, have we freed the eye-glafles from the greateft part of the effect of difpertion. We may do it entirely by pulling the eyeglafs a little nearer to the field-glafs. This will render the violet rays a little divergent from the red, to as to produce a perfect picture at the bottom of the eye. But by doing fo we have hurt the diltinctnefs of the whole picture, becaufe \(\mathbf{F}\) is not in the focus of RD. We remedy this by drawing both glaffes out a litte, and the ielefcope is made perfect.

This improvement cannot be applied to the confrution of quadrant telefcopes, fuch as fig. 20. Mr Ramiden has attempted it, however, in a very ingenious way, which merits a place here, and is alfo initructive in another way. The field-glafs HD is a planoconvex, with its plane fide next the image GF. It is placed very near this image. The confequence of this difpofition is, that the image GF produces a vertical image \(g f\), which is much lefs convex towards the glafs. He then places a lens on the point \(C\), where the red ray would crofs the axis. The violet ray will pais on the other fide of it. If the focal diftance of this glafs be \(f c\), the vifion will be ditin:t and free from colour. It has, however, the inconveniency of obliging the eye to be clofe to the glafs, which is very troublefome.

This would be a good conitruction for a magic-lanthorn, or for the object-glafs of a folar microfcope, or indeed of any compound microfope.

We may prefume that the reader is now pretty familiar with the different circumfances which mult be confidered in the confruction of an eye-piece, and proceed

Vol. XX. Part 1.
to cunfider thofe which muft be employed to ereet the Telefoups: object.

This may be done by placing the lens which receives the light from the objectoglafs in fuch a maner, that 2 fecond image (inverted with refject to the firlt) may be formed beyond it, and this may be viewed by an eyeglals. Such a conilrusion is bepetend in fer Sats. Such a conilrucion is repretented in fig. 23. DXXX But, b.fides many other deficts, it tinges the object pro- Fig. 23. digioully with colour. The ray od is difperled at \(d\) into the red ray \(d r\), and the violet \(d v, v\) being farther from the centre than \(r\), the retracted ray \(v v^{\prime}\) csolles \(r r^{\prime}\) both by reafon of fyherical aberration and its greater re. frangibility.

But the common day telefcope, invented by F. Rheita, has, in this refpect, greatly the advantage of the one now deferibed. The rays of compound light are di!? perfed at two points. Tlie violet ray in its courfe falls without the red ray, but is accurately culleened with it at a common focus, as we thall demonftrate by and by. Since they crof each other in the focus, the violet ray muff fall within the red ray, and be lefs refracted than if it had fallen on the fame point wilh the red ray. Had it fallen there it would have feparated from it ; but by a proper diminution of its refraction, it is kept parallel to it, or nearly fo. And this is one excellence of this telefcope : when conffucted with three eye-glaffes perfectly equal, the colour is fenfibly diminithed, and by ufing an eye-glafs fomewhat fmaller, it may be removed entirely. - We fay no more of it at prefent, becaufe we thall find its confruction included in another, which is 1 ill more perfect.

It is evident at firf fight that this telefcope may be improved, by fubftituting for the eye-glafs the Huyghenian double eye-glafs, or field-glafs and cye-glafs reprefented in fig. 19. and 20.; and that the firit of thefe may be improved and rendered achromatic. This will require the two glafles ef and \(g h\) to be increafed from their prefent dimenfions to the fize of a field-glafs, fuited to the magnifying power of the telefcope, fuppofing it an aftronomical telefcope. Thus we ftall have a telefcope of four eye-glaffes. The three firt will be of a confiderable focal ditance, and two of them will have a common focus at \(b\). But this is confiderably different from the eye-piece of 'wur glafles which are now ufed, and are far better. We are indebted for them to Mr Dollond, who was a mathematician as well as an artif, and in the courfe of his refearch difcovered refources which had not been thought of. He had not then difoovered the achromatic object-glaf,, and was bu'y in improving the eye-glaffes by diminithing their fuherical aherration. His filf thought was to make the Huyghenian addition at both the images of the dyy telefcope. This fuggetted to him the following eyc-piece of five glaffes.

Fig. 24. reprefents this eye-piece, but there is not Fig. 2. roons for the object-glafs at it proper difta!ce. A pencil of rays coming fiom the upper point of the of ject is made to converge (by the object-glafs) 10 G , where it would form a picture of that part of the object. But it is intercepted by the lens \(A a\), and its axis is tent towards the axis of the elefcope in the direction \(a b\). At the fame time, the rays which converged to \(G\) converge to \(g\), and there is formed an inverted ficture of the object at \(g f\). The axis of the nencil is again refracted at L 1

\section*{T E J 「 266}

Te Peope. b, croffes the axis of the telefcope in H, is refrafed again at \(c\), at \(d\), and at \(c\), and at lath crolles the axis in 1. The rays ot this pencil, aiverging from \(g\), are made Ielo divelging, and proceed as if they came from \(\xi^{\prime}\), in the line \(B g g^{\prime}\). The lens \(c \mathrm{C}\) caufs them to converge to \(g^{\prime}\), in the ine \(\mathrm{G}^{\prime \prime} \mathrm{C} g^{\prime}\). 'The lens \(d \mathrm{D}\) rakes them converge 1 lill more to \(\mathrm{G}^{\prime \prime}\), and there they form an esect picture \(G^{\prime \prime} F^{\prime \prime}\); diverging from \(G^{\prime \prime}\), they are rendered parallel by the refraction at \(e\).

At \(H\) the rays are nearly parallel. Had the glafs Bí been a little farther from \(A\), they would have been accurately fo, and the object-glais, with the glaftes \(A\) and \(B\), would have formed an aftronomical teleicope with the Huyghenian eye-picce. The glafles C, D, and \(E\), are intended merely for bending the rays back again till they agan crof the axis in I. The glats C tends chicfly to diminith the great angle \(\operatorname{PH} b\); and then the two glafles D and \(E\) are another Huyghenian cye-picce.

The art in this confruction lies in the proper adjuftment of the glaffes, to as to divide the whole bending of the pencil pretty equally among them, and to form the laft image in 1. . focus of the eye-glats, and at a proper dilance trom the other glats. Bringing \(B\) nearer to \(A\) would bend the pencil more to the axis. Plecing \(\mathbb{C}\) farther from \(B\) would do the fame thing; but this would be accompanied wih more aberration, becaufe the rays would fall at a greater diflance from the centies of the lenfes. The greatef bending is made at the field-glals D; and we imagine that the telefcope would be improved, and made more diftinct at the edges of the field, by employing another glafs of great focal difance between C and D.

There is an image formed at II of the obje民t-oglafies, and the whole light paffes through a fmall circle in this place. It is ufual to put a plate bere pierced with a hole which has the diameter of this image. A fecond image of the object-glafs is formed at \(I\), and indced wherever the pencils crofs the axis. A lens placed at H makes no change in any of the angles, nor in the magnifying power, and affects only the place where the images are formed. And, on the other hand, a lens placed at \(f\), or \(\mathrm{F}^{\prime \prime}\), whete a real image is formed, makes no change in the places of the images, but afleets the mutual inclination of the pencils. This affords a refource to the artit, by which he may combine properties which feem incompatible.

The aperture of A determines the vifible field and all the other apertures.

TVe muft avoid forming a real image, fuch as \(f_{S}\), or \(\mathrm{T}^{\prime \prime} \mathrm{G}^{\prime \prime}\), on or very near any glafs. For we cannot lie this image without feeing alorig with it everv particle of dult and every foratch on the glafs. We fee them as making part of the object when the image is cxactly on the glafe, and we lee them confufedly, and fo as to confufe the olject, when the image is near it. For when the image is on or very near any glafs, the fencil of light occupics a very fmall pat of its furface, and a particle of duft intercepts a great proportion of \(i\) i.

It is plain that this conftruction will not do for the telefope of graduated inftruments, lecaule the microuncter cannot lee applied to the fecond image \(f g\), on ac-- count of ita being a little diftorted, as has been obferved of the II uyghenian cye-piccc.

Alfo the interpoittion of the glass C makes it difficult Teiefoppe. to correct the dilpernon.

By proper reafoning from the correction in the Huyglienian cye-picce, we are led to the beft conftruction of one with thtee glaffes; which we thall now confider, tahing it in a particular form, which nall make the dricuflion eafy, and make us fully matlers of the principles which lead to a better form. '1herefore let PA (fig. 25.) be the glals which firtl receives the light fig. 2\%. proceeang tiom the image formed by the ot.ject-glafs, and let JP be the axis of the extreme pencil. This is efiacted into Pla, whicin is again refracted into \(\mathrm{ll} r\) by the nex. lens \(\bar{B} r\). Let \(b\) be the focus of parallel rays of the fecund lens. Draw PBr. We know that \(A b\) : \(b B=P B: B r\), and that rays of one kind diverging from \(P\) will te collecied at \(r\). But if \(P R, P V\) be a red and a violet ray, the violet 1ay will be more refracted at \(V\), and will crols the red ray in fome intermediate point \(g\) of the line \(\mathrm{R} r\). If therefore the furt image had been lomed precifely on the lens PA, we fhould have a fecond image at \(f g\) free from all coloured fringes.

It the refructions at \(P\) and \(R\) are equal (as in the common diy tclelcope), the dilperfion at \(V\) muft be equal to that at P , or the argle ov \(r=V^{r} P R\). But ne have ultimately \(\mathrm{RPV}: \mathrm{R} r \mathrm{~V}=\mathrm{BC}: \mathrm{AB},(=\mathrm{B} b: \mathrm{A} b\) by the tocal theorem). Iherefore \(g \mathrm{~V} r: g r \mathrm{~V}\), (or or \(: g V\), or \(C f: f B)=B b: A b\), and \(A B: \Lambda b=\) lir:lig.

This dhows ly the way the advantage of the common day telefcopc. In this \(A \mathrm{~A}=2 \mathrm{~A} b\), and therefore \(f\) is the place of the lat image which is frce fiom coloured fringes. But this image will not be feen free from coloured fringes through the cye-glafs \(\mathrm{C} r\), if \(f\) be its focus: For had \(g r, g\) g been both red reys, they would have been parallel after refraction; but \(g v\) being a violet say, will be more refracted. It will rot indeed be fo much deflected from parallelifm as the violet rey, which naturally accompanies the red aay to \(r\), becaule it falls nearer the centre. By computatien its difperfion is diminithed about \(\frac{7}{7}\) th.

In order that \(g\) er may be made parallel to \(g r\) after refraction, the refraction at \(r\) muft be fuch that the difo perfion correfponding to it may be of a proper magnitude. How to determine this is the queftion. Let the difperfion at \(g\) be to the difperfion produced by the refiaction at : (which is required for producing the intended magnifying power) as 1 to 9 . Make \(9: 1=\) \(f f^{\prime}: f^{\prime} \mathrm{C}=f \mathrm{C}: \mathrm{CD}\), and draw the perpendicular \(\mathrm{D} r^{\prime}\) meeting the refracted ray \(r r^{\prime}\) in \(r^{\prime}\). Then we know by the common focal theorem, that if \(f^{\prime}\) be the focus of the lens \(C r\), red rays divesging from \(g\) will be united it \(r^{\prime}\). But the violet ray \(g\) \& will be retracted into evr parallel to \(r^{\prime} r^{\prime}\). For the angle a \(r^{\prime} r: v g r=\) (ultimatcly ) \(f \mathrm{C}: \mathrm{CD}=9: 1\). Therefore the angle vir \(r\) is equal to the difperfion produced at \(\%\), and therefore equal to \(r^{\prime} v v^{\prime}\), and \(v^{\prime} v^{\prime}\) is parallel \(10 r^{\circ} z^{\prime}\).

But by this we have deftroyed the dillinet vifion of the image firmed at \(f_{g}\), becaufe it is no longer at the focus of the eve-glafs. Iut ditinct vifion will be refored by puhing the glafies nearer to the olje: ही-glats. This makes the rays of each particular pencil more divergent after refraction through \(A\), but farcely makes any change in the directions of the pencils themfelves. Thus the image comes to the focus \(f^{\prime}\), and makes no fenfible change in the difperfions.

In the common day telefcupe, the fint image is formed in the anterior focus of the firt cye-glafs, and the icond image is at the anterior focus of the lant eye-glafs. If we change this lalf for one of half the focal dithance, and pufh in the cyc-piece till the image formed by the ohject-glafs is half way between the firt eye-glass and its focus, the lalt image will be formed at the focus of the neve eye-giafs, and the eye-piece will be achrom:tic. This is eafily feen by making the ufual computations by the focal theorem. But the vifible field is diminilhed, becaufe we cannot give the fame aperture as before to the new eye-glafs; but we can fubltilute for it two eye glafles like the former, placed clofe together. This will have the fame focal diftance with the nerv one, and will allow the fame aperture that we had before.

On the ep principles may be demonftrated the correction of colour in eye pieces with three glaffes of the following conll ruction.
I.at the glafies \(A\) and \(B\) be placed fo that the poferior focus of the firt nearly coincides with the anierior focus of the fecond, or rather fo that the anterior focus of B may be at the place where the imare of the ob\(\mathrm{j} \in \mathrm{C}\)-glafs is formed, by which fituation the aperture necefliry for tranfmitting the whole light will be the fnullert pofible. Place the third C at a diflance from the fecond, wich exceeds the fum of their focal diftances by a pace which is a third proportional to the difance of the firlt and fecond, and the focal dillance of the fecond. The diltance of the firlt eye-glafs from the object-glafs mult be equal to the prodect of the focal diitance of the firt and fecond divided by their fun.

Let \(\mathrm{O} o \mathrm{~A} a, \mathrm{~B} b, \mathrm{C} c\), the focal diftances of the glafies, be \(\mathrm{O}, a, b, c\). Then make \(\mathrm{AB}=a+b\) nearly; \(\mathrm{BC}=b+c+\frac{b^{2}}{b+c} ; \mathrm{OA}=\frac{b c}{b+c} . \quad\) The amplification or magnifying power will be \(=\frac{o b}{a c}\); the equivalent eyeglars \(=\frac{a c}{b}\); and the field of vifion \(=343^{S^{\prime}} \times\) Aperture of A foc. ditt. ub. gi.

Thefe eye-pieces will admit the ufe of a micrometer at the place of the finf inage, becaufe it has no diftortion.

Mr Dollond was anxious to combine this achromatifm of the eye-pieces with the advantages which he bad found in the eye-pieces with five glaffes. This eve piece of thrce glafies neceflurily has a very great refraction at the glafs B , where the pencil which has come from the other fide of the axis mult be rendered again convergent, or at lea: parallel to it. This occafions confider. able aberrations. This may be avoided by giving part of this refraction to a glafs put between the firlt and fecond, in the dame way as he has done by the glafs B put between \(A\) and \(C\) in his five glafs eye-piece. But this deranges the whole procefs. His ingenuity, however, furnounted this difficulty, and he made eye-pieces of four glafles, which feem as perfeet as can te defired. Ife has not publifhed his ingenious inveftigation; and we obferve the London autifts work very much at ran:lom, probably copying the proportions of fome of his
beft glafes, without underflanding the principle, and Teleforpe. therefore frequently mittaking. W'e fee many eycpieces which are far from heing achromatic. We imagine therefore that it will be an acceptable thing to the artills to have precife inftrualions how to proceed, nothing of this kind having appeared in our language, and the invelligations of Fuler, dislembert, and even Bofcovich, being fo alifrufe as to be inacceffise to all but experienced analylls. We hope to reveler it extremely fimple.

It is evident, that if we make the rays of different colours unite on the furlace of the lalt eye-glafs but one, commonly called the field-s/afs, the thing will be done, becaule the diperfion from this point of union vill then unite with the difperfinn produced by thi glafis alone; and this increafed difperfion may be corrected by the lat eye glafs in the way already thown.

Therefure let A, Hi (fig. 26.) be the fations which Fix. 26. we have fixed on for the fitl and fecond eye-glafles, in order to give a proper portion of the whole refraction to the fecond glafs. Let \(b\) be the amerior focus of B . Draw PBr through the centre of B. Make \(\mathrm{A} b: \ell \mathrm{B}\) \(=\triangle \mathrm{B}: \mathrm{BK}\). Draw the perpendicular \(\mathrm{K} r\), mecting the refracted ray in \(r\). We know by the focal theorem, that red rays diverging from \(P\) will converge to \(r\); but the violet ray PV , heing more refracted, will cro's \(R r\) in fome point \(g\). Drawing the perpendicular f \(f\), we get \(f\) for the proper place of the field-glafs. Let the refracted ray \(R r\), produced backward, treet the ray OP coming from the centre of the object-ryars in O . Let the angle of dfperfion RPV lie called \(p\), and the angle of difperfion at V , that is, \(r \mathrm{~V} v\), be \(v\), and the angle \(\mathrm{V} r \mathrm{R}\) be \(r\).

It is evident that \(\mathrm{OR}: \mathrm{OP}=p: v\), becaufe the difperfions are proportional to the fines of the refractions, which, in this cafe, are very nearly as the refractions themfelves.
Let \(\frac{O P}{O H}\left(\right.\) or \(\frac{o p}{p B}\) or \(\left.\frac{p \mathrm{~B}}{b \mathrm{~B}}\right)\) be made \(=m\). Then \(v=\) \(m p ;\) alfo \(p: r=\mathrm{BK}: \mathrm{AB},=b \mathrm{~B}: \mathrm{A} b\), and \(r=p\). \(\frac{\mathrm{A} b}{\bar{b} \mathrm{~B}}\), or making \(\frac{\mathrm{A} b}{\mathrm{~B} b}=n, r=n \rho\); therefore \(v: r=m: n\), \(=\frac{p \mathrm{~B}}{b \mathrm{~B}}: \frac{\mathrm{A} b}{b \mathrm{~B}},=p \mathrm{~B}: \mathrm{A} b\).

The angle \(\mathrm{R} g \mathrm{~V}=g \mathrm{~V} r+g r \mathrm{~V}=p \cdot \overline{m+n}\); and \(\mathrm{R} g \mathrm{~V}: \mathrm{R} r v=\mathrm{R} r: \mathrm{R} g\), or \(n+n: n=\mathrm{R} r: \mathrm{R} g\), and \(\mathrm{R} g=\mathrm{R} r \frac{n}{m+n}\). But \(\mathrm{R} r\) is ultimately \(=\mathrm{BK}=\mathrm{AB}\) \(\frac{\ell \mathrm{B}}{\mathrm{Ab}}=\frac{\mathrm{AB}}{n}\). Thereforc \(\mathrm{R} g=\frac{\mathrm{AB}}{n} \times \frac{n}{m+n}=\frac{n}{m+n^{2}}\), and \(B f=\frac{A B}{m+n}\).

This valte of Bf is evidently \(=b \mathrm{~B} \times \frac{\mathrm{AB}}{p^{\mathrm{B}}+\mathrm{Ab}}\). Now \(b B\) being a conilant quantity while the gla is \(B\) is the fanc, the place of union varies with \(\frac{A B}{p 3+q b^{\prime}}\). If we remove \(B\) a little farther from \(A\), we increafe \(A B\), and \(\rho \mathrm{B}\), and \(\mathrm{A} b\), each by the fame quantity. This evidently diminithes \(\mathrm{B} f\). On the other liand, bringmg B nearer to A increales \(\mathrm{B} f\). If we keep the diftance between the glafles the fame, but increafe the focal diflance \(b \mathrm{~B}\), we augment \(\mathrm{B} f\), becaufe this change aug-

ments

\section*{T E L [ 268\(] \quad\) T E L}

Teiefrene. ments the numerator and diminifies the dencminator of the fraction \(\frac{b B \times A B}{p B+A b}\).

In this manner we can unite the colouss at what diflance we pleafe, and confequently can unite then in the place of the intended field-glafs, from which they will diverge with an increafed difpertion, viz. with the difpertion competent to the refraction produced there, and the difperfion \(p \times \overline{m+n}\) conjoined.

It only remains to determine the proper focal diftances of the field-glafs and eye-glafs, and the place of the eye-glafs, fo that this difperfion may be finally corrected.

This is an indeterminate problcm, admitting of an infinity of folutions. We fhall limit it by an equal divifron of the two remaining refractions, which are neeeffary in order to produce the intended magnifying power. Thiis confruction has the advantage of diminifling the aberration. Thus we know the two refractions, and the difperfion competent to each; it being nearly \(\frac{\pi}{E}\) th of the refraction. Call this \(q\). The whole difperfion at the field-glafs confilts of \(q\), and of the angle \(\mathrm{K} g \mathrm{~V}\) of fig. 19. which we alfo know to be \(=p \overline{x^{m+n}}\). Call their fum \(s\).
Fig. 27.
Let fig. 27. reprefent this addition to the eye-piece. \(\mathrm{C} g\) is the field-glafs coming in the place of \(f g\) of fig. 26. and \(R g w\) is the red ray coming from the glafs BR. Draw \(g s\) parallel to the intended emergent pencil from the eye-glafs; that is, making the angle Csg with the axis correfpond to the intended magnifying power. Bifect this angle by the line \(g \mathrm{~K}\). Make \(s g: g q=s: q\), and draw \(q \mathrm{~K}\), cutting \(\mathrm{C} g\) in \(t\). Draw is D , cutting \(\varepsilon k\) in \(\delta\), and the axis in D. Draw \(\delta d\) and \(\mathrm{D} r\) perpendicular to the axis. Then a lens placed in \(D\), having the focal ditance 1 ) \(d\), will deftroy the difperfion at the lens \(g c\), which refracts the ray \(g w\) into \(g r\).

Let \(g v\) be the violet ray, making the angle \(v g r=s\). It is plain, by the common optical theorem, that \(g r\) will be refracted into \(r r^{\prime}\) parallel to \(\partial \mathrm{D}\). Draw \(g \mathrm{D} r^{\prime}\) mecting \(r r^{\prime}\), and join \(v r^{\prime}\). By the focal theorem two red rays \(g r g v\), will be united in,\(v\). But the violet ray \(g v\) will be more refracted, and will take the path \(v v^{\prime}\), making the angle of difperfion \(r^{\prime} v v^{\prime}=q\), very nearly, becaufe the difperfion at \(v\) does not fenfibly differ from that at \(r\). Now, in the fmall angles of refraction which witain in optical infruments, the angles \(r r^{\prime} v, r g v\) are very nearly as \(g r\) and \(r r^{\prime}\), or as \(g \mathrm{D}\) and \(\mathrm{D} r^{\prime}\), or as CD and DT; which, by the focal theorem, are as \(\mathrm{C} d\) and \(d \mathrm{D}\); that is, \(\mathrm{D} d: d c=r g v: r r^{\prime} v\). But \(\mathrm{D} d: d \mathrm{C}\) \(=\) Dд: \(\dot{\partial} t=\{g: g q\), \(=s: q\). But \(r g v=s ;\) therefore \(r r^{\prime} v=q\), = \(r^{\prime} v v^{\prime}\), and \(v v^{\prime}\) is parallel to \(r r^{\prime}\), and the whole difiperion at \(g\) is corrected by the lens \(\mathrm{D} r\). The focal diftance \(\mathrm{C} \varepsilon\) of \(\mathrm{C} g\) is had by draning \(\mathrm{C} \approx\) parallel to I: \(g\), meeting \(\mathrm{li} g\) in \(x\), and drawing \(x<\) perperidicular to the axis.

It is cafy to fee that this (not inclegant) confruction is not limited to the equality of the refractions \(\mathrm{wg} r, \mathrm{~K} r r^{\prime}\). In whatever proportion the whole refraction wegs is divided, we always can tell the proportion of the difperfons which the two refractions uccafion at \(g\) and \(r\), and can thercfore find the values of \(s\) and \(q\). Indeed this folutiun includes the problem in p. 266. col. 2. par. ult.; but it had not ofcurred to us till the prefent occafion.

Our readers will not be difpleafed with this variety of Teleficpe. refource.

The intelligent reader will fee, that in this folution fome quantitics and ratios are aflumed as equal which are not flicitly fo, in the fame manner as in all the elementary opticsl theorems. The parallelifm, however, of \(v v^{\prime}\) and \(r r^{\prime}\) may be made accurate, by pufhing the lens D\() r\) nearer to \(\mathrm{C} g\), or retiring it from it. We may alfo, by pufting it flill nearer, induce a fmall divergency of the violet ray, fo as to produce accurate vifion in the eye, and may thus make the vifion through a telefoope more perfect than with the naked eye, where difperfion is by no means avoided. It would therefore be an improvement to have the eye-glafs in a fiding tube for adjufiment. Bring the telefope to diftinct vifion; and if any colour be vifible about the edges of the field, ftift the eye glafs till this colour is removed. The vifion may now become indiftinct : but this is corrected by fhifting the place of the whole eye-piece.

We have examined trigonometrically the progrefs of a red and a violet ray through many eye. Fieces of Dollond's and Ramfden's beft telefcopes; and we have found in all of them that the colours are united on or very near the field-glafs; fo that we prefume that a theory fomewhat analogous to ours has directed the ingenious inventors. We meet with many made by other artifts, and even fome of theirs, where a confiderable degree of colour remains, fometimes in the natural order and often in the contrary order. This muft happen in the hands of mere imitators, ignorant of principle. We prefume that we have now made this principle fufficiently plain.

Fig. 28. reprefents the eye-piece of a very fine fpy- Fig. 28. glafs by Mr Ramiden; the focal length of its objectglafs is \(8 \frac{1}{2}\) inches, with \(\mathrm{I}_{\mathrm{r}}^{\mathrm{r}}\) th th aperture, \(2^{\circ} 0 \mathrm{j}^{\prime}\) of vifible field, and 15.4 magnifying power. The diftances and focal leng ths are of their proper dimenfions, but the apertures are \(\frac{x}{8}\) larger, that the progrefs of a lateral pencil might be more diftinctly drawn. The dimenfions are as follow:
Foc. lengths \(\mathrm{Aa}=0.775 \mathrm{Bb}=1.025 \mathrm{C} c=1.01 \quad \mathrm{D} d=0.79\) Difances \(A B=1.18 \mathrm{BC}=1.83 \mathrm{CD}=1.105\).

It is peifectly achromatic, and the colours are united, not procifely'at the lens \(\mathrm{C}_{g}\), but about \(\frac{1}{50}\) th of an inch nearer the eye-glafs.

It is obvious that this combination of glafes may be ufed as a microfcope ; for if, inflead of the image formed by the object-glafs at FG, we fubflitute a fmall object, illuminated from behind, as in compound microfcopes; and if we draw the eye-piece a very fmall way from this object, the pencils of parallel rays emergent from the eye-glafs \(D\) will become convergent to very diftant points, and will there form an inverted and enlarged picture of the object, which may be viewed by a Huyghenian eye-piece ; and we may thus get high magnifying powers without ufing very deep glafies. We tried the eye-picce of which we have given the dimenfions in this way, and found that it might be made to magnify 180 times with very great difinctnefs. When ufed as the magnifier of a folar microfoope, it infinitely furpafles every thing we have ever feen. The pilure formed by a folar microfope is generally fo inditinet, that it is fit only for amufing ladies; but with this magnifier it feem-

\section*{T E L [ 260 ] T E L}
retercope. ed perfectly harp. We therefore recommend this to the artilts as a valuable article of their trade.

The only thing which remains to be confulered in the theory ol refracting telefcopes is the forms of the different lenfes. Hitherto we have had no occafion to confider any thing but their focal diflances; but their aberrations depend greatly on the adjultment of their forms to their fituations. When the conjugate focules of a lens are determined by the fervice which it is to perform, there is a certain form or proportion between the curvatures of their anterior and pollerior furfaces, which will make their aberrations the fmalleft polfible.

It is evident that this proportion is to be obtained by making the fluxion of the quantity within the parenthefis in the formula at the top of col. 2. p. 248. equal to rothing. When this is done, we obtain this formula for \(a\), the radius of curvature for the anterior furface of a lens. \(\frac{1}{a}=\frac{2 m^{2}+m}{2 m+4}+\frac{4 m+4}{2(m+4) r}\), where \(m\) is the ratio of the fine of incidence to the fine of refraction, and \(r\) is the diftance of the focus of incident rays, pofitive or negative, according as they converge or diverge, all meafured on a fcale of which the unit is \(n\), = hall of the radius of the equivalent ifcofeles lens.

It will be fufficiently exact for our purpofe to fuppofe \(n=\frac{3}{2}\), though it is more nearly \(\frac{31}{20}\). In this cafe \(\frac{1}{a}=\frac{b}{7}\) \(+\frac{10}{7 r},=\frac{42 r+70}{49^{r}}\). Therefore \(a=\frac{49 r}{42 r+70}\). And \(\frac{1}{b}\) \(=\frac{1}{a}-1,=\frac{1-a}{a}\).

As an example, let it be required to give the radii of curvature in inches for the eye-glafs be of page 262 . col. 1. par. 4. which we fhall fuppofe of \(1 \frac{1}{2}\) inches focal diftance, and that ec \((=r)\) is \(3 \frac{3}{4} t h\) inches.

The radius of curvature for the equivalent ifofceles lens is 1.5 , and its half is 0.75 . Therefore \(r=\frac{2 \frac{1}{3}}{0.75}\), \(=5 ;\) and our formula is \(a=\frac{49 \times 5}{42 \times 5+70},=\frac{245}{280},=\) c.875; and \(\frac{1}{b}=\frac{1-a}{a},=\frac{0.125}{0.875}\), and \(b=\frac{0.875}{0.125}\), \(=7\).

Thefe ralues arc parts of a fcale, of which the unit is 0.75 inches. Therefare
\[
\begin{aligned}
& a, \text { in inches, }=0.875 \times 0.75, \\
&=0.65525 \\
& b, \text { in inches, }=7 \times 0.75,
\end{aligned}=5.25 .
\]

And here we mult obferve that the pofterior furface is concave: for \(b\) is a pofitive quantity, becaule \(1-a\) is a politive quantity as well as \(a\); therefore the centre of Sphericity of both furfaces lies beyond the lens.

And this determination is not very different from the ufual practice, which commonly makes this lens a plane convex with its flat fide next the eye: and there will not be much difference in the performance of thefe two lenfes; "for in all cafes of maxima and minima, even a pretty confiderable change of the beft dimeafions does not make a fenfible change in the refult.

The fame confideration leads to a rule which is very
fimple, and fufíciently exact for ordinary fituations. Telefoppe. This is to make the curvatures fucl, that the incident and emergent pencils may be nearly equally inclined to the furfaces of the lens. 'Thus in the eye-pice with five glaffes, \(A\) and \(B\) thould be molt convex on their anterior fides; C fhould be molt convex on the pofterior fide; D Alould be nearly ifufceles; and E nearly planoconves.

But this is not fo ealy a matter as appears at firf fight. The lenfes of an eye-piece bave not only to bend the feveral pencils of light to and from the axis of the telefcope; they have allo to form irrages on the axes of thefe pencils. 'Thefe offices frequently require oppofite forms, as mentioned in par. 3. col. 2. p. 261. Thus the glafs A fig. 28. hould be molt convex on the fide Fig. \(2 \%^{\text {g }}\) next the object, that it may producc little diftortion of the pencils. But it fhould be mof convex nest the eye, that it may produce diftinet vifion of the image FG, which is very near it. This image flould have its concavity turned towards \(\Lambda\), whereas it is towards the object-glafs. We mutt therefore endeavour to made the vertical image \(f g\) flatter, or even convex. This requires a glafs very flat before and convex behind. For fimilar reafons the objcet-glafs of a microfcope and the fimple eye-glafs of an aftrononical telefcope flould be formed the fame way.

Ihis is a fubject of moft difficult difcuffion, and requires a theory which few of our readers would relifh; nor does our limits afford room for it. The artils, are obliged to grope their way. The proper method of experiment would be, to make eye-pieces of large dimenfions, with extravagant apertures to increafe the aberrations, and to provide for each ftation \(\mathrm{A}, \mathrm{B}, \mathrm{C}\), and I , a number of lenfes of the fame focal diftance, but of different forms: and we would advife making the trial in the way of a folar microfcope, and to have two eyepieces on trial at once. Their pictures can be formed on the fame fcreen, and accurately compared; whereas it is difficult to keep in remenbrance the performance of one eye-piece, and compare it with another.

We have now treated the theory of refracting tele. fcopes with confiderable minutenefs, and have perhaps exceeded the limits which fome readers may think reafonable. But we have long regretted that there is not any theory on this fubject from which a curious perfon can learn the improvements which have been made fince the time of Dr Smith, or an artift learn how ta proceed with intelligence in his profeffion. If we have accomplifhed either of thefe ends, we truft that the public will receive our labours with fatisfaction.

We cannot add any thing to what Dr Smith has delivered on the theory of refecting telefcopes. There appears to be the fame poffibility of correcting the aberration of the great feculum by the contrary aberration of a convex fmall fpeculum, that we have practifed in the compound object glafs of an achromatic refracting telefcope. But this cannot be, unlefs we make the radius of the convex fineculum exceedingly large, which deftroys the magnifying power and the brightnefs. This therefore mult be given up. Indeed their performance, when well cxecuted, does already furpafs all imagination. Dr Hesfchel has found great advantages. in what he calls the front view, not ufing a plane mirror to throw the pencils to one Gde, But this cannot

Telefoope be practifed in any but telefcopes fo large, that the iofs of light, occafioned by the interpofition of the oblerver's head, may be diliregarded.

Nothisc remains but to defcribe the mechanifm of fome of the moth convenient forms.

To defcribe all the varieties of thape and accommodation which may be given to a telelcope, would be a taft as tritling as prolix. 'The artilts of London and of Paris have racked their inventions to pleafe every fancy, and to fuit every purpofe. We flall content ourfelves with a few general maxims, deduced from the fcientific confideration of a telefcope, as an infrument by which the vifual angle fubtended by a dittant object is greatly magnified.

The chief confideration is to have a fteady view of the diftant object. 'This is unattainable, unlefs the axis of the inttrument be kept conftantly directed to the fame point of it : for when the telefcope is gently hifted from its pofition, the oljed feems to mowe in the fame or in the oppofite direction, according as the telefcope inverts the object or hows it ered. 'This is orring to the magnifying power, becaule the apparent angular motion is greater than what we naturally connect with the motion of the telefcope. This does not happen when we look through a tube without glafies.

All thaking of the inllrument therefore makes the object dance before the eye; and this is difagreeable, and inders us from leeing it diftinctly. But a tremulous motion, however fmall, is infintely more prejudicial to the performance of a telelcope, by making the object quiver before us. A perlon walking in the room prevents us from feeing diftindly; nay, the very pulfation in the body of the obferver, agitates the floor enough to produce this effec, when the telefcope has a great magnitying power: For the vifible motion of the object is then an imperceptible tremor, like that of an harpfichord wire, which produces an effect precilely fimilar to optical inditinctnefs; and every point of the object is diffufed over the whole fpace of the angular tremor, and appears coexittent in every part of this face, juft as a harpfichord wire does while it is founding. The more rapid this motion is, the indilinetnefs is the more complote. 'Therefore the more firm ard elaftic and well bound togetler the frame-work and apertures of our tel-fcope is, the mare lurtful will this confequence be. A mounting of lead, were it practicable, wonld be preferable to wood, irm, or brafs. This is one great caure of the indininctnefs of the very fineth reflecting telefcopes of the ufual conftructions, and can never be totally removed. In the Gicgorian form, it is hardly puffible to dimp the clatic remor of the fmall fpeculum, carried by an arm fupported at orie end only, even though the tube wese motionlefs. We were witnefies of a great improvement made on a four feet rellecling telefoope, by fupporting the fmall fpeculum by a ftrong plate of lead placed acrofs the tube, and led by an atjuning forew at each end. Put even the great mirror may vibrate enough to produce indillinctnefs. Refiacting tekfoots are fiee from this inconveniency, becaufe a finall angular motion of the ohicen-glafs round one of its own do: meters las ro Cerfible ffer on the image in its focus. 'l'liey areattecied only by an angular motion of the axis of the tele-fupe or of the eyc-gliffis s.

This fingle cunfuderation gives us great help towards
judging of the nerits of any particthar apparatus. We Telefoope. thould fludy it in this particular, and fee whether its form makes the tube readily lutceptible of iuch tremu. lous motions. If it does, the firmar it is and the more elaftic it is, the worfe. All forms therefore where the tube is fupported only near the middle, or where the whole imnediately or remotely depend on one narrow joint, are defective.

Reafoning in this way, we fay with confidence, that of all the forms of a telelcope apparatus, the old tathioned fimple ftand reprefented in fig: 29. is by far the beft, Fig. 29. and that others are fuperior accolding as the difpofition of the points of fupport of the tulae approaches to this. Let the pivots \(A, B\), be fixed in the lintel and fole of a window. Let the four braces terminate very near to thefe pivats. Lee the telefcope lie on the pin Ff, refting on the fhoulder round the eye piece, while the far end of it retts on one of the pins \(1,2,3, \& i c . ;\) and let the diftance of thefe pins from T very little exceed the iength of the teletcope. The trembling of the axis, even when confiderable, cannot affect the pofition of the tube, Lecaule the braces terminate almolt at the pivots: The tremor of the brace CD does as litile harm, becaufe it is nearly perpendicular to the tube. And if the ob\(\mathrm{j}=\mathcal{C}\) glafs were clofe at the upper fupporting pin, and the focus at the lower pin F , even the bending and trembling of the tube will have no effect on its optical axis. The inftrument is ouly fubjest to horizontal tremoss. "lhele may be almont annihilated by having a flender rod coming from a hook's joint in the fide of the window, and paffing through fuch another joint clofe by the pin F. Vire have feen an intrument of ihis form, having AB parallel to the earth's axis. The whole apparatus did not coft 50 fhillings, and we find it not in the leaff fenfible manner affected by a florm of wind. It was by obfervations with this inflimment that the tables of the motions of the Georgium Sidus, publithed in the Edinburgh 'Franfactions, wete conflructed, and they are as accurate as any that have yet appeared. This is an excellent equatorial.

But this apparatus is not portable, and it is fadly cleficient in elegance. 'lhe following is the bef method we have feen of combiniag thefe circumftances with the indifpenfable requifites of a good telefcope.

The pillar VX (fig. 30.) rifes from a finm fand, and Fig. 30 has a horizontal metion round a cone which completely fillsit. This motion is regulated by a rack-work in the box at \(V\). The ferew of this rack-work is turncd by means of the handle P , of a convenient length, and the forew may be difengaged by the click or detent \(V\), when we would turn the inttrument a great way at once. The telefcope las a sertical motion round the joint? placed near the middle of the tube. Tle lower end of the tube is fuppoated by the flay OT. This confitts of a tube liT, fallencd to the pillar by a joint \(T\), which allows the flay to move in a vertical plane. Writhin this tube flides another, with a fiff motion. This tul: is connected with the telefope by another joint \(\cap\), alfo admittings motion in a verticai plane. The fide \(M\) of this inner tube is formed into a reck. in which works a pinion fixed to the top of the tule lill. and turned by the tlat finger-piece li. 'The reader will readily fee the advantages and the remaining defects of this apparatus. It is very portable, becaufe the telefoope is cafily difengrged fiom it, and the legs and flay fold up. If the

\section*{T E L}

Telofence. joint \(Q\) were immediately under \(A\), it would be much freer from all tremor in the vertical plane. But nothing can hinder other tremors arifing from the long pillar and the three furingy legs. Thefe communicate all external agitations with great vigour. The infirument thould the fet on a Atone pedeltal, or, what is better, a cafk filled with wet fand. This pedeftal, which necelfity perllaps fuggefted to our fcientific navigators, is the belt that can be imagined.
Fig. \(3^{1}\). is the itand ufually given to reflceling telefcopes. 'The vertical tube FBG is fafened to the tube by finger ferews, which pals through the flits at \(E\) and G. 'i his arch turns round a joint in the head of the divided pillar, and has its edge cut into an oblique rack, which is acted on hy the horizontal fcrew, furnilhed with the finger-piece \(A\). This fcrew turns in a horizontal fquarc frame. This frame turns round a horizontal joint in the off-fide, which cannot be feet in this view. In the fide of this frame next the eye there is a finger-fcrew \(a\), which pafies through the frame, and prefles on the round horizontal plale D. By fcrewing down this finger-fcrew, the frame is brought up, and preffes the horizontal fcrew to the rack. Thus the elevation of the telefcope is fixed, and may be nicely changed by the finger applied to \(\Lambda\) and turning this fererv. The horizontal round plate D moves liffly sound on another plate of neanly equal diameter. This under plate has a deep conical hollow focket, which is nicely fitied by grinding to a folid cone formed on the top of the great upright pillar, and they may be firmly fixed in any pofftion by the finger-fcrew E. To the under plate is faltened a box \(c\), containing a horizontal firew C, which always works in a rack cut in the edge of the upper plate, and cannot be difengaged from it. When a great vertical or lorizontal motion is wanted, the fcrews \(a\) and \(E\) are flacked, and by tightening them the telefcope may be fised in any pofition, and then any finall muvements may be given it by thie finger plates A and C.

This fand is very fubject to brik tremor, either from external agitation of the pedeftal, or from the immediate action of the wind; and we have feldom feen diatinetly through telefcopss mounted in this manner, till one end of the tube was preffed againft fomething that was very fteady and unelaffic. It is quite aftonifhing what a change this produces. We took a very fine telefcope made by James Short, and laid the tube on a great lump of foft clay, preffing it firmly down into it. Several perfons, ignorant of our purpofe, looked through it, and read a table of logarithms at the diftance of 310 yards. We then put the telefcope on its fland, and pointed it at the fame object; none of the company could read at a greater diffance than 235 yards, although they could perceive no tremor. They thought the vifion as flarp as before; but the incontrovertible proof of the contrary was, that they could not read at fuch a ditance.

If the round piates were of much greater dimenfions; and if the lower one, inttead of being fixed to the pillar, were fupported on four fout pillars flanding on another plate; and if the vertical arch had a horizontal axis turning on two upright frames firmly fived to the upper plate-the inflrument would be much frcer from tremor. Suck flands were made formerly; but being much
more bulky and inconvenient for package, they have \(\underbrace{\text { Telci:ore }}\)
gone intodilufe. gone into difúc.

The high magnifying powers of Dr Herfchel's telefcopes made all the ufual apparatus for tixcir fupport extrenely imperfect. But his judgemont, and his ingenuity and fertility in refource, ait as cmincut as his phiilofophical ardour. He has contrived lor his reflecting tciefcopes flands which have ciciy property that can be defired. The tubes are all fupported at the two cids. I he motions, both vertical and horizontal, are contrived with the utmoft fimplicity and firmne!so We cannot more properly conclude this article than with a delcription of his 40 feet telefcope, the nobleft monument of philofophical zeal and of princely munificence that the world can boalt of.
Fig. 32. reprefents a view of this influment in a meridional fituation, as it appeats when feen from a convenient diftance by a perfon placed to the fouth-weft of it. The foundation in the ground confifts of two concentric circular brick walls, the outermof of which is 42 feet in diameter, and the infide one 21 feet. They are two feet fis inches deep under ground; two feet three incles broad at the botom, and one foot two inches at the top; and are capped with paving fones about three inches thick, and twelve and three quarters broad. The bottom frame of the whole apparatus refis upon thefe two walls by twenty concentric rollers III, and is moveable upon a pivot, which gives a horizontal motion to the uhole apparatus, as well as to the telcicope.

The tube of the telefcope, A, though very fimple in its form, which is cylindrical, was attended with great difficulties in the conthuction. This is not to be wondered at ; when its fize, and the materials of which it is made, are confidered. Its length is 39 feet four inches; it meafures four feet ten inches in diameter; and every part of it is of iron. Upon a moderate computation, the weight of a wooden tube mult have exceeded an iron one at leaf 3000 pounds; and its durability would have been far interior to that of iron. It is made of rolled or flueet iron, which has been-joined together without rivets, by a kind of feaming well known to thofe who make iron funnels for ftoves.

Very great mechanical kill is ufed in the contrivance of the apparatus by which the telefcope is fupported and directed. In order to command every altitude, the point of fupport is moveable; and its motion is effected by mechanifm, fo that the telefcope may be moved from its molt backward point ol fupport to the moll forward, and, by means of the fulleys GG fufpended from the great beam H , be fet to any altitude, up to the very zenith. The tube is alfo made to reft with the point of fupport in a pivat, which permits it to be turned fidewife.

The concave face of the great mirror is 48 inches of polified furface in diameter. The thicknefs, which is equal in every part of it, remains now about three inclies and a half; and its weight, when it came from the caft was 2118 pounds, of which it muft have loft a fmall quantity in polifhing. To put this fpeculum into the tube, it is fufpended vertically by a crane in the laboratory, and placed on a fruall narrow carriage, which is drawn out, rolling upon planks, till it comes near the back of the tube; here it is again

Plate DAXST.

\section*{T K L [ 272 ] T F. M}

Tell, fufpended and placed in the tube by a peculiar apparaTriler. tus.

The method of oblerving by this telefcope is by what Dr Herfchel calls the frome riezu; the obferver being placed in a feat C, fufrended at the end of it, with his back towards the object he views. There is no fmall fpeculum, but the magnifiers are applied immediately to the firf local image.

From the onening of the telefcope, near the place of the eye-glafe, a fpeaking pipe runs down to the bottom of the tube, where it goes into a turning joint; and after feveral other inflections, it at length divides into two branches, one going into the obfervatory D , and the other into the work room E. By means of the fpeaking pipe the communications of the obferver are conveyed to the affiftant in the obfervatory, and the workman is directed to perferm the required motions.

In the obfervatory is placed a valuable fidereal timepiece, made by Mr Shelion. Clofe to it, and of the fame height, is a polar diftance-piece, which has a dialplate of the fame dimenfions with the time-piece: this piece may be made to fhow polar diftance, zenith diftance, declination or altitude, by fetling it differently. The time and polar diftance pieces are placed fo that the affiftants fit before them at a table, with the feeak-ing-pipe rifing between them; and in tbis manner obfervations may be written down very conveniently.

This noble inftrument, with proper eye-glaffes, mag. sifies above 6000 times, and is the largent that has ever been made. Such of our readers as wifh for a fuller account of the machinery attached to it, viz. the flairs, ladders, and platorm B , may have recourfe to the fecond part of the Tranfactions of the Royal Society for 1795 ; in which, by means of 18 plates and 63 pages of letter-prefs, an ample detail is given of every circumRance relating to joiner's work, carpenter's work, and finith's work, which attended the formation and erection of this telefcope. It was cumpleted on Auguf the 28th 1789, and on the fame day was the fixth fatellite of Saiurn difcovered.
TELL, William, an illuntious Swifs patriot, chief inftrument of the revolution which delivered the Swifs cantons from the German yoke in 1307 . Grifler, the governor of thefe provinces for the emperor Albert, having ordered him, under pain of death, to floot at an apple placed on the head of one of his children; he had the dezterity, though the diftance was very confiderable, to flrike it off without hitting the child. The tyrant, perceiving he had another arrow concealed under his cluak, alked him for what purpofe? To which he boldly replied, "To have fhot you through the heart, if I had had the misfortune to kill my fon." The enraged governor now ordered him to be hanged; but his fel-low-citizens, animated by his fortitude and patriotifm, flew to arms; attacked and variquihed Grifler, who was flot to death by Tell ; and the affociation for the independency took place that inflant.
Teli.-Tafe, a name fometimes given to the PerpetualLog. See that article.

TETLLER, an officer of the exchequer, in ancient records called tallic.. There are four of thefe officens, whofe duty is to receive all fums due to the king, and to give the clerk of the pells a bill to charge him therewith. They likewife pay all money due from the bing, by warrant from the auditor of the receipt; and male
weekly and yearly books both of their receipts and pas. ments, which they deliver to the lord treafurer.

TELLLINA, a genus of flell-fifl. See Coxcrio. logy Index.

TEMISSA, a large town in Africa, about 120 miles north-eaft of Mourzouk, the capital of Fezzan. Here the caravan of pilgrims from Bornou and Nigritia, which takes its departure from Mourzouk, and travels by the way of Cairo to Mecca, ufually provides the flores of corn and dates, and dried meat, that are requifite for its dreary paffage.

TEMPE, in Ancient Geograpliy, a moft pleafant place or valley of Theflialy. That it was there, appears from the epithets Thefjailica (Livy), Thiffala (Ovid); but in what particular diftrict is the queflion. From the Phthiotica of Catullus, it ftould leem to be of Phthiotis: but che Peneus, which ran through Tempe, was at too great a diflance, being feparated from it by Mount Othrys and others. Fift, however, we fhall define Tempe, previous to the determining the particular diftrict in which it lay. The Peneus, according to Pliny, reinning down between Offa to the fouth and Olympus to the north for 500 ftadia, is for half that fpace navigable : in the direction of this courfe lies what is called Tempe, extending in length for five miles, in breadth for about an acre and a half, with gentle convexities rifing on the right and left hand. Within glides the pure ftream of the Peneus, charming in the grafs on its banks, and harmonioufly vocal with the mufic of birds. In this defcription Strabo and Elian agree; the laft adding, that it has an agreeable variety of places of retreat; and that it is not the work of man's hand, but the fpontaneous production of nature; and Strabo fays, that formerly the Peneus formed a lake in this fpot, being checked in its courfe by the higher grounds about the fea; but that an opening being made by an earthquake, and Mount Ofla torn from Olympus, the Peneus gained a free, courfe between them. But Livy, who calls 'Tempe a grove, remarks a degree of horror rather than amenity, with which the Roman army was ftruck on marching over the narrow pafs; for, befides the defile, difficult to go over, which runs on for five miles, there are fteep rocks on each hand, down which the profpect is apt to caule a dizzinefs, heightened by the noife and depth of the interfluent Peneus. Hence it appears that Tempe was in the Pelafgiotis, whofe extremity was formerly the Peneus, but afterwards, as is probable, allotted to Maynefia; and thus Pliny places the mouth of the Peneus not in Theflaly itfelf, but in the Magnefia of Theffaly.
TEmpeh, in a inechanical fenfe. See Templring.
Temper, in a moral fenfe, the difpofition of mind, whether natural or acquired. The woid is feldom u'ed by good writers without an cpithet, as a good or bard temper ; though one of the moft beautiful poems in the language is entitled The Triumphis of Temper.
It is well obleened ly an elegant :ffyyift, that more conflant uneafinels ariles from ill tenper than from ill fortune; as a bad temper embitters every fweet, and converts a parad: Ce into a place of torment. For fubduing the heart to foftnefs, and preferving a due balance of the parfionc, a proner culture of the undertanding and of the tafte is the beft method. He who employs

\section*{T E M \(\left[\begin{array}{lll}273\end{array}\right] \quad\) T E MI}

Tomper, his time in the fludies of clegant literature, or the fine lempera- arts, has almolt always a good temper ; whill the man ment. ment. who is abforbed in the purluits of profound fcience is apt
to acquire a feverity of difpofition, little lefs difagreeable, though generally much lefs pcrnicious, than the capricioulnefs of the idler. Mufic, painting, and poetry, teach the mind to felect the agreeable parts of thofe objeets which furround us, and by halituating it to a pure and permanent delight, gradualiy fupesinduce an habitual good humour. It is of infinite importance to happinefs to accultom the mind, from infancy, to turn from deformed and painful fcenes, and to contemplate whatever can be found of moral and natural beauty.

So much of the happinefs of private life depends on the government of the temper, that the temper ought to be a principal object of regard in a well-condu¢ted education. The fuffering of children to tyramnize without controul over fervants and inferiors, is the ruin of many an amiable difpofition. The virtues of humanity, benevolence, humility, cannot be too early enforced; at the fame time, care thould be taken that an infant of two or three years old fhould never be beaten or fpolien to harfhly for any offence which it can pullibly commit.

TEMPERAMENT, among phyficians, the fame with conftitution, or a certain difpolition of the folids and fluids of the human body, by which it may be properly denominated frong, weak, lax, \&c.

In every perfon there are appearances of a temperament peculiar to himfelf, though the ancients only took notice of four, and fome have imagined thele were deduced from the theories of the four humours or four cardinal qualities; but it is more probable that they were firf founded on obfervation, and afterwards adapted to thofe theories, fince we find that they have a real exiltence, and are capable of receiving an explanation. The two that are moft diftincty marked are the fanguineous and melancholic, viz. the temperaments of youth and age.
1. Sanguineous. Here there is laxity of folids, difcoverable by the foftnefs of hair and fucculency; large fyttem of arteries, redundaney of fluids, florid complexion; fenfibility of the nervous power, efpecially to plealing ohjects; irritability from the plethora; mobility and levity from lax folids. Thefe characters are diftinctly marked, and ase proved by the difeafes incident to this age, as hemorrbagies, fevers, \&c. but thefe, as they proceed from a lax fyttem, are more eafly cured.
2. Melancholic Habit. Here greater rigidity of folids occurs, difcoverable by the hardnefs and crifpature of the hair; fimall proportion of the fluids, hence drynefs and leannefs; fmall arteries, hence pale colour; venous plethora, hence turgefcency of thefe, and lividity ; fenfibility, frequently exquifite ; moderate irritability, with remarkable tenacity of impreflions; feadinefs in action and flownefs of motion, with great frength; for excefs of this conflitution in maniacs gives the moft extraordinary infance of human frength we know. This temperament is moft diftinctly marked in

Vot. XX. Part 1.
old age, and in males. The fanguincous temperament Timpesaof youth makes us not diflinguifi the melancholic till ment. the decline of life, when it is very evident, from difsales of the veins, hamorrhoids, apoplexy, cachexy, ob. Ilructions of the vifcera, particularly of the liver, dropfies, affections of the alimentary canal, chiefly from weaker influence of the nervous power. So much for the fanguineous and melancholic temperaments; the other two are not fo eafily explained. The choleric temperament takes place between youth and manhood. In the
3. Choleric, the diftribution of the fluids is more exactly balanced; there is lefs fenfibility, and lefs obefity, with more inritability, proceeding from greater tenfion, lefs mobility and levity, and more fleadinefs in the Arength of the nervous power. As to the
4. Phlegmatic. This temperament cannot be diftinguifhed ly any characters of age or fex. It agrees with the fanguineous in laxity and fueculency. It differs from that temperament, and the melancholic, by the more exact diflribution of the fluids. Again, it differs from the fanguineous, by having lefs fenfibility; irritability, mobility, and perhaps Arength, though fometimes indeed this laft is found to be great.

Thefe are the ancient temperaments. The temperaments, indeed, ate much more various; and very far from being eafily marked and reduced to their genera and fpecies, from the great variety which is oblervable in the contlitutions of dificrent men.

TEMPERAMENT of the Mufical Scale, is that modi-Defumiom fication of the founds of a mufical inftrument, by which the fe founds may be made to ferve for different degrees of different fcales. See Music, Chap. VII.

Temperament, though intimately conneeted with mufic, is not, properly feaking, a part of that fcience. The objects of mufic, as a fcience, are, to afcertain the laws of mufical found, as depending on the powers of the human voice. The purpofe of temperament is, to regulate, in a way leaft adverfe to thefe laws, a certain departure from them, rendered necellary by the imper fections of inftruments.

Although the temperament of the fcale of inftruments be practically familiar, the true principles on which it depends have been much difputed. Various opinions have been hazarded, and fyftems propofed. We offer an abridged view of that which appears to us to merit a preference ( 1 ).

Before confideration of the tempered fcale, a fhort Nature of review of the nature of the true feale is neceffary. the tine

From the conformation of the vocal organs, all na- fale. tions, in finging, make ufe of the fame intcetions of Notes, and voice. Thefe infleetions, called notes, are faid to be their piech. grave or actute, in proportion to the degree of hoarfenefs or Chrilinefs with which they are fung. The fate of voice with refpect to gravity or acutenels with which any one note is fung, is termed its pitch.

Two notes having the fame pitch are termed umifons, Uninms i=d or are faid to be in unifon to one another. The differ-intervals. ence of pitch between any note and another is denomisated an imerzal.

M m In
(A) Among? the very numerous authors on the fubject of temperament, we have felected, for our chicf gaides, the late Dr Robert Smith of Cambridge, and Profefior John Robiton of Edinburgh,

Temperament.
5-
Key note or fundamental.

6
Natural fcale and its degrees.
or from the disection of recently hearing it, feleds a particular note, from the previous imprefion of which the voice naturally forms other notes, at certain thougin uncqual intervals. The note, thus relected, is termed the key note or fundamental. When chofer, it infantly allumes a particular and predominant character. The ear involuntarily refers to it the intonation of all other notes, readily recurs to it during performance, and is diflatisfied unlefs the voice clofe upon it.

Where the finger has affumed a key note, and, after finging that note, fings the nute nearell in acutenefs to it without forcing the voice, and fo on, the ferics of notes, thus naturally formed, conftitutes what is called the natural fale. The notes of it are termed its degrees; thus the key note is the fifl degree of the fcale; the nalural note next in acutenels to \(i t\), is named the fecond degree, or fecond of the foale, and fo on.

Two untaught men, attempting to fing the fame fale together, always fing in unifon. But a man and a woman, making the fame attempt, ing naturally in fuch a difference of pitch, although they proceed by the fame intervals, that the eighth note only of the male voice afcending, is in unifon with the key note of the female voice. Were the male voice to afcend to a ninth note, it would be in unifon with the fecond of the female vaice; the tenth note of the former would be in unifon with the third of the latter, and fo on.

We have thus two fcales in fucceffion, perfectly fimilar in the relation of the degrees of each to their refpective key notes; but differing in pitch by the interval between thefe key notes.

This interval, comprebending feven fmaller intervals and eight degrees, is, from this laft circumftance, called an offave: and this term is alfo applied, fomewhat inaccurately, to the feries of the eight degrees. Thus we fay, that the ocfave formed by the female voice is an oflave aculer than that which is produced by the male voice; meaning, that the eight degrees fung by the
woman are acuter by the interval of an oftave, dian Tompera thole fung by the man.

Not only are the natural octaves of the male and female voice exabty fimilar ; but the fame limilarity is All octavi found in the extremes of the human voice, and, beyond are fimila them, as far as mufical founds can be produced. Many men can fing the fecund octave below, and mont women the fecond octave above, a given key note common to both woices. Yet the gravelt octave of fuch a male voice, and the acuteft octave of fuch a female voice, are equally fimilar in their relations (although they differ in pitch by an interval of two vetaves), as the two central octaves are.

All the different natural inflections of the human All mufic voice are thus contained in one octave, firce all other cortained oftaves are only repetitions of the fame intiections in a graver or acuter pitch.
The oftave, then, confifts of eight degrees and feven natural intervals. Two of thefe intervals, thofe between the third and fourth, and the feventh and eighth degrees, are fenfibly lefs different in eitch than the others. And confifts o: although we have no direct meafures of the pitch eight defounds, we term thefe fmaller intervals femitonc, and feven int the others tonic intervals, prefuming the latter to be vals. equal to each other, and a femitonic interval to be equal to the half of a tonic one.

The degrees of the natural fcale are, by Britifh mufi-Reprefen cians, diftinguifned by the firft feven letters of the al. tation of phabet. The letter C, for fome reafon lefs important the fale than difficult to explain, has been appropriated to the note moft eafly affumed as a key note by both the male and female voice; the fecond of the fcale is termed D, the third E , and fo on. As the human voice, and confequently moft mufical compofitions, comprehend four octaves, we reprefent the ordinary octave of the male voice by Roman capitals, and that of the female voice by Roman minulcular letters. The graveft male octave is dillinguifued by Italic capitals, and the acuteft female octave by minufcular Italics. The whole natural fale may therelote be exbibited chus:
\[
\begin{array}{cc}
\begin{array}{c}
\text { Graveft } \\
\text { Male Octave. }
\end{array} & \begin{array}{c}
\text { Ordinary } \\
\text { Male Octave. }
\end{array}
\end{array} \begin{gathered}
\text { Onale Octave. }
\end{gathered} \begin{gathered}
\text { Acuteft } \\
\text { Female Ociave. }
\end{gathered},
\]
- In this exbibition. the juxtapofition of the thirds and fourthe, and of the Cevenths and eighths or replicates of the firt degree, indicates the femitonic intervals; and the afterifks reprefent the tonic intervals of the natural fcale, or the artificial intercalary founds, which, as we fhall prefently fee, it becomes neceffary to fubftitute in thofe intervals.

Were all voices of the fame compals, and were mufical feclings falisfied with the natural foale, we might reft here. Beirg furnimed with a key note adapted to all voices, andoxith infruments accurately tuned to that key note, it would be unneccflary to examine whether any other note of the natural fcale could be affumed as the key note of a different \(f\) cale, and if it could, whether any agreeable effect refulted from the difcovery.

But the ufe of different fcales, the key notes of which are derived from the different degrees of the natual fcales, has been found not only to be one of the chief
fources of the pleafure imparted by mufical perform. ances, but to be indifpenfably neceflary, from the phyfical inequality of roices.

The central 'c' of the fcale, called in mufic the tenor C, can be produced by every fpecies of voice. The gravell male voices, termed bafs, can form this note, hut very few notes above it. The treble, or acuter f.male voice alfo produces it, but feldom delcends farther. The acutcr male voices, called tenor, have this ' \(c\) ' fcarcely above the middle of their compafs, and it is not much below the middle of that of the countertenor or gravell female voices. Nus it is obvious that an air in the natural fcale, which thould rife above ' \(c\) ', and fall below it in the fame proportions, might be fung by the tenor or counter-tenor voice, but would be tuo acute fur the bafs voice, and too grave for the treble. Either of thefe voices, in order to execute the fame air, mult aflume a different key note from ' \(c\) '; and as all
rempera- the degrees of the fcale are regulated by the key note, ment. the air mult of courfe be executed in a fcale different from that of ' \(c\) '.

Again, fuppufe a finger who can fisig a given air on\(1 y\) in the feale of \(B\), to be accompanied by an inftrument tuned in the fale of ' \(c\) '. Should the lyrift begin on his own key note, he is a femitone above the key note of the finger; and flould he begin on the note which is in unifon with the finger's key note, the next degree is wrong, being but a femitonic interval by the inftrument, and a tonic interval by the voice. In flort, all the degrees but one will be found wrong. This is an evident confequence of the inequality of the famitonic to the tonic intervals; and if the tonic intervals, which we prefume to be equal, be not exackly fo, the difcordance will be fill greater.

The remedy for this is apparently obvious. If the femitonic intervals are each equal to half of any of the tonic intervals, we need only to interpofe other founds between each two of the dejrees which form the tonic intervals; and then, in place of eight degrees and feven unequal intervals, we fhall have twelve degrees and twelve equal intervals, each of them equal to a femitone. An inftrument thus furnithed, appears to be adapted to any voice, and to refemble the modern harpfichord or organ, which have twelve feemingly equal intervals in the octave. Such were the practical refources of the Greek muficians, fanctioned by the approbation of Arifloxenus, and of all thofe who were fatisfied with the decilion of the ear alone.

But philofophers and mathematicians afcertained the exiftence of a certain connexion between mufical intervals and mathematical proportions, and gradually opened the way to the difcovery that the relations of the mulical fcale, as naturally formed by the human voice, depend on principles equally plain and certain with the fimpleft geometrical propofitions.

Pythagoras is faid to have difcovered, that if two mufical chords be in equal tenfion, and if one of them be half the length of the other, the fhort one will found an octave above the long one; if one third florter, it will produce the fifth : if one fourth thorter, it will give the fourth. Thus the relation of the key to its oftave was difcovered to correfpond to the ratio of \(2: 1\); that of the key to its fifth to be in the ratio of \(3: 2\); and that of the key to its fourth to be in the ratio of \(4: 3\). For intance, if a chord of a given fize and tenfion, and 12 inches long, produce ' \(c\) ', another of the fame fize and tenfion, but only fix inches long, will give the octave \(c\); one eight inches long will found the fifth ' \(g\) '; and one nine inches long will produce the fourth ' \(f\) '. Now as the fring of eight inches giving the fifth, and that of fix inches producing the octave, are in the ratio of \(4: 3\), which is that of the fourth; it follows, that the interval between the fifth and oftave is a fourth: and as the chord of nine inches producing the fourth, and the oftave of fix inches, are in the ratio of \(3: 2\), the interval between the fourth and octave mult be a fifth. Thus the octave ' \(c\) ' \(c\), is divided into a fifth ' \(c g\) ', and a fourth ' \(g\) ' \(c\), or into a fourth ' \(c f\) ', and a fifth ' \(f\) ' \(c\), both
in fucceffion. The two fourths 'c \(f\) ', and ' \(g\) ' \(c\), leave an Temperainterval 'f \(g\) ', correfponding, as we have feen, to the ratio \(\underbrace{\text { ment. }}\) of \(9: 8\).

We have thus the ratios of the octave, of the fifth, and Ratio of of the fourth; and it does not appear that the ancient the najur theorits proceeded farther. They feem to have pre-third niferted the harmony of fourthes and fifths to that of thirds nor thard, and tixtlis, fo effential in moderin harmony. By pur-tone. fuing the fyllem of the mathematical ratios, we find that \(5: 4\) gives the major third 'ce'. And the fifth ' \(g\) ' being already deternined by the ratio \(3: 2\), we afcertain the ratio of the minor third 'e \(g\) ' to be \(6: 5\), which is the difference between \(3: 2\) and \(5: 4\). In the fame way, the ratio of the third ' \(e\) ' being \(5: 4\), and that of the fourth ' \(f\) ' being \(4: 3\), we afcertain the ratio of the femitone 'ef' to be \(16: 15\), or \(4: 3-5: 4\).

A note in the ratio of \(5: 4\), or that of a major third Ratio of to 'f', gives ' \(a\) ', the major lixth of the natural feale, fixth and and a note in the fame ratio of \(5: 4\) to ' \(g\) ' produces ' \(b\) ', major fethe major feventh of that fcale. 'The ratio of 'ga' will vemh. thus be \(10: 9\), and that of 'a b' \(9: 8\), the fame with that of 'f \(g\) '; and that of 'b'c will thus be \(16: 15\) like 'e f'. \({ }^{19}\)

We have in this way the mathematical ratios of all Ratio of the degrees of the natural fcalc except that of the fe-fecond. cond ' d '. Confidering however, the fecond to be a perfect fourth graver than the fifth, and having afcertained the fifth ' \(g\) ' to be a perfect fourtli below \(c\), as 2 : i is to \(3: 2\); fo \(3: 2\) gives \(9: 8\), which we take for the ratio of the fecond.

Thus have been formed two diftinet fyftems of into. Aritionenation of the natural foale; that of mean tones and fe nean and mitones founded on the rules of Arloxenur and the Prthagopractice of ancient artifts, and that of the ratios, dedu-ftems. ced from the dilcoveries of Pythagoras, and the calculations of mathematicians.

The difference between the Arifoxenean fyftem of Circular remean tones and femitones, and the Pythagorean fyftem prefentaof mathematical ratios, will beft appear from the fol-icale. lowing conftruction. Let the circumference of a circle (fig. I.) be divided by dotted lines (according to the principles of Arifoxenus) into five larger and equal intervals, and two fmaller intervals alfo equal. Let it alfo be divided by full lines into portions determined by means of the mufical ratios. Thus let the arches CD , FG, and \(A B\) be proportional to the logarithm of \(9: 8\), GA and DE to thofe of \(10: 9\), and EF and BC to thofe of \(16: 15(\mathrm{~B})\). Let us divide another circle in the fame manner ; but inftead of having its points of divifion marked C.D, \&c. let them be marked 'key" \(2 \mathrm{~d}, 3^{\mathrm{d}}, 4\) th, 5 th, 6th, 7 th. This circle, which may be defcribed on a piece of card, is to be placed on the other, and is to move round their common centre.

In whatever point of the outer circle the point ' \(\mathrm{key}^{\text {, Infufficien }}\) of the inner one be placed, it is obvious that the other \({ }^{c y}\) of the points of the outer circle will fhew what degrees of it, fcale for by correfponding with the other points \(2 \mathrm{~d}, 3 \mathrm{~d}, \& \mathrm{c}\). of compofition the inner circle, will ferve for degrees of the fcale de- in difiterent termined by the point "key.' By this we fee clearly fcales. the infufficiency of the degrees of the natural fcale, for the performance of compoficions in different fcales, and M m 2 the

Femfara- the inefficacy of the Arituxencan remedy of incan ment.

23
Galitcu's difoovery of serial cudulation tones.

But although the errors of the Arilloveneans were demonltrated by the certainty of the ratios, and although the dependence of munal intervals on the latter be faid to have been known fince the days of Pythagoras, the nature of that relation remained unknown for ages. Galiteo difsorered that the ratios exprefs the frequency of the aërial undulation, by which the feveral founds are generated. He demonitrated that the vibrations of two chords, of the fame matter and thicknefs, and of equal tenfion, will be in the ratio of their lengths, and that the number of ofcillations made in a given time will be inverfely as their lengths. The frequency of the fonorous undulations of the air is therefore inverfely as the length of the ftring. Thus 2: I being the ratio of the oftave, the undulations which produce the acuter found are twice as frequent as thofe which generate the graver. The ratio of the fifth, \(3: 2\), indicates that in the fame time that the ear receives three undulations from the upper found, it receives only two from the lower. This is not peculiar to founds produced by the vibration of Atrings: thofe produced from the vibration of bells, and from the undulation of the air in pipes, are

24
Pitch of found determined by aërial undula. ¿:ons.

25 regulated by the fame law.

Thus, it is demonfrated that the pitch of mufical found is determined by the undulations of the air ; and that a certain frequency of undulations produces a certain and unalterable mufical note. It has been found that any noife whatever, if repeated 240 times in a fecond, at equal intervals, produces the tenor ' \(c\) '; if 360 times, the ' \(g\) ', or fifth above. It had been imagined that mufical found was only to be produced by thofe regular undulations, which are occafioned by the vibrations of claftic bodies. We are affured that the fame effect will be produced by any noife, if repeated not lefs than 30 or 40 times in a fecond; and that the experiment has been tried with a quill fnapping againt the teeth of a whecl.

By Galileo's difcovery, the principles on which the jun intonation of the natural fcale depends, are fhown to be certain and plain. To proceed in our fearch of an exact meafure of temperament of this perfect intonation, we mull confider the nature and effects of confonant and diffonant chords.

A chord is a combination of two or more fimultaneous mufical founds. If the coalefcence be fo complete that the compound founds cannot be diftinguilhed, the chord is faid to be confonant; if the feparate founds are dillinctly heard, the chord is termed diffonant.

All confonances are pleafing, although fome are more fo than others. All diffonances are unfatisfactory, and fome are very harlh.

In confonances, no inequality of found is perceptible.
let one of the pipes be only 23 inches and feven-tenths Tempers.* long, it will give 243 vibrations in a fecond. There e ment. fore the 1 ft , the 8 oth, the 160 th, and the 240 th vibration of the longer pipe, will coincide with the 1 It, the 81it, the 162 d , and the 243 d of the thorter. In the inflant of coincidence, the aerial agitation produced by the one vibration is reinforced by that produced by the other. The deviations from coincidence gradually increafe till the 40 th vibration of the longer pipe, which will commence in the middle of the 41 ft vibration of the fhorter one. The vibrations here bilecting cach other, the aerial agitations of both will be weakened. The compounded found will confequently be ftronger at the coincidences and weaker at the bifections of the vibrations. The increafe of Arength, which is termed the beat, will recur thrice in every fecond. Thus the vibrations are in the ratio of \(80: 81\), or of a comma; and the compounded found now fuppofed is an unifon imperfed by a comma.

If a third pipe, tuned a perfect fifth to the longer of the two former, be founded at the fame time with the fhorter, the diffonance will beat nine times in a fecond; and is thus fhown to be a fifth imperfect by a comma.

The perfection or imperfection of any confonance may thus be afcertained with equal facility and precifion: and by this method, any perfeet confonance may be altered to any acquired ftate of temperament.

The theory of beats is therefore valuable, as giving Beats af. \({ }^{27}\) us the management of a phenomenon intimately con-ford an ex. nected with perfect harmony, as affording us precife and act meapracticable meafures of all deviations from it, and as fure of ten thus forming the bafis of the mon accurate fyftem of \({ }^{\text {perament. }}\) temperament.

For the preparatory procefs of determining the exact degrces of the fcale, let us attend to the following ingenious and amufing experiment.

Let two harpfichord wires be exactly tuned in unifon Fundamer at the pitch of the tenor ' \(c\),' to be asted on fimultane-tal experioufly by a wheel rubbed with rofin, like that of a vielle. ment.
Let a fcale of 240 equal parts be defcribed under one of the Atrings, equal in length to the founding part of it, and numbered from the end at which the wheel is applied. Let a moveable bridge be placed under this flring, but fo as not to alter the tenfion of it in the leaf.

The two open ftrings being in perfect unifon, with. out any beating whatever, let the moveable bridge be advanced flowly from the nut, while the wheel is applied to both ftrings. All kinds of chords, confonant and diffonant, will of courfe be fucceffively heard. Between the confonances there will be a beating, which will increafe as we approach the confonance, ceafe on our reaching it, appcar again as we leave it, diminifh as we recede from it, and again increafe as we approach to the fucceeding confonance.

After this general view, let us more particularly examine the feveral degrees of the fcale.

On placing the moveable bridge at 120 , we fhall Determin hear a perfcet octave, without any beating. If the di- tion of th vifion be not quite exact, there will be a little beating ; octave. but by thifting the bridge very gently to either fide, the increafe or diminution of the beating will guide us to the true place, where it will entirely ceafe.

32
On placing the bridge at 160 , the perfect concord of tion of th
empera- the key and fifth will be heard. Any alteration of ment. the hridge to either fide will produce a difagreeable \(\xrightarrow{ }\) termina-terminafect rth. \(3^{2}\) terminan of the ijor third. beating.

A rapid flutter in the vicinity of 180 will ceale at that point, and give place to the confonance of the key and fourth.

On approaching 192, an angry wafpih beating is fucceeded at that point by the animating concord of the key and major third.
As we leave 192, the beating affumes a melancholy character, and ceafes at 200 , the place of the plaintive confonance of the key and minor third.
Between that point and the nut, we have unly a fucceffion of difcords. As we were at a lofs to afcertain the mathematical ratio of the fecond of the fcale (art. 19), fo we have fome difficulty in determining its juit place by the theory of beats, and the experiment under confideration. We arc uncertain whether we fhall fix it at a minor tone, or at a major tone above the key. Buth form a harfh diffonance with the key. The major tone, however, is thought lefs difagreeable : it admits of five more concords in the oftave than the minor; and the ratio of it \(9: 8\), is that fuggefted by the fimilarity of its interval with the fifth, to the interval of the fifth and octave (art. 19), On thefe accounts we prefer it; and its place in the divifion under our precife confideration is \(213 \frac{7}{2}\).

Let the bridge now be placed near, and flowly moved to 150 : the beatings fubfide into a confonance, lightly pleafing, that of the key and minor fixth.

At 144, we have the agreeable concord of the key and major fixth. From 144 to 120 we hear nothing but difcord.

In this interval, however, we bave to find the place of the fenfible note or major feventh. The ear informs us, that the interval between the major feventh and the oftave, muft be fimilar to that between the major third and the fourth. Applying to the former interval the ratio of the latter, that of \(16: 15\), we place the moveable bridge at 128 ; for as 15 is to 16 , fo 120 gives 128. We alfo feel, that the interval between the fifth and major feventh is exactly fimilar to that between the key and major third, of which the ratio is \(5: 4\). Now, applying the fame ratio to 160 , the place of the fifth,
we find \(5: 4:: 160: 128\). We thus determine 128 Tempertto be the place of the major feventh of the fale.
'Ihe interval or difference between the minor tone 10: 9 , and the major tone \(9: 8\), is \(81: 80\), termed Ratios of comma. This interval is not employed in practical mu-fimpte inm fic, but mult be dillinetly underitood by theorilts, and tervals. particularly in treating of temperament.

There are therefore four defcriptions of fimple intervals; that is, intervals which do not include more than a major tone. Thefe are, comma, of which the ratio is \(81: 80\); hemitone, or \(16: 15\); minor tone, or 10: 9 ; and major tone, or \(9: 8\) (c).

We have now to confider how far the perfect intona- Temperation of the natural fcale mult be departed from in keyed ment necef. inftruments, fuch as the organ and harpfichord; fo that fary in the fame found may ferve for different degiees of differ-ftruments. ent fcales.

Thefe inftruments have twelve founds in every octave; that is, they have the eight natural degrees and four intercalary founds, viz, between C and \(\mathrm{D}, \mathrm{D}\) and \(E, F\) and \(G, G\) and \(A\), and \(A\) and \(B\).

The purpofe of thefe intercalary founds is, that an air may be performed in any pitch; that is, that any found may be taken for a key note, and that other founds may be found to form the fcale of that key note, at intervals correfponding to thofe of the natural fcale.

Thus, if inftead of C , the key note of the natural fcale, we take \(B\) for the key note required; \(A\), which is the feventh to \(B\), will by no means anfwer for the feventh of the affumed fcale; for the interval between A and B is a major tone, of which the ratio is \(9: 8\), whereas the interval between the feventh of the fcale and the octave, can orly be a hemitone, the ratio of which is \(16: 15\). We mut therefore employ the intercalary found between \(A\) and \(B\), which in this employment we call \(\mathbf{A}\), or A Marp. But we fhall prefently fee that we cannot tune even this found in the ratio of 16 : I 5 with B. For, let us take F for the key note of another fcale, we find that B will not ferve for the fourth of that fcale, being a major tone above A the third; whereas the fourth of the fcale is only a hemitone above the third. We muft therefore have recourfe to our intercalary found between \(A\) and \(B\), which
(c) The logarithmic meafures of thefe intervals, and of the compound intervals determined in the way which we: have defcribed, are

The oftave being thus divided into 3010 equal parts, a circle of which the circumference is divided into 30 : degrees, and a concentric moveable circle having a nonius fubdividing each into ten parts, will form a convenien: inftrument for examining all temperaments of the fcale.

\section*{T E M}

Tempera- which we muft here call BD , or B flat, and which ment. ought in this ftate to be tuared a hemitone above \(A\), or in the ratio of \(16: 15\) with that note. Now, this intercalary found cannot be both in the ratio of \(16: 15\) with \(A\), and in the fame ratio of \(16: 15\) with B . This would extend the whole interval between \(A\) and \(B\), to the ratio of about \(8: 7\); whereas it thould only be in that of \(9: 8\). We muft therelore tune the intercalary found in fuch a diminifhed relation to A and to B , that it may ferve either for A or Bb .

But, even independent of thefe intercalary notes, fome temperament of the natural fale is neceifary.

Let the four fifths, ' \(\mathrm{c} g\) ', ' \(g\) ' \(d\), \(d a\) ', and ' \(a \bar{e}\) ', be tuned all perfect. Then tune the tro perlect octaves from ' \(\bar{e}\) ' downwards, ' \(\bar{e} \epsilon\) ', ' \(e: \mathrm{e}\) '. The major thind 'c \(c\) ', refulting from this procefs, will be ton tharp by a comma, or \(81: 80\), and will beat 15 times in a fecond. The minor third ' g ', and the major fixth ' \(\mathrm{c} a\) ', will be ftill more difcordant.

It is therefore impoffible to have perfect fifths, and at the fame time perfect thirds and fixths. Now, although a perfect fifth, occafionally employed, be pleafing, yet the ear dnes not relifh a fucceffion of perfect fifths; fuch a fucceffion not only renders the harmony languid, but creates a doubt as to the key, which is unfatisfactory. On the other hand, an alternate fucceffion of major and minor thirds and fixths conffitutes the chief and moift brilliant part of our harmonics. We therefore find it neceffary to facrifice fomewhat of the perfect harmony of the fifths to that of the third and fixths.
It is this accommedation which is properly called Temperament; and to this fytem of it, by which the fifths are diminimed, and the thirds and fixths preferved perfect, we give the preference.

We have juff feen that four confecutive perfect fifths compofe an interval, greater, by a comma, than two octaves and a major third. But in the tuning of our infruments requiring temperament, thefe intervals muft be rendered equil. Becaufe, as we have feven hem:tonic intervals in the fifth, twelve in the octave, and
four in the major third; fo the interval of four-fifuhs Tencrerian contains twenty-cight hemitonic intervals, and that of two octaves and major third contain allo twenty-eight, being twenty-four tor the two octaves, and four for the major third. The real difference being, howewer, a comma, it is plain, that if we kcep the major thirds peffect, we mult diminilh or Hatten each of the fourfiths one-fourth of a comma.

It is not eafy to afcertain with perfect exaGnefs the quarter comma by which the firlt fifth ' c g ' is to be diminithed. We fhall, however, be fufficiently accurate for practical purpoles if we flatten ' \(g\) ' tiil a beating of 9 beats in four feconds is produced (D).

Having in this manner tuned ' g ', we diminifh the next fifth ' g ' \(d\), one-fourth of a comma, by tlattening \(d\) till ' \(g\) ' \(d\) beat half as fall again as 'c \(g\) ', or \(13 \frac{1}{\frac{1}{2}}\) beats in four feconds ( E ).

The next fitth, \(d a\), muft be diminiflied in the fame proportion by flattening \(a\) till ' \(d a\) ' beat 15 times in fix leconds.

Inflead of tuning upward the fifth \(a \bar{e}\), tune downward ( \(F\) ) the octave \(a^{\prime} a^{\prime}\), and then tune upward the filth ' \(a\) ' \(e\), and flatten it till it beat 15 times in eight leconds.
If we take 15 feconds for the common period of all thefe beats, we thall find
\[
\begin{aligned}
& \text { The beats of ' } \mathrm{cg} \text { ' }=34 \\
& G \cdot{ }^{\prime}{ }^{\prime}=25 \\
& { }^{\prime}{ }^{\prime} a^{\prime} a^{\prime}=37^{\frac{7}{2}}
\end{aligned}
\]

On tuning downwards the oftave \(e^{\text {' }} \mathrm{e}\) ' we have the major third 'ce' perfect without any beating; and we proceed, tuning upwards a fifth flattened by one--Ourth of a comma, and when the beating becomes too quick, tuaing downward an octave. We may do this till we reach ' \(b\) ' \(*\) which hould be the fame with \(c\), a perfect octave above 'c'.

It will be better, however, to flop at ' g ' \(\mathcal{X}\), and then to tune fifths downward from ' \(c\) ' and octaves upwards, when we get too low. Thus we have ' \(c\) ' \(F, F\) ' \(f\) ', ' \(f\) ' \(B\) ' \(b\),
(D) If any concord, whofe perfect ratio is \(\frac{m}{n}\) ( \(m\) being the greatelt term of the fmalleft integers exprefing that ratio), be tempered fharp by the fraction \(\frac{g}{q}\) of a comma, and if M and N be the pulfes made by the acute and grave notes of the concord during any nunber of feconds, the number \(b\) of beats made in the fame time by this concord will be \(=\frac{2 q n \mathrm{~N}}{161 p-q}\), or \(\frac{2 q n \mathrm{M}}{161 p+q}\); and if it be tempered flat, then, \(b=\frac{2 q \pi \mathrm{~N}}{161 p+q}\), or \(\frac{2 q n \mathrm{M}}{161 p-q}\). (Smith's Harm. 2d cdit. p. 82, \&c.). Now, let \(\frac{m}{n}\) be \(=\frac{3}{2}\), the ratio of the fifth; \(q=1, p=4\); therefore, \(\frac{p}{q}=\) one-fourth of a comma, and \(\mathrm{N}={ }^{\prime} \mathrm{c}^{\prime}\) or 240 pulfes in a fecond. Therefore, \(\frac{2 q \mathrm{~m} \mathrm{~N}}{161 \times p+q}=\frac{2 \times 3 \times 240}{161 \times 4+5}=\frac{144^{\circ}}{645}=2.25\) beats in four feconds very nearly.
(E) Beraufe fifhs, being in the ratio to each other of \(3: 2, \mathrm{~N}\) in this fifth \(=360\).
(F) The grave octaves of the upper terms of each of thefe tempcred fifths may be determined with perfect accuracy, by making the grave octave beat with the lower term of the tempered fifth as often as the upper term does with it; for in!tance, by making G ' \(c\) ' beat as often as 'c g ', \&c. For, it has been demonftrated by Dr Smith, that the upfer term of a minor concord beats equally with the lower term, and with the acuter oflave of that term; but that the upper term of a major concord beats twice as falt with the acuter octave of the lower term, as it does with the lower term itfelf. 'Therefore, as ' \(g\) ' beats twice as fal with \(c\) as with ' \(c\) ', and is with its grave octave \(G\) in the ratio of \(2: 1, G\) ' \(c\) ' beats precifely as often as ' \(\mathrm{c} g\) '.
 ment. caule the notes marked 冬 or \(b\), are, when tuned in this way, in the belt relation to thofe with which they are
moft frequently employed as major thirds, and the major third is the harmonic interval moft in ule (G). Another fyitem of temperament is that whach divides
(C) The procefs of temperament thus recommended, will be greatly facilitated by employing a pendulum made of a ball of about two ounces weight, fliding on a light deal rod, having at one end a imall ring. Let this pendulum be hung by the ring on a peg, and the ball adjufted fo as to make 20 vibrations in 15 feconds. This done, mark the rod at the upper edge of of the ball, and adjuit it in the fame manner for \(24,28,32,36,42,44\), and 48 vibrations. Then having calculated the beats of the different fiftis, fet the ball at the correlponding mank, and temper the found till the beats keep pace exactly with the pendulum.

In order to difcover, fhould it be neceffary, the number of pulfes made in a fecond by the tuning fork, by which we tune the tenor ' \(c\) ' of our inflrument, let a wire be ftretched by a weight till it be unifon or octave below the fork; let \(\frac{1}{40}\) th then be added to the weight. Being thus tempered by a commn, the contemporaneous foundings of the fork and wire will produce a beating; and on multiplying the beats by 80 , the produd gives the number of pulfes of the fork, and confequently of the ' \(c\) ' of the inftrument tuned from it. But the common ' \(c\) ' tuning forks are fo nearly confonant to \(2 \not 7_{0}\) pulfes, that this procel's is fearcely neccfiary.

On the fytem of temperament now propofed, Dr Smith makes the following ufeful obfervation and deduction.
'The ofave confiting of five mean tones and two limmas, it is obvious that by enlarging the tones we diminifh the limmas, and that the increment of the tone is two-fiths of the contemporaneous diminution of the limma. Let \(v\) reprefent any minute variation of this temperament: the increment of a mean tone is \(2 v\), and the contemporaneous diminution of the limma - \(5 \%\). Again, if the tone be diminithed by \(-2 v\), the limma will increafe by - \(5 \%\). Let us obferve the variations of the intervals in the latter cafe.

The perfeet fifth confiling of three tones and a limma, its variation will be \(-6 v+5 v\), or \(-v\). That is, the fofth is flattened by the quantity \(v\). Confequently the fourth is fharpened by that quantity.

The fecond, being a tone above the key note, and being therefore flattened by - 20 , the minor feventh is increaled by \(2 \boldsymbol{\sigma}\).

The minor third confinting of a tone and a limma, its variation is \(-2 v+5 v\) or \(3 v\). Accordingly, that of the major fixth is \(-3 v\).

The major third, or two tones, is therefore diminifhed by - \(4 v\). Confequently the minor fixth is increafed by 4 v.

The major feventh, being the inverfion of the limma is therefore varied by \(-5 \nu\).
The tritone being diminifhed - \(6 v\), the falle fifth is accordingly \(6 \%\).
On this oblervation, Dr Smith has founded the following geometrical conftruction: Divide the ftraight line CE (fig. 2.) into fix equal parts \(\mathrm{C} g, g d, d a, a \mathrm{E}, \mathrm{E} b, b ;\), and interfect the points of divifion with the fix parallel lines \(g \mathrm{G}, d \mathrm{D}\), \&c. reprefenting the intervals arranged according to the fyftem of mean tones and limmas.

Let any length \(g \mathrm{G}\), on the firf line to the right of the line CE , reprefent a quarter of a comma, \(G\) will thus mark the place of the perfect fift, and \(g\) that of the tempered fifth, flattened by a comma.
'Take \(d \mathrm{D}\), double of \(g \mathrm{G}\), on the fecond parallel alfo on the right hand; D will mask the place of the perfect feconl, and \(d\) that of the tempered fecond, flattened by the half comma \(d \mathrm{D}\).

By fetting off \(a\) A on the third parallel to the left, equal to \(g G\), we have \(A^{\prime}\) the perfect major fixth, and \(a\) the transferred major fixth, flarpened by the quarter comma A \(a\).

The major third being in the fytem of mean tones kept perfect, the place of that degree will be e.
By taking \(b \mathrm{~B}\) on the fifth line, on the right, equal to \(g \mathrm{G}\), we find B to be the place of the perfect major feventh, and \(b\) to be that of the tempered major feventh flattened by the quarter comma \(b \mathrm{~B}\).

And by making \(t \mathrm{~T}\) on the fixth line, to the right, equal to \(a \mathrm{D}\), we have the contemporaneous temperament of the tritone flattened by the half conma \(i T\), and of the falfe fifth, tharpened by that quantity.

Any other ftraight line \(\mathrm{C} t^{t}\) drawn from C , acrols thefe parallels, will reprefent, by the intervals \(g^{\prime} \mathrm{G}, d^{\prime} \mathrm{D}, \& \mathrm{c}\). the temperaments of another fyftem of mean tones and limmas. Since it is plain that the fimultantous variations \(g g^{\prime}, d d, \& c\). from the former temperament, are in the juft proportions to each other. The flraight line thus employed, ( \(C e^{\prime}\), or \(C e^{\prime \prime}\) ), has therefore been termed the temperer.

As the arrangement of the founds of keyed infiruments having only thelve keys for an oftare, and meant to be ufed in different fcales, muft approach nearly to a fyftem of mean tones, or rather mean limmas, this conftruction of Dr Smith's is very ufeful. The temperer points out, not only all the temperaments of the notes with the key note, but alfo the temperaments of the hamonic concords. Thus it will be feen, that the temperament of the minor third forming the interval between the major third and fiftl, is in all cafes the fame with that of the major fixth and octave, and that the temperament of the major third forming the interval between the fourth and major fixth, is equal to that of the key and major third of the fcale.

It has been propofed, in order to render Dr Smith's conftruction fill more ufeful, that it hould be drawn of fuch a fize as to admit of the following fupplementary fcales.
1. A fcale of \(g G\) divided into thirteen parts and a half, expreffing the logarithmic meafures of the temperaments mentioned in the note ( c ), a comma being \(=.54\).
2. A fcale of \(g G\) divided into 36 parts, giring the beats made in 16 feconds by the notes \(c, g\), when tempered by any quantity \(\mathrm{G}_{5}\).

\section*{T E M［ 280\(] \quad \mathrm{T}\) E M}

Temprra－the alterations between the fifths and major thirds，flat－ ment，
Eemper－ ance． tening the fifths and tharpening the major thirds，and making hoth beat equally fall along with the key：and fince enlarging the fifth increafes the tone，and confe－ quently diminifies the limma，the intercalary founds be－ come thus better fuited for their double fervice of the charp of the note below，and the flat of the note above． Much，however，is lof in the brilliancy of the major thirds，which are the moft effective concords．The fifths are not much improved，and the fixths are evident－ ly hust by this temperament（H）．

Thefe methods of tuning by beats are incomparably more exact than by the ear．We cannot miltake above one beat，that is，in the fifh \(\mathrm{r}_{\mathrm{o}}^{5}\) th，and in the major third \(\frac{1}{80}\) th of a comma．

We have offered a hort view of what appears to us to be the preferable fyltem of temperament．It has been deduced fom the obfervations of the moll able the－ orifts，and will greatly affift a tuner；but to him there are farther neceffary，as to a mufical performer，a correct ear，patient attention，and long practice．
TEMPERANCE，that virtue which a man is faid to poffefs who moderates and reftrains his fenfual appe－ tites．It is often，however，ufed in a much more gene－ ral fenfe，as fynonymous with moderation，and is then applied indifcriminately to all the paffions．

Temperance（fays Mr Nelfon）is the virtue that bridles our irregular defires；it is nearly allied to pru－ dence，and has a clofe connection with juftice；it calms revenge，and quenches the fire of unjult refentment；it checks the epicure，and flops the riotous hand of the Bacchanalian；it extinguifhes or abates the flames of luft，and banifhes every lawlefs action；it filences the
flippant detracting tongue，and gives in its flead a pleafing moderation of fpeech；it fhuts the door againt avarice，and proves experimentally，that happinefs does not confift in the eager purfuit or acquifition of riches， but in a contented nind；it curbs the flrongen of all other paffions，gaming，and diftinguifhes jully the ab－ lurdity and folly of making that a dangerous trade， which was only defigned as a relaxation and an amufe－ ment ：temperance，in a word，is the parent of many virtues；the parent of peace，profperity，health，and joy．

Nothing can be more flrange to all obfervation than the practice of forfaking temperance；fince every day＇s experience groves to us，that intemperance produces the oppolite to what we leek．Suppofe，when a child is born，we afk the parents what it is they wifh in that child ；they will anfwer，life．But as life alone，that is， mere exiftence，may，by infirmity or other accidents，be very wretched，they will naturally wilh for health and bappinefs．Well then，life，health，and happinefs，are the general wihhes of parents for their children．Now let us fee how their wifhes are likely to fucceed．Their firt Itep is ufually a thameful neglect of the food of na． ture，the breat ；the next，a blind gratification of their will ；the third，an almoft total neglect of their man． ners；and a fourth，the cherifting them in every irre－ gular affection．Where then is the wonder that parents are difappointed？Life and health depend on proper food and other judicious management on one part ；and if fick，an obedience to remedies on the other part；and happinefs effentially depends in the firft place on health； in the next，on the due government of our fenfes，affec－ tions，and pafions．See here how much mankind de－ viate from themfelves；low far they depart from their

3．A fcale of \(g G\) divided into 60 parts，for the beats of the major third \(C\) ．
4．A fcale of \(g G\) divided into 72 parts，for the beats of the minor third \(C e b\) ．
5．A fcale of \(g \mathrm{G}\) divided into 48 parts for the beats of the fourth cf ．
6．A fcale of \(g G\) divided into 89 parts for the beats of the minor third \(g c\) ．
7．And，\(g\) G divided into 80 parts for the beats of the major third \(f a\) ．
Thus provided，and having determined by \(D_{r}\) Smith＇s conftruction，the temperament of＇\(g\)＇，＇\(d\)＇，＇\(a\)＇，＇\(e\)＇，＇\(b\)＇，and ＇f，the accurate tuning of the whole oftave as a fyftem of mean tones with perfeet major thirds may be completed as follows．

Let＇f \({ }_{3}\)＇be tuned a perfect major third above＇\(d\)＇；＇\(g\) 炎＇a perfect major third above＇\(e\)＇，and \(c\) 縈 a perfect ma－ jor third above＇a＇．

Let＇\(b b\)＇be tuned a perfect major third below＇\(d\)＇，and＇e \(b\)＇a perfect major third below＇\(g\)＇．
（H）To adjuft the temperer to this mede，let EG（fig．2．）be divided in \(p\) ，fo that \(E p\) may be to \(p G\) ，as 3 to 5．＇Then draw \(\mathrm{C} f\) ，cutting \(g \mathrm{C}\) in \(g^{\prime}\) ，and \(C t^{\prime}\) fhall be the temperer required．It will be found that F ，\(e^{\prime}\) and \(G g^{\prime}\) are each of thom 32 of their refpective fales．

Let therefore＇ c g＇beat 32 times in 16 feconds

Tempe- own principles. But what is the remody? Nothing more obvious. Let parents exercife their reafon in all the fteps they take fur their children's welfare; let them
cxamine right and wrong; let them not only avoid paftion, but labour to corrcét their own errors of julgement, that they may be the better enabled to prevent them in their children; but, particu!arly, let them fix in them the knowledge, love, and habit, of temperance.

I'EMPERING, in the mechanic arts, the preparing of tleel and iron, fo as to render them more compact, hard, and firm ; or even more foft and pliant, according to their refpective occafions.

TEMPLARS, TEMPleEs, or Kinghts of the Tem\(p / c\), a religious order inftituted at Jerufalem in the beginning of the 12 th century, for the defence of the holy fepulchre and the protection of Chrittian pilgrims. 'They were firt called The poor of the IIoly City, and afterwards afiumed the appellation of Templars, becaule their houfe was near the temple. The order was founded by Baldwin II. then king of Jerufalem, with the concurrence of the pope; and the principal articles of their rule were: That they fhould hear the holy office throughout every day; or that, when their military duties hould prevent this, they hould fupply it by a certain number of pater nofters: that they flould alftain from flefh four days in the weck, and on Fridays from eggs and mitk-meats: that each knight might have three horfes, and one efquire: and that they fhould neither hunt nor fowl. After the ruin of the kingdom of Jerufalem about is 86 , they fpread themfelves throv:rh Germany and other countries of Europe, to which they were invited by the liberality of the Chrifians. In the year 1228 , this order accquired fability, by being confirmed in the council of Troyes, and fubjocted to a rule of difcipline drawn up by St Bernard. In every mation they had a particular govemor, called mafice of the Temple, or of the militia of the Temple. Their grandmafter had his refidence at Paris.

The order of 'Templars flourified for fome time, and acquired, by the valour of its knights, immenfe riches and an eminent degree of military renown : but as their profperity increafed, their vices were multiplied, ancl their arrogance, lusury, and cruelty rofe at laft to fuch a monftrous height, that their privileges were revoked, and their order fupprefled with the moft terrible circumflances of infamy and feverity. Their accufers were two of their own body, and their chief profecutor Philip the Fair of France, who addreffed his complaints to Clement V. The pope, though at firft unwilling to proceed againft them, was under a neceffity of complying with the king's defire ; fo that, in the year \(130 \%\), upor an appointed day, and for fome time afterwards, all the knights, who were difperfed throughout Europe, were feized and imprifoned, and many of them, after trials for capital crimes, were convicted and put to death. In 1312 the whole order was fupprefled by the council of Vienne. A part of the rich revenues they poffified was beftowed upon other orders, efpecially on the knights of St John, now of Malta, and the reft confifated to the refpective treafuries of the fovereign princes in whofe dominions their poffeffions lay.- The knights Templars, in order to juftify the feverity with which they ware treated, were charged with apoftafy to the Saracens, and holding correfpondence with them, kith infulting

Vol. XX. Part I.
the majefty of God, turning into derifion the gofpel of Temphes, Chrift, and trampling upon the obligation of all laws Tempice. human and divine. Candilates, it is faid, upon ad. mifion to this order, were commanded to (pit, in toker of contempt, upon an image of Chritt, and after admifion to worftip either a cat or a wooden head crowned with gold. It is fat ther affumed, that, among them, the odious and unnatural act of fodomy was a matter of obligation; and they are charged with other crimes too horritle to be mentioned, or even imagincd. However, though there be reafon to believe, that in this order, as well as others of the fame period, there were flocking examples of impiety and profligacy; yet that the shole order was thus enormoully corrupt, there is no reafon to believe. The pope indcerl, tlough he aficd with feverity, afted with juftice. He fent two cardinals to Paris, who, publihing his bull againft the order, condenned thofe 'Templars who bad made the voluntary confeffion to be buint by a flow fire. The ciminels recanted their former confefions, hut acknowledged themfelves worthy. of death, becaule they liad unjuflly accufed the order of crimes of which they were innocent. Several authors of thore times whote in defence of the ordcr; and Boccace alleges, that its cxtirpation was owing to the avasice of the king of France, who coveted the sich putfelfions the Templars then enjoyed in Prance.

The king of Arragon was much prefled to treat tle Templars in his kingdom as they had been treated in France; but his conftant anfwer wac, "We muft be firft convinced of their ģuilt, and it will be then time enough to talk of their punithment." The people, however, were in general fo provoked againft them, that they were compelled to thut themfelves up in the fortrefles belonging to their order, to mevent their beirg torn in picces; which precaution was reprefented to the hing of Arragon as an att of rebellion. He naarched, iherefore, with a corps of troops againft one of thefe fortreffes. The knight who commanoed furrendered inmediately, and told the king the truth, afturing him that they defned nothing but a fair trial; with whic! declaration the king was extreniely mored, took the whole order into his protection, and forbade any to abufe or infult them under the hervieft penalies. At the fame time he declared be was ready to receive any informations againft them that were fupported by proofs; but if the informers failed theiein, he would punifh them as they deferved.

Thefe facts piead flrongly for the innocence of the Templars, or at leat they prove that their guilt muft have been exaggerated; and if we add, that many of the accufations advanced againft them flatly contradict each other, and that many members of this unfortunate order folemnly avowed their innocence while languift. ing under the fevereft tortures, and even with their dying breath-it would feem probable, that King Pinlip fet on foot this bloody tragedy, with a view to gratify his avarice, and glut his refentment againft the Templars, and efpecially againft their grand-matter, who had highly offended him. The principal caule of his insincible hatred againft them was, that in his quarrel with Boniface VIIII. the knights efpoufed the caule of the pope, and furnimed him with money to carry on the war. They originally wore a white habit, with red crofles fewed upon their cloaks as a mark of diftinction.

TEMIPLE, Sir Wielias, was borm in London in
\(\mathrm{N} n\)

\section*{T E M [ 282 ] T E M}

Sempie. the year 1628. The family from which he fprung was ancient, and is faid to have affumed the fumame of 'remple from the manor of Tcmple, in the hundred of Spar-len-Hall, in Leicefterfhire. He was firll fent to fehool at Penfehurf, in Kent, under the care of his uncle, the celebrated Dr Hammond, then minifter of that parih; but at the age of ten he was removed thence to a fchool at Biflop-Stortford, in Hertfordthire. When he had acquired a fufficient knowledge of the Greek and Latin, he returned home at the age of fifteen ; and, two years after, he went to Cambridge, where he was placed under the tuition of the learned Dr Cudworth, then fellow of Emanuel college. His father, Sir John Temple, being a flatefman, feems to have defigned him for the fame way of life; and on this account, after refiding at Cambridge two years, which were principally fpent in acquiring a competency of French and Spanin, both languages exceedingly ufeful for hi intended purfuits, he was fent abroad to finifh his education.

Mr Temple began histravels by vifiting France in 1648. As be chole to pais through the Ine of Wight, where his majefly was detained a prifoner, he there accidentally met with the fecond daughter of Sir Peter Oiborn of Chickfand, in Bedfordilire, then governor of Guernley for the king; and his lady being on a journey with her brother to St Maloes, where their father then was, our young traveller joined their party. Thi gave rife to an honourable attachment, which at the end of feven years, concluded in a happy marriage. Having refided two years in France, and learned the French language perfectly, Mr Temple made a tour through Holland, Flanders, and Germany, during which he became completely mafter of the Spanifh. In 1654 he returned from the continent, and, marrying Mifs Oftorn, paffed his time in retirement with his father, his two brothers, and a fifter, then in Ireland, happy in that perfect harmony which has been fo often remarked in their family.

As he rejected all offers made him of employment ander Cromwell, the five years which be lived in Ireland were fpent chietly in improving himfelf in hiffory and philofophy; but at the Reftoration, in 1660 , being cheren a member of the convention there, while others were trying to make their court to the king, Mr ' Mem ple oppofed the poll-bill with fo much fpirit, that his conduct foon attracted the attention of the public, and brought him into notice. In the fucceeding parliament, in 166 T , he was elected with his father for the county of Carlow; and in the year following, he was chofen one of the commifioners to be fent from that parliament to the king, which gave him an opportunity of waiting on the duke of Ormond, the new lord-lieutenant, then at London. Soon after he went back to Ireland, but with a refolution of quitting that kingdom, and of remoring with his family to England.

On his return he met with a very favourable reception from the duke of Ormond ; and foun acquired fuch a confiderable flare in his efteem, that the duke complained of him as the only man in Ireland that had never afked any thing from him. When he montioned his alefign of carrying his fanily to England, his grace faid, that he hoped he would at lean give him leave to write in his favour to the two great minifers, Clarendon then lord chancellor, and the earl of Arlington, who was fecretary of fate. This the dule did in fuch ภrong
terms, as procured hin the friendmip of thefe two nuble- Tenaple. men, as well as the good opition of the king. Mr Trmple, however, made no chlor ufe of this advantage than to tell Lo:d Arlington, that if his majenty had any cmployment abroad, which he was fit for, he flould be happy io undertake it; but, at the fame time, he requefted that he miglat not be fent into any of the nothern climates, to which he had a very great averfion. Lord Arlington replied, he was very forry he had made fuch an objection, as there was no other employment then undifpoled of except that of going enroy to Sweden. However, in 1665 , about the beginning of the firf Dutch war, Lord Arlington fent a meffenger to acquaint him that he muft immediately come to his houfe; which he did, and found that his lordfhip's bufinefs was to tell him, that the king had occafion to fend fome perfon abroad upon an affair of the utmoft importance, and that he had refolved to make him the firt offer; but that he mult know, without delay, and without telling him what it was, whether he would accept of it, and that he mun be ready to fet out in two or three days, without mentioning it to any of his friends. After a little confideration, Mr Temple told his lordfip, that, as he took him to be his friend, and as he had advifed hinu not to refufe, as it would be an entrance into his majefly's fervice, he fhould confult no farther. This bufinels was to carry a fecret commifition to the bifhop of Munfier; which he fet out with on :he fecond of Augult, and executed it fo much to the fatisfaction of Charles II. that, on his return to Brufiels, his majefty appointed him refident there, and created him a baronet. As Bruffels was a flace which he had long wifhed to refide at, in April I 666 he fent for his family; but, before their arrival, he had been again obliged to depart upon bufinefs to the prelate's court: for the bifhop having liftened to terms of accommodation with France, Sir William wrote two letters to diffuade him from that alliance; and thefe not having the defired effect, he went in difguife to Munfter, where, though he arrived too late to fecure the prince in his firf engagement, yet he prevailed on him to permit five or fix thoufand of his beft troops to enter into the Spanimh fervice. In this journey he paffed for a Spanifh envoy, having twenty Spanifh guards to attend him. In this manner he firft went to Duffeldorp, where the duke of Newburgh, though in the French interell, gave hin a guad to Dortmund; but when lie reached that place, finding the gates flut, he was forced to proceed to a village, at the dinance of a league, which being full of Brandenburgh troops, he was under the neceflity of lodging in a barn, upon a flraw bed, with his page for a pillow. Next day he was entertained at a cafle belonging to the bilhop of Munfter, by one Gorges a Scotch licutenant-general in that prelate's fervice, with what he calls a very epifcopal way of dinking. The general coming to the large hall, in which food a great many flaggons ready charged, he called for wine to drink the king's hoalth. A filver bell, that might hold ahout two quats, was upon this brought him; and, as foon as he received it, he pulled out the clapper, and giving it to Sir William, to whom be intended to drisk, ordered the bell to be filled. When he was done, he drank off the contents to his majefty's heath; and atked Sir William for the clapper, put it on, atd tuang down the bell, rang it, to flew that he had dank fair,

\section*{T E M [ 28 ; ] T E M}

Tempice and left nothing in it. He then took out the clapper, defired Sir William to give it to whom!oever he pleafed; and, ordering the bell to be filled again, prefented it to Sir William: but as the latter fildum ufed to drink, he lad generally fome gentleman with him to fupply his place in this refpeet whenever it might be neceflary. Having linifled his bedinels at Munfter, he returned to Bruffels, where he palled a year with great pleafure and fatisfaction.
'Iwo months after the conclution of the pace with the Dutch at Breda, Sir William's filter, who refided with him at Brulfels, being very defirous of feeing Holland, he went thither incognito to gratify her defire ; but while he was at the Hague, he paid a private vifit to Mr De Witt, in which he laid the foundation of that clofe intimacy which afterwards fubfited between them.

In the fpring of 1667 , a new war breaking out between France and Spain, which cxpofed Bruffels to the danger of falling into the hands of the former, Sir William fent his lady and fanily to England; but he himfelf remained there with his fifter till the Chriftmas following, when he was ordered by the king to come over privately to London. Taking tle Hague in his way, he paid another vifit to De Witt, and, purfuant to his inftructions, propofed thofe overtures to him which produced the triple alliance. Soon after his arrival at the Britifh court, he returned, on the \(16: \mathrm{h}\) of January 1668 , with the character of envoy extraordinary and plenipotentiary to Holland; where a conference being opened, he brought that treaty to a perfect conclufion in the thort fpace of five days. The ratifications of this alliance being exchanged on the 15 th of February, he repaired to Bruffels; and a treaty being fet on fort between France and Spain at Aix-la-Chapelle, he fet out for that place on the 24 th of April in quality of his inajelty's ambafiador extrao:dinaty and mediatur. Here he arrived on the 27th: and it was chielly owing to his alfiftance that the Spaniards were brought to fign the articles of that peace on the fecond of May. This fervice being completed, he rcturned to Bruffels, with a view of remaining there in lis former ftation of refident; but he reccived letters from the earl of Arlington, with the king's order to continue as ambaffador, and to ferve his country in that quality in Holland, as on account of the late alliances, his majefly was refolved to rencir a character which the crown of England had dificontinued there fince the time of King James. Sir William being now left at libetly to return to England, embraced the opportunity ; and, upon his arrival at London, he was reccived with every poffible demonfration of favour both by the ling and the court.

Setting out again for Holland, with his new character of the king's ambaflador, he arrived at the Hague in the end of Auguit 1668. Here he enjoyed the confidence of that great minifter De Witt, and lived in great intimacy with the prince of Orange, who was then only eighteen years of age, tut, in September 1669, le was hurried back to England by Lord Arlington, who ordered him to put his foot in the flirut as foon as he fhould receive his letter. When Sir William waited on the earl, he found that he had not one word to fay to him; for, after making him attend a long time, he only afked a few indiferent queftions refpecting his journey. Next day he was received as coolly by the
king; hut the fecret foon came out, and he preffed Temple. to return to the Hague, and pave the way for a war with Holland. This, however, he exculed himfelf from having any hand in; which fo much provoked the lord treafurct Clifford, that he refufed to him an arear of two thoufand pounds due from his embalfy. Diliguited with Arlinglun's behaviour, which was fo unlike the friendilip, he had formerly phofefed, Sir William now retired to his houfe at Sheen near l'ichmond, in Surry ; and in this retreat, when free from the hurry of bufinel, he wrote his Oblervations on the United Provinces, and one part of his Mifcellanies, in the time of the fecond Dutch war. About the end of fummer, however, 1673 , the king willing to put an erd to the war, fent for Sil: Willian, and defired him to go to Holland to negotiate a peace; but powers having been fent from thence at this time to the Marquis de Frefno, the Spanill ambaffador at London, Sir William was ordered to confer with him ; and a treaty was accordingly conclucled in three days, and the point carried refpecting the fuperiority of the Britim flag, which had been fo long contefted. In June \(167+\) he was again fent ambaflador to Holland to offer the king's mediation between France and the confederates, then at war, which was accepted not long after; Lord Pierkeley, Sir Willian Temple, and Sir Leoline Jenkins, being declared ambafadors and mediators; and Nimeguen, which Sir William had propofed, was at length agreed upon by all parties to be the place of treaty. During his flay at the Hague, the prince of Orange, who was fond of the Englinh language, and of the plain Englifh way of eating, conftantly dined and fupped once or twice a week at his houfe; and by this familiarity he fo much gained the prince's confidence and efteem, that he had a confiderable hand in his marriage with the Princefs Mary, daughter of lames II

In July 1676 he removed his family to Nimegucn, where he fpent the remainder of that year without making any progrefs in the treaty; and the year following his fion was fent over with letters from the lord-treafurer, ordering him to return, and fucceed Mr Coventry as fecretary of fate. In confequence of this order, Sir William came over to England in the fpring of 1677 ; and though the affair of the fecretary's place was dropped at his defire, he did not return to Nimeguen that year. About this time, the prince having the king's leave to come over, he foon after married the Princefs Mary; and this gave occafion for a netv coolnefs between Lord Arlington and Sir William, as he and the lord-treafurer Oiborn, who was related to Sir William's lady, were only privy to that affair. After the prince and princefs were gone to Holland, as the court always feemed inclised to favour France, the king wifhed to engage Sir William in fome negociations with that crown: but he was fo ill fitisfied will this propofal, that he ofered to give up all pretenfions to the office of fecretary; and defiring the lord-treafurer to acquaint his majefty with his intentions, retired to Sheen, in hopes of being taken at his word. Upon a difcovery, bowever, of the French defigns not to evacuate the Spanifh towns agreed by the treaty to be delivered up, the king commanded lim to go upon a third embaify to the flates; with whom he concluded a treaty: by which England engaged, in cafe France refufed to evacuate the towns in forty days, to declare war immedi-
\(\mathrm{Nn}_{2}\) ately

\section*{T E M [ 284 ] T E M}

Temp.e. ately again? the nation; but before half that time was elapled, one Du Crofs was fent from the Englith court is Hulland upon a bufnefs which damped all the goud sumour excited by the treaty there, and which produced fuch fudden and aftonithing changes in this country, as gave sir William a dillafte for all public employments.

Ia \(16-9\) he went back to Nimeguen, where the Fiench delayed to fign the treaty illl the laft hour ; but having concluded it, be returned to the Hague, whence he was foon after fent for to enter upon the fecretary's office, which Mr Coventry at length refolved to relign. He accordingly came over, and went to court, as all his friends hoped, with a full intention of aftuming his ortice; but he ftarted fome difficulty, becaufe he had not a feat in the houfe of commons, thinking that, by his not being a member, the public bufinets would luffer at fuch a clitical time, when the contefts between the two parties ran fo high that the king thougint fit to fend the duke of York into Ilanders, and the parliament to put the lord-treafurer Danly into the Tower. After this his majetly ftill prefled Sir William to be fecretary of llate; ufing as an argument for his compliance, that he had nobody to confult with at a time when he had the greateft need of the beft advice. Notwithlanding all this, Sir William declined the king's offer, advifing him to cheofe a council in whom he could confice, a:ad upon whofe abilities he could depend. This advice the king followed; and the choice of tbe perfons being concerted between his majelly and Sir William, the old council ras diffolved four days after, and the new one eltablithed, of which the latter was a member.

In 1680 the councils began again to be changed, on the king's illnefs, at the end of fummer, and the duke of York's return privately to court. In this juncture Sir William, endeavouring to bring to the king's favour and bulinefs fome perfons to whom his majefty had taken a dilike, if not an averfion, he met with fuch treatsnent from them as gave him a freft diftalte to the court, at which be feldom made his appearance ; fo that he reinded principally at Sheen. Soon after this the king fent for him again ; and having propofed that he thould go as ambaffador into Spain, Sir William confented: But when his equipage was almoft ready, and part of the money paid down for it, the ling changed his mind, and told him that he would have him defer his journey :ill the end of the feffion of parliament, in which he was chofen a member for the univerfity of Cambridge. In this fellion the fpirit of party 5 an fo high that it was impoffible to bring the houfe to any kind of temper. The dulie was fent into Scotland; but this would not fatisfy then, nor any thing but a bill of exclufion; which Sir William ftrenuoully oppofed, faying, that "His endeavour ever hoould be to unite the royal family, and that he would never enter into any councils to divide them." Not long after this period, the parliament heing difolvcd by his majelly, without the advice of his privy council, and contrary to what he had promifed, Sir William made a bold fpecch againft it ; for which he was very ill ufed by fome of thofe friends who had been molt carneft in promoting the laft change in the miniltry. Upon this he grew quite tired of public bufinefs, declined the offer he had of again ferving for the univerfity in the next parliament, that was foon after called, and met
at Oxford; and feeing his majefty refolved to govern without his parliament, and to litpply his treafury through ancther channel, he retired to Sheen a few days after, whence he fent word by his fon, that " he would pals the reft of his days like a good fubject, but would never more meddle with public afiairs." From that time Sis William lived at this place till the end of that reign and for fome time in the next; when laving purchaled a linall feat, called Moor Pali, near Farnham in Surry, which he conceived a great fondnefs for, on account of its folitude and retirement, and its healthy and pleafant fituation, and being much allicted with the gout, and broken with age and indimities, he refolved to fpend the remainder of his life in this agreeable retreat. In his way thither, thenefore, he waited on King James, who was then at Windfor, and begged his favour and protection to one " that would always live as a good fubject, but, whatever might happen, never again enter upon any public employment ;" defiring his majefty to give no credit to any thing he might hear to the contraty. The king, who ufed to lay that Sir William 'lemple's character was always to be believed, promifed him whatever he defired, gently reprached him for not entering into his ferrixe, which, he faid, was his own fault; and kept his word as faithfully to Sir William as Sir William did to his majefly, during the furprifiner turn of affairs that foon after followed by the arrival of the prince of Orange. At the time of this happy sevolution, in 1688 , Moor Pask becoming unfafe, as it lay in the way of both armies, be went back to the houfe at Sheen, which he had given up to his fon; to whom he refufed leave, though importunately begged, to go and meet the prince of Orange at his landing: but atier king James's abdication, when the prince reached Windfor, he went thither to wait upon his highnefs, and carried his fon along with lim. The prince preffed him to enter into his ferrice, and to be fecretary of fate; but his age and infirmities confirming him in the refolution he had made not to meddle any more with public affiars, he was fatisfied that his fon alone thould enjoy his majeny's favour. Mr John Temple was upon this appointed fectetary at war ; but he had hardly been a week in that olfice, when he refolved to put an end to his own exiftence; which he did on the 14th of April 1689 , by throwing himfelf out of a boat, hired for that purpofe, in thooting London-bridge; having birlt put ftones into his pocket to make him fink fpcedily.

In \(169+\) Sir William had the misfortune to lofe his lady, who was a very extraordinary woman, as well as an affectionate wife. He was then confiderab!y turned of fixty; at which age he practifed what he had fo often declared to be bis opinion, that "an old man ought then to confider himfelf of no farther ufe in the world except to himfelf and his friends." After this he lived four years very much athicted with the gout; and his ftrength and fpirits being worn out by the infirmities of age, he expired in the month of lanuary 1698 . He died at Moor-Park, where his heart was buried in a filver box under the fun dial in his garden, oppofite to a window from which he ufed to contemplate and admirc the works of nature, with his fifter, the ingenious Lady Gifford. Ihis was according to his will; in purfuance of which his body was privately interred in Weftminfter Abbey, and a marble monument erected in 1722, after
the death of Lady Gifford, who refembled him in genius as well as in perfon, and left behind her the charraster of one of the boit and molt conlant friends ina the norld.
Sir William Temple's principal works are, 1. Memiors from 1672 to 1692: They are very afeful for thofe who with to be acquainted with the afliars of that periud. 2. liemarks upon the State of the United 1'iovinces. 3. An Introduction \(t\), the Hittory of England: '1hbis is a Sketch of a Gencral Hiltory. 4. Letters written during his latt cmbaffics. Aud, 5. Mifcellanies, which contain a gieat many curious pieces that difplay confiderable depth of thought. He was an accomplinhed gentleman, a found politician, a patriot, and a great fcholar. And if this great idea frould perchance be faded by fume touches of vanity and Jpleen, the reader will be fo candid as to confider, that the greatell, wifelt, and the beit of men, have till fome failings and imperfections which are infeparable from human nature.

Temple, Templum, a public building, erected in honour of fome deity, cither true or falle; and wherein the people meet to pay religious worfhip to the fame. The word is formed from the Latin complum, which fome derive from the Greek repervo, fignifying the fame thing; and others from teuve, abicinuto, "I cut off, I feparate," in regard a temple is a place feparated from common ufes; ollacrs with more p:obability derive it from the old Latin word templare, "to contemplate." It is certain the ancient augurs gave the name templa to thofe parts of the hearens winich were marked out for the obfervation of the flight of birds. Their formula was this: Templa réfua funto. Temples viere originally all open, and hence received their name. Sec Phil. Tranf. \(\mathrm{N}^{0} 47 \mathrm{r}\). fect. 5. where we have an account of an ancient temple in Ireland of the fame fort as our famous Stonehenge. The word templum, in its primary fenfe amang the old Romans, fignifiod nothing more than a place fet apart and confecrated by the augurs, whether inclofed or open, in the city or in the fields.

Clemens Alexandrinus and Eufebius refer the origin of temples to the fepulchres built for the dead. This notion has been lately illuftrated and confirmed by a variety of tellimonies by Mr Farmer in his Treatife on the Worhip of Human Spirits, p. 373, \&sc. Herodotus and Strabo will have the Egyptians to have been the firtt who built temples to the gods. The firft erected in Greece is alcribed to Deucalion, by Apollonius, Argonaut. lib. iii. In antiquity we meet with many people who would not build any temples to their gods for fear of confining them to too narrois bounds. They performed their facrifices in all places indifferently, from a perfuafion that the whole world is the temple of God, and that he required no other. This was the doctrine of the magi, followed by the Perfians, the Scythians, the Numidians, and many other nations mentioned by Herodotus, lib. i. Strabo, lib xv. and Cicero in his fecond oration againit Verres.

The Perfians, who worfhipped the fun, believed it would wrong his power to inclofe him in the walls of a temple, who had the whole world for his habitation; and hence, when Xerxes ravaged Greece, the magi exhorted him to deftroy all the temples he met with.

The Sicyonians would build no temple to their goddefs Coronis; nor the Athenians, for the like reafon,
erect any flatuc to Clemency, who, thicy faid, was to Tempie. live in the heats of men, not within flone walls.

The Bithynians had no temples but the mountains to worftip on; nor lad the ancient Germans any other but the woods.

Even fome philofophers have blamed the ufe and building of temples, particularly Diogenes, Zeno, and his followers the Stoics. Hut it may be faid, that if God hath no need of temples, men have need of places to ineet in for the public offices of religion: according. ly temples may be traced back ever into the remoteil antifuity. Sce \(I\) ofpinian de Origine Tomplorum.

The Romans had feveral kinds of temples; whereof thofe built by the kings, \&cc. confecrated by the augurs, and wherein the excrife of religion was regularly performed, were called, by way of eminence, cimpla, "temples." Thofe that were not confecrated, were called ades. The little temples, that were covered or roofed, they called cedicuhc. Thofe open, facella. Some other edifices, confecrated to particular mylteries of religion, they called fana and dehdra.

All thele kinds of temples, Vitruvius tells us, had other particular denominations, according to the form and manner of their conftruction, as will be hereafter fpecified.

Indeed the Romans outdid all nations with regard to temples: they not ouly built temples to their gods, to their virtues, to their difeafes, \&\&c. but alfo to their emperors, and that in their life time; inftances whereof we mect with in medals, infcriptions, and other monuments. Horace compliments Auguftus hereupon, and fets him above Hercules and all the herces of fable; becaufe thofe were admitted into temples only after their death, whereas Augultus liad his temples and altars while living.

> Prafenti tibi maturos largimur honores;
> Jurandajgue tuum per nomen ponimus aras.

> Epift. ad. Aug.

Suetonius, on this occafion, gives an inftance of the modefly of that emperor, who would allow of no ter;stles being erected to him in the city; and even in the provinces, where he knew it was ufual to raife temples to the zery proconfuls, refufed any but thofe erected in the name of Rome as well as his own.

The moit celebrated temples among the Romans were the Capitol and Pantheon. They had alfo the temple of Saturn, which ferved for the public treafury; and the temple of Janus.

The temple at Jerufalem was fimilar in its plan to the Tabernacie. The firft temple was begun by Solomon about the year of the world 2992, and before Chrift 1012 according to fome chronologers, and finithed in eight years. Great miltakes have been committed refpecting the dimenfions of this temple, by confounding the emblematical defcription of Ezekiel with the plain account of it in the books of Kings and Chronicles. It confifted of the holy of holies, the fancluary, and a portico. The holy of holies was a fquare room of 20 cubits; the fanctuary, or holy place, was \(40 \mathrm{cu}-\) bits long and 20 broad, coniequently the length of both thefe together was 60 cubits. The portico, which flood before the fanctuary, was 20 cubits long and 10 cubits broad. Whether the prrtico was feparated by a wall

\section*{T E M}

I E M

Tomple. From the ref of the temple or not, is not mentioned in fcripture. If it was, the whole length of the temple, computing the cubit at 22 inches, did not exceed 110 feet in length and 36 feet 8 inches in breadth. In the portico tlood the two brazen pillars called Jachin and Boar, which, upon comparing and reconciling the feemingly different accounts in different places, appear to have been 40 cubits high and about 4 cubits diameter. The court probably at firf extended all round the icmple. Now we are told, that the court about the tabernacle was 100 cubits long and 50 broad; and as Sulomon made every part of the temple about twice as large as the correfponding part in the tabernacle, we have rea. fon to conclude, that the court around the temple was 200 cubits long and 100 broad. According to this defcription, which is taken from the feripture hittory, the temple of Solomon was by no means fo large as it is commonly reprefented. Still, however, it was very inagnifeent in fize and fplendid in ornament. It was plundered of its treafures in the reign of Rehoboam, and repaired by Joaft ; it was again fpoiled in the time of Ahaz and of Hezekiah ; and after being reftored by Jofiah, was demolihind by Nebuchadnezzar in the year of the world \(3+16\), after it had flood 476 years according to Jofephus, and according to Uher 428 years.

The fecond temple was built by the Jews, after their return from the Babylonifh captivity, under the direc. tion and influence of Zerubbabel their governor, and of Ioflua the high-prieft, with the leave and encouragement of Cyrus the Perfian empercr, to whom Judea was now become a tributary kingdom. According to the Jews, this temple was deflitute of five remarkable appendages, which weic the chief glory of the firft temple; viz. the ark and mercy-feat, the Shechinah, the holy fire on the altar, which had been firt kindled from heaven, the urim and thummim, and the fitit of prophecy. This temple was p?undered and profaned by Antiochus Epiphanes, who alfo caufed the public wormip in it to ceafe; and afitrwards purified by Judas Maccatreus, who reflored the divine worlhip; and after having food 500 years, rebuilt by Herod, with a magnificence approaching to that of Solomotr's. 'Tacitus calls it immenface opu. lentice tomplum; and Jofephus fays, it was the mof allomifling fisucture he tad ever feen, as well on account of its arclitecture as its magnitude, and likerwife the richnefs and magnificence of its various parts and the repratation of its facred appurtenances. This temple, which Herod began to build about \(\mathbf{5} 6\) years before the lirth of Chrift, and fo far completed in nine years and \(a\) half as to be fit for divine fervice, was at length dcfroced by the Romans on the fame month and day of the menth on which Solomon's temple was deftroyed by the Babylonians.
Maurice's Indiant An-

3 he Indian temples, or pagodas, are fometimes of a prodigious fize. They are commonly erected near the hanks of the Ganges, Kifna, or other facred rivers, for p. 35 .

Craufford's Sketches, vol. i. 2. \(\mathrm{I}=6\). the benefit of ablution in the purifying flream. Where no river flowe near the foot of the pagoda, there is invarinbly in the front of it a large tank or refervoir of water. Thefe are, for the moft part, of a quadrangular form, are lined with freefone or marble, have feps regularly defcending from the margin to the bottom, and Mr Crauford oblerved many between three and four hunded feet in breadth. At the entrance of all the more confiderable pagodas there is a portico, fupported
by roves of lofty columns, and afcended by a handfome thiglit of flome fteps; lumetimes, as in the inflance of Tripetti \({ }^{*}\), to the number of more than a hundred. U11der this portico, and in the ccurts that generally inclofe the whole building, an innumerahle multitude affemble at the rifing of the fun; and, laving bathed in the 11ream below, and, in conformity to an immemoriai cuftom over all the Eaft, having left their faidals on the border of the tark, impatiently await the unfolding of the gates by the miniftering brahmin. The gate of the pagoda univerfally fronts the eaft, to admit the ray of the folar orb; and, opening, prefents to the vicw an edifice partitioned out, according to Mr Thevenot in his account of Chitanagar, in the manner of the ancient cave-temples of Elora, having a central nave or body; a gallery ranging on each fide ; and, at the farther end, a fanctuary, or chapel of the decity adored, furrounded by a flene balluftrade to keep off the populace. Thofe who with to perufe a more particular account of the Indian temples may confult Maurice's Indian Antiquities. Sec alfo Pagoda and Seringiam.

Trimele, in Architeclure. The ancient temples were diffinguilhed, with regard to their confruction, into various kinds; as, Tcmple in antre, PEdes in antis. Thefe, according to Vitruvius, were the moft fimple of all temples, having only angular pilafters, called artue or paraftatie, at the corners, and two Tufcan columns on each fide of the doors. Temple tetrafyle, or fimple tetrafyle, was a temple that had four columns in fiont, and as many behind. Such was the temple of Fortuna Virilis at home. Temple profille, that which had only columns in its front or forefide; as that of Ceres at Eleufis in Greece. Temple ampliprofyle, or double proflylc, that which had coluinns both before and behind, and which was alfo tetraftyle. Temple, periptere, that which had four rows of infulated columns around, and was hexaftyle, i. e. had fix columns in front ; as the temple of Honour at Rome. Tomple diptere, that which had two wings and two rows of columns around, and was alfo octollyle, or had eight columns in front; as that of Diana at Ephefus.

Temples, among us, denotetwo inns of court in Lon. don, thus called, becaufe anciently the dwelling houfe of the knight's templars. At the fuppreftio: of that order, they were purchafed by the profeflors of the common law, and conserted into hofpitia or inns. They are called the inner and middlo temple, in relation to Efiex-boufe; which was aifo a part of the boufc of the templars, and called the orter temple, becaufe fituated without Temple-Bar. In the middle temple, during the time of the iemplars, the king's treafure was hept ; as was alfo that of the kings of France in the houle of the templars at Paris. The chief officer was the maffer of the temple, who was fummoned to parliament in 47 Hen. II1. and from him the chief minitter of the tem-ple-church is fill called mafler of the temple.
Templese, in Anatomy, a double part of the head, reaching from the forehead and eves to the two ears. The temples are chicily formed of two boncs called offic temporis. 'Thefe parts, according to phyficians, wcre called tempora, from their ftowing the age or time of a man by the colvur of the hair, which turns white in this part before any other; which Homer feems to have been awate of, by his calling men poliocrocasphi, g.d. "grey-templed."
fempora!, TEMPORAL, a term senerally ufed for fecular, as Tempora- a diftinetion from ecclefiatical. Thus we fay temporal tities.

TEMPORALITLES of BISHOPS, are the revenues, lands, tenements, and lay-fecs, belonging to billops, as they are barons and lords of parliament.

The cuitody of the temporalitics of bilhops forms a branch of the king's ordinary revenues (fee Revenul:. Thefe, upon the vacancy of the biflopric, are inmodiately the right of the king, as a confequence of his prerogative in church matters; whercby he is confidered as the founder of all archbifhoprics and bifhoprics, to whom, during the vacancy, they revert. And for the fame reafon, before the diffolution of abbeys, the king had the cuftody of the temporalities of all fuch abbeys and priories as were of royal foundation (but not of thofe founded by fubjects), on the death of the abbot or prior. Another rcaton may allo be given why the policy of the law hath vefted this cuftody in the king; becaufe, as the fuccefior is not known, the lands and poffertions of the fee would be liable to fooil and devaltation if no one had a property thercin. Therefore the law has given the king, not the temporalities thenfelves, but the cuftody of the temporalities, till fuch time as a fucceffor is appointed; with power of taking to himfelf all the intermediate profits, without giving any account to the fucceffor; and with the right of prefenting (which the crown very frequently exercifes) to fuch bencfices and other preferments as fall within the time of vacation. This revenue is of fo high a nature, that it could not be granted out to a fubjee, before or even after it accrued : but now, by the fatute \({ }_{5}\) Edw. III. Itat. 4 . cap. 4 and 5. the king may, after the vacancy, leafe the temporalities to the dean and chapter; faving to himfelf all advowfons, efcheats, and the like. Our ancient kings, and particularly Willian Rufus, wore not only remathable for keeping the bifhoprics a long time vacant, for the fake of enjoying the temporalities, but alfo committed horrible wattes on the woods and other parts of the eftate; and to crown a!l, would never, when the fee was filled up, reflore to the bifhop his temporalities again, unlcis he purchafed them at an exorbitant price. To remedy which, King Henry I. granted a charter at the begiming of his teign, promifing neither to fell, nor let to farm, or take any thing from, the domains of the church, till the fuccelfor was inflalled. And it was made one of the articles of the great charter, that no wafte fhould be committed in the temporalities of bihoprics, neither flould the cuffody of them be fold. The fame is ordained by the flatute of Weffminfter the firft ; and the ftatute 14 Edw. III. flat. 4. cap. 4. (which permits a leafe to the dean and chapter) is fill more explicit in prolibiting the other exactions. It was alfo a frequent abufe, that the king would, for trifling or no caufts, feize the temporalities of biflops, even during their livec, into his own hands: but this is guarded againf by fatute 1 Edw. III. Atat. 2. cap. 2.

This revenue of the king, which was formerly very confiderable, is now by a cuftomary indulgence almoft reduced to nothing : for, at prefent, as foon as the new biflop is confecrated and confirmed, he ufually receives the refitution of his temporalities quite entire and untouched from the king ; and then, and not fooner, he has
a fec-fimple in his bilhoptic, and may maintain an action Tenarity fur the profis.

TENACSY, in Naturnl Philofophy, that quality of Lodies by which they futlain a confiderable preflure or force of :my kind without breaking. It is the quality oppofite to fragility or brittlenefs. Sce STLEENGIII of Materinls.
'IENACULUM, in Surgery, an infrument ufed in amputation, for pulling out blecding veffels that are to be tied by ligatures. Sce Surgery.

Tenailles and? Sec Fortification, Sect. I. TENAILLIONS. \(5 \$ 3\). and 5 .
'TENAN'I, one that holds lands or tenements of fome lord or landlord, by rent, feally, \&cc. See Tenure.

TENAWIT. Sce Lowia, Ornithology Index. Tench. Sce Cyprinus, Ichthyology Index.
TENDER, a fnall hip in the fervice of men of war, for carrying men, provifions, or any thing elfe that is neceflary.

TENDONS, in Anotomy, are white, firm, and tenacious parts, contiguous to the mufcles, and uftally forming their extremities. See Anatomy, \(\mathrm{N}^{2} 85\).

TENEBRIO, in Natural Hifory, a genus of infeas belonging to the order of coleoptera. Sce liv:owiology Index.

TENEDOS, in Ancient Grograply, an illand on the coalt of Troas, at the diflance of to fiadia from the continent, and 80 in compafs; with a cognominal Æooiian town, and a temple of Apollo Smintheus. Its origin is derived from Temnes or Tenes, who being expofed in a coffer or bog by his father Cygnus the Thracian, at the infligation of the mother-in-las, was by fate carried to this ifland, made king of it, and at length worhipped as a god on account of his virtues. The ifland was famous for its earthen ware, for which purpofe it had an excellent red clay ; and hence Bochart would derive the appellation from timetom, a " red clay." Tenedia focurif, is a prove: bial faying to denote feverity; from a law there pafted, that perfons found in the act of adultery flould be put to death; a feverity executed on the king's fon; and therefore, in the coins of Tenedus, on one fide are two heads in memorial of the king and his fon, and no the reverfe an axe, (Arithot!c). This ifland ftill retains its ancient name ; and is one of the frialleft iflands of the Archipelago, fituated near the coaft of Leffer Afn, we? of the ruins of 'Troy. It is chiefly rocky, but fertile, being remarkable for producing the befl Mufcadine wine in the Levant; and its pofition, thus near the mouth of the Hellefpoar, has given it importance in all ages; veffels bound toward Conflantinople finding fhelter in its port, or lafe anchorage in the road, during the Etefian or contrary winds, and in foul weather. The emperor Juftinian erected a magazine to receive the cargoes of the corn fhips from Alexandria. when detained there. This was a lofty building, 280 feet long and 90 brond. The voyage from Egypt was rendered lefs precarinus, and the grain preferved until it could be tranfported to the capital. Afterwards, during the troubles of the Grcek empire, Tenedos experienced a variety of fortune. The pirates, who infefted thefe feas, made it for many years their place of rendezvous; and Othman feiz it in 1302 , procured veffels, and thence fubdued the other inlands of the Archipelago.

\section*{T E/N}
fienedns, It has continued in the poffellion of the Turks ever 'leneriti: fince: and on the eaftern fide is a pretty large town,
feated at the foot of a mountain, with a fine harbour commanded by a cattle. E. Long. 27. 0. N. Lat. 29 . 30.

TENERIFF, an illand of Africa, and one of the Canaries, being the molt confiderable for riches, trade, and extent. It lies to the fouth of the illand of Salvages, to the well of the Grand Canary, to the north of the illand of Gomera, and to the ealt of that of Palma. It is of a triangular form, being about 45 miles in length and 20 in breadth; and in the centre is the famous penk, called by the natives El Pico de Teyde, which in clear weather may be feen at the diftance of I 20 miles, like a thin blue rapou: very little darker than the fky.

The moll frequented harbour is called Santa Cruz, which is on the fouth fide of the ifland, and where fhips with good anchors and cables may be fafe in all weathers. At this port is the principal commercial town in the inland, called alfo Santa Cruz, in the middle of which is a mole, built at a valt expence for the convenience of landing; between the mole and the town is a fort called St Plilip's, and near it is a Iteep rocky den or valley, beginning at the fea hore, and running far in land, which would reader the attack of an enemy very dificult; there are alfo other forts for its defence, all joined together by a thick ftone wall, and mounted with cannon.
Gias: Hi- Santa Cruz is large town, containing feveral churches jioricat ico and convents, an holpital, and the bell conftructed pricount of the vate buildings of any in the Canary iflands. It conCamary IJ hands.
thing of the manners of their anceftors, nor have they: Tenerifi: preferved any remains of their language. They are fairer tian the Spaniards of Andalufia.

Teneriff contains about 96,000 perfons, fuppofed to be equal to the number of inhabitants of all the rell of the feven illands put together. The peafants in general are wretchedly clothed; when they do appear better, they are habited in the Spanifh fathion. The men, in a genteeler line, drefs very gayly, and are feldom roya e to feen without long fwords. It is remarked, that few Nere Sout them walk with dignity and eafe; which may he attri- I3. buted to the long cloaks they ufually wear. The women wear veils; thofe morn by the lower ranks are of black ftuff, thofe of the higher of black filk; and fuch among the latter as have any claim to beauty are far fiom being over careful in concealing their faces by them. The young ladies wear their fine long black hair plaited, and faftened with a comb or a ribband on the top of the head.

The common people, and in this they refemble the inhabitants of moil of the iflands in the Pacific ocean lately difcovered, have in them a ftrong tendency to thieving; they are befides lazy, and the molt importunate beggars in the world. "I obferved likenife (fays Mr White) that the itch was fo common among them, and had attained fuch a degree of virulence, that one would almoll be led to belicre it was epidemic there. Some of the women are fo abandoned and thamelefs, that it would be doing an injullice to the prollitutes met with in the ftreets of London to fay they are like them. 'The females of every degree are faid to be of an amorous conflitution, and addicted to intrigue ; for Which no houfes could be better adapted than thofe in Teneriff.
"The manufactures canied on here are very feu, and the product of them little more than fufficient for their own confumption. They confilt of taffeties, gauze, coarfe linens, blankets, a little filk, and curious garters. The principal dependence of the inhabitants is on their wine (their tlaple commodity), oil, corn, and every kind of hock for hipping. With thefe the iflond abourds : and, in their feafon, produces not only the tropical fruits, but the regetable productions of the European gardens, in the greateft plenty. Teneriff cnjovs an agreeable and healthful mediocrity of climate. Indecd none feems better adapted for the reftoration of a valctudinarian ; as, by going into the mountains, he may graduate the air, and choofe that ftate of it which bed fints his complaint. But although the inhabitants are thus healthy, and have fo little occafion for medical aid, they loudly complain of the want of knowledge in the profeflional gentlemen of the ifland."

The height of the peak of Teneriff has been fo varioully eftimated and calculated by different travellers and geographers, that we can only take the mean between the two extremes of their decifions. Dr Halley Rye's Es allows but two miles and a quarter from the level of the rurfion f fea to the fummit of the fugar-loaf, whilt the Spanifh fencriff account of the Canary inlands. tranflated by Mr Glas in 1763 , makes it no lefs than five miles; and others have afligned a height different fiom both thefe. That it is an extinguifhed volcano is univerfally hnown.
"The crater of the pak of l'eneriff (lays Mongez) is a truc fulphur-pit, fimilar to thofe of Jtaly. It is about 50 fathoms long and 40 broal, rifing abruptly

claro obfcuro; though he was inferior in the fprightinefs of his touch, and the lightnefs of his pencil.

TENISON, DR THOMAs, archbifhop of Canterbury, was born at Cottenham in Cambridgefhire in 1636 ; and ftudied at Corpus Chrilli college in Cambridge. In his youth, while the fanatical government lafted, he applied himfelf to phyfic ; but afterward went into orders, and was fome time minifter of St Andrew's church, Cambridge ; where be attended the fick during the plague in 1665 , which his parihioners acknowledged by the prefent of a piece of plate. He ftowed himfelf very active againt the growth of Popery by his writings both in King Charles and in King James"s reigns: in 1680 he was prefented to the vicarage of St Martin's in the Fields, London, to which parifh he made feveral donations; and among others, endowed a free fchool, and built a handfome library, which he furnillhed with ufeful books. King William and Queen Mary, in 1689 , prefented him to the archdeaconry of London ; in 1691, he was nominated to the fee of Lincoln, and in 1694 he fucceeded Dr Tillotfon as archbilhop of Canterbury. He performed all the duties of a good primate for 20 years, and died in 1715 .

TENNIS, a play at which a ball is driven by a racket.
As many perfons would become players at tennis, provided they could eafily underftand the rudiments of the Gomes game, fo as to form fome judgement of the players, or at proved by leaft to know who wins and who lofes, we have here at-Beaufort. tempted to give fo plain a defcription of it, that no one can be at a lofs, if ever he fhould bett or play. As to the executive part, it requires great practice to make a good player, fo that nothing can be done without it ; all we prefume to do is to give an infight into the game, whereby a perfon may not feem a total ftranger to it when he happens to be in a tennis court.

The game of tennis is played in moft capital cities in Europe, particularly in France, from whence we may venture to derive its origin. It is efteemed with many to be one of the molt ancient games in Chriftendom, and long before King Charles I.'s time it was played in England.

This game is as intricate as any game whatever; a perfon who is totally ignorant of it may look on for a month together, without being able to make out how the game is decided. Therefore we thall begin by defcribing the court in which it is played.

The fize of a tennis court is generally about 96 or 97 feet by 33 or 34 , there being no exact dimenfion afcribed to its proportion, a foot more or lefs in length or width being of no confequence. A line or net hangs exa\&tly acrofs the middle, over which the bail mult be Aruck, either with a racket or board to make the flroke good. Upon the entrance of a tennis-court, there is a long gallery which goes to the dedans, that is, a kind of front gallery, where fpectators ufually ftand, into which, whenever a ball is fruck, it tells for a certain ftroke. This long gallery is divided into different compartiments or galleries, each of which has its particular name, as follows; from the line towards the dedans are the fir \(_{j}{ }^{f}\) gallery, door, fecond gallery, and the laft gallery, whic is called the fervice fide. From the dedans to the lait gallery are the figures \(1,2,3,4,5,6\), at a yard difance each, by which the chaces are marked, and is one of the mof effential parts of the game, as will appear in the following defcription.

Tenism,
Telnis:
\(\underbrace{\text { Cunn }}\)

00
On chimneys, from which there exhale aqueous vapours and fulphureous acids, which are fo hot as to make the thermometer rife from \(9^{\circ}\) to \(34^{\circ}\) of Reammur. The infide of the crater is covered with yellow, red, or white, argillaceous earth, and blocks of lara partly decompoled. Under thefe blocks are found fuperb cryftals of fulphur; thefe are eight-fided rhomboidal cryftals, fumetimes an inch in length, and, I fuppofe, they are the fineft cryftals of volcanic fulphur that have ever been found. The water that exhales from the fpiracles is perfectly pure, and not in the leaft acid, as I was convinced by feveral experiments. "The elevation of the peak above the level of the fea is near 1900 toifes." W. Long. 16. 18. N. Lat. 28. 29.

TENESMUS, in Medicine, is a continual defire of going to ftool, but without any ftool being ready to be voided. See Medicine, N \({ }^{\circ} 111\).

TENIERS, David, the Elder, a Flemifh painter, born at Antwerp in 5 582. He received the firt rudi. ments of his art from the famous Rubens, who highly efteemed him for his promifing genius, and with great fatisfaction examined and commended his defigns. From the fchool of that celebrated painter Teniers went to finifh his ftudies at Rome. He attached himfelf to A. dam Eliheimer for fix years; and from the initructions of two fuch incomparable mafters, he formed to himlelf a peculiar Ayle, which his fon cultivated fo happily af. terward as to bring it to the utmoft perfection. His pictures were fmall; and his fubjects ufually fhops, elaboratories, humorous converfations, and rural feltivities. The demand for his pieces was univerfal ; and even his mafter Rubens thought them an ornament to his cabinet. He died at Antwerp in 1640.

Teniers, David, the Younger, alfo an admirable painter, was the fon of the former, and was born at Antwerp in 1610. He obtained the name of Ape of Painting, from his imitating the manner of different painters with fuch exaftnefs as to deceive even the niceft judges. He improved greatly under his father, and obtained fuch reputation as introduced him to the favour of the great. The archduke Leopold William made him gentleman of his bedchamber; and all the pictures of his gallery were copied by Teniers, and engraved by his direction. The king of Spain and Don Juan of Auftria fet fo high a value on his pi\&tures, that they built a gallery on purpofe for them. William prince of Orange honoured him with his friendflup ; and Rubens not only efteemed his works, but affifted him with his advice. His príncipal talent lay in landfcapes, adorned with fmall figures. He alfo painted men drinking and fmoking, chemifts elaboratories, country fairs, and the like. His fmall figures are fuperior to his large ones. He died in 1694 .

The works of the father and fon are thus difinguined : The latter difcover a finer touch and frefler pencil, greater variety of attitndes, and a better difpofition of the figures. The father retained fomething of the tone of Italy in his colouring, which was Atronger than the fon's; befides. the fon ufed to put at the bottom of his pietures, David Teniers, junior.

Abraham, another fon of David the Elder, was equal, if not fuperior, to his father and brother in the expreflion of his characters, and his undertanding the

\section*{TENT290 T E N}

Incmis. On the other fide of the line are allo the finf gallery, wrou dosr, fecond sallory, and laf gallory; which is called the hazurd fude. Every ball ilruck into the lat gallery on this lide reckons for a certain froke the fime as the dedins. Between the fecond and this lait gailery are thie figures 5, 2. 10 mark the chaces on the hazard-fide. Dver this long gallery, or thele compartiments, is a covering, called the pent-houle, on which they play the ball from the lervice-fide, in order to begin a let of tonnis, from which it is called a fervice. When they mifs putting the ball (fo as to rebound from the pent-houfe) over a certain line on the fervice-fide, it is deemed a fault, two of which are rechoned for a froke. If the ball rolls round the pent-loufc, on the oppulite fide of the court, fo as to fall beyond a certain line detcriond for that purpofe, it is called paffe, rechons for nothing on either fide, and the player mult ferve again.

On the right-liand-fide of the court from the dedans is what they call the tambour, a patt of the wall which projects, and is fo contrived in order 10 make a varicig in the ftroke, and reader it more difficuit to be returnod by the adverfary; for when a ball inikes the tambour, it varies is direction, and requires fome extraorcinary jud gement to return it over the line. The laft thing on the right hand fide is called the grill, wherein if the ball is ftuck, it is \(2 \mathbf{I}^{10} \mathbf{1} 5\), or a certain froke.

The game of tennis is played by what they call fits ; a fet of temmis confilts of fix games: but if they play what is called an adrantage-fet, two above five games muft be won on one fide or the other fucceffirely, in order to decide; or, if it comes to fix games all, two games muft fill bs won on one fide to conclude the fet; fo that an advantage-fet may laft a connderable time; for which kind of fets the court is paid more than for any other.

We mut now defcribe the ufe of the chaces, and ly what means thefe chaces decide or interfere fo much in the game. When the player gives his fervice at the beginning of a fet, his adverfary is fuppofed to return the ball; and wherever it falls after the firit rebound untouched, the chace is called accordingly; for example, if the ball falls at the figure 1 , the chace is called at a yard, that is to fay, at a yard from the dedans: this clace remains till a fecond fervice is given; and if the flayer on the fervice fide lets the ball go after his adserlary returnsit, and if the ball falls on or between any of theie figures or chaces, they mult change fides, there being two chaces; and he who then will be on the hezard filte, muft play to win the firft chace; which if hoe wins by latiking the ball fo as to fall, after its firf rebound, nearer to the dedans than the figure 1 , without his adverfary's being able to return it from its funt hop, le wins a troke, and then procceds in like manner to win the fecond chace, wherever it fhould happen to be. If a ball falls en the line with the firft gallery door, lecond gallery, or lat gallery, the chace is likewife called at fuch or fuch a place, naming the gallery, door, \&ic. When it is juft put over the line, it is called a chace at the line. If the player on the fervice-fide returns a ball with fuch force as to ftrike the wall on the bazard-fide fo as to rebound, afier the firf hop over the line, it is alfo called a chace at she line.

The chaces on the hazard-fide procced from the batl being returned eillier too hard or not quite hard ennugh; Wo that the ball after its furf rebound falls on this fide of
the blue line, of line which defribos the hazaid-fide chaces; in which cafe it is a chace at 1, 2, \&e. prond. ed tiaete is no chace deponding. When they change fides, the player, in order to win this chace, mult put the ball over the line anywhere, fo that his adserfaly does not return it. When there is no chace on the hezard-fide, all balls put over the line from the fervice fide, without being returned, reck:on for a throke.

As the game depends chi. fly upon the marking, it will be neceffary to explain it, and to recommend thole who play at tennis to have a good and unbiafted marker, for on him the whole fet may depend: he can mark in favour of the one and againt the other in fuch a mamer, as will render it two to one at llarting, though even plavers. Instead of which the marker llould be sery attentive to the chaces, and not be anyway partial to either of the players.

This game is marked in a vely fingular manner, which makes it at frit fomewhat dititult to underliand. The firt froke is called is, the fecond 30 , the third 40 , and the fourth game: unlefs the players get four flrokes each ; in that cafe, iniftead of calling it 40 all , it is called douce: after which, as foon as ariy ftroke is got, it is called ndeantage; ard in cafe the trokes become equal again, deuce again, till one or the other gets two flrokes following, which win the game; and as the games are won, to they are marked and called; is one game lore, two games to one, \&c. towards the fet, of which io many of thefe games it confilts.

Although but one ball at a time is played with, a number of batls are made ufc of at this game to avoid trouble, and ase handed to the players in bafkets for that purpofe: by edhich means they cau play as long as they pleafe, without ever having occalion to thoop for a ball.

As to the odds at tennis, they anc by no means fixed, but are generally laid as follow :

Upon the firt ftroke being won betreet even players, that is, fiftecn love, the odds are of the
\begin{tabular}{lllllll} 
Single gane & - & - & & - & 7 to & 4 \\
Thinty love & - & & - & - & 4 & \(I\) \\
Forty love & - & & - & - & 8 & 1 \\
Thirty fifteen & - & - & & 2 & 1 \\
Forty fifteen & - & - & & 5 & 1 \\
Forty thirty & - & - & - & 3 & \(I\)
\end{tabular}
\begin{tabular}{llll} 
The odds of a four game fet when the & \\
firft game is won, are & - & 7 & 4 \\
When two games love & - & - & 4 \\
Three games love & - & - & 8 \\
I \\
When two games so one & - & - & 2
\end{tabular}
\begin{tabular}{llll} 
The odls of a fix game fet when the \\
fill game is won, are & - & - & 3 \\
\hline
\end{tabular}

The foregoing odds, as beforefaid, are generally hid, but the chaces interfering makes the odds very precarious; for example, wherr there is a chace at half a yard, and a let is five games all, and in every other refpect equal, the odds are a good five to four; and if it were fix games to five, and forty thirty with the fame chace, the odds then would be a guinea to a fhilling; fo that it is. plain that the odds at this game difier from thofe of any other: for one. froke will reduce a let, fuppofing the players to be five games all, from an even wager to three to two, and fo on in proportion to the llage of the fet.
There are various methods of giving odds at tennis, in order to make a match equal ; and that they may be undertood, we fhall give the following lift of them, with their meanings, fo that any perfon may form a judgement of the advantage received or given.

The loweft odds that can be given, excepting the choice of the fides, is what they call a bifque, that is, a ftroke to be taken or fcored whenever the player, who receives the advantage, thinks proper: fur inflance, fuppofe a critical game of the fot to be forty thirty, by taking the bifque, he who is forty becomes game, and fo in refpeet of two bifques, \&ec.

The next greater odds are fiftect, that is, a certain flroke given at the beginning of each game.

After thefe, kalf thirty, that is, fifteen one game, and thirty the next. Then follow the whole thirty, forty, \& \(c\).

There are alfo the following kind of odds which are given, viz.

Round fervices; thofe are fervices given round the pent-houle, fo as to tender it eafy for the friker-oult (the player who is on the hazard fide) to return the ball.

Half-court, that is, being obliged or confined to play into the adverlary's half-court; fometimes it is played fraightwife, and at other times acrofs; buth which are great advantages given by him fo confined, but the ftrait half-court is the greatent.

Touch-no-wall, that is, being obliged to play within the compafs of the walls, or fides of the court. This is a confiderable advantage to him who receives it ; as all the balls muft be played genily, and confequently they are much eafier to take than thofe which are played hand, or accoreing to the ufual method of play.

Barring thie ha未ards, that is, barring the dedans, tans. bour, grill, or the lafl gallery on the hazard-fide, or any particular one or more of them.

Thefe are the commun kind of odds or advantages given; but there are many others, which are according to what is agreed by the players: fuch as playing wete board againit racket, cricket-Lat againll racket, \&c.

The game of tennis is alfo played by four perfons, two partners on each fide. In this cafe, they are generally confined to their particular quarters, and one of each fide appointed to ferve and Itrike out; in every other refpect, the game is played in the fame manner as when two only play.

Any thing more to be faid upon this fubject would be needlets, as nothing can be recommended after reading this fhost account of tennis, but practice and atten. tion, without which no one can become a prolicient at the game.
TENOR, or TeNour, the purport or content of a writing or inftrument in law, \&c.
Tenor, in Mufic, the firtl inean, or middle part, or that which is the ordinary pitch of the voice, when neither raifed to a treble nor lowered to a bafs.
TENSE, in Grammar, an inflection of verbs, whereby they are made to fignify or diftinguifl the circumflance of time in what they affirm. See Gramimar.

TENI', in War, a pavilion or portable houfe. 'Tents are made of canvas, for officers and foldiers to lie under when in the field. The fize of the officers tents is not fixed; fome regiments have them of one fize and fome of another ; a captain's tent and marquee is generally ro \(\frac{1}{2}\) feet broad, 14 deep, and 8 high : the fubalterns are a foot lefs; the major's and licutenant-coloncl's a fort larger; and the colonel's two feet larger. The fubalterns of foot lie two in a tent, and thofe of horfe but one. The tents of private men are 6 feet fquare, and 5 feet high, and hold five foldiers eacl. The tents for horfe are 7 feet broad and 9 feet deep: they hold likewife five men and their borfe accoutrements.- The word is formed from the Latin tentorium, of tendo "I fretch," bccaufe tents are ufually made of canvas Itretched out, and fuftained by poles, with cords and pegs.

Text, in Surgery, a foll of lint made into the fhape a nail with a broad tlat head, chiefly ufed in deep wounds and ulcers. They are of fervice, not only in conveying medicines to the mof insimate recelfes and finufes of the wound, but to prevent the lips of the wound from uniting before it is healed from the bottom; and by their affitance grumous blood, fordes, \&c. are readily evacuated.

TENTER, Trier, or Prover, a machine ufed in the cloth manufactory, to Aretch out the pieces of cloth, fluff, \&cc. or only to make them evea and fet them fquare.

It is ufually about \(4 \frac{1}{2}\) feet high, and for length exs ceeds that of the longett piece of cloth. It confifts of feveral long fquare pieces of wood, placed like thofe which form the barriers of a manege; fo, however, a6 that the lower crofs pieces of wood may be raifed or lowered as is found requifite, to be fixed at any height by means of pins. Along the crofs pieces, both the upper and the under one, are hooked nails, called tenterhooks, driven in from pace to ipace.

To put a piece of Cloth out the TENTER. While the piecs is yet quite wet, one end is faftened to one of the O. 2
ends

\section*{T E N \\ 22 T E N}

Tenter ends of the tenter ; then it is pulled by force of arms toTentls. wards the other end, to bring it to the length required : Teaths. that other end being faftened, the upper litt is hooked on to the upper crofs-piece, and the lowelt lit to the loweft crofs-pieee, which is afterwards lowered by foree, till the piéce have its defired breadth. Being thus well atretched, both as to length and breadth, they bruhh it with a thiff hair bruth, and thus let it dry. Then they take it off; and, till they wet it again, it will retain the length and breadth the tenter gave it.

TENIHREDO, the SAW-Fl.Y; a genus of infects belonging to the order of hymenoptera. See Entomoд.осу Index.

TENTHS, and First frivits of Spiritual Preferneents, a branch of the hing's revenue. See Revenue.
Thefe were originally a part of the Papal ufurpations over the clergy of this kingdom; firll introduced by Pandulph the pope's legate, during the reigns of King John and Henry III. in the fee of Norwich; and afterwards attempted to be made univerfal by the popes Clement V. and John XXII. about the beginning of the \(14^{\text {th }}\) century. The firft fruits, primitice or annates, were the firl year's whole profts of the firitual preferment, according to a rate or valor made under the direction of Pope Innocent IV. by Walter bilhop of Norwich in 38 Hen . HII. and aflerwards advanced in value by commillion from Pope Nicholas III. A. D. 1292, 20 Edu. I.; which valuation of Pope Nicholas is fill preferved in the exchequer. The tenths, or decima, were the
B.ack 4.

Conment. roi. i. tenth part of the annual profit of each living by the fame valuation ; which was alfo claimed by the holy fee, under no better pretence than a ftrange mifapplication of that precept of the Levitical law, which direets, that the Levites " Chould offer the tenth part of their lithes as a heave offeri.g to the Lorci, and give it to Aaron the higharieft." But this claim of the pope met with vigorous refiliance from the Englift parliament; and a vasiety of acts were pafied to prevent and reltrain it, particularly the fatute 6 Hen. IV.c. r. which calls it a horrible mijchief and damuabie cuffom. But the Popifts clergy, blindly devoted to the will of a foreign maller, fill kept it on foot ; fometimes more fecretly, iometimes more openly ard avowedly : fo that in the reign of Henry VIII. it was computed, that in the compafs of 50 years \(8 c 0,000\) ducats had been fent to Rume for firft fruits orly. And as the clergy exprefied this willingnefs to contibute fo much of their income to the head of the church, it was thought proper (when in the fame reign the papal power was abolifhed, and the king was declared the head of the church of England) to annex this revenue to the crown; which was done by fatute 26 Hen . VIII. c. 3. (confirmed by flatute I Eliz. c. 4.) ; and a new salor lenfficiorum was then made, by which the clergy arc at prefent rated.

By thefe laft mentioned fatutes all vicarages under ton pounds a year, and all rectories under ten marks, are dilcharged from the payment of firl fruits: and if, in fuch livings as continue chargeable with this payment, the incumbent lives but half a year, he thall pay only one quarter of his firft fruits ; if but one whole year, then half of them; if a year and a half, three quarters; and if two years, then the whole, and not otherwife. Likewife by the flatute 27 Hen VIII. c. 8. no tenths are to be paid for the firl year, for then the firf fruits are due : and by other flatutes of Queen Anne, in the
fifth and fixth years of her reign, if a benefice be under Tenthe 5ol. per annum clear yearly value, it fhall be difcharged Tenure of the payment of firlt iruits and tenths.

Thus the richer clengy being, by the criminal bigotry of their Popifh predeceffors, lubjected at firft to a foreign exaction, were afterwards, when that yoke was thaken off, liable to a like mifapplication of their revenues through the rapacious difpolition of the then reigning monarch ; till at leng th the piety of Queen Anne rettored to the church what had been thus indirectly taken from it. This the did, not by remitting the tenths and firit fruits entirely; but, in a fpirit of the truelt equity, by applying thefe fupertluities of the larger benefices to make up the deficiencies of the Imaller. And to this end fte granted her royal charter, which was confirmed by the flatute 2 Ann . c. 11 . whereby all the revenue of firlt fruits and tenths is vefted in trultees for ever, to form a perpetual fund for the augmentation of poor livings. This is ufually called Queen Anne's bounty; which has been filll farther regulated by fubfequent fitututes.

TENUKE, in Law, fignifies the manner whereby lands or tenements are held, or the dervice that the tenant owes to his lord.

Of this kingdom almof all the real property is by the policy of our laws fuppofed to be granted by, dependent upon, and holden of, lome luperior lond, by and in confideration of certain fervices to be rendered to the lord by the tenant or poffeflor of this property. The thing holden is therefore fyled a senement, the poffeflors thereof tenants, and the manner of their poffeffion a tenure. Thus all the lands in the kingdom are fuppofed to be holden, mediately or immediately, of the king; who is flyled the lord paramount, or above all. Such tenants as held under the king immediately, when they granted out porder the king immediately, when they granted out por- Comments.
tions of the lands to inferior perfons, became alfo lords vol. in. with refpect to thofe inferior perfons, as they were fill tenants with refpect to the king; and, thus partaking of a middle nature, were called mefne or middle hords. So that if the king granted a manor to A , and he granted a portion of the land to B, now B was faid to hold of A, and A of the king ; or, in other words, B held his lands immediately of A, but mediately of the king. The king therefore was fiyled lord paran:ount : A was both tenant and lord, or was a mefne lord; and B was called tenant paraval or the loweft senant, being he who was fuppofed to make avail or profit of the land. In this manner are all the lands of the kingdom holden which are in the hands of fubjects : for, according to Sir Edward Coke, in the law of England we have not properly allodium, which is the name by which the feuditts abroad diftinguith fuch eftates of the fubject as are not holden of any fuperior. So that at the firft glance we may oblerve, that our lands are either plainly feuds, or partake very frongly of the feodal nature.

All tenures being thus derived, or fluppofed to be derived, from the king, thofe that held immediately under him, in right of his crown and dignity, were called his scnants in capite, or in chief; which was the moft honourable fpecies of tenure, but at the fame time fubjected the tenants to greater and more burdenfome fervies than inferior tonures did. And this diflinction ran through all the different forts of tenure.

There feem to have fubfilled among our ancellors four principal fpecies of lay-tenures, to which all other may be zeduced : the grand criteria of which were the natures of
the feveral fervices or renders that were due to the lords from their tenants. The fervices, in refpect of their quality, were either free or bafe fervices : in refpect of their quantity and the time of exacting them were either certain or uncertain. Free fervices were fuch as were not unbecoming the character of a foldier or a freeman to perform; as to ferve under his lord in the wars, to pay a fum of money, and the like. Bafe fervices were fuch as were fit only for peafants or perfons of a fervile rank; as to plough the lord's land, to make his hedges, to carry out his dung, or other mean employments. The certain fervices, whether free or bafe, were fuch as were flinted in quantity, and could not be exceeded on any pretence; as, to pay a ftated annual-rent, or to plough fuch a field for three days. The uncertain depended upon unknown contingencies; as, to do military fervice in perfor, or pay an affeffment in lieu of it when called upon; or to wind a hoin upon the appearance of invaders: which are free fervices; or to do whatever the lord fhould command; which is a bafe or villein fervice.

From the various combinations of thefe fervices have arifen the four kinds of lay-tenure which fubfited in England till the middle of the laft century; and three of which fubfift to this day. Of thefe Bracton (who wrote under Henry III.) feems to give the cleareft and moft compendious account of any author ancient or mo. dern ; of which the following is the outline or abstract: "Tenements are of two kinds, frank-tenement, and villenage. And of frank-tenements, fome are held freely in confidetation of homage and knight-fervice; others in free-focage, with the fervice of fealty only. And again, of villenages, fome are pure, and others privileged. He that holds in pure villenage thall do whatfoever is commanded him, and always be bound to an uncertain fervice. The orher kind of villenage is called villein-focage; and thefe villein-focmen do villein fervices, but fuch as are certain and determined." Of which the fenfe feems to be as follows; firf, where the fervice was free, but uncertain, as military fervice with homage, that tenure was called the tenure in chivalry, per fervitium militare, or by knight-fervice. Secondly, where the fervice was not only free, but alfo certain, as by fealty only, by rent and fealty, \&c. that tenure was called liberum focagium, or free focage. Thefe were the only free holdings or tenements; the others were ville. nous or fervile: as, thirdly, where the fervice was bafe in its nature, and uncertain as to time and quantity, the tenure was purum villenagium, abfolute or pure villenage. Laftly, where the fervice was bafe in its nature, but reduced to a certainty, this was fill villenage, but diftinguithed from the other by the name of privileged villenage, villenagium privilegiatum; or it might be ftill called focage (from the certainty of its fervices), but degraded by their bafenefs into the inferior title of villanum focagium, villein-focage.
1. The military tenure, or that by knight-fervice, was done away by ftat. 12 Car. II. For an account of this fpecies of tenure fee FEODAL System, and Knight-Service; and for its incidents, fee Relief, Primer-seisin, Wardship, Marriage, Fines, and Escheat.
2. The fecond fpecies of tenure or free-focage, not only fubfifts to this day, but has in a manner abforbed and fwallowed up (fince the flatute of Charles the Se-
cond) almof every other fpecies of tenure. See Socacie.

The other grand divifion of tenure, mentioned by Bracton, is that of villenage, as contradiflinguithed from liberum tenementum, or frank-tenure. And this (we may remember) he lubdivides into two clafles, pure and privileged willenage: from whence have arifen two other lpecies of our modern tenures.
3. From the tenure of pure villenage have fprung our prefent copyhold-tenures, or tenure by copy of courtroll at the will of the lord; in order to obtain a clear idea of which, it will be previoully neceffary to confult the articles Manor and Vilienage.

As a farther confequence of what has been there explained, we may collect thefe two main principles, which are lield to be the fupporters of a copyhold-tenure, and without which it cannot exift: 1. That the lands be parcel of and fituate within that manor under which it is held. 2. That they have been demifed, or demifable, by copy of court.roll immemosially. For immemorial cuftom is the life of all tenures by copy; fo that no new copyhold can, frictly feeaking, be granted at this day.

In fome manors, wherc the cultom hath been to permit the heir to fucceed the anceilor in his tenure, the eftates are fyyled copyholds of inheritance; in others, where the lords have been more vigilant to maintain their rights, they remain copyholds for life only; for the cuftom of the manor has in both cafes fo far fuperfeded the will of the lord, that, provided the fervices be performed or ftipulated for by fealty, he cannot in the firf inflance refufe to admit the heir of his tenant upon his death; nor, in the fecond, can he remove his prefent tenant fo long as he lives, though he holds nominally by the precarious tenure of his lord's will.

The fruits and appendages of a copyhold-tenure, that it hath in common with free tenures, are fealty, fervices (as well in rents as otherwife), reliefs, and efcheats. The two latter belong only to copyholds of inheritance; the former to thofe for life alfo. But, befides thefe, copyholds have alfo heriots, wardfhip, and fines. Heriots, which are agreed to be a Danifh cuftom, are a render of the beft bealt or other good (as the cuifom may be) to the lord on the death of the tenant. This is plainly a relic of villein tenure; there being originally lefs hardhip in it, when all the goods and chattels belonged to the lord, and he might have feized them even in the villein's lifetime. Thefe are incident to both fpecies of copyhold; but wardihip and fines to thofe of inheritance only. Wardfhip, in copyholdeftates, partakes both of that in chivalry and that in focage. Like that in chivalry, the lord is the legal guardian, who ufually affigns fome relation of the infant tenant to act in his ftead: and he, like guardian in focage, is accountable to lis ward for the profits. Of fines, fome are in the nature of primer-feifins, due on the death of each tenant, others are mere fines for alienations of the lands; in fome manors, only one of thofe forts can be demanded, in fome both, and in others neither. They are fometimes arbitrary and at the will of the lord, fometimes fixed by cuftom; but, even when arbitrary, the courts of law, in favour of the libetty of copyholders, have tied them down to be reafonable in their extent; otherwife they might amount to difacrifors

\section*{T E N}
the lame fervice, and the horfe, fack, and broch, of the fame prices.
\({ }^{1} 3^{\text {mo }}\) Ldw. I. Ilenry de Averning's tenure of the manor of Nioton in Effex, was to find a man, a horfe worth ten ftillings, four horfe-fhoes, a leather fack, and an iron broch.

I he year following, three perfons held thirty acres of land in Carlcton in Norfolk, by the fervice of bringing the king, whenever he hall be in England, twentyfour patiies of freth herrings, at their firf coming in.

Another held his manor in Nor folk of that king, by amually fupplying him at his exchequer with two veffels, called mues, of wine made of pearmains. "Here (fays our author) it is worth obferving, that in King Edward the Firth's time pearmain cyder was called zuine." This therefore feems to account for the mention of vineyards in old times in Kent, Suffex, and other parts of England, which las fo often puzzled many people to elucidate.

Another perfon, in the 2 Ift of the faid king, held thirty acres of land, valued at ten tuillings yearly in the exchequer, or fourpence per acre, in Cambridgefhire, for furnifhing a trufs of bay for the king's ne-ceffary-huufe or privy, whenever he fhall come into that county.

Another, in the \(34^{\text {th }}\) of that king, held a manor in Kent for providing a man to lead three greyhounds when the king thall go into Gafcony, fo long as a pair of floes of fourpence fl.ould laft.

And that we may not again recur to thefe old tenures, we flall further add, from the fame author, that in the fift year of King Edward II. Peter Spileman made fine to the king for his lands by ferjeanty, to find one to ferve as a foldier for forty days in England, with a coat of mail; alfo to fird liraw for the king's bed, and hay for his horfe.
'This article of flraw for the king's bed we did not fo much wonder at, when we found it in an article in William the Conqueror's time ; butit is fomewhat more remarkable fo late as the days of King Edward II.

Several others, we find, held their lands of the crown in thofe times by very diferent tenures. One, by paying two white capons annually; another, by carrying the king's ftandard whenever he happens to be in the county of Suffex ; another, by carrying a red or batoon before the ling on certain occafions; another, by ferving the office of chamberlain of the exchequer, a very good place at prefent; another, by building and upholding a bridge; another, by being marcchal (neritricum), i. e. as Mr Blount tranlates it, of the laundrefles in the king's army; another, by acting as a ferjeant at arms for the king's army whiln in England; one fupplies a fervant for the king's larder; another, for his wardrobe; others, to find fervants for this or that foreft; another, a hauk; one piefents the king a pair of feaslet hofe annually; others are bound to fippply foldicrs with armour for certain days, for the lieeping this or that cafle; one, viz. for the manor of Elfton in Nottinghamfhire, pays yearly rent of one pound weight of cummin feed, two pair of gloves, and a flcel necdle; another, is to repair the iron-work of the king's ploughs; Ela countefs of Warwick, in the \(13^{\text {th }}\) year of King Edwaid I. helu the manor of Hokenorton in Oxiordllire, in the barny of D'Oyly, by the ferjeanty

Tos of carvine at the kingrs table on bis bith day, and the to bave the linife the king then \(u^{r} c s\) at table.

TliOS, one of the twelve Ionian cities, was fituatcd on the lumis fide of the Ionian penimfina, and ditkinguillsed by being the place whore the poct Anacreon and the hitorian I Iecainus were born.

IER A PHIM, or 'limenPIIM, a word in the Hebrew langunge, which has exercilicd much the ingenuity of the critics. It accurs 13 or 14 limes in the O.1 'I'lament, and is comononly interpreted idols. We will nut tronble ont readers vith the numerous conjeclures which have been formed refpecking the meaning of this word. The only way to determine it, if it be at all pofiole, would be to examine and compare all the paffises in which it oecturs, and to conftult the ancient tranlations. Conjętures are ufclefs; cvery man may make a new one, which will have jut as good a lille to belief as thore which hare been already propofed.
'I'ElRCERY, oi 'PFRCERA, one of the larectit iflands of the Azores, or Weftern illands, Jying in the Allan. tic ocean. It is about 40 miles in circumference; and furrounded with craggy rocks, which render it almos inacceffible. The foil is ferile, abourding in com, wine, and fruits; and they have plenty of cattle to fupply the hhips which call there. Their principal trade is woud. The inhabitants are lisely, addicted to gatlantry, and ase laid to be extremely revengeful. It is Subject to Portugal; and Angra is the capital town. W. Jong. 27. I. N. Lat. 28.45.

TEREBELALA, the PIERCER, a genus of infcets belonging to the clafs of vermes, and order of mollufa. See fien.nnwtiloiog y Inden.

TLIEDINTHUS. See Pistacis, Botany \(I_{n-}\) dix.

TEREDO, a genus of vermes belansing to the order of teitacca. See Concholoci Index.

TERENCE, or Públius TEREsTiUs AFFR, a celebrated comic poet of ancient Rome, was bom at Carthage in, Africa. He was nave to 'Ierentius Lucanus the femator ; who gave him his liberty on account of of his wit, his good mien, and great abilities. Terence, on his becoming a freed man, applicd himfclf to the writins of comedies; in the exccution of which he imitated Mimander and the other celebrated comic pocts of Greece. Cicero gives him the mof pompous culaGitme, both for the purity of his langunge and the perfpicuity and beauty of his compofilions, which he confiters as the rule and fandard of the Jatin iongue; and obferves, that they were efeemed fo fiae and elegant, that they were thought to have been written by Scipio and Lelius, who were then the greatef perfonages and the mof eloquent of the Roman peoplc. Terence died while on a voyage into Greece, about the I 5 th year beforc the Chriftian cra. There are fix of his comedies cxtant, oif which the bett editions are the lilzevir one I635, I 2mo; that cum integris notis Dorati, ci felcitis שarivrl' \(1686,8 \mathrm{ra}\); Wefternovius"s, in Lwo vols 4 to, \({ }^{3} 726\); and that of Bentlcy the fame year, 4io. Nadame Dacier has given a beautiful Erencli ve:fion of this author; and a very good Englilh tranhation was publificd in 4 to, 3 , 68 , by Mr Colman.

PERM, in Laiw, is generally taken for a limitation of time or eftate; as, a leafe for term of life or years.
ferm, however: is more particularly ufed for that time
whercin our courts of jullice are open; in oppofition to Jorm. which, the reft of the yent is called vacation.
'Lrima, in Grammar', denotes fome word ol cxpretion in a language.

I'he word term, icrminus, is borrowed metaphorically, by the ghammarians and philolophers, from the mealuters or furveyors of lands: as a field is defined and difingullued by its crmint, or linits, fo is a thing or matter lpoken of by the word or term it is denoted by.

TERME in the Ares, or TE゙RII of Art, is a vord which, befides the litcral, and popular meaning which is has or may have in common lninguace, bears a further and peculiar meaning in feme art or fciercc.

TrRMS, the feveral times or Cafons of the year; wherein ihe tribunals, of courls of judicature, are open to all who think fit to complain of wrong, or to feek their rishls lyy duc comle of lar, or action; and during which the courts in Wenminfter-lan!! fit and give judgement. But the hish coust of malisment, thic clancery, and inferior courts, ciu not oblerve the terms; only. the courts of ling's-bench, common-pleas, and excixequer, which ave the higheft courts at common law. In contraditinction to thefe, the zeft of the yeer is called Eacatior.

Of thefe ierms tise:e are four in every yoar, during which time matters of juftice are difpatched. Hilaryterm, which, at Jonder, begins the 23 d day of Jamary, or if that be Sunday, the next day after; and ends the 3 2th of February following. Eaier-tcrin, which begins the Wrednefday fortnight after Eafter-day, and ends the Monday next after Afenfion-day. Trinizyterm, beginning the Friday next after Trinity-Sunday, and ending the Wednefday fortnight after. Michael. mas-tern, which begins the fixth day of November, ar.d ends the 28th of Norember following. Eacls of theteterms have allo their returns. Thefe terms are fuppofed by Mr Sellen to have been inffituted by Williaim the Conqueror; but Sir H. Spelman hath flewn. that they were gradually forned from the canonical conftitutionsof the church; being no other than tho?e leifire feafons of the year which were not occupied by the great fefiivals or fatts, or which were not liable to the general avocations of rutal bufinefs. Throughout all Chriftendom, in very early times, the whole year was one continual term for hearing and deciding caufes. For the Chriftian magiftrates, in order to diftinguifh themfelves from the heathens, who were very fuperfitious in the obfervation of their dics faffi and refafi, adminiliered juftice upon all days alike ; till at length the church interpofed, and exempted certain holy feafons from being profaned b; the tumult of forenfic litigations; as, particularly, the time of Advent and Chriftmas, which gave rife to the winter vacation; the time of Lent and Eafter, which created that in the fring; the time of Pentecof, which praduced the third; and the long vacation, between midfummer and Michaelmas, which was allowed for the hay-tinde and harveft. All Sundays alfo, and fome peculiar feftivals, as the days of the purincation, afcenfon, \& © were included in the fame prohibition, which was eftabilifhed by a canos of the church, A.D. 517 , an: fortified by an imperiai conftitution of the younger Theodofus, comprized in the Theodofian cotc. Afierwards, when our own legal confitulion was eflablifed, the commencement and duation of our law

Terms. terms were sppointed, with a view to thefe canonical prohibitions ; and it was ordered by the laws of King Edward the Confeffor, that from Advent to the octave of the Epiphany, from Septuagefima to the octave of Eafter, from the Alcention to the octave of Pentecont, and from three in the afternoon of all Saturdaystill Monday morning, the peace of God and holy church thall be kept throughout the whole kingdom.

And fo extravagant was afterwards the regard paid to thele holy times, that though the author of the Mirror mentions only one vacation of confiderable length, containing the months of Augult and September, yet Britton fays, that in the reign of King Edward I. no fecular plea could he held, nor any man fworn on the Evangelifts, in the time of Advent, Lent, Pentecoft, harveft, and vintage, the days of the great litanies, and all folemn fellivals. He adds, that the billops and prelates granted difpenfations for taking affizes and juries in fome of thefe holy feafons, upon reafonable occafions; and foon after a general difpenfation was eftablifted in parliament by flat. Weftm. I. 3 Edw. I. cap. 51. that aflizes of novel diffeifin, mort d'anceflor, and darrein prefentment, fhould be taken in Advent, Septuagefima, and Lent, as well as inquefts; at the fpecial requeft of the king to the bifhops. The portions of time that were not included within thefe prohibited feafons fell naturally into a fourfold divifion; and from fome feftival, or Caint's day, that immediately preceded their commencement, were denominated the terms of St Hilary, of Eafer, of the Holy Trinity, and of St Michael: which terms have been fince regulated and abbreviated by feveral acts of parliament; particularly Trinity-term by flat. 32 Hen. VIII. cap. 2. and Michaelmas-term by ftat. 16 Car. I. cap. 6. and again by ftat. 24 Geo. II. cap. 48 .

Terms, Oxford. Hilary or Lent-term begins January \(14^{\text {th }}\), and ends the Saturday before Palm-Sunday. Eafter-term begins the tenth day after Eafter, and ends the Thurfday before Whitfunday. 'Trinity-term begins the Wednefday after Trinity-Sunday, and ends ifter the act, or 6th of July, fooner or later, as the vice chancellor and convocation pleafe. Michaelmasterm begins OAtober the 10 th, and ands December the rith.

Terms, Cambridge. Lent-term begins January the 14 th, and ends Friday before Palm-Sunday. Eafterterm begins the Wednefday after Eafter-week, and ends the week before Whitfunday. Trinity-term begins the Wrdnefday after Trinity-Sunday, and ends the Friday after the commencement, or ad of July. Mi-chaelmas-term begins Oftober the 10 th, and ends December the 16 th.

Terns, Scotti/J. The court of feffion has two terms, the winter and funmer. The winter begins on 12 th Norember, and ends 11 th March, only there is a recefs of three weeks at Chriftmas. The fummer tern commences, 12 th May, and ends ith July. The court of exchequer has four terms: 1. Candlenas term begins 15 th January, and ends 3 d February; 2. Whitfuntide tcrin beings 12th May, and ends 2d June; 3. Lammas term begins ifth June, and ends gth July; 4. Martinmas term begins 24 th November, and cnds 20 th December.

Tfrms, Irifb. In Ireland the terms are the fame as at London, exsent Michaelmas term, which begins

Oltober the 13 th, and adjourus to November the 3 d , and thence to the 6 th.

TERMES, a genus of infects belonging to the order of aptera. See Extomolocy Index.

TERMINAL1A, in antiquity, feafts celebrated by the liomans in honour of the god 'Cerminus.

Terminalia, a genus of plants belouging to the clafs polygamia. Sce Botany Index.

TERMINI, in Architeflure, denote a kind of flatues or columns, adorncd on the top with the figure of a man's, woman's, or fatyr's head, as a capital; and the lower part ending in a kind of theath or lcabbard.
TERMINUS, in Pagan worthip, an ancient deity among the Romans, who prefided over the fones or landmarks, called termini, which were held fo facred, that it was accounted facrilege to move them; and as the criminal became devoted to the gods, it was lawful for any man to kill him. The worthip of this deity was inftituted by Numa Pompilius, who, to render landmarks, and confequently the property of the people, facred, erected a temple on the 'Tarpeian mount to Terminus.

\section*{tern. See Sterna, Ornithology Index.}

TERNA'TE, the mofl northerly of the Molucca or Clove iflands in the Eaf Indies. It abounds in cocoanuts, bananas, citrons, oranges, and other fruits peculiar to the torrid zone; but cloves are the mofl valuable produce. It is in the poffeflion of the Dutch. Malaya is the capital town. E. Long. 129.0. N. Lat. I. O.

TERNI, a town of Italy in the pope's territories, and in the duchy of Spoletto, with a bihop's fee. It is but a fmall place; though there are very beautiful ruins of antiquity, it having been a very confiderable Roman colony. It is fituated on the top of a high mountain, and to the weft of it are fields which are extremely fertile. E. Long. 12. 40 N. Lat. 42 . 34.

TERNSTROMIA, a genus of plants belonging to the clafs polyandria. See Botany Index.

TERPANDER, a celebrated Greek poet and mufician. The Oxford marbles tell us that he was the fon of Derdeneus of Lefbos, and that he flourifhed in the 381 ft year of thefe records; which nearly anfwers to the 27 th Olympiad, and 67 Ift year B. C. The marbles inform us likewife, that he tauglt the nomes, or airs, of the lyre and flute, which he performed himfelf upon this laft inftrument, in concert with other players on the flute. Several writers tell us that he added three flrings to the lyre, which before his time had but four; and in confirmation of this, Euclid and Strabo quote two verfes, which they attribute to Terpander himfelf.

\section*{The tetrachord's reftraint we now defpife,}

The feven-ftring'd lyre a nobler Atrain fupplies.
Among the many fignal fervices which Terpander is faid to have done to mufic, none was of more importance than the notation that is afcribed to him for afcertaining and preferving melody, which before was traditional, and wholly dependent on memory. The invention, indeed, of nuffical characters has been attributed by Alypius and Gaudentius, two Greck writers on mufic, and upon their authority by Boethius, to Pythagoras, who flourified full two centuries after Terpander. But Plutarch, from Heraclides of Pontus, affures us that Terpander, the inventor of nomes for the cithara, in

\section*{T E R}
eeppanker, hexameter veife, fet them to mufic, as well as the verfes
Terra. of llomer, in order to fing them at the public games: And Clemens Alexandrinus, in telling us that this mu. fician wrote the laws of l,ycurgus in verfe, and fet them to mufic, makes ufe of the fame exprefion as Plutarch; which feems clearly to imply a written melody.

After cnumerating the airs which 'lerpander had compofed and to which he had given names, Plutarch continues to fpeak of his other compofitions; among which he defcribes the proems, or hymns for the cithara, in heroic verfe. Thefe were ufed in after-times by the rhap!oditts, as prologues or introductions to the poems of Homer and otleer ancient writers. But Terpander rendered his name illuftrious, no lefs by his performances upon the flute and cithara than by his compofitions. This appears by the marbles already mentioned; by a paffage in Athenæus, from Hellanicus, which informs us that he obtained the furf prize in the mufical contefts at the Carnean games; and by the teftimony of Plutarch, who fays, that "no other procf need be urged of the excellence of 'I'erpander in the art of playing upon the cithara, than the regifter of the Pythic games, from which it appears that he gained four prizes fucceffively at thofe folemnities. Of the works of this poet only a few fragments nuw remain.
- IERRA AUSTRALIS incognits, a name for a large unknown continent, fuppofed to lie towards the fouth pole, and which for a long time was fought after by navigators. The voyages of Captain Cook have afcertained this matter as much as it probably ever will be. (See South Sea; Cook's Difcoweries, N 47, 48, 68, 69; and America, \(N^{0} 4\) ). On this fubject Captain Cook exprefles himfelf as follows: "I had now made the circuit of the Southern ocean in a high latitude, and traverfed it in fuch a manner as to leave not the leaft room for the poffibility of there being a continent, unlefs near the pole, and out of the reach of navigation. By twice vifiting the tropical fea, I had not orily fettled the fituation of fome old difcoveries, but made there many new ones, and left, I conceive, very little more to be done even in that part. 'lhus I flatter myfelf, that the intention of the voyage has in every refpect been fully anfwered; the fouthern hemifphere fufficiently explored; and a final end put to the fearching after a fouthern contiment, which has at times engrofied the attention of fome of the maritime powers for near two centuries paft, and been a favourite theory amongh the geographers of all ages. That there may be a continent, or large tract of land near the pole, I will not deny: on the contrary, I am of opinion there is; and it is probable that we have feen a part of it. The excellive cold, the many iflands, and valt floats of ice, all tend to prove that there mut be land to the fouth; and for my perfuafion that this fouthenn land muft lie or cxtend farthelt to the north, oppofite to the fouthern Atlantic and Indian oceans, I have already affigned fome reafons; to which I may add. the greater degree of cold experienced by us in thefe feas than in the Southern Pacific ocean under the fame parallels of latitude."

TERRA Firma, in Geograpliy, is fometimes ufed for a continent, in contradifinction to inands.

TERRA Firma, otherwife called New Cafile or Cuתilla del Oro, a country of America, bounded on the north by the North lea and part of the Atlantic ccean, by the fame fea and Guiana on the eaft, by the country of the A mazons and Peru on the Touth, ind by the Pa. Yol. XX. Payt I.
cific ocean and Veragua on the weft. It lies between
4 terr. 62 and 83 degrees of weft longitude, and between the equator and 12 degrees of north latitude; being upwards of 1200 miles in length from eaft to wetl, and 800 in breadtly from north to fouth. It had the name of \(C_{a}\). Aella del Oro from the quantity of gold found in the diAricts of Uraba and other parts; and was firt difcovered by the celebrated Columbus in his third voyage.

The climate is neither pleafant nor healthy; the inhabitants one part of the year being forclsed by the molt intenfe and burning heat, and the other almolt drowned with perpetual floods of rain, pouring from the fky with fuch violence as if a general deluge was to enfue.

In fo large a tract of country the foil muil necenarily vary. Accordingly, in fome parts it is a barren land, or drowned mangrove land, that will farce produce any kind of grain; in others it yields Indian corn, balms, gums, and drugs, almuft all maner of fruits as well of Old as of New Spain, fugar, tobacco, Bratil wood, and feveral other kinds of dyeing woods; a va. ricty of precious flones, particularly emeralds and fapphires; venion and other game. The plantations of cacao, or chocolate nuts, in the diftrict of the Caraccas, are efteemed the beft in America. The mountains abound with tygers, and, according to fome, with lions, and great numbers of other wild beafts. The rivers, feas, and lakes, teem with filh, and allo with alligators; and the bowels of the carth were once furnillied with the richeft treafures, now almoft exhaulta. The fame may be faid of the pearl fifheries on the coalt, which are far from being fo profitable now as formerly.

Terra Firma is a very mountainous country. Terra Firma Proper, in paricular, confilts of prodigious high mountains, and deep valleys flooded more than half the year. The mountains in the provinces of Carthagena and St Martha, according to Dampier, are the highelt in the world: being feen at lea 200 miles off: from thefe runs a chain of hills of almof equal height, quite through South America, as far as the ftraits of Magel. lan, called the Cordilleras des Audes. The province of Venezuela alfo, and diftrict of the Caraccas, the molt northerly parts of South America, are almoit a contimued chain of hills, feparated by fmall valleys, pointing upon the coaft of the North fea. A chain of barren mountains, almof impaflable, runs through the province of Pupayan from north to fouth, fome whereof are volcanoes; but towards the thores of the Pacific ocean it is a low country, flooded great part of the year.

The principal rivers of Terra Firma are; the Darien, Chagtre, Santa Maria, Conception, Rio Grande or Magdalera, Maricaibo, and Oroonoko.

Terra Firma contains the provinces of Terra Firma Proper or Darien, of Carthagena, St Martha, Rio de la Hacha, Venezuela, Comana, New Andalufia or Paria, New Granada, and Popayan.
'Cerra Fima Pioper lies in the form of a crefcent, about the fpacious bay of Panama, being the ithmus which joins South and North America; and extending in length between the two feas 300 miles, but in breadth, where the inthmus is narrowef, only 60. Here are found gold mines, gold fands, and fine pearls; and though the land is generally rourg, there are fome fruitful valleys, watered by rivers, brooks, and fprings. The chief places are Panama and Porto Bello.

The inhabitants of Terra Firma have never been thoroughly fubdied, and in all probability nerer will ; as ! !
they

Terre.
they are a brave and warlike people, have retreats inaccefible to Europeans, and bear an inveterate enmity to the Spaniards. See Darien.

TERRA Japonica, or Catecliu, a drug which was formerly fuppofed to be an extract from the feeds of the areca catechu, is obtained from the mimofa catechu. See Materia Medica index.

Terra Puzzolana. See Puzzolana.
TERR压Filuts, Son of the Earth, a fludent of the univerfity of Oxford, formerly appointed in public acls to make fatirical and jefting fpeeches againft the members thereof, to tax them with any growing corruptions, \&c.

TERRACE, a walk or bank of earth, raifed in a garden or court to a due elevation for a profpect. The name is alfo given to the roofs of incufes that are flat, and whereon we may walk.

TERRAQUEOUS, in Geography, a name given to our globe, becaufe confifing of land and water.

TERRAS, or Tapras, in Mineralogy, a fpecies of ar-

Kiruan's Minerato\(5{ }^{\circ}\) gillaceous earth, differing little from puzzolana, but in being more compact and hard, porous and fpongy. It is generally of a whitifh yellow colour, and contains more heterogeneous particles, as fpar, quartz, fhoerl, \&c. and fomething more calcareous carth; it effen vefces with acids, is magnetic, and fufible per fe. When pulverized, it ferves as a cement, like puzzolana. It is found in Germany and Sweden.

A fpecies of red earth has been found in the pariih of St Elizabet! in Jamaica, which turns out to be an excellent fubfitute for terras or puzzolana earth, and may therefore be of great value to the inhabitants of the Weit Indies.

One meafure of this earth, mixed with two of well flaked lime, and one of fand, forms a cement that anfiwers extremely well for buildings in water, for it foon hardens and becomes like a flone.

TERRASON, Abee John, a French writer, born at Lyons in 1669. He diftinguifhed himfelf in the difpute concerning Homer, between La Motte and Madame Dacier, by writing a Difertation contre Plliade. He wrote a political and moral romance called Sethos, full of learning and philofophy; and another capital work of his is a French tranfation of Diodorus Siculus. He died in 1750 .

TERRE Verte, in the colour-trade, the name of a green earth much ufed by painters, both fingly for a good fanding green, and in mixture with other colours. The name is French, and fignifies "green earth."

It is an indurated clay, of a deep bluifh green colour, and is found int the earth, not in continued flrata or beds, as mof of the other earths are, but in large flat maffes of different fizes, imbedded in other frata; thefe break irregularly in the cutting, and the earth is generally hrought out of the pit in lumps of different fizes. It is of a fine, regular, and even firucture, and not very hard. It is of an even and glofiy furface, very fmooth to the touch, and in fone degree refembling the morochthus or French clalk, but adhering firmly to the tongue. It does not fain the hand in touching it ; but being drawn along a rough furface, it leaves an even white linc, with a greenifh cafl.

It does not effervefce with acide, and burns to a dulky hrown colour. It is dug in the ifland of Cyprus, and in many parts of Frane and faly. That from the neigh.

\section*{298 T E S}
bourhood of Vemona has been efleemed the beft in the world ; but of late there bas been fome dug in France tl.at equals it. There is alfo an earth dug on Mendip Hills, in the finking for coal, which, though wholly unoblerved, is nearly, if not wholly, of equal value. When fcraped, and the finer parts feparated, it is ready to be made up with oil for the ufe of the painters, and makes the moft true and lafing green of any fimple body they ufe.

TElRRESTRIAI, fomething partaking of the nature of earth, or belonging to the globe of earth; thus we fay, the terreftrial globe, \&c.

TERRIER, a fmall hound to hunt the fox or bad. ger; fo called becaule he creeps into the ground, as ferrets do into the coney-burrows, after the fox, \&c.

Tertullian, or Quintus Septimus Florexs Tertullianus, a celebrated priefl of Carthage, was the fon of a centurion in the militia, who ferved as proconful of Africa. He was educated in the Pagan religior, ; but being convinced of its errors, embraced ChriLianity, and became a zealous defender of the faith. He married, it is thought, after his baptifm. Afterwards he took orders, and went to home; where, during the perfecution under the emperor Severus, he publifhed his Apology for the Chrifians, which is, in its kind, a mafterpiece of eloquence and learning ; and at the beginning of the third century he embraced the fect of the Montanifs. He lived to a very great age, and died under the reign of Antoninus Caracalla, about the year 216. Nany of his works are fill extant, in all of which he difcovers a great knowledge of the Holy Scriptures, a lively imagination, a ftrong, elevated, and impetuous flyle, great eloquence and ftrength of reafoning; but is fonetimes obfcure. His Apology and Prefcriptions are moft eftecmed. The beft editions of his works are thofe of Rigault : efpecially that of Venice in 1746, folio. Pamelins and Alix, Mr Thomas, and the Sieur du Foffé, have written his life; aud Rigault, M. de J'Aube Epine, Father Petau, and other learned men, have publifhed notes on his works.

TERUNCIUS, in antiquity, a very fmall brafs coin in ufe among the Romans.

The inconvenience of fuch very fmall pieces being foon found, the teruncius became nifufed, but its name is flill retained in reckoning, and thus it becane a money of account. The termencius at finf was a quarter of the as, or libra; lience, as the as contained twelve ounces, the teruncins contained three, whence the name, which is formed of the Latin tres uncio. Teruncius was alfo ufid for the quarter of the denarius; fo that when the denarius was at ten afee, the teruncius was worth two and a half; and when the denaius was rien to fixteen, the teruncius was worth four. See Dinarius.
'IESSELATEI) PAvemerts, thofe of rich nofaic work, made of curious fquare marbles, bricks, or tiles, called teflieter from their refembling dice.

\section*{T E S [ 299 ] T E S}

Tefiera number of fides, diffinel from the two hoizontal planes above and below. And it was thus dillinguilhed from the talus, which being round at each end, contained only four planes or faces on which it could fand; and thercfore when thrown had no more than two fide faces in view. Hence ludere talis at ludere tefferis, are fpoken of by Roman writers as two different games. The fyllable tris occurs often in Romim infcriptions. The word teflewa was applied to many other things, not fo much from a fimilitude in the figure, as from the relation they bore to foine other thing of which they were the fign or token ; as the points on the upper plane of the dye denoted the good or ill fuccels of the caft.

The eeffera hofpitalis was either public or privatc. As to the former, we find among the infcriptions publifued by Gruter inflances of two municipal towns which put themfelves under the patronage of the Roman governor; and the reciproeal engagement between them, engraved on two copperplates, in the form of an ohlong fquare, with a pediment at the top, is called in both effera hafpitalis. The defign of it was to cultivate or maintain a lafting friendbhip betweea private perfons and their families; and gave a mutual claim to the contracting parties and their defendants of a reception and kind treatment at each other's houles, as cccafion offered. For which end thofe teffere were fo contrived as beft to preferve the memory of that tranfiction to poflerity. And one method of doing this was by dividing one of them lengthwife into two equal parts; upon each of which one of the parties wrote his name, and interchanged it with the other. From this cuftom came the prevailing expreffion tefferam hafpitalem confringere, applied to perfons who violated their engagements.

The tefferce frumentarice were fmall tallies given by the emperors to the populace at Rome, entitling then to the reception of a quantity of corn from the public at flated featons. The perfon who had the infpection of thefe was called refferarius. They were made of wood and of fone.

There was another kind of tefiera which intitled perfons to a fight of the public games and other diverfions, ufually made in the form of an oblong fquare.

The tefer a militaris was a fignal given by the general or chief commtnder of an army, as a direstion to the foidiers for executing any duty or fervice required of them. This, upon urgent occafions, was only vocal; but, in ordinaty cafes, it was written on a tablet, commonly made of wood. Befide thete civil and military teffere, there are others which relate to religious affairs, and mey be called facred.

TESSOUVA, a confiderable town in Africa, fituated eaft of Mourzouk, the capital of the kingdom of Fezzan. Near this town a deep and rapid flream is faid to have exilled, but was overwhe!med by the moving fands fo frequent in Arrica.

TEST, a veffel ufed in metallurgy for abforbing the feorix of metallic bodies when melted. See Curet, under Ores, Reduction of.

TEST-ACt, in Law, is the fatute 2 ; Car. II. cap. 2 . which directs all officers, civil and military, to take the oaths, and make the declaration açaint tranfubfantiation, in the court of King's Eench, or Chaicery, the next term, or at the nest quarter-feffions, or (by fublequent Ratutes) within fix moaths after their aunifion;
and alfo within the fame time to receive the facrament of the Loond's Suppar, according to the ufage of the church of Eingland, in fome public church, immediately after divine fervice or fermon, and to deliver into court a certificate thereof figned by the minititer and church warden, and alfo to prove the fame by two credible witneffes, upon forfciture of 5001 and difability 10 hold the faid oflice.
The avowed objeet of this act was to exclede from places of truft all members of the church of liome; and hence the difienters of that age, if they did not fupport the bill when pafing through the two houfes of parliament, gave it no oppofition. For this part of their conduet they have becn often cenfired with feverity, is ha ving betrayed their rights from telentment to their cricmies. But is this a fair fate of the cafe? Were any rights in rcality betrayed? That the dread of a popifl fuccefior and of popifl influence was the immediate and urgent cauie of paling the ref-nit, is indeed true; but that the legifature, when guarding againft an impending evil, had not likewife a retrofped to another from which they had fo recently been delivered, is not fo evident. It it be proper to fupport an eftablifhed church as a branch of the conflitution, and if the teft-act be calculated to afford that fupport to the church of England, it is probable that the deliberations of parliament were as much infuenced by the dread of puritanic fury, and a renewal of the covenant, as by apprehentions of a perfecution from a popifh king and popith courcils. That the members of the chutch effablifhed by law in England had as much reafon to dread the effects of porser in the hands of Puritans as in the hands of \(\mathrm{P}_{2}\). pifts, no impartial man will controvert, who is not a ftranger to that period of our national hiffory; and that it was the duty of the legillature by every method in their power to provide for the fecurity of the conflitution againft the machinations of both its enemies, will be admitted by ail but fuch as are in love with anarchy on the one hand, or with defpotifm on the other.

Many people, when they talk or write of the tefl-act, feem to think that it was framed in oppofition to the religious opinions of the church of Rome; and finding the Proteflant diffenters, who abhor thefe opinions, deprived by it of their civil rights, they fpeak with indignation of a law which confounds the innocert with the guilty. But all this proceeds from a palpable miftake of the purpofe of the teft. As the legiflature had no authority to make laws againt any opinions whativer, on account of their being falfe in theology; fo it is not to be fuppofed that, in their deliberations on the TESTACT, the members of that auguft body took into their confideration the comparative orthodoxy of the difinguihing tenets of the Catholics and I'uritans. As a rcligious fect ihey might eftecm the latter much more than the former; but if they found that both had combined with their theological doctrines opinions reipecting civil and ccclefiaftical government, inconfiftent with the fundamental principles of the Englifl conflitution, they had an undoubted right to enact a law, by which none flould be admitted to offices, in the esecution of which they could injure the conttitution, without previounly giving lecurity that ineir adminiffration flould fupport it in all its branches. It had not then been doubted, nor is there reafon to doubt yet, but that an eifablifhed religion is neceflare, it conjunction with civil govera.

\section*{T E S [ 300\(]\) T E S}
ment, to preferve the peace of fociety; and therefore in every well regulated flate an eflablithed religion muft be fupported, not becaufe it is the duty of the civil magifrate to conduct his fubjects to future happinefs, but becaufe he cannot without fuch an eftablifhment preferve among them prefent tranquillity. The eflablifiment which mult bell anfwer this purpote, is that which, teaching the great and unchangeable duties of morality, is moit acceptable in its government and forms of worthip to the majority of the people; and therefore in giving a legal ellablithment to one conflitution of the church in preference to all others, it is only this circumflance, and not the comparative purity of the rival churches, viewed merely as ecclefiaftical corporations, to which it is the bufinets of the legifature to pay attention. At the time when the tefl-ait paffed the two houfes of parliament, the effablifhed church of England was certainly more acceptable to the great body of the people and to all ranks in the fate, than any one of the feets, whether Catholic or Proteftant, which diffented from her; and therefore it was the duty of the legillature to preferve to that church all her privileges and immunities, and to prevent thofe haflile fectaries from doing her injury in the difcharge of any civil office with which they might be entrufted. It was with this vicw that the teflact was formed; and it is with the fame view that the legiflature has hitherto rejected every petition for its repeal. In doing fo, it deprives no man of his rights, far lefs of rights which confcience calls upon him to maintain at every hazard; for the rights of individuals to hold civil offices are not inherent, but derived from the leginature, which of courfe muft be the judge upon what terms they are to be held. The legiflature of England has excluded from many offices, civil and military, evexy man who will not give fecurity, that in the difcharge of his public duty he will fupport the church eftablifhed by law; and as the tell of his intention it requires him, before he enters upon his office, to remonnce the doktrine of tranfubfantiation, and receive the facrament of the Lord's Supper in fome public church, according to the liturgy of the church of England. Whether this be the moit proper teft that could have been enakted, may well be quelioned; but that in a country abounding with fectaries of various denominations, who agree in nothing but venomous hoffility to the religious eftablifhment, fome teft is neceffary, feems incontrovertible, if it be the bufinefs of the legiflature to preferve the public peace.
'To this it will be replied, That the public peace in Scotland is preferved without a telt, and that therefore a ter: cannot be neceffary in England. This is plaufible, hut not conclufive. For 40 years after the Revolution, there was in Scotland no denomination of Chriflians but
thofe of the Prefhyterian church, eftablifhed by law, the Proteflant Epicopalians, whofe church had been eftabillued prior to that event, and the adherents to the church of Rome. The Epifcopalians and Papilts were effectually excluded from every office in which they could injure the ecclefialtical eltablifhment, by the foveral reltrictions under which they were laid, on account of their attachment, real or fuppofed, to the abdicated family of Stuart. The penal laws operated up. on them more powerfully than a religious telt. It is to be obferved too, that in the church of Scotland, though her clergy are better provided for than any other parochial clergy perhaps in Europe (A), thacre is nothing of that fplendor and temporal power which in England excite envy to clamour againft the effabliflment, under the pretence of mantaining the caufe of religious liberty. Yet even in Scotland a religious teft is occafionally exacted of civil officers. In the royal boroughs of that part of the united kingdom, no man can hold the office of a magiflrate without previoully fwearing the burgefs-oath (fee Seceder, No 8.) ; and every inltructor of youth, whether in fchools or colleges, may be called upon to qualify himfelf for his office, by fubleribing the eftablifhed Confeffion of Faith. The burgefsoath is a more effectual teft than that which is required of magitrates in England; for a man might with a fafe confcience receive the facrament of the Lord's Supper occafionally in a church" at which he would not lwear to abide and defend the fame to his life's end." This teft appears to us to be neceffary in boroughs, where faction is commonly blended with fanatictim; and if thofe fectaries which, at their firl appearance in 1732, were infignificant, if not contemptible, continue to multiply, and to imbibe prituciples much more pernicious than thofe which wele held by their fathers, it may perhaps be found expedient to extend fome teft over the whole country.

We do not, however, by any means, wifh to fee the facramental teft introduced into Scotland. A teft may be neceflary to fecure to the church all her rights and immunities; but to receive the facrament can give her no fuch fecurity, whillt it leads inevitably to the profanation of a facred ordinance. A much better teft would be, to require every man, before he be admitted to an executive office, to fivear that in the difcharge of it he will be careful to maintain all the rights and privileges of the church eftablifhed by law. Such an oath no fenfible and peaceable diffenter could refufe; for it would not bind him to communicate with the effablifhed church; and he cannot be ignorant that it belongs not to the execulive government, but to the legiflature, to determine what hiall be the religion of the fate. On this account, we cannot help thinking that the members
(A) There are indced many livings in the church of England, and probably in other churches, to which nothing in the church of Scotland ran be compared in refpect of emolument; but thefe rich benefices bear no proportion to the number of thofe which, in this age of unavoidable expence, cannot afford to the incumbents the means of decent fubfifence as gentlemen. In the churcly of Scotland many livings amount to 2001, cach annually; and we have reafon to hose, that when the prefent lan for nugmenting the fipends of the clergy las been extended over Scotland, very few will be below 1021. ; whilf in Eigland the vicarages and finall rectories, from which we have reafon to believe that the incumbents reap not 8ol. a-year, greatly exceel in number all the livings in Scotland? Nay we doubt if there be not upwards of a thoufand livings in England and Wales from which the reftor or vicar derives not above scl. annually.

\section*{T E S}
of the legillative hody fhould be fubjeated to no religions tell whatever, that they may be at freedom to reform the corruptions of the church, or to exchange one cllablifiment for another, fhould they find fuch cxchange expedient. If this reafoning be juft, it will be difficult to vindicate that claufe of 25 Car. 11. and of 1 Geo. I. in which it is enatted, that no member flall vote or fit in either houre of parliament till he hath, in the prefence of the houre, fubbcribed and repented the declaration agruinlt tranfublantiation, the invocation of faints, and the facrifice of the mafs. The church of lome is indeed a very corrupt fociety; but if it be not for the purity of her doetrines and government that any church is eftablililed in preference to all others, why fhould that particular church be precluded from the polfibility of obtaining a legal eflabliflment in Great Britain, cven though fhe were to become molt acceptable to the majority of all ranks in the kingdom? The Englidi Catholics have unqueltionably greater reafon to complain of this teff, than either they or the dififenters have to complain of the law which requires every civil and military officer to receive the Lord's Supper in the eflablilhed church.

TESTACEOUS, in Natural Hifory, an epithet: fynonymous with Testacea. See above.

TESTAMENI', or Last WiLl. 'Teftaments bot't Tuftinian and Sir Edward Coke agree to be fo called, becaufe they are tcRatio mentis: an etymon which feems to favour too much of conceit; it being plainly a fubfantive derived from the verb tefari, in like manner as juramentum, incrementum, and others, from other verbs. The defnition of the old Roman lawyers is much better than their etymology; voluntatis noflix jufa fententia de co, quod quis pof morterm fuam fieri witit: which may be thus rendered into Englifh, "the legal declaration of a man's intentions, which he wills to be performed after his death." It is called fententia, to denote the circumfpection and prudence with which it is fuppofed to be made : it is volumatis nofree fententia, becaufe its eflicacy depends on its declaring the teflator's intention, whence in Englifh it is emphatically flyled his wuill; it is jufta fententia; that is, drawn, attefted, and pablifhed, with all due folemnities and forms of law; it is \(d e\) eo, quod quis poft mortem fuam fieri velit, becaufe a teftament is of no force till after the death of the teftator.

Thefe teflaments are divided into two forts; written, and verbal or nuncupative ; of which the former is commited to writing : the latter depends merely upon oral evidence, heing declared by the teftator in extremis, before a fufficient number of witneffes, and afterwards reduced to writing.

But as nuncupative wills and CoDICILS (which were formerly more in ufe than at pre'ent when the art of writing is becone more general) are liable to great impofilions, and may occafion many perjuries, the fatute of frauds. 29 Car. II. c. 3 . emects, I. That no written will fhall be revoked or altered by a fubfequent nunctipative one, except the fame be in the lifetime of the teffator reduced to writing, and read over to him, and approved ; and unlefs the fame be proved to have been
fo done by the oaths of three witncffes at the leaft, who, Teflament. by fatute 4 and 5 Anne, c. 16 . muft be fuch as are admilfible upon trials at common law. 2. That no nuncupative will ftall in anywife be good, where the eftate bequeathed exceeds 3ol. unlefs proved by three fuch wituefies, prefent at the making thereof (he lioman law requiring feven), and unlefs they or fome of them wère fpecially required to bear witnefs thereto by the teftator himmelf; and unlefs it was made in his laft fick. nefs, in his own habitation or dwelling houfe, or where he had been previoully refident ten days at the leaft, except he be furprifcd with ficknefs on a journey, or from home, and dies without returning to his dwelling. 3. That no nuncupative will fhall be proved by the witneffes after fix months from the making, unlefs it were put in writing within fix days. Nor flall it be proved till fourten days after the death of the telfator, nor till procefs hath firlt iftued to call in the widow, or next of kin, to contef it if they think proper. Thus hath the legitlature provided againft any fraud in fetting up nuncupative wills, by fo rumerous a train of requifites, that the thing itfelf has fallen into difule; and hardly ever heard of, but in the only inflance where favour ought to be flown to it, when the teftator is furprifed by fuddea and violent ficknefs. The tellamentary words mult be fpoken with an intent to beffueath, not any loofe idle difcourfe in his illnefs; for he muft require the byflanders to bear witnefs of fuch his intention; the will muft be made at home, or among his family or friends, unlefs by unavoidable accident, to prevent impofitions from ftrangers: it muf be in his laft ficknefs; for if he recovers, he may alter his difpofitions, and have time to make a written will : it mall not be proved at too long a difance from the teflator's death, leil the words fhould efcape the memory of the witneffes; nor yet too haftily and without notice, left the family of the teffator fhould be put to inconvenience or furprile.

As to written wills, they nieed not any witnefy of their publication. We fpeak not here of devifes of lands, which are entirely ancther thing, a conveyance by fatute, unknown to the feodal or common law, and not under the fame jurifdiction as perfonal teftaments. But a teftament of chatels, written in the teffator's ou: hand, though it has neither lis name nor feal to it, nor witneffes prefent at its publication, is good; provided fufficient proof can be had that it is his hand-writing. And though written in another man's hand, and never figned by the teflator, yet if proved to be according to his in. ftructions and approved by him, it hath been held a good teflament of the perfonal ellate. Yet it is the fafer and more prudent way, and leaves lefs in the breall of the ecclefaatical judge, if it be figned or fealed by the teftator, and publifhed in the prefence of witneffes; which laft was always required in the time of Bracton; or rather he in this refpect has implicitly copied the rule of the civil law.

No teflament is of any effec till afier the death of the teftator; Nam omane teflamentum morto confumn:a. tum oft, et voluntas tefatoris off ambulatoria ufque at nimterm. And therefore, if there be many teftaments, the lalt will overthrows all the former; but the republication of a former will revolie one of a later date, and eltablithes the firt again.
Regularly, every per!on hath full powcr and literty to make a will, that is not under fome fgecial prolitition

\section*{T E S}

Tefament. by law or cuftom : which prohibitions are principally upon three accounts; for want of fufficient difcretion; for want of fuificient liberty and free-will; and on account of cumital condict.
x. In the firt fpecies are to be reckoned infants, under the age of 14 if males, and 12 if females; which is the rule of the civil has. For thengh fome of our common lawyers have held that an infant of any age (even four years old) might make a teflament, and others have denicd that under 18 he is capable; yet as the ecclefiaftical count is the judge of every teftator's capacity, this cafe muft be governed by the rules of the ecclefiaftical law. So that no objection can be admitted to the will of an infant of 14 , merely for want of age; but if the ieftator was not of fufficient difcretion, whether at the age of 14 or 24 , that will overthrow his teftament. Madmen, or otherwife non compotes, idiots or natural fools, perfons grown childilh by reafon of old age or diftemper, fuch as have their fenfes befotted with drunken-nefs,-all thefe are incapable, by reafon of mental difability, 10 make any will fo long as fuch difability lafts. To this clafs alfo may be referred fuch perforis as are born deaf, blind, and dumb; who, as they have always wanted the common inlets of underftanding, are incapable of having animum toflandi, and their teftaments are therefore void.
2. Such perfons as are inteftable for want of liberty or freedom of will, by the civil law are of various kinds; as prifoners, captives, and the like. But the law of Eng. land does not make fuch perfons abfolutely inteftable; but only leaves it to the difcretion of that court to judge upon the confideration of their particular circumftances of durefs, whether or no fuch perfons could be fuppofed to have libroum animum teflandz. And with regard to feme-coverts, our laws differ fill more materially from the civil. Among the Romans there was no diffinction ; a married woman was as capable of bequeathing as a feme-fole. But with us a married woman is not only utterly incapable of devifing lands, being excepted out of the llatute of wills, 34 and 35 Hen . VIIII. c. 5 . but alio flue is incapable of making a tellament of chattels, without the licenfe of her hufband. For all her perfonal chattels are abfolutely his own; and he may difpofe of her chattels real, or fhall have them to himself, if he furvives her: it would be therefore extremely inconfiftent to give her a power of defeating that provificn of the law, by bequeathing thofe chattels to another. The queen-confort is an exception to this general rule, for the may difpofe of her chattels by will, without the confent of her lord; and any feme-covert may make her svill of goods which are in lher poffefion in auter droil, as cxecutrix or adminiftratrix; for thefe can never be the property of the burband : and if fhe has any pinmoney or feparate maintenance, it is faid fie may difpofe of her favings therenut by teflament, without the controul of her hufland. But if a female fole makes her will, and afterwards marries, fuch fubfequent marriage is efteeracd a revocation in law, and entirely vacates the will.
3. Perfons incapable of making teflaments on account of their criminal conduct, are in the firll place all traitors and felons, from the time of conviation; for then their goods and chatels are no longer at their own difpofal, but forfeited to the king. Neither can a felo de
fo make a will of goods and chattels, for they are for- Teflament feited by the act and manner of his death; but he may mane a devife of his lands, for they are no: fubject to any forfeiture. Outlaws alfo, though it be but for debt, are incapable of making a will to long as the outlawry fubfins, for their goods and chattels are forfeited duing that time. As for perfons guilty of other crimes, fhort of felony, who are by the civil law precluded from making tettaments (as ufurers, libeliers, and others of a worle flamp), at the cominan law their teflaments may be good. And in general the rule is, and has been to at leaft ever fince Glanvil's time, quod libera fit cujuf. cunque ultima voluntas.
'Teftaments may be avoided three w:ys: 1. If made by a perfon labouring under any of the incapacities be-fore-mentioned; 2. By making another teftament of a later date ; and, 3. By cancelling or revoking it. For though I make a laft will and teftament irrevocable in the ftrongelt words, yet I am at liberty to revoke it; becaufe mine own act or words cannot alter the difpofition of law, fo as to make that irrevocable which is in its own nature revocable. For this, faith Lord Bacon, would be for a man to deprive himfelf of that which, of all other things, is moft incident to human condition; and that is, alteration or repentance. It hath alfo been held, that, withcut an exprefs revocation, if a man, who hath made his will, afterwards marries and hath a child, this is a prefumplive or implied revocation of his former will which he made in his fate of celibacy. The Romans were alfo wont to lay afide teflaments as being inofficiofa, deficient in matural duty, if they difinherited or totally paffed by (without affigning a true and fufficient reafoin) any of the children of the teftator. But if the child had any legacy, though ever fo fmall, it was a proof that the teftator had not loft his memory or his reafon, which otherwife the law prefumed ; but was then fuppofed to have acted thus for fome fubftantial caule : and in fuch cafe no quercla inofficiof tefamenti was allowed. Hence probably has arifen that groundlefs vulgar error of the neceflity of leaving the heir a fhilling, or fome other exprefs legacy, in order to difinherit him effectually ; whereas the law of England makes no fuch wild fuppoftion of forgetfulnefs or infanity; and therefore, though the heir or next of kin be totally omitted, it admits no in?fficiof to fet afide fuch a teftament.

Testamest, in Scots Law. See Latw, Ne chexi. 2. \& zc.

Testamient, Old and Nete, See Bible and Scrifture.

TESTATOR, the perfon who makes his will and teftament.
TESTER, Teston, the name of a coin fruck in Franee by Louis XII. in 1513 , and in Scotland in the time of Francis I1. and Mary quecn of Scotland, fo called from the head of the king, which was engraved upon it. The filver it contained was 11 deniers 18 grains, its weight feven deniers ry grains, and its value ro fols. The coinage of it was prohibited by Henry III. in 1575 , when the ralue of it was augmented to it fols fix deniers. The tefton or tefler among us was rated at 12 d . in the reign of Hemy V1II. and afterwards reduced to 6 d.

TESTES, in Anatomy, the teflictes. See the next articlc.

TESTICLE

\section*{TE T [ 303 ] T E U}

Tefticie TES'IICLE (eflis), a double part in aninals of the male kind, ferving for the office of generation. See Anatomr, \({ }^{\circ} 107\).
'IES'sTMONY. See Logic, \(\mathrm{N}^{\circ} 29\), and Metsruysics, \(\mathbf{N}^{0} 135-138\).

Testimony, in Law. See Evinence.
TEs'lUDO, the Tontorse, a genus of animals belonging to the clafs of amphibia, and order of reptilia. See Erpitology Index.

Testudo, in antiquity, was particularly ufed among the poets, \&c. for the ancient lyre; becaufc it was originally made by its inventor Mercury, of the back or hollow of the teftudo aquatica, or fea-tortoife, which he accidentally found on the banks of the river Nile. See LyRE.
'Iestudo, in'the military art of the ancients, was a kind of cover or fcreen which the foldiers, e. gr. a whole company, made themfelves of their bucklers, by holding them up over their heads, and ftanding clofe to each other. I'his expedient ferved to fhelter them from darts, ftones, \&c. thrown upon them, efpecially thole thrown from above, when they went to the affault.

Testudo, was allo a kind of large wooden tower which moved on feveral wheels, and was covered with bullock-hides, ferving to thelter the foldiers when they approached the walls to mine them, or to batter them with rams. It was called tefludo, from the ftrength of its roof, which covered the workmen as the Gell does the tortoife.

TE'IANUS, a dreadful fpafmodic diforder, in which the whole body becomes rigid and inflexible. It moft commonly proves mortal. See Medicine, No 279.
'IETHYS, a genus of infeets belonging to the clafs of vermes, and order of mollufca. See Helminthology Index.
"IE'TRACERA, a gerus of plants belonging to the clafs polyandria; and in the natural fyitem ranging under the doubtful. See Botany Index.
 "power"), four powers; the name of the 15 th clafs in Linnæus's Sexual Syltom. See Botany Index.

TETRAGONIA, a genus of plants belonging to the clafs icofandria; and in the natural method ranging under the \(3^{\text {th }}\) order, fucculenta. See Botany Inde:

TETRAGRAMMATON, \(\tau\) тrgzyeaprestrov, a denomination given by the Greeks to the Hebrew name of God nin', "Jekova," becaufe in the Hebrew it consifts of four letters.

TETRAGYNIA, ( \(\tau \varepsilon \sigma \pi \xi^{\varepsilon} \varsigma\), " four," and yova "a woman") ; the name of an order, or fecondary divifion, in the Sexual Syftem. See Butany Index.

TETRAND'RIA, ( \(\tau=\sigma \alpha \xi_{5}\) "four," and exing "a man or huiband") ; the name of the fourth clals in the Linnæan Syftem. See Botany Index.

TETRAO, a genus of bi:ds belonging to the order of galline. Se Ornithology Inder:

TETRODON, a genus of fifhes arranged by Linnæus under the clafs of amplibia, and order of nantes; but placed by Gmelin under the clafs of pifces, and order of branchioflesi. See Icyriyolocy Index.

TEITRARCH, a prince who holds and governs a fourth part of a kingdom. Such originally was the import of the title ietrarch; but it was afterwards applied to any fetty ling or fovereign ; and became fyno-
nymous with ethnarch, as appears from the following Tetrasch confidcrations: 1. That Pliny makes mention of fix tetrarehics within the city of Decapolis. 2. That He rod's kingdom was only divided into three parts, which yet were called eerarchics, and the fovereigns thereof, Lalie iii. 1. ectrarcher. 3. Jofephustells us, that, after the battle of Philippi, Antony, going into Syria, contlituted Herod tetrarch; and on medals the fance Herod is called ethnarch.
'TE'TRAS'IYLE, in the ancient architecture, a building, and particularly a temple, with four columns in its front.
'TETUAN, an ancient and pleafant town of Africa, fofephus's in the kingdom of Fez, and in the province of Habata. Antiog. b . It is pretty well built, and the inhabitants are about xiv. c. 2?. 15,000 in number, who call themfelves Andalufians, and almoft all fpeak Spanifl; but they are great pirates. Some fay there are 30,000 Moorifh inhabitants, and 5000 Jews. W. Long. 5. 26. N. Lat. 35. 27.

TEUCRIUM, Germander, a genus of plants belonging to the clafs didynamia; and in the natural fyltem ranging under the \(4^{2 d}\) order, Vericillata. See Botany Index.

TEUTHIS, a genus of fimes belonging to the order of abdominales. See Icurtyology Index.

TEUTONES, or Teutony, in Ancient Geograply, a people always by hiforians joined with the Cimbri; both feated, according to Mela, beyond the Elbe, on the Sinus Codanus, or Baltic ; and there it is fuppofed, lay the country of the 'Teutoncs, now Ditmarfo; diverfity of dialects producing the different terms Teut, Tut, Dit, Tid, and Thod, which in the ancient German language fignified people. Of the Fe Teutones, Virgil is to be underftood in the epithet Teutonicus, an appellation which more lately came to be applied to the Germans in general, and later ftill the appellation Alcmanri.
'Ihe Teutones, in conjunction with the Cimbri and Ambrones, made war on the Romans, and marched towards Italy in the year \(101 \mathrm{~B} . \mathrm{C}\). We are told, that the Teutones alone were fo numerous, that they were fix whole days without intermilion in pafling by the Roman camp. In Tranfalpine Gaul they engages the Roman conful Marius; but were defeated with incredible flaughter; 100,000 of them, according to the lowert calculations, being killed on the fpot. According to others, the number of thofe killed and taken prifoncrs amounted to 290,000 . The inhabitants made, fences for vineyards of their bones. Their king Teutobochus, faid to be a monfrous giant, was taken prifoner and carried to Rome. See Giant,

TEUTONIC, fomething belonging to the Teutones, The Teutonic language is fuppofed to have been the language of the ancient Germans, and hence is reclioned amongtt the mcther-tongues. See Pirlology, \(\mathrm{N}^{\circ} 219\).

Tevtonic Order, an order of military knights, eftablifhed towards the clofe of the twelfth century, on the following occafion.-When the emperor Barbaroffa engaged in a crufade for the secovery of the Holy Land out of the hands of Saladin, he was followed by great numbers of German volunteers, who from various motives enlifted under his banners. After the death of Barbasoffa, the Germans, who had fignalized themfelves before Acre or Ptolemais, refolved to choofe another leader; and at laft fxed their choice npon Erederic

\section*{T E X [ 304 ] T H}

Teutonic duke of Suabia, fecond fon to the emperor, and Henry II Texture. duke of Brabant. Under thefe generals they behaved with fo much bravery, that Henry ling of Jerufalem, the patriarch, and feveral other princes, determined to reward their valour by infituting an order of knighthood in their favour. This was accordingly done; and our new knights had at firt the title of the kuighiss of St George ; afterwards it was thought proper to put them under the tutclage of the Virgin Mary, to whom there was alveady an hofital dedicated on Mount Zion, for the relief of German pilgrims. From this time they were called Equites Mariani, or knights of St Mary. Laws, regulations, and flatutes, were drawn up for them by the Chriftian Kings in Syria and the patiarch; and among other obligations it was required, that every perfon admitted to the privileges of the ordcr thould be of noble parentage; that the order fhould defend the Chrittian religion and the Holy Land ; that they fhould exercife hofpitality towards the Chriftians in general, but particularly thofe of their own country; and that they hould with all their power endeavour to propagatc and extend the Chriftian faith and the religion of Jesus. In the year 1190, having become rich by donations from the fupertitious, they elected their firft grandmaller, Henry Walpot, a German, who had diftinguihed himfelf by his zeal and valour; and their choice was confrmed by the emperor. The following year, Pope Celeftine III. confimed their privileges already granted, giving them the title of the Teutonic knights of the hofpital of St Mary the Virigin. By the conditions of this bull, they vowed perpetual continence, obedience, and poverty; obligations which it may well be innagined were not very itrictly kept. See Polakd, No 59, 61, \(67-69\), and Prussia, No 3 3. 4.

TEWit. See Tringa, Ornithology Index.
TEDKESBURY, a town in Gloucefterhire, formerly noted for its monaftery, and now containing about 500 houfes, with a magnificent church. It is feated at the confluence of the rivers Severn and Avon, has a cotion manufactory, and fends two members to parliament. W. Long. 2. 13 . N. Fat. 52. 0.
TEXEL, a town of the United Provinces, in North Holland, feated at the mouth of the Zuyder-Zee, with a good harbour, and a ftrong fort. It is feated in a fruitful ifland, known all over the world by the great number of flips that pafs this way every day from all parts ; it is about fix miles long and five broad, lying a little nothward of the continent of Holland, between which and the ifland is one of the principal paffiges out of the Zuyder-Zec into the ocean. It is defended from the fea by fand hills ard ftrong banks. Moft of the foil is applied to feed fheep, of which they have great flocks: and the cheefe made of their milk is faid to vie with the Parmefan. This ifland contains feveral fair villages, and a torm on the ealt fide, called Burch, frongly fortified and garrifoned, and inhabited chiely hy fiffermen. N. Lat. 53. 8. 1.. Long. 4. 51.

TPEXT, a relative term, contradifinguilhed to glofs or commentaly, and fignifying an original difcourfe exciefive of any note or interpretation. 'This word is particularly ufed for a certain paffage of leripture, chofen Ly a preaclier to be the fubjuct of his fermon.

TEXTURE, roperly denotes the arrangement and colkefion of feveral fender bedies or threals interwoven
or entangled among each other, as in the webs of fpi- Textars ders, or in the claths, fuffs, \& c.

Texture is alfo ufed in fpeaking of any union or conAtituent particles of a concrete body, whether by weav. ing, hooking, knitting, tying, chaining, indenting, intruding, comprefling, attracting, or any other way. In which fenfe we fay, a clofe compact texture, a lax porous texture, a regular or irregular te:iture, \&ic.

\section*{THABOR. See Tabor.}

THALES, a celebrated Greek philofopher, and the firt of the feven wife men of Greece, was born at Miletus about 640 B . C. In order to improve himfelf in the knowledge of the fciences, he travelled into Egypt, where he difcourfed with the priefts and other learned men. Some fay that he married ; but others obferve, that he eluded the folicitations of his mother on this head, by telling her, when he was young, that it was too foon ; and afterwards, that it was too late. Thales acquired great reputation by his widom and learning : he was the firt among the Greeks who foretold ecliples of the fun, and made extraordinary difcoveries in aftronomy. Thales was the author of the Ionian fect of philofophers, who were thus called from his being born at Miletus, a city of Ionia. He maintained that water was the principle of which all the bodies in the univerfe are compofed; that the world was the work of God; and that God fees the moft fecret thoughts in the heart of man. He faid, "That the moft difficult thing in the world is to know curfelves; the moff eafy to advife others; and the moff freet to accomplifh our defires. That, in order to live well, we ought to abfain from what we find fault with in others. That the bodily felicity confifts in health, and that of the mind in knowledge. That the moft ancient of beings is God, becaufe, he is uncreated: that nothing is more beautiful than the world, becaufe it is the work of God; nothing more extenfive than fpace, quicker than fpirit, Aronger than neceffity, wifer than time." It was alfo one of his fentences, "That we ought never to fay that to any one that may be turned to our prejudice; and that we fhould live with our friends as with perfons that may become our enemies." He thanked God for three things; that he was born of the human, not of the brute fpecies; a man, and not a worman; a Greck, and not a barbaisan. None of the ancient philofophers evcr applied themfelves more earnefly to the Audy of aftronomy than Thales. Diogenes Laertius reports, that leaving his lodging with an old woman to contemplate the fars, he fell into a ditch; on which the good weman cried, "How canit thou know what is doing in the heavens, when thou canit not perceive what is at thy feet?" He went to fee Croefus, who was marching with a powerful army into Cappadocia, and enabled him to pafs the river Halys without making a bridge. Thales died foon after, at about 92 years of age. He compofed feveral trcatifes in verfe, on metcors, the equinoxes, \&\&c. but they are all lof.

THALIA, in Paman mythology, one of the nine mufes. She prefided over Comedy; and is reprefented crowned with a garland of iyy, lolding a mafls in her hancl, and wearing bukins on her feet.

Truasis, a genus of plants lelonging to the clefs monandria; and in the natural fyftom ranging under the 8th order, Scitaminec. See lowasy Indin.

THALICTRUM,

\section*{THA \(\boldsymbol{T} 305\) i T H \&}

Thalic- THALICTRUM, Meadow-ruf, a genus of plants truin, belonging to the clafs polyandria; and in the natural thames. fyftem ranging under the 26 th order, Multifiliguct. See Botany Index:

THAMES, the fineft river in Great Britain, which takes its rife from a copious fpring, called Thames IIead, two miles fouth-weft of Cirencelter in Gloucelterilire. It has been erroneonfly faid, that its name is Ifis till it arrives at Dorchefter, 15 miles below Oxford, when, being joined by the Thame or Tame, it affumes the name of the Thames, which, it has been obferved, is formed from a combination of the words Thame and Ifis. What was the origin of this vulyar error, cannot now be traced. Poetical fietion, however, has perpetuated this error, and invefled it with a kind of claffical fancuity. "It plainly appears (fays Camden), that the river was always called Thames or Tems, before it came near the Thame; and in feveral ancient charters granted to the abbey of Malmilury, as well as that of Eniham, and in the old deeds relating to Cricklade, it is never confidered under any other name than that of Thames." He likewife fays, that it occurs nowhere under the name of Ifis. All the hiforians who meation the incurfions of Ethelwold into Wilthire in the year 905 , or of Canute in 1016, concur likewife in the fame opinion, by declaring, that they paffed over the Thames at Cricklade in Wilthire. It is not probable, moreover, that Thames Head, an appellation by which the fource has ufually been diftinguithed, fhould give rife to a river of the name of Ifis; which river, after having run half its courfe, thould reaflume the name of Thames, the appellation of its parent fpring. About a mile below the fource of the river is the firf corn-mill, which is called Kemble Aill. Here the river may properly be faid to form a conflant current ; which, though not more than une feet wide in the fummer, yet in the winter becomes fuch a torrent as to overflow the meadows for many miles around. But, in the fummer, the Thames Head is fo dry, as to appear nothing but a large dell, interiperfed with fones and weeds. From Somerford the Alream winds to Cricklade, where it unites with many other rivulets. Approaching Kemsford, it again enters its native county, dividing it from Berkfhire at Inglefham. It widens confiderably in its way to Lechlade; and being there joined by the Lech and Coln, at the diftance of \(13^{8}\) miles from London, it becomes navigable for veffels of 90 tons. At Enfham, in its courfe north-eaft, to Oxford, is the firf bridge of fone; a handfome one, of three arches, built by the earl of Abingdon. Paffing by the ruins of Godflow nunnery, where the celebrated Fair Rofamond was interred, the river reaches Oxford, in whofe academic groves its poetical name of Ifis has been fo often invoked. Being there joined by the Charwell, it proceeds fouth ealt to Abingdon, and thence to Dorchefter, where it receives the Tame. Continuing its courfe fouth-eaft by Wallingford to heading, and forming a boundary to the counties of Berks, Bucks, Surry, Middlefex, Effex, and Kent, it wafhes the towns of Henley, Marlow, Maidenhead, Windfor, Eton, Egham, Staines, Laleham, Chertfey, Weybridge, Shepperton, Walton, Sunbury, Eat and Weft Moulfey, Hampton, Thames Ditton, Kinglton, Teddington, Twickenham, Richmond, Inleworth, Brentford, Kew, Mortlake, Barnes, Chifwick, Hammerfmith, Putney, Fulham, Wandfworth, Batterfea, Chelfea, Vol. XX. Fart I.
